Ulmus campestris of Northern Europe and the adjoining portion of Asia. Called in Britain *wych-elm* (from being used to make the chests called in Anglo-Saxon "hwæcce," by Chaucer "wiche," by Caxton "whutche," and in French "huche," the word *elm* occurring in Anglo Saxon and with very little change throughout the Germanic languages, "almr" in Icelandic, "alm" or "ælm" or "elm" in Danish, "olm" in Dutch, "olm" or "ilme" or "ulme" in different German dialects (Prior), at Constantinople "gaurō" (Forsk.), and the ΟΡΕΟΠΤΕΛΕΑ of Theophrastus iii. 14. 1, a lofty tree growing on mount Ida, — may be compared: *U. campestris* was observed by Forskal near Constantinople. Westward, the "atinia" identified by Columella with the Gallic elm, or "atinias gallicas" named according to Pliny xvi. 29 to xvii. 15 from their lofty stature, are referred here by Daubeney: *U. campestris* is known to grow wild throughout middle and Northern Europe (Engl. bot. pl. 1886, A. Dec., and Lindl.). By European colonists was carried to Northeast America, where it continues to be planted for ornament.

Salix helix of Europe and the adjoining portion of Asia. Willows never becoming trees are mentioned by Theophrastus iii. 13. 7. and the ΕΛΙΚΗΝ of the Arcadians — is referred here by writers: the "helicem" according to Pliny xvi. 69 is the humblest of three kinds of willow known in Asia Minor: *S. helix* was observed by Sibthorp, and Fraas, in the marshes of Greece. West-

ward, the "amara" kind of Virgil ecl. i. 79, may be compared: *S. helix* is termed "*s. humilis capitulo squamoso*" by Tournefort inst. 591, "*s. monandra*" by Hoffmann; was observed by Pollini in Italy; and is known to grow throughout middle Europe (Engl. bot. pl. 1343. and Pers.). "*S. purpurea*," termed "*s. vulgaris nigricans folio non serrato*" by Tournefort inst. 590, also seen by Sibthorp in the marshes of Greece, and known to grow as far as Lapland and Iceland (Hook., and Wats.), its bark according to Lindley "the most bitter" of all, is regarded as not distinct: by European colonists according to Carey, was introduced into the "low grounds" of Canada and our Northern States.

Pinus peuce of the mountains of Northern Greece. The ΠΕΥΚΗ: ΙΔΑΙΑ of Theophrastus iii. 9. 1, taller and straighter than the ΠΑΡΑΙΑ kind, with thicker leaves and the cone longer and less dehiscent, — or the "excelsa" kind of Latin writers, is referred here by J. D. Hooker linn. j. viii. 31: *P. peuce* was observed by Griesbach on mount Peristeri in Macedonia (Daub.); the alleged "*P. sylvestris*" seen by Sibthorp on the Bithynian Olympus, may also be compared.

Abies excelsa of Northern Europe and Asia and mountains farther South. Called in Britain *spruce* or *spruce-fir* (Prior), in Italy "*pezzo*" or "*abeto rosso*" or "*abeto di Germania*" (Lenz); and the ΕΑΑΘΗ: ΘΗΛΕΙΑ of Macedonia, distinguished by Theophrastus iii. 9. 6, — is referred here by Fraas: *A. excelsa* was observed by him in Greece, but not South of mount Pindus. Westward, the "*abies*" is mentioned by Plautus, Virgil, Propertius, the timber according to Pliny xvi. 38 and 76 in great request for spars and masts, and the foliage pectinated like that of "*picea*;" was observed by Caesar v. 12 in Gaul, and the "*abies gallica*" is expressly mentioned by Palladius nov. xv. 11: piles or posts of *A. excelsa* occur in the early lake-villages of Switzerland (Troyon), and the tree is known to grow on the Alps and Appenines, the Pyrenees, Carpathians, and throughout Northern Europe as far as Lat. 68° 15, but in Britain occurs only planted for ornament (Pers., Buch, A. Dec., Daub. and Lenz). By European colonists, was carried to Northeast America, where it continues under cultivation.

Asplenium ruta-muraria of Northern Climates. A fern called in Britain *wall-rue* (Prior); and the ΠΗΓΑΝΙΩΝ enumerated by Theophrastus i. 10. 4 among plants whose leaves are fleshy but not thickened, — may be compared: *A. ruta-muraria* was observed by Sibthorp in rock-clefts from mount Parnassus to Constantinople. Westward, the "*rutula*" is mentioned by Cicero (Ainsw.): *A. ruta-muraria* is described by Matthioli 734, and Lobel adv. 362 (Spreng.); is termed "*ruta muraria*" by Tournefort inst. 541; and is known to grow throughout middle and Northern Europe (Engl. bot. pl. 150). Farther West, is known to grow on "limestone cliffs, Vermont to Michigan, Virginia, and southward along the mountains" (A. Gray, and Chapm.); was however observed by Conrad near Philadelphia, and by Nuttall along the Arkansas.

Asplenium adiantum-nigrum of Europe and the adjoining portion of Asia. Called in Greece "*skörpithi*" (Sibth.) or "*skröpithi*" or "*skröpithōhörtōn*" (Fraas), and the ΔΡΥΟΠΤΕΡΙC of Theophrastus, — growing according to Dioscorides on the moss-clad portion of old oaks and resembling the "*ptērithi*" but much smaller, roots hairy at the junction, and employed for extirpating hair, is referred here by Sibthorp, and Fraas: *A. adiantum-nigrum* was observed by them in Greece, not infrequent in shady places and on mounds, sometimes on old oaks as described by Dioscorides. Westward, the "*thruoptēris*" or "*ptēriōn*" or "*numphaia ptēris*" is identified in the Syn. Diosc. with the "*philiklam*" of the Romans: the "*dryopteris*" is mentioned by Pliny xxvii. 48, the bruised root constituting "*psilothrum*" (depilatory ointment), but his account of the plant seems taken from Dioscorides: *A. adiantum-nigrum* is termed "*filicula quæ adiantum nigrum officinarum*" by Tournefort inst. 542; and is known to grow in middle Europe as far as Britain (Engl. bot. pl. 1950).

Usnea florida of Northern Climates. The ΦΑΚΚΟΝ described by Theophrastus iii. 8 as growing in rags pendent and hoary on the branches of oaks, — is referred here by Fraas: *U. florida* was observed by Sibthorp on trees around Athens and in Bœotia. Farther South, the "*oschnah*" is mentioned by Avicenna as growing even on the walnut (Spreng.); and the "*aschnah*" is also mentioned by Ebn Baitar. Westward, *U. florida* is described by Tournefort inst. 550; is termed "*u. vulgatissima tenuior et brevior cum orbiculis*" by Dillenius 69. pl. 13. f. 13; and is known to grow throughout the wooded portion of Europe (Engl. bot. pl. 872). Farther West, a species regarded as identical is frequent on forest-trees in North America.

Usnea barbata of Europe and the adjoining portion of Asia. Perhaps included in the "*phaskōn*" of Theophrastus: — *U. barbata* was observed by Sibthorp, and Bory, in the woods of Greece and on the Bithynian Olympus, and called "*anēraithōhörtōn*." Westward, is termed "*u. barbata loris tenuibus fibrosis*" by Dillenius 63. pl. 12. f. 6; is known to grow throughout the wooded portion of Europe (Engl. bot. pl. 258); and according to Sprengel, in common with the preceding species becomes more fragrant when growing on trees of the pine tribe.

Alectoria jubata of Europe and the adjoining portion of Asia. The ΦΑΚΚΟΝ growing according to Theophrastus iii. 8 on the ΑΛΙΦΛΟΙΟC but shorter and blackish, — may be compared: *A.*

jubata is termed "usnea jubata nigricans" by Dillenius pl. 12; and was observed by Sibthorp in woods on the Bithynian Olympus, and var. "rigida" on mount Athos and in Boeotia.

Lyceperdon epidendrum of Europe. The ΠΕΖΙC of Theophrastus i. 6, — or "pezicae" of the Greeks described by Pliny as a kind of fungus having neither root nor stem, may be compared: *L. epidendrum* was observed by Sibthorp in the Peloponnesus; is known to grow also in France and Britain (Bulliard herb. fr. i. pl. 503, and Sibth. oxon. 400).

Plocanium coccineum of shoal water in the Mediterranean and adjoining portion of the Atlantic. The sea ΦΥΚΟC described by Theophrastus iv. 6 as drifted by the North wind against Crete, more beautiful in colour than sea-purple, and used for dyeing fillets and garments, — is referred here by Sprengel: the "phōinissōn alōs phukōs" mentioned by Nicander as an antidote against serpents, is identified by Dioscorides with the "phukōs thalassion upōmēkēs kai phoinissōn;" the third kind used for dyeing garments in Crete, is described by Pliny xxvi. 66 as "crispis foliis;" and *P. coccineum* was observed in the Propontis by Sibthorp. And farther North, *P. coccineum* is known to grow around Britain (Huds. 586, Turner i. pl. 59, and Engl. bot. pl. 1242).

Laurencia botryoides of the Mediterranean, Red Sea, and Indian Ocean. The ΑΜΠΕΛΑΟC: ΠΟΝΤΙΑ of Theophrastus iv. 7 — is referred here by Billerbeck: *L. botryoides* was observed by Forskal p. 192 in the harbour of Constantinople; by Virlet, in the gulf of Saros; and by Bory, on rocks on the coast of Greece. Farther South, was observed by Forskal in the Red Sea near Mocha; and is known to grow around the Kint islets on the coast of Australia (Bory).

Cystoseira selaginoides of the Mediterranean, and the Atlantic coast of Europe. The ΕΛΑΤΗ: ΠΟΝΤΙΑ of Theophrastus iv. 7, — may be compared: the sea "abies" is mentioned by Pliny xiii. 25; the "ēnalōn murikēn," by Aelian xiv. 24; the "myrica marina," by Clusius; *C. selaginoides* was observed by Sibthorp, and Bory, around the coast of the Peloponnesus; and is known to grow as far North as Britain (Billard., and Engl. bot. pl. 1968).

Alcyonidium nemalion of the Adriatic, and coasts of the Peloponnesus. The CΥΚΗ: ΠΟΝΤΙΑ of Theophrastus iv. 7, — is referred by Billerbeck to *Fucus turbinatus*. *A. nemalion* was discovered by Bertoloni in the Adriatic; and was observed by Bory at the Southern extreme of the Peloponnesus.

Laminaria saccharina of the European coast along the Atlantic. Called in Britain *honey-ware*, from "war" the Anglo-Saxon name for "seaweed" (Prior): the ΠΡΑCΟΝ growing according to Theophrastus iv. 6 outside of the entrance to the Mediterranean and very large more than a palm wide, — is referred here by Fraas, and Lenz: *L. saccharina* has its surface coated with a layer of sugar, much used according to Duchesne p. 364 by the Icelanders.

"305 B. C." (Sm. b. d.), Rhodes besieged by Demetrius: — who in the following year made peace with the Rhodians and returned to Athens.

Echium vulgare of Europe and the adjoining portion of Asia. Called in Britain *viper's bugloss* (Prior), and the "ēhis" herb with which Alcibiades bitten by a viper was healed — (Demetrius Chlorus, and schol. Nicand. ther. 541), may be compared: the "ēhiōn ētērōn" is described by Numenius as the useful kind, having a stem with elevated leaves and branches (schol. Nicand. ther. 637); the "Alkiviōu ēhiōs" is commended by Nicander; *E. vulgare* was observed by Sibthorp, Chaubard, and Fraas, growing around Constantinople and in the Peloponnesus. Westward, is said to have been introduced into Britain by the Romans (F. Adams transl. P. Aeg.); is described by Tournefort inst. 135, and Blackwell pl. 299; and is known to grow in waste ground throughout middle Europe as far as Denmark (Pers.). By European colonists, was carried to Northeast America, where it has become a weed in waste ground, observed by A. Gray especially abounding along the Shenandoah.

Lycopsis echioides of the East Mediterranean and Tauro-Caspian countries. — Two kinds of "ēhiōn" are distinguished by Nicander, and the "mikrōn ēhiōn" is described by Numenius as having prickly leaves and a small root (schol. Nicand. ther. 637): the "ēhiōn" or "thōritha" or "alkiviathion" is described by Dioscorides as having elongate rough leaves resembling those of "aghōūsēs," several stems, purplish flowers, and fruit like the head of a viper; the "echis" or "doris" or "pseudanchusa," distinguished from the "anchusa" by the root not giving out red juice, was employed by the Magians against "tertianis" intermittent fever, a leaf collected with the left hand being applied externally (Plin. xxii. 24): *L. echioides* "calycibus fructiferis inflatis pendulis" was observed by Sibthorp, and Chaubard, in wooded situations in Greece and Cyprus; and is known to grow also in Armenia (Buxb. cent. i. pl. 1, Pers., and Bieb.). Westward, the "ēhiōn" is identified by Dioscorides with the "alkiviakōm" of the Romans: the "alcibion herba" was known to Pliny xxvii. 22 only from its medicinal use; but *L. echioides* has been observed in France (Dec. fl. fr., and Bory).

"304 B. C." (Sm. b. d.), P. Sulpicius Saverrio and P. Sempronius Sophus consuls, after a victorious campaign by the Romans against their neighbours the Samnites, peace concluded and the Second Samnite war terminated.

Not later than "303 B. C." (Clinton iii. p. 482, see also C. Mull. fragm. Meg. p. 398), Megasthenes sent as ambassador to king Sandrocottus or Chandragupta at Palimbothra on the Ganges — (regarded as identical with Pataliputra).

The art of *writing*, according to Megasthenes, was unknown among the Indians; a statement denied by others. He also found the ideas of the "Brahmanes" or Bramins agreeing in many respects with those of the Greeks; as in regard to the origin of the world, its spherical shape, and the omnipresence of its author and governor "thēōs" (Strab. xv. i. 53, 59, and 67); but "like Plato," maintaining the "immortality of the soul and judgment after death."

"Serpents large enough to swallow deer and bullocks," are mentioned by Megasthenes, — and some years later, by Deimachus (Strab. ii. i. 9, Plin. viii. 14. 1, and Aelian xvi. 22); evidently species of *Python* or Indian boa.

Musa nov. sp. of Tropical Hindustan. Almost stemless, dying to the ground each season, and called in the environs of Bombay "cowdera" or "ran-khela" (Graham); the TAAA tree on whose bark, Megasthenes was informed, the aboriginal inhabitants of India subsisted, — may be compared: *Musa nov. sp.* was observed by Graham "common on the Ghauts and hilly parts of the Concan during the rains," the leaves "used for thatching houses," and the bulb or stem boiled and eaten, the poor people about Hurrhundarghur are mentioned by Gibson as having subsisted for two months entirely "on the inner rind and heart of " this bulb; which according to Davis is sometimes "dried and pounded into a kind of flower of which cakes are made." The "*M. superba*" wild in the Dindigul valleys, and observed by Drury at high elevations "on the mountains in Travancore" is perhaps identical.

Sterculia villosa of Tropical Hindustan. Called in Tamil "odul" or "oadal" (Drur.); and possibly included among the trees furnishing the bark with which certain Bramins seen by Megasthenes were clothed — (Strab. xv. i. 60): assuming the coat of bark, is mentioned by Kalidasa vicram. 5: *S. villosa* was observed by Nimmo in the Concan South of Bombay (Graham); by Roxburgh, Royle, and Wight, in other parts of the peninsula and as far as Assam, bags and ropes made of the bark, which is easily stripped off the whole length of the tree, and the ropes used by all elephant-hunters in the Himalaya as well as in the Annamallay forests (Drur.). *S. guttata*, whose tough and pliable inner bark is converted into a flaxy substance of which clothing is made (Drur.), has been already noticed.

Grewia oppositifolia of Tropical Hindustan. Perhaps included among the trees furnishing the bark clothing — (Strab. xv. i. 60): *G. oppositifolia* was observed by Buchanan, Roxburgh, and Royle, in the Khree Pass and Dheyra Dhoon, the inner bark used for cordage and coarse cloth; by Powell, and Stewart, in the Punjaub, the bark made into sandals, but the chief value of the tree consisting in its leaves which largely serve as fodder (Drur.).

Antiaris saccidora of Western Hindustan. A majestic forest-tree called in the environs of Bombay "chandul" (Graham), in the Northern Concan "kurwut" or "juzoogry," in Malabar "araya-angeli," in Tamil "nettavil-marum" (Drur.); and possibly among the trees furnishing the bark clothing — (Strab. xv. i. 60): *A. saccidora* was observed by Lush "in 1837" in the deep ravines at Kandalla, is termed by Nimmo "lepurandra," and according to Graham "is common in the jungles near Coorg," the bark so flexible that by beating with water it can be inverted and the branch sawed off, and a sack formed by leaving a short untouched segment for the bottom; was observed by Drury and others as far as Malabar and Travancore, pieces of the bark soaked and beaten used by the hill-people as clothing.

Celtis Orientalis of Hindustan. The *Indian nettle-tree* is called in Bengalee "chakan-tubunna" (Drur.); and is perhaps one of the trees furnishing the bark clothing — (Strab. xv. i. 60): the "jivanti" of Susrutas sutr. 19 to chikits. 37, is referred here by Hessler: *C. Orientalis* was observed by Rheede iv. pl. 40 in Malabar; by Graham, "common along the foot of the Ghauts" as far as Bombay; by Retz, Roxburgh, Buchanan, and Royle, in mountainous situations common throughout to Travancore, Bengal, and Assam, where the inner bark forming a kind of natural or primitive cloth is worn by the Garrows (Pers., and Drur.).

Calamus rotang of Tropical Hindustan. The *rattan* is called in Telinga "bettam," in Bengalee and Hindustanee "beta" or "bet" (Drur.); and the ΕΥΚΑΜΠΕΙC branches of trees, flexible enough to make hoops, seen in India by Megasthenes — (. . .), may be compared: *C. rotang* was observed by Rheede xii. pl. 64 in Malabar; by Lush, and Graham, nearly as far as Bombay; by Roxburgh iii. 777, and Drury, in other parts of the peninsula and frequent in Coromandel and Bengal, believed to be the stouter of the different kinds of rattan exported from the valleys of the Himalaya; by Burmann, on Ceylon (Steud.). Farther East, is termed "*c. petraeus*" by Loureiro p. 260. (Pers., and Steud.). By European colonists, was carried to the Mauritius Islands, observed in gardens there by Bojer. (See *C. rudentum*.)

Calamus extensus of Eastern Hindustan. The ΚΑΛΑΜΟΥC: ΧΑΜΑΙΚΑΙΝΕΙC procumbent

and fifty fathoms long according to Megasthenes — (Strab. xv. i. 56), or “kalamōu ēpigēiōn” of Theophrastus iv. 11. 13, may be compared. *C. extensus* is known to grow in Silhet, over the trees of the forest to the length of “five or six hundred feet” (Drur.).

Colocasia nymphaeifolia of Hindustan. Called in Malabar “welie-ela” (Rheede); and the edible roots ΠΙΖΑΙ: ΔΙΑΦΟΡΟΙ: ΤΑΙ: ΓΛΥΚΥΤΗCΙΝ growing spontaneously according to Megasthenes and in great abundance in the marshes of Hindustan, — may be compared: *C. nymphaeifolia* was observed by Rheede xi. pl. 22 in watery places in Malabar (Pers.), where it forms part of the food of the inhabitants (Roxb., and Drur.); by Graham, “in moist places throughout the Con-cans” to and beyond Bombay.

“302 B. C.” (Kitt. cycl. bibl.), by treaty, the war with Ptolemy brought to a close, and Coele-Syria, Palestine, and Arabia Petraea annexed to Egypt.

“301 B. C.” (Burm. hist., and Mason 40), accession of Ranman, grandson of Dwattayan, as Burmese king, — represented as a “bad king.” He reigned “fifty” years.*

One hundred and twentieth generation. Jan. 1st, 300, mostly beyond youth: the Greek poets, Asclepiades of Samos, Philetas, Aratus, Nossis of Locri, Anyte of Tegea, and Antagoras of Rhodes; the comic poets, Damoxenus, Hegesippus, Philemon the younger, Plato the younger, Theognetus, Bathon, and Posidippus; the tragic poets, Lycophron, Homerus the younger, Sositheus, Alexander of Aetolia, Philiscus of Corcyra, Dionysides, Sosiphanes, and Aeanctides; the dramatists, Rhinthon of Tarentum, and Sotades the younger; the philosophers, Teles, Colotes, Timon, Metrodorus, and Dionysius of Heraclea; the geographer, Patrocles; the historians, Diyllus, Athanis, Psaon of Platea, Philochorus, Lycus of Rhegium, Callias of Syracuse, Idomeneus of Lampsacus, Timaeus, Duris of Samos, Ctesibius, and Anticlides; the orators, Cineas, and Demochares; the medical writers, Serapion of Alexandria; the grammarian Zenodotus of Ephesus; other writers, Daimachus, Simmias of Rhodes, Amometus, Lynceus of Samos, Leonidas of Tarentum; the sculptor Praxiteles; the painters, Philoxenes, Perseus, Pausias, Aetion, Ctesilochus, and Aristolaus (Bryan).

Angiras son of Uru, son of Manu Chakshusha, son of Ripu, son of Slishti, son of Dhruva, as early possibly as this date. An extract from his writings — is preserved by Hemadri in the Sraddha Mayukha (H. H. Wils. transl. vishnu purana i. 13 and ii. 7). Angiras is mentioned in the Rig Veda samhita as well as in the Mahabharata, and his descendants in the Sama Veda x. 10 (transl. Stev.).

Aegle marmelos of Tropical Hindustan. Called in Tamil “willa-marvum,” in Telinga “mare-doo,” in Bengalee “bela” (Lindl.), in the environs of Bombay “bilwa” or “bale” (Graham), in which we recognize the “bel” whose fruit according to Angiras marks the size of balls of food to be presented to Brahmans — (H. H. Wils. note to v. p. iii. 13), and the “vilva” of Susruta sutr. 46 and chikits. 18 to 28: the downless “mēlon akantēs” growing according to Nonnus dion. xxii. 25 in the forest beyond the Hydaspes, may also be compared: *Ae. marmelos* is described by Rumphius i. pl. 81; was observed in Hindustan by Rheede iii. pl. 37, Roxburgh, Wight; by Graham, “a thorny tree” occurring around Bombay and “about temples in many parts of the Deccan,” the pulp of the fruit “much used by the natives in cases of chronic diarrhoea;” and according to Royle, the astringent rind is used in dyeing yellow. Farther East, is enumerated by Mason v. p. 494 as “exotic” in Burmah, “cultivated extensively by the” natives, and “highly esteemed for its medicinal properties.” Westward from Hindustan, the “bull” is mentioned by Ishak ben Amran, Rhazes, Elbasri, Mosih, Ebn Samhun, Serapion, and Ebn Baitar; and “bel Hendi” fruit, brought from India to Egypt, is enumerated by Forskal mat. med. as constipating and employed medicinally.†

* *Agathis loranthifolia* of mountains in the Siamese countries and Malayan archipelago. The dammer pine is a mistletoe-leaved Coniferous tree called in Tenasserim “theet-men” king of woods (Mason); and the Burmese superstition of using its wood for the beam of balance-scales as early probably as this date, also the driving a peg of it into a boat or house-post “to avert evil.” — mentioned by Berdmore: *A. loranthifolia* was observed by Griffith, and Mason 544, in Tenasserim, but is not known to yield dammer (see *Hopea odorata*), its wood “used by native carpenters for various purposes,” being “very hard,” white and “rather light;” was observed by Loureiro ii. 710 in Anam; and by Rumphius ii. pl. 57, on Amboyna.

† *Feronia elephantum* of Tropical Hindustan. The size of a wood apple also assigned for these balls by Angiras — (H. H. Wils.): *F. elephantum* is called in Tamil “vallanga” or “vola-marum,” in Telinga “yellanga,” in Bengalee “kath-bel;” was observed in Hindustan by Roxburgh cor. ii. pl. 141; by Wight, the fruit affording “a very pleasant jelly” closely “resembling black currant jelly;” by Graham, “a large and handsome tree” called “cawtha,” in “gardens” and found by Gibson in “the vale of the Taptee common, also on the Mool river, and throughout Guzerat;” the fruit “with a grey coloured very hard rind,” was observed by myself to resemble an unripe orange. Eastward, enumerated by Mason v. p. 452 and 760 as “exotic” in Burmah, found by Phayre under cultivation

"299 B. C." (Hervey-Saint-Denys), Kiu-ping-youen or Kiu-youen commencing his elegiac poem called Li-sao.

Hibiscus Syriacus of Eastern Asia. A flowering shrub called in English gardens "althæa" (A. Gray), in Japan "kin" or usually "mukunge" (Thunb.); and the "althæa flowers" of Kiu-youen 29* — may be compared: *H. Syriacus* was observed by Kaempfer, and Thunberg, in Japan, cultivated everywhere for hedges, and (according to Jap. centen. comm. 76) its fibres used for cordage. Westward, by Roxburgh in Hindustan; by Graham, "in every garden" around Bombay, both "single and double varieties;" by Forskal, Delile, and Clot-Bey, in the gardens of Egypt; and by Forskal, in gardens at Constantinople. Farther West, the "flos siriacus" or "flos malvae" is mentioned by Simon Januensis sinon.; and *H. Syriacus* is described by Camerarius hort. med. pl. 4, and Gerarde. By European colonists, was carried to Northeast America, where it continues in gardens.

"298 B. C." (Sm. b. d.), L. Cornelius Scipio and Cn. Fulvius Maximus Centumalus consuls, the Samnites invading the territory of Lucanians in alliance with Rome, the third Samnite war.

"297 B. C. = 18th year of Nan-wang" (Chinese chron. table), beginning of the Fortieth cycle.

"295 B. C." (Sm. b. d.), Q. Fabius Maximus and P. Decius Mus the younger, consuls, great defeat of the Samnites, Etruscans, Umbrians, and Gauls at Sentinum.

Sisymbrium officinale of Europe and the adjoining portion of Asia. Called in Britain *hedge mustard* (Prior), in Greece "agriōpōrihō" (Forsk.) or "agriōvrōuva" (Sibth.), in Italy "verbena muschia" (Mazziari, and Targ.); and possibly the plant tendered by the verbenarius on this occasion, tufts of grass from the capitol being sometimes employed, — as appears from Pliny xxii. 3: the "verbena" is mentioned by Plautus, Terence, Horace, Virgil, Propertius, Festus, Celsus v. 28, and the "verbenaca mas" by Pliny xxv. 59 both kinds superstitiously employed by the Gauls: *S. officinale* is described by Fuchs pl. 592; is termed "e. vulgare" by Tournefort inst. 228; and is known to occur in waste places from Sweden to the Mediterranean and North Africa (fl. Dan. pl. 560, Curt. lond. v. pl. 50, Pers., and Wats.); was observed by Forskal, Sibthorp, and Chaubard, from the Peloponnesus to Constantinople, but seems unknown in Eastern Asia (Ledeb., and A. Dec.). By European colonists was carried to Greenland (Wats.), and to Northeast America, where it continues around dwellings and along walls, observed by myself from Salem to Philadelphia, known to occur in the "upper districts" of our Southern States (Chapm.), and found by Scouler at the mouth of the Columbia (Hook.; see *Verbena officinalis*).

"In this year" (Sm. b. d.), Cyprus recovered by Ptolemy. Who about this time, admonished by a dream, caused the statue of a god to be brought from Sinope to Alexandria. On arrival, the statue was found by his interpreter Timotheus and the Egyptian priest Manetho to be that of Serapis, and the great temple to Serapis was commenced (Callim., Apollod., Tacit., and Plut. is. and osir. 28).

Bupleurum fruticosum of the shores of the Mediterranean. A woody-stemmed umbelliferous plant called in Greece "anēmōpurōma" (Fraas), affording perhaps the CECEAI enumerated by Manetho among the ingredients of the "kuphi" incense (Plut. is. and osir. 88): the "kuōnōn phrikēn" of the Egyptians — is identified with the "sēsēli aithiōpikōn," of Dioscorides, a great shrub with boughs two cubits long, ivy-like leaves oblong as in "pēriklumēnōu," and "anēthōu"-like tops, the seeds crowded as in "purōs" and very odorous, mentioned also by Oribasius, and referred here

by the natives in one of the provinces. *F. elephantum* is termed "anisifolius" by Rumphius ii. pl. 43; and according to Lindley, "both leaves and flowers exhale a powerful odour of anise."

Spondias mangifera of Tropical Hindustan and Burmah. The *hogplum* is called in Burmah "kywæ" (Mason), in Telinga "amatum," in Bengalee "amra" (Lindl.), in Hindustanee "ambara," in Tamil "caat-maavu," in Malabar "ambalam" (Drur.), at Bombay "ran amb" (Graham); and the size of its fruit also assigned for these balls by Angiras — (H. H. Wils.): the "amburanus" tree was seen by John de' Marignolli in Adam's garden on Ceylon (Yule cath. 362): *S. mangifera* is known to grow on the mountains of Coromandel (Lindl.), and as far as Travancore; is described by Rumphius i. pl. 61; was observed by Rheede i. pl. 50 in Malabar; by Graham, "a large tree" in woods around Bombay "probably planted;" its "leaves deciduous in the cold weather." Eastward, is enumerated by Mason v. p. 461 and 489 as indigenous in Burmah, its intensely astringent fruit "considered a specific" in wounds by poisoned arrows, formed the chosen offering of the Karens according to their own tradition, and hence "God cursed the Karen nation and placed it lowest among all the nations by whom they are surrounded." According to Roxburgh, the trunk when wounded yields large quantities of a mild insipid gum exactly like gum arabic.

* *Traha incisa* of Yeso and the neighbouring countries. A species of *water-chestnut* called on Yeso "bekanbe," in Japanese "hisi" (Sieb.); and possibly the "chataigne d'eau" of Kiu-youen 29: — *T. incisa* is described by Siebold and enumerated among the useful plants of Yeso.

by writers: the "vōuplēurōn thēnthrōn" is mentioned by Demetrius Chlorus (schol. Nicand.): *B. fruticosum* was observed by Sibthorp on the seashore of Thessaly, but by Fraas, extending farther inland in Southern Greece. Westward, is described by Anguillara p. 212 (Spreng.); is termed "*b. arborescens salicis folio*" by Tournefort inst. 310; and is known to grow in rocky situations along the Mediterranean shore of France (Linn. hort. cliff., and Pers.).

"In this year" (Ptol. math. syn. vii. 2 and 3, and Blair), astronomical observations commenced at Alexandria by Timocharis and Aristyllus. Who "introduced the manner of determining the positions of the stars according to their Longitudes and Latitudes;" referring them however to the Equator.

Numenius, a pupil of Dieuches (Spreng.), possibly at this time writing

Geranium asphodeloides of the East Mediterranean countries. The XAAXHC of Numenius, a leaden or copper-coloured flower, — is referred here conjecturally by Sprengel: *G. asphodeloides* is termed "g. orientale columbinum flore maximo asphodeli radice" by Tournefort cor. 20 and trav. ii. pl. 14; is described also by Burmann *geran.* 28. 27, and Miller; was observed by Sibthorp on Par-nassus, by Chaubard in the Peloponnesus.

"294, March 9th, four hours before midnight" (Blair), *occultation* of the star Spica Virginis by the moon, observed at Alexandria by Timocharis; the star according to his measurement, "eight degrees West from the Equinoctial point."

"Hardly later than this year" (Sm. b. d.), Antiochus eldest son of Seleucus healed by Erasistratus. Erasistratus resided some years at Alexandria, and made anatomical discoveries: he divided the nerves into those of sensation and those of motion.

Lythrum salicaria of Europe and Northern Asia. Called in Britain *purple loosestrife* (Prior), in Germany "*weiderich*" (Grieb), in Italy "*salcerella*" or "*riparello*" (Lenz): the "*herbam lysimachiam*" discovered by Lysimachus and celebrated by Erasistratus, — growing according to Pliny xxv. 35 in wet ground and having upright branchlets, willow-like leaves, purple flowers, and if placed on the yoke quieting disagreeing oxen, is referred here by writers: *L. salicaria* was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent in wet situations from the Dardanelles to the Greek islands and Peloponnesus. Westward, is described by Matthioli, and Clusius; is termed "*partyke*" or "*lysima-chia purpurea*" by Lobel hist. p. 185, "*salicaria vulgaris purpurea foliis oblongis*" by Tournefort inst. 253; and is known to grow in Italy and throughout middle Europe as far as Denmark (Pers., and Lenz), often according to A. Decandolle springing up in abundance on the removal of the forest. Eastward from Greece, was observed by Kaempfer, and Thunberg, in Japan and called "*sju*" or usually "*fagi*." By European colonists, was carried to Northeast America, where it continues under cultivation (A. Gray), and has besides become naturalized from Upper Canada and Maine to the environs of Boston (Doug., Nutt., and myself); was also carried to Australia (Dec.). According to Lindley, is "an astringent which has been recommended in inveterate cases of diarrhœa."

Lysimachia atropurpurea of the East Mediterranean countries. Possibly the plant discovered by Lysimachus: — the "*lusimahiōn purrōn*" growing according to Dioscorides in wet ground, its stems a cubit or more high and leaves willow-like, identified in the added Synonyms with the "*lutrōn*," is referred here by Fraas: *L. atropurpurea* is described by Commelyn rar. pl. 33; is termed "*l. orientalis angustifolia flore purpureo*" by Tournefort cor. 7; and was observed by Sibthorp, Chaubard, and Fraas, in wet situations in and around the Peloponnesus.

Lysimachia vulgaris of Europe and the adjoining portion of Asia. Called in Britain *loosestrife* (Prior), in Italy "*lisimachia*" (Lenz), and possibly included in the "*lysimachiam*" in question: — the "*lusimahiōn hrusōēithēs*" differing according to Dioscorides only in the colour of the flower, is referred here by writers: *L. vulgaris* was observed by Sibthorp in woods on the Bithynian Olympus and around Constantinople. Westward, is described by Tragus f. 69 (Spreng.); is termed "*l. lutea major*" by Tournefort inst. 141; and is known to grow in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 689, Pers., and Lenz).

"293 B. C." (Blair, and Sm. b. d.) division of the day into hours adopted at Rome; and the first *sun-dial* erected there by the consul L. Papirius Cursor. To avert a pestilence, the worship of Aesculapius introduced at the command of the Delphic Oracle or of the Sybilline books (Val. Max. i. 8, and Ovid. met. xv. 620).

Bauhinia scandens of Tropical Eastern Asia and the Malayan archipelago. A woody climber called in Burmah "*myouk-hlæ-ga*" (Mason), in Tagalo "*banot*" (Blanco); and its remarkably contorted stem said to have been the origin of Aesculapius' snake-rod — (Loudon): *B. scandens* was observed by Rheede viii. pl. 29 in Malabar; by Nimmo, and Graham, in a garden at Bombay, and "*wild in the Concans*;" by Roxburgh, Royle, and Drury, as far as Travancore; by Mason 406, in Burmah; by Loureiro, in Anam (Steud.); by Blanco, on the Philippines; and by Rumphius v. pl. 1, on Amboyna (1'er.).

"The same year" (. . .), earliest contemporary Roman record, a *Latin inscription* on the

tomb of L. Scipio Barbatus, presenting the following forms of letters, D, F, G, Q, S, V; the language being essentially the same — as seventy years later in the time of Plautus.

About this time (. . .), by Ptolemy, the *Alexandrian Library* founded; and at the entrance of the harbour, the ΦΑΠΟC or *light-house* commenced. — The light-house was completed in the reign of his successor, and was much celebrated in after times; continuing “one hundred and fifty cubits high” when visited by Abd-allatif i. 4.

“291 B. C.” (Jap. centen. comm. 45), end of the reign of Koan, sixth daïro of Japan. His stone coffin is regarded as the earliest specimen of *stone-cutting* in Japan.

“290 B. C.” (Sm. b. d.), P. Cornelius Rufinus and M. Curius Dentatus consuls, at the end of fifty-three years, the Samnites finally subdued by the Romans: peace concluded, and the Third and last Samnite war ended.

“288 B. C.” (C. Mull. fragm. Megasth. p. 398, see also Strab. ii. 1. 9), Sandrocottus or Chandragupta succeeded by his son Allitrochathes or Amitraghata, now king at Palimbothra (Patna) on the Ganges. — Deimachus was sent as ambassador to Allitrochathes (Strab. ii. 1. 9).

Abrus precatorius of the wooded seashore of Tropical climates. A woody twining plant called in Hindustanee “gunj” or “ghungchi,” in Bengali “gunj” or “kunch,” in Tamil “gundu-mani” or “kunri-mani” (Drury), in Sanscrit “gunja” or “krishnala” (Lindl.); and as early probably as this date, its seeds called “retti” employed in the Hindu system of weights* — (Drury): the “krishnala” is mentioned in the Institutes of Manu viii. 134 to 330; an open mouth is compared in colour to a “gunja” seed by Bhavabhuti maha-vir. 5; and the “kakachincha” or “kakadani” or “rakta” or “hinsra” of Susrutas iv. 30 is referred here by Hessler: A. precatorius was observed by Rheede viii. pl. 39 in Malabar; by Graham, “very common” in the environs of Bombay, where I found it not altogether confined to the seashore; by Roxburgh, Wight, and Drury, along the peninsula and as far as Assam, the seeds prized “for necklaces and other ornaments.” Farther East, by Mason v. 522 “exotic” in Burmah and called “rwæ-gnay” or “khyen-rwæ,” its seeds used by jewellers as weights: by Blanco, universally known to the natives throughout the Philippines and called in Tagalo “bañgati” or “saga” or “sagamamin,” in Pampango “cansasaga,” in Ylocano “bugayon,” in Bisaya “gicos-gicos” or “caloo” or “mangadolong” or “aroyangyang,” the leaves and roots having the taste of liquorice: by myself, on the Feejeean Islands, where oracles and other objects sacred with the natives are coated with its seeds, indigenous also throughout the Tongan, Samoan, and Tahitian Islands, but not seen on mid-ocean coral-isles, nor on the unwooded shores of the Hawaiian Islands and Peru. Westward from Hindustan, was observed by myself on Zanzibar; by Grant, at “Ukuni 4° S.,” and “plentiful in Uganda” on the Upper Nile; by Forskal p. 138 among the mountains of Yemen, called “byllia,” and pods sold at Cairo; by Alpinus, and Hasselquist, under cultivation in Egypt and the seeds eaten (Lindl.); by Cadamosto in 1454 at the mouth of the river Senegal. Farther West, is called in Guayana “panacoco,” by the Caribs “aouarou” (Desc.), having reached America before the arrival of Columbus; was observed in the West Indies by Sloane i. p. 181, and P. Browne.

“286 B. C.” (Plut., and Clint.), Pyrrhus, after holding Macedonia seven months, driven out by Lysimachus.

Berosus, who was “born in the reign of Alexander” (Sm. b. d.), may have been writing as early as this date, — though his history of Babylonia was completed somewhat later.

Colocasia antiquorum of Tropical America. The *cocco* or *taro* is called by Polynesians “taro” or “talo” or “tao” (Hale), in Burmah “peing” (Mason), in Sanscrit “kuchoo” (Roxb., the Carib name of *Dioscorea alata*), in Bengalee “kuchoo,” in Telinga “chama,” in Tamil “shema kilangu” (Drur.), in the environs of Bombay “aloo” (Graham), among the mountains of Yemen “kerir” or “kurr,” in Egypt “kulkas” (Forsk.), in Equatorial Africa “myoog’wah” (Grant); and the ΓΟΓΓΑC root, growing according to Berosus in marshes along the Euphrates, esculent and equal to barley bread, — may be compared (the name seemingly derived from introduction by way

* *Phaseolus mungo* of Tropical Hindustan. Annual with a flexuous stem (Pers.), and called in Bengalee “mash-kulay,” in Hindustanee “moong thikeree,” in Telinga “minoomooloo,” in Tamil “oalandoo” (Drur.), in the environs of Bombay “ooreed” (Graham): and as early probably as this date, its seeds used as weights by the Hindu goldsmiths — (Burnouf soc. beng.): the “mudja” is mentioned in the Institutes of Manu ix. 39, and Vishnu purana i. 6; and the “munjam” seen in Hindustan is described by Ebn Batuta as a species of “mash:” P. mungo was observed by Graham 248 “a cultivated pulse in the environs of Bombay; by Roxburgh iii. 296, Wight i. 246, and Drury, from Malabar to Travancore and the Circars, “the most esteemed of all the” kinds of pulse, and “bread for many of their religious ceremonies” made of it by the natives; the root according to Royle him contains a narcotic principle. (See P. max).

of the Ganges): hardly later than this date, the "kölökasiön" is mentioned as an Egyptian root by Diphilus of Siphnus (Athen. iii. 2): *C. antiquorum* was seen under cultivation there by Ishak Israeli, Ali ben-Redwhan, Abd-allatif, Belon, Alpinus, Forskal, and Delile; by Grant, around huts of Uganda and Unyoro from the Upper Nile to "2° S.;" by myself, on Zanzibar; by Forskal among the mountains of Yemen; by Graham, "very generally cultivated" in the environs of Bombay; by Roxburgh, Royle, Wight, and Drury, in other parts of Hindustan; by Mason, in Burmah; by Loureiro ii. 535, in Anam; by myself, on the Malayan archipelago, New Zealand, the Feejeean, Tongan, Samoan, Taheitian, and Hawaiian islands. Farther East, was observed by Schomburgk under cultivation by the Waraus of the delta of the Orinoko (edit. Raleigh). Northward and Westward from Egypt, the "colocasia" is mentioned by Glaucias, Claudius Iolaus, Virgil, Columella, by Pliny xxi. 51 to 102 as cultivated in both Egypt and Italy: *C. antiquorum* is termed "*a. ægyptium*" by Columna ecphr. ii. pl. 1, "*a. maximum ægyptiacum quod vulgo colocasia*" by Tournefort inst. 159; was observed by Belon, and Sibthorp, on Cyprus, Crete, and Zante; by Tenore, in Southern Italy; by Bossier, in Spain, and called "alcolcaz," and by Clusius in Portugal (A. Dec.). By European colonists, was carried to Madeira, observed there by myself; and doubtless in some instances to America, observed by Sloane i. pl. 106 in the West Indies.

Certain Indian weeds appear to have accompanied the introduction of *rice* and *taro* into Egypt; and being inconspicuous, or of no known utility, may have escaped the attention of ancient writers:

Elatine verticillata of Tropical Eastern Asia. An annual plant that seems to have accompanied the introduction of taro and rice: — observed by Delile pl. 26 in the rice grounds of Egypt. Eastward, by Rheede ix. pl. 78 in Malabar: by Graham, on "margins of tanks and other moist places" in the environs of Bombay; by Roxburgh cor. pl. 142, and Wight, in other parts of Hindustan; and by Mason, in Burmah.

Ammania auriculata of Tropical Asia. — Observed by Delile pl. 15 in the rice grounds of Egypt; and enumerated by him p. 29 as occurring also in India. Transported to Europe, is described by Willdenow hort. berol. i. 7.

Jussiaena repens of America? Aquatic or subaquatic, and called in Egypt "forgaa" or "frækal" (Forsk.), on Madagascar "vouloun-ranou" (Boj.); and possibly introduced into Egypt as early as this date: — observed by Forskal p. 210 at Rosetta, pentapetalous and creeping on the river-bank and margin of fields; by Bojer, on Madagascar. Eastward, is enumerated by Delile p. 30 as occurring also in India; was observed by Rheede ii. pl. 51 in Malabar; by Graham, in the environs of Bombay, "common on the margins of the tanks, and in rice-fields during the rains;" by Roxburgh, and Wight, in other parts of Hindustan; and by Mason, in Burmah. Farther East, was observed by myself in Peru and Chili, pentapetalous and aquatic, and hardly having the aspect of an introduced plant; by Short, in Kentucky, and is further enumerated by A. Gray 703 as growing "in water Illinois? and southward:" the "*J. erecta*" observed by Nuttall along the Arkansas, by Pursh from the Dismal swamp to Carolina, and according to R. Brown cong. occurring also in Equatorial Africa, may be compared.

Sphæranthus suaveolens of Equatorial Africa. Called in Bengalee "chagul-nudie," in Tamil "kottang-karundie," in Telinga "bodatarum," on the Deccan "moondie" (Drur.), in Equatorial Africa "bozeaa" (Grant), in Egypt "habagbag" (Forsk.); and known there as early probably as this date: — observed by Forskal p. 154 on the river-bank near Rosetta, the plant and leaves exhaling the odour of hyssop; by Grant, along the Upper Nile on the "mud edges of Madi burn," and used medicinally in ague by the Wanyamuezi. Eastward, is enumerated by Delile p. 30 as occurring also in India; was observed by Rheede x. pl. 43 in Malabar: by Graham, in the environs of Bombay, "a very common plant on rice fields during the cold season;" by Roxburgh, Wight, and Drury, in other parts of Hindustan, its flowers seeds and roots employed medicinally; by Burmann pl. 94, on Ceylon. Farther East, is employed on Java as diuretic (Ainslie); was observed by Blanco on the Philippines, used medicinally by the natives, and called in Tagalo "sambong gala."

Grangea Maderaspatana of Tropical Asia. A diminutive procumbent plant called in Bengalee "namuti," in Tamil "mashiputri," in Telinga "mustarù," in Malabar "nelampata" (Drur.); and known in Egypt as early probably as this date: — observed by Delile along the canal at Alexandria; by Grant, on the "Nile bank, 14° to 15°." Eastward, was observed by Rheede x. pl. 49 in Malabar; by Graham, in the environs of Bombay, "on rice fields etc. in the cold weather;" by Roxburgh, Wight, and Drury, in other parts of Hindustan, its leaves used medicinally as a stomachic, also in antiseptic and anodyne fomentations (Ainslie); is known to occur also on Java (Lindl.).

Ethulia conyzoides of Tropical Asia. Known in Egypt as early probably as this date: — observed by Forskal p. 153 near Rosetta, on the mud of the Nile. Eastward, according to Delile p. 30, and Persoon, occurs also in India.

Sphenoclea pongatium of Tropical Asia. Called in Malabar "pongati" (Rheede); and known in Egypt as early possibly as this date: — observed there in rice grounds by Delile; and according

to R. Brown bot. cong. 58, occurs also in Equatorial Africa (A. Dec.). Eastward, was observed by Rheede ii. pl. 24 in Malabar; by Graham, and Nimmo, in the environs of Bombay, "in rice fields during the rains;" by Retz, and Roxburgh, in other parts of Hindustan; by Mason, in Burmah; by Blanco, on the Philippines, and called in Tagalo "silisilihan." By European colonists, was carried prior at least to "1806" to the West Indies (Le Dru, and A. Dec.).

Damasonium Indicum of Tropical Hindustan. An aquatic plant with large cordate leaves, called in Malabar "ottel ambel" (Rheede), in Egypt "ouedneh cheytany" (Del.); and known there as early possibly as this date: — observed there in rice grounds by Delile. Eastward, was observed by Rheede xi. pl. 46 in Malabar; by Graham, and Nimmo, in tanks Bombay, and "generally throughout the Concan;" by Roxburgh cor. ii. pl. 185, in other parts of Hindustan.

Scirpus (Isolepis) fistulosa of Tropical Asia. — Observed by Forskal p. 15 in moist cultivated ground near Rosetta. Eastward, according to Delile p. 29, occurs also in India.

Cyperus difformis of Tropical Asia. — Described by Plukenet alm. pl. 192: observed by Delile around Cairo and Rosetta; by Sibthorp, and Chaubard, at Patras in Greece; and according to Savi and Parlatores flor. ii. (A. Dec.), introduced into the rice grounds of Italy. Eastward from Egypt, was observed by Graham in the environs of Bombay; by Roxburgh, in other parts of Hindustan.

Panicum (Oplismenus) colonum of Tropical Asia?. A grass called in Egypt "abou roukbeh" geniculate (Del.); and possibly known there as early as this date: — described by Plukenet alm. pl. 189, and Ehret pict. pl. 3; and observed by Forskal p. 19, and Delile, along the Nile from Rosetta to Cairo; by Grant, on the Nile bank as far as "16°." Eastward, was observed by Graham in the environs of Bombay; by Roxburgh, in other parts of Hindustan, according to Persoon in cultivated ground; is described by Rumphius vi. pl. 5; and this or an allied species aboriginally introduced, was observed by myself abundantly naturalized on the Hawaiian Islands. Farther East, was observed by Humboldt and Bonpland (Steud.) in Tropical America.

Panicum fluitans of Tropical Asia?. Called in Egypt "zommeyr" (Del.); and known there as early perhaps as this date: — described by Plukenet alm. pl. 417; observed by Forskal p. 18, and Delile, at Alexandria, Damietta, and Rosetta; and known to occur also in Arabia and on Madagascar (Pers.). Eastward, was observed by Graham in the environs of Bombay; by Retz obs. iii. 8 to v. 13, and Roxburgh, in other parts of Hindustan.

"In this year (= 5th year of sixth Mikado," Humb. cosm. iv.), in Japan, land sinking in the district of Omi an inland lake formed, and the volcano of Fusi jama makes its appearance, — "12,441 feet" in elevation; whose most violent eruptions were in "A. D. 799, 800, 863, 937, 1032, 1083, and 1707," but has since remained tranquil.

"285, June 26th, Monday," (Blair), the *Astronomical Era of Dionysius* of Alexandria. Who first found "the *Solar year* to consist of 365 days 5 hours and 49 minutes."

Allium schoenoprasum of Northern climates. Called in Britain *chives* (Prior), in Germany "schnittlauch" (Grieb), in France "cive" or "civette" or "ciboulette" (Nugent), in Italy "erba cipollina" or "porro settile" (Lenz), in which we recognize the Egyptian "pēshē" (ms. Par. 44. p. 333, from "pēsh" to divide) and the KAPTON of Diphilus of Siphnos — (Spreng.): the "skōrō-thōprasōn" of Dioscorides, large like the leek, partaking of the properties of the leek and garlic, and becoming mild when cooked, may also be compared: *A. schoenoprasum* is known to grow wild in Siberia (Pers.), and according to A. Gray also in North America, as far as the shores of Lakes Superior and Huron. Westward from Greece, the "porrum sectivum" was brought into notice by Nero (Plin. xix. 33 to xx. 21); the "sectile" is mentioned by Columella xi. 3; *A. schoenoprasum* has been long cultivated in middle Europe, is described by Buxbaum cent. pl. 45, and is known to grow wild throughout Northern Europe as far as Lapland (fl. dan. pl. 971, Pers., and Fraas).

"Nov. 2d" (Astronom. can., and Clint.), abdication of Ptolemy in favour of his son Ptolemy II. Philadelphus. — The hieroglyphic ovals of Ptolemy II. Philadelphus occur on various monuments; as on the temple built by him at Philæ: and his memory has always been cherished, from the patronage he extended to Literature, and the large additions he made to the Alexandrian Library.

"In the ensuing winter" (Champoll.-Fig.), the noted Coronation-festival of Ptolemy II. at Alexandria. Described very particularly by Callixenus.

Matthiola incana of the shores of the Mediterranean and Atlantic as far as Britain. Called in Britain *stock* or *stock-gilliflower* (Prior) or *winter-gilliflower* (Ainsw.), in France "giroflée" (Nugent), in Germany "levkoje" (Grieb), in Italy "for bianco" or "leucoio bianco" or "viole bianche" (Lenz), in Greece "viōla" (Fraas), in Egypt "mantour" or "kheyley" (Del.); in which we recognize the ΛΕΥΚΟΙΟΝ flowers carried in the Coronation-festival according to Callixenus, — and produced in Egypt at all seasons according to Athenæus v. 25 to xv. 17: the coronary "lēukōiōn" is mentioned by Theocritus vii. 64, Philonides, and the "lēukōiōn porphurōn" by Dioscorides: a "Cheiranthus" is enumerated by Forskal p. liii among the coronary plants of Egypt: *M. incana* was observed by Delile, and Clot-Bey, growing about Cairo, cultivated besides for ornament; by Sibthorp, and Fraas,

wild on the seashore of Crete and the Peloponnesus, and elsewhere under cultivation. Westward, the "léukōiōn" or "vasilēiōn" is identified in Syn. Diosc. with the "ὀρῶula alva" or "viola alva" or "augustia" of the Romans; the "leucoium" is mentioned by Columella ix. 4. 4 to x. 97: *M. incana* is termed "leucoium rubrum" by Brunswyck (Spreng.), "*M. incanum majus*" by Tournefort inst. 220; was observed by Lenz wild in Italy; is known to grow wild on the seashore of Spain and Portugal (Pers.), also near Bayonne and Teste in France, and on almost inaccessible cliffs around the Isle of Wight (Laterr., Wats., and A. Dec.). By European colonists, was carried to Northeast America, where it continues a favourite garden flower.

"283 B. C. = 40 years" after the death of Alexander and "2 years" after his own abdication (Polyb., Porphyr., and Clint.), death of Ptolemy Soter. His son Ptolemy II. married Arsinoë daughter of Lysimachus; and afterwards another Arsinoë, his own sister (schol. Theocr., and Clint. iii. p. 379).

In ascending the Nile, the first temple beyond Philæ is at Debod; and presents sculptures of the Ethiopian king Ergamenes, a cotemporary of Ptolemy II. (Leps. eg. and sin. p. 123 and 243; the localities in several of Champollion's sheets of Nubian temples, having been transposed). On Philæ also, there is "a whole chamber containing nothing but *Ethiopian representations* and inscriptions."

Philinus of Cos, reputed founder of the medical sect of Empirici, and "a pupil of Herophilus" (Sm. b. d.), hardly later than this date.

Nasturtium officinale of Europe, Northern Asia, and Northwest America. Called in Britain *water-cress* (Prior), in Germany "brunnenkresse" (Grieb), in Italy "crescione" or "nasturtio aquatico" or "sisembro aquatico" (Lenz), in Greece "nērōkarthamōn," in which we recognize the "sisymbrium" growing "in riguis" known to Philinus — (according to Pliny xx. 91), also the "sisumvriōn tō ēn tōis uthasin" of Zopyrus (Orib. xiv. 62), and "sisumvriōn ētērōn" an aquatic herb according to Dioscorides with leaves at first round and as they increase dividing after the manner of rocket, eaten crude, and in the added Synonyms identified with the "karthaminēn" by some called "siōn": "N. officinale" was observed by Sibthorp, Chaubard, and Fraas in the water of springs everywhere in Greece. Farther South, the "sisymbrium" of Dioscorides, and Galen, is referred by Ebn Baitar to the "hurfa elma"; "N. officinale" was observed by Hasselquist in Palestine, is enumerated by Clot-Bey as recently introduced into Egypt, and was received by Richard p. 15 from Abyssinia. Westward, is described by Anguillara p. 114 (Spreng.): is termed "s. aquaticum" by Tournefort inst. 226; and is known to grow in Algeria (Munby). Italy, and throughout middle Europe as far as Denmark (fl. Dan. pl. 690, and Pers.). Eastward from Greece, is known to grow in Armenia and throughout Northern Asia as far as Behring's Straits (Ledeb.); was observed by Thunberg in Japan, abounding in ditches and called "ta seri"; and across the Pacific, was observed by Chamisso on St. Paul Island (Schl.), and by Scouler at the mouth of the Columbia (Hook.). Possibly by European colonists carried to Tropical Hindustan, where it was observed by Graham "in gardens," but no native name is given; and to Burmah, where it is enumerated by Mason as "exotic," and seems also devoid of native names. Clearly by European colonists, was carried to Northeast America, where it continues under cultivation, and was observed by Nuttall naturalized on Long Island; was also carried to Madeira, the Canaries, and Cape Verd Islands (Bory, Braun, and A. Dec.); to the mountains of the West Indies (Sloane, and Pursh); and to the Mauritius Islands, where according to Bojer it has become naturalized.

Thymus zygis of the Mediterranean countries. Called in Greece "smari:" the ΖΥΓΙΑ of Philinus, — identified by Dioscorides with the "ἐρpullōs agriōs," not creeping but erect with narrow leaves and flowers pungent to the taste, is referred here by writers: *T. zygis* was observed by Forskal, and Sibthorp, from Constantinople to the environs of Athens. Farther South, the "zugitha" was known to Athenæus xv. 23 in Egypt. Westward, *T. zygis* is described by Clusius hist. i. 358 (Spreng.); is termed "thymbra hispanica coridis folio" by Tournefort inst. 197; was observed by Forskal on Malta, and is known to grow in Switzerland (Pers.).

Fritillaria Pyrenaica of the mountains of the Mediterranean countries. Called in Greece "gazōuli" (Fraas); and the ΑΕΙΡΙΟΝ and ΙΟΝ, purple-flowered according to Philinus — (Athen. xv. 27), may be compared: *F. Pyrenaica* was observed by Sibthorp, Chaubard, and Fraas, on mountains from the Peloponnesus to Parnassus; is known to grow also in Russia and on Caucasus (Pers., and Adam), and is termed "f. tulipifolia" by Bieberstein (Bory). Westward, is termed "t. flore minore" by Tournefort inst. 377; and is known to grow in North Italy and on the Pyrenees (All, Gawl., and Steud.).

"282 B. C." (Sm. b. d.), C. Fabricius Luscinus and Q. Aemilius Papus consuls, the Boii defeated and peace granted to them. In Southern Italy the Samnites revolting, defeated with the Lucanians and Bruttians, Thurii relieved, and a Roman fleet attacked by the Tarentines.

"Nov. 9th, three hours and a half after midnight" (Blair), another *occultation* of the star Spica

Virginis observed at Alexandria by Timochares; the moon covering the star with the North part of her disk.

"281 B. C." (Polyb., and Clint.), Lysimachus defeated by Seleucus, and slain.

Plectranthus crassifolius of Tropical Arabia. Called there "medan," and in Egypt "zatar hendi" (Forsk.), equivalent to "origani indici" of the letter on preserving health to king Antiochus — (Hippocrat. coll.): the "setargi indi" is also mentioned by Mesue electuar.: *P. crassifolius* was observed in Egypt by Vesling obs., Forskal, and in a greenhouse there by Delile. Farther South, was observed by Forskal p. 109 under cultivation along the base of the mountains of Yemen.

"280, January" (. . . Clint. iii. p. 346), Seleucus succeeded by Antiochus Soter, second Greek king of Syria.

Dictamnus fraxinella of Europe and the adjoining portion of Asia. The herb according to Agathon called by the barbarians on the Tanais ΦΡΥΞΑ, resembling ΠΗΓΑΝΩ, and giving out flames if a stepmother is plotting — (Plut. fluv. 14. 5), may be compared: the "fraxinellam" of Crescenzo, Tragus 26 (Spreng.), and Tournefort inst. 430. is referred here by writers: *D. fraxinella* was observed by Sibthorp, and Chaubard, frequent from the Peloponnesus to the woods on mount Hæmus; and Westward, is known to grow in Italy, Germany, and as far as France (Renealm. pl. 121, Jacq. austr. pl. 428, and Pers.).

Cynanchum vincetoxicum of Europe and the adjoining portion of Asia. An upright species called in Italy "vincetossico" (Lenz); and the ΚΥΟΨΑ herb growing according to Agathon along the Argive river Inachus, resembling ΠΗΓΑΝΩ, and placed on the umbilicus to induce abortion — (Plut. fluv. 18), may be compared: the "asklēpias" growing on mountains according to Dioscorides, and having long branches, its leaves applied externally in diseases of the matrix and mammæ, and its slender fragrant roots an antidote in bites of poisonous animals, identified with the "kission" or "kissophullon" in the added Synonyms, is referred here by Fuchsius and others: *C. vincetoxicum* was observed by Sibthorp on Parnassus and other high mountains in Greece. Westward, the account of the "asclepiades" by Pliny xxvii. 18 seems taken from Dioscorides; but the "vincatossicam" is mentioned in a medical formula of the time of Charlemagne, and "vincetoxici" by Nicolaus Praepositus: *C. vincetoxicum* is described by Matthioli p. 129, Lobel, Dalechamp, and according to Dodoens p. 407 its roots are certainly fragrant (Spreng.); is termed "asclepias albo flore" by Tournefort inst. 94, "vincetoxicum officinarum" by Moench; was observed by Lenz in Italy; by Forskal, near Marseilles; is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 849, and Pers.), but not in Britain. According to Lindley, is "emetic and purgative," and is named from having been "once celebrated as an antidote to poisons."

"The same year" (Polyb., Blair, and Clint.), landing in Southern Italy of an army under Pyrrhus, to aid the colonists of Tarentum against the Romans; who were now becoming known to the Greeks. A history of Pyrrhus is given by a contemporary, Hieronymus of Cardia; one of the first Greeks who wrote on Roman affairs — (Dionys. ant. i. p. 16).

"The same year" (Polyb., and Clint.), the *Achaean League* or republic, instituted among the Greek States.

"In this year (= 50th of the First Calippic period," Hipparch., and Sm. b. d.), observation of the summer solstice by Aristarchus of Samos. Aristarchus maintained, That the Earth not only rotates, but moves in an oblique circle around the sun: — an opinion advanced also somewhat later by Seleucus the Babylonian (Humb. cosm. ii.).

"Before the close of the year" (Dexipp., and Clint.), in Macedonia, Ptolemy Ceraunus defeated by an army of Gauls. who next proceeded South, as far as Delphi in Greece; — but at the end of two years were repelled, and by invitation of Nicomedes king of Bithynia, entered Asia Minor (Liv. xxxviii. 16).

"278 B. C." (Clint.), the epoch in Literature called the "School of Alexandria." Philosophy divided into four recognized Sects, under Strato, Zeno, Epicurus, and Arcesilaus; and the establishment of a Library, attracting the *seat of learning* from Athens to Alexandria. The "first regular body of grammarians or critics" also formed, and called "ēpikutikōi" (Blair).

Rumex obtusifolius of Europe and the adjoining portion of Asia. Called in Britain *dock* (Lindl.), in Greece "lapathō" (Sibth.) or "lapatō," in Egypt "humaid" (Forsk.); and the "bulapathon" of Solon Smyrnaeus, differing only in length of root and the effect on dysentery — (Plin. xx. 83 to 86), may be compared: *R. obtusifolius* was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent in waste places from the Peloponnesus to Constantinople: by Forskal, as far as Cairo in Egypt; by Grant on the Coast range of Eastern Africa in "Lat. 6° 38' S." Westward, the "herba lapathi" called "paratella" is mentioned by Macer Floridus. . .; the Anglo-Saxon "docca" is trans-

lated "dilla" in Æfric's glossary, and the "paradilla" or "padella" is mentioned by Galfridus pr. pm. (Prior): *R. obtusifolius* is termed "l. folio minus acuto" by Tournefort inst. 504; was observed by Pollini in Italy (Lenz), and is known to grow throughout middle Europe (Curt. lond. iii. pl. 22, Lam. fl. fr., and Pers.). By European colonists, was carried to Northeast America, where it has become a frequent weed in our Atlantic States, and is distinctively termed by A. Gray "bitter dock." Is used medicinally according to Lindley, having 'properties similar to those of' *R. crispus*.

"274 B. C." (Blair, and Clint.), departure from Italy of Pyrrhus, defeated at Maleventum by the Romans under Curius.

As early probably as this date (Strab. xvi. 4. 5, and Plin. vi. 21), by Ptolemy II., Dionysius sent as ambassador to India, while Satyrus proceeded down the Red Sea to the country of the Troglodytes, to investigate the hunting of elephants.

"273 B. C." (Liv., Eutrop., and Clint.), arrival in Rome of ambassadors from Ptolemy II. of Egypt, seeking friendship.

Under Ptolemy II. (inscript. adul. ii. p. 141), "Troglodytic and Ethiopic" elephants were first brought from Adulë to Egypt to be trained for the purposes of war. The account is confirmed by Agatharchides 1 and 56, and the species is again asserted to be the African: (by what route the elephants reached their destination we are not informed, but it seems probable that the public and the Syrian king were deceived by landing *Indian elephants* on the coast near Adulë).

Odina Schimperi of Eastern Equatorial Africa. A tree called "m'oooomboo" (Grant); and possibly furnishing the net in which a serpent "thirty cubits" long was captured, and brought down the Nile to Ptolemy II. at Alexandria — (Agatharch. 78): *O. Schimperi* was observed by Grant from "5° S. to 3° N." on the Nile, and nets for game made from its roots; was received also from Africa and described by Hochstetter.

Acacia sp. of Eastern Equatorial Africa. A large tree, prickly-stemmed, and called "m'salla" (Grant); and possibly furnishing lashings on the above occasion: — observed by Grant "Dec. 12, 1862." in woods in Madi on the Nile, its inner bark made into lashings.

Ficus Kotschyana? of Eastern Equatorial Africa. A tree with huge boughs, and called "m'koo" (Grant); possibly furnishing lashings on the above occasion: — observed by Grant from "5° S. to 3° 30' N." on the Nile, its bark used for bark-cloths and short ropes.

"272 B. C." (Liv., Blair, and Clint.), the Tarentine Greeks, although aided by a Carthaginian fleet, defeated by the Romans. Terminating the war in Southern Italy.

"In this year" (Sm. b. d.), Pyrrhus invading the Peloponnesus slain before Argos, and the kingdom of Macedonia recovered by Antigonus Gonatas.

Aratus of Cilicia, physician and astronomical poet, was invited to the court of Antigonus Gonatas. — He is mentioned by Theocritus vi and vii, Cicero orat. i. 16, and is quoted by Paul (Acts xvii. 28).

"270 B. C." (Polyb., Diod., and Sm. b. d.), Hieron II., a son of Hierocles, made king at Syracuse. He is praised in the Sixteenth idyl of Theocritus.

Glaucium violaceum of Egypt and the Mediterranean countries. Called in Egypt "ridjlet el ghrab" (Forsk.) or "rigl el-ghorab" crow-foot (Del.); and the KYANEION XEAIONION of Theocritus xiii. 40, growing in company with AΔΙΑNTON around a fountain, — may be compared: *G. violaceum* was observed by Sibthorp in Cyprus and the Peloponnesus; and by Forskal, and Delile, around Alexandria and in the Egyptian Desert to the vicinity of Cairo. Westward, is termed "g. flore violaceo" by Tournefort inst. 254, "chelidonium hybridum" by Linnæus; is known to grow in various parts of Southern Europe as far as France (Lam. fl. fr., and Pers.), but as occurring in Britain does not seem permanently naturalized (Engl. bot. pl. 201, and A. Dec.).

Cistus Monspeliensis of the Mediterranean countries. Called in Greece "vōukithō:" the ΑΗΔΩΝ of Theocritus xxi. 10, — identified by Dioscorides with a kind of "kistōu" yielding "lathanōn," the leaves longer and becoming clammy in Spring, is referred here by Fraas: *C. Monspeliensis* was observed by Sibthorp, and Fraas, on dry hills in Greece and the Greek islands. Westward, is termed "c. ladanifera monspeliensis" by Tournefort inst. 260, and is known to grow in Spain and Southern France (Pers.; see *C. Creticus*).

Cistus incanus of the Mediterranean countries. Called in Greece "kōunōuklia," or by the Turks "ladan oṭu:" the ΠΟΔΟΚΙCCOC or ΠΟΔΟΚΙCΤOC of Theocritus v. 131 — is referred here by Hogg: *C. incanus* is termed "c. mas secundus folio longiore" by Tournefort inst. 259; was observed by Sibthorp frequent from Samos to Cyprus and the Peloponnesus; by Hogg in Sicily, and having "large rose-coloured flowers;" is known to grow also in Spain and Southern France (Pers.).

Fragaria vesca of Northern climates. Called in Britain *strawberry*, in Anglo-Saxon "streow berie" (Prior), in France "fraise" (Nugent), in Germany "erdbeere," in Italy "fraga" or "fragola" (Lenz), in Greece "phraōuli" (Forsk., and Fraas) or "kōukōumaria" (Sibth.); and the ΚΟΜΑ ΠΟΙCΙ upon which goats are reposing in Theocritus v. 129 — are identified with "fraga" by Apule-

ius; the "*humi nascens fragum*" is mentioned by Virgil ecl. iii. 92; "*montanum fragum*" and "*silvestri nata sub umbra mollia fraga*" by Ovid met. i. 104 to xiii. 815; "*terrestribus fragis*" among wild esculents by Pliny xv. 28 to xxi. 50; and the "*phragōuli*" by Nicolaus Myrepsus iii. 46: berries of *F. vesca* occur in debris of the earliest lake-villages of Switzerland; the plant was cultivated in the mediæval period (A. Dec.); is described by Ruellius, and Valerius Cordus (Spreng.); is termed "*f. vulgaris*" by Tournefort inst. 295; is known to grow wild in North Italy and Portugal (Brot., and Lenz) and throughout middle and Northern Europe as far as Lapland and Iceland (Hook., Pers., and Wats.); was observed by Forskal, Sibthorp, Chaubard, and Fraas, on mountains from the Peloponnesus to Constantinople; the medicinal use in Egypt of "*fragaria*" root is mentioned by Forskal mat. med., and cultivation of the "*fraisier*" according to Clot-Bey has been recently introduced. Eastward, *F. vesca* is known to grow wild on the Taurian mountains (Bieb.), and from Lat. 54° on the Volga to and beyond the Yenisei throughout Siberia (Gmel., and Pall.). Farther East, from Alaska and the Pacific shore of America to Cumberland House on the Saskatchewan (Hook., and Wats.) and throughout Canada and our Northern States; extending along the Atlantic to Lat. 43° as observed by myself, and farther South on mountains. From Europe, was however introduced into the gardens of North America, where it continues to be occasionally cultivated; into Jamaica and the Mauritius Islands, and in these Tropical localities has become naturalized on the mountains (Purdie in Hook. j. bot. for 1844, Bory, and Boj.).

Galega officinalis of the Mediterranean countries. An allied plant is called in our Middle States *goat's rue* (a name doubtless derived from Europe): the ΑΓΓΙΛΙΟΝ eaten by goats according to Theocritus v. 128, — and growing on mountains according to Babrius iii. 3 (Daub.), may be compared: *G. officinalis* was observed by Sibthorp on mount Athos and the Bithynian Olympus. Westward, is described by Hieronymus Fracastor, Gesner, Matthioli, Gerarde, and Morison ii. pl. 7; is termed "*g. vulgaris floribus cæruleis*" by Tournefort inst. 398; and is known to grow in Barbary and various parts of Southern Europe as far as France (Lam. fl. fr., and Pers.). By European colonists, was carried to Egypt (Clot-Bey); and to the Mauritius Islands, where it was observed under cultivation by Bojer.

Scabiosa columbaria of Europe and the adjoining portion of Asia. Called in Greece "*psôrōhōr-tōn*," and the ΚΝΥΖΑ growing among good plants for fodder according to Theocritus iv. 25 — may be compared; also the "*psōra*" plant of Aetius (Ruel ii. 145): *S. columbaria* was observed by Sibthorp frequent on the Greek islands. Farther South, is known to grow on the mountains of Abyssinia (A. Richard), and the "*djussar er raaja*" observed by Forskal on the mountains of Yemen is regarded by him as perhaps identical. Westward, is described by Columna (Tenor., and A. Dec. p. 707); is termed "*s. capitulo globoso major*" by Tournefort inst. 465; was observed by Munby in Algeria, by Gussone in Italy, by Forskal near Marseilles, and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 314, Engl. bot. pl. 1311, and Pers.). "*S. coronopifolia*" observed by Sibthorp pl. 114 on rocks in Greece, is regarded as not distinct (Steud.).

Erica arborea of the wooded portion of the Mediterranean countries. A small tree called on the Canaries "*brezo*" (Lowe), in Italy "*scopa arborea*" (Lenz), in Greece "*riki*" (Sibth.) or "*ērēikē*" (Fraas); and the ΕΡΕΙΚΑC cut with the woodman's hatchet according to Theocritus v. 64 — is referred here by Fée: *E. arborea* was observed by Sibthorp, and Chaubard, frequent in the Peloponnesus and on the Greek islands. Westward, is termed "*e. maxima alba*" by Tournefort inst. 602; is known to grow in Italy and throughout Southern Europe; was observed by Lowe on the Canary Islands (Major edit. Bethenc. p. 134); by myself, in the mountain-region of Madeira. (See *E. multiflora*)

Cyclamen hederæfolium of the West Mediterranean countries. The ΚΥΚΛΑΜΙΝΟΝ of Theocritus v. 123 growing along the river Ales — (in Italy) according to the scholiasts, and the herb described by them as also called "*kalamithran*," altogether useless or its slender root sometimes applied to chilblains, may be compared: *C. hederæfolium* is described by Lobel pl. 605; was observed by Hogg on Sicily; by Lenz in North Italy; was already cultivated in Britain in the days of Gerarde 845, but has since become naturalized and is called *sow bread* (Engl. bot. pl. 548, Pers., Wats., A. Dec., and Lindl.). According to Smith, and Burnett, "*a very acrid plant*" that "*has been used medicinally, its action being that of a drastic purgative*" (Lindl.).

Calamagrostis calamagrostis of Europe and the adjoining portion of Asia. The ΚΑΛΑΜΟC around a temple in the city of Neileus according to Theocritus xxviii. 3, — or "*ētērōs phragmitēs*" slender and whitish according to Dioscorides i. 114, may be compared: *C. calamagrostis* was observed by Sibthorp not infrequent by the road-side between Smyrna and Bursa; and by Forskal p. 24, abounding in the Ghobeibe marsh in the Sinai peninsula. Westward, the "*calamus qui circa sepes*" is mentioned by Pliny: *C. calamagrostis* is termed "*gramen paniculatum arundineum panicula densa*" by Tournefort inst. 523; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 280, Engl. bot. pl. 403, and Pers.).

"269 B. C." (Plin., Blair, and Clint.), Fabius Pictor and Q. Ogulnius Gallus consuls, *silver* first coined at Rome.

As early at least as this date, navigation practised on the Indian Ocean and along the African coast as far as the Equator.

Guatteria lucida of Equatorial East Africa. A shrub growing along the seashore on Mombas island. — Carried in 1824 to the Mauritius Islands, and cultivated there (Boj.).

Riedleia capitata of Equatorial East Africa. Growing on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Corchorus procumbens of Equatorial East Africa. An annual growing in moist openings on Zanzibar. — Carried to the Mauritius Islands, and cultivated in kitchen-gardens (Boj.).

Triumfetta tomentosa of Equatorial East Africa. Suffrutescent, growing on Mombas Island. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Grewia ulmifolia of Equatorial East Africa. A bush growing on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Grewia cuneifolia of Madagascar and Equatorial East Africa. A bush, — carried to the Mauritius Islands, and cultivated there (Juss. pl. 49, and Boj.).

Cissus fragariaefolia of Equatorial East Africa. Perennial, growing on the outskirts of the forest on the mainland and on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Omphalobium? *scandens* of Equatorial East Africa. A climbing shrub, growing on the islands of Zanzibar and Pemba. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Crotalaria strigosa of Equatorial East Africa. Biennial, growing on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Cytisus glomeratus of Madagascar and Equatorial East Africa. Biennial, growing on Zanzibar, the Comoro Islands, and Madagascar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Indigofera hirta of Madagascar and Equatorial East Africa. Perennial, growing on Zanzibar, the Comoro Islands, and Madagascar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Tephrosia noctiflora of Equatorial East Africa. Perennial, growing on Zanzibar and the Comoro Islands. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Tephrosia hirta of Equatorial East Africa. Perennial, growing on Mombas island. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Desmodium spectabile and *D. lactescens* of Equatorial East Africa. Shrubs growing on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Rhynchosia malacophylla of Equatorial East Africa. Perennial, twining, growing on Mombas island. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Rhynchosia inflata of Madagascar and Equatorial East Africa. Perennial, twining, growing on Zanzibar, the Comoro Islands, and the West side of Madagascar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Cassia (*Chamaecrista*) *pulchella* of Equatorial East Africa. Suffrutescent, growing on Zanzibar. — Carried to the Mauritius Islands, and almost naturalized there (Boj.).

Phyllolobium? *Zanzibarense* of Equatorial East Africa. Perennial, twining, growing on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Telfairia pedata of Equatorial East Africa. A perennial Cucurbitaceous vine called "kouemé," — cultivated at Mombas, Zanzibar, and Mozambique. Carried by captain Joliff to the Mauritius Islands in 1807; re-introduced in 1824, and continuing generally cultivated (Boj.).

Hedyotis densiflora of Equatorial East Africa. Annual, growing on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Nimusops fruticosa of Equatorial East Africa. Growing on Mombas island and Pemba. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Vahea Comorensis of the Comoro Islands. A twining shrub, with fruit of the form and colour of an orange, — growing on the mountains around Musamodo, the chief town on Johanna or Anjouan. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Bignonia (*Spathodea*) *tenuifolia* of Equatorial East Africa. A twining shrub, growing on the mainland and on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Bignonia (*Arthrophyllum*) *Comorensis* of the Comoro Islands. A shrub, growing in ravines along streams on Johanna or Anjouan (Boj.).

Tanæcium pinnatum of Equatorial East Africa. A tree, growing on Zanzibar, and Pemba, and in Mozambique. — Carried to the Mauritius Islands, and cultivated there (Jacq. coll. iii. pl. 18, and Boj.).

Dicerocaryum sinuatum of Equatorial East Africa. Perennial, growing in the sands of the seashore of Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Convolvulus (Calonyction) Comorensis of the Comoro Islands. Perennial, twining, growing in the bushy forests along streams on Johanna. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Convolvulus (Calonyction) comosperma of the Comoro Islands and Madagascar. Perennial, twining, growing on the Comoro Islands, Seychelles, Galéga, and the West side of Madagascar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Ipomaea arachnoidea of Equatorial East Africa. Perennial, twining, growing on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Ipomaea ligulata of Madagascar and Equatorial East Africa. Annual, growing on Zanzibar, the Comoro Islands, and around Boyana Bay on the West side of Madagascar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Ipomaea macropoda of Equatorial East Africa. An annual vine, growing on Zanzibar and the Comoro Islands. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Convolvulus (Jacquemontia) umbellata of the Comoro Islands. Annual, growing in grassy places on the mountains on Johanna. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Convolvulus (Jacquemontia) hastigera of the Comoro Islands. A perennial vine, growing in ravines along streams on Johanna and Mohila. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Convolvulus (Elythrostamna) convolvulacea of the Comoro Islands and Madagascar. Annual, growing even in cultivated ground on Johanna. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Calystegia ochroleuca of Equatorial East Africa. A perennial vine, growing on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Ehretia corymbosa of the Comoro Islands. A shrub, — carried to Mauritius and Bourbon, and almost naturalized there.

Solanum suaveolens of Madagascar and Equatorial East Africa. Suffrutescent, growing on Zanzibar and Madagascar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Solanum nodiflorum of Equatorial Africa, Madagascar, and the neighbouring islands. Annual. — Carried to the Mauritius Islands, almost naturalized there, and besides cultivated abundantly in kitchen gardens (Jacq. rar. ii. pl. 326, and Boj.).

Solanum heterocanthum of Madagascar and Equatorial Africa. Suffrutescent. — Carried to the Mauritius Islands, and growing spontaneously there in various localities (Boj.).

Solanum anghivi of the Comoro Islands and Madagascar. A shrub. — Carried to the Mauritius Islands, and growing there spontaneously in various localities (Lam., and Boj.).

Solanum Balbisii of the Comoro Islands and Madagascar. Suffrutescent. — Carried to the Mauritius Islands, and cultivated there (Roth, bot. mag. pl. 2828, and Boj.).

Campuleia coccinea of Madagascar and the Comoro Islands. Perennial, growing on mountains on Johanna. — Carried to the Mauritius Islands, where it has become naturalized and a troublesome weed (Pet. Th., Hook. exot. pl. 203, and Boj.).

Moschosma polystachya of Equatorial East Africa. Annual, growing on the mainland and on Zanzibar and the Comoro Islands. — Carried to the Mauritius Islands, and growing there spontaneously in one locality (Linn., Jacq., and Boj.).

Ocimum cinnamomeum of Equatorial East Africa. Annual, growing on the mainland and on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Thunbergia alata of Equatorial East Africa. A perennial vine, growing on the mainland and on Zanzibar. — Carried to the Mauritius Islands, cultivated there and growing spontaneously (Hook. exot. pl. 177, and Boj.).

Polygonum Owenii of Equatorial East Africa. Called at Mombas “m’bilivilli,” — and observed there by Bojer, growing in savannas and among rubbish. Cultivated in gardens as a medicinal plant.

Fluggea Comorensis of the Comoro Islands. Suffrutescent, growing in valleys and on mountains on Johanna. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Phyllanthus atropurpureus of the Comoro Islands. A shrub, growing in valleys at the margin of forests on Johanna. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Tragia furialis of the Comoro Islands. Annual, growing along streams on Johanna. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Euphorbia obconica of Equatorial East Africa. Suffrutescent, growing on Mombas island and Pemba. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Casuarina lateriflora of Madagascar and Equatorial East Africa. A tree. — Carried to the Mauritius Islands, cultivated there, and called “filao” (Lam., and Boj.).

Pandanus sessilis of Equatorial East Africa. A bush, growing on the mainland and on Zanzibar and Pemba. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Phoenix Equinoxialis of Equatorial East Africa. A palm of the stature of a bush, growing in the extensive forests on Pemba. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Costus sarmentosus of Equatorial East Africa. A perennial vine, growing on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Sansevieria cylindrica of Equatorial East Africa. Perennial, growing on Zanzibar. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Dioscorea toxicaria of Equatorial East Africa. A perennial vine, growing on Mombas island, the tubers along the stem poisonous, if cooked and eaten inducing vomiting. — Carried to the Mauritius Islands, and cultivated there (Boj.).

As early possibly as this date, the poet Bion removing from Smyrna to Sicily. — His death is mentioned by Moschus 3, who styles himself a pupil.

Adonis autumnalis of Europe and the adjoining portion of Asia. Called in Britain *rose-parsley* (Ainsw.), in Italy "camomilla di fior rosso" or "adonide" or "fior d' atone" (Lenz), in which we recognize the "adonium" of Ovid and ANEMONAN that sprung from the tears of Venus on the death of Adonis according to Bion i. 66, — from the blood of Adonis according to Nicander, and Ovid met. x. 503: the "mēlan," one of the two kinds of "anēmōnas" distinguished by Cratevas (schol. Theocr. v. 92), may also be compared: *A. autumnalis* was observed by Sibthorp, and Fraas, in waste and cultivated ground in Southern Greece and called "mōrōhōrtōn;" by Reuter and Margot, in wild situations on Zante. Westward, the "adonium" is mentioned by Pliny xxi. 34 as sown or occurring in cultivated ground in Italy; *A. autumnalis* is described by Gerarde as "ranunculus arvensis foliis chamæmeli flore minore atrorubente" by Tournefort inst. 291; is known to occur in Italy and in grain-fields throughout middle Europe (Pers., A. Dec., and Lenz); in Britain, is regarded by Watson and others as exotic.

One hundred and twenty-first generation. May 1st, 267, mostly beyond youth: the Greek poets, Heracleitus of Halicarnassus, and Dionysius Iambus; the comic poets, Machon, and Apollodorus of Carystus; the philosophers, Lycon, Lacydes, Hermachus, Menippus of Gadara, Meleager of Gadara, Cleanthes, Lysimachus, and Hieronymus of Rhodes; the historians, Philostephanus of Cyrene, Ister, Neanthes of Cyzicum, and Nymphis of Heraclea; the grammarians, Lysanias of Cyrene, Sosibius of Laconia, and Euphoriion of Chalcis; other writers, Timosthenes, Philon of Heracleia, Apollonius son of Sotades, and Euphantus of Olynthus; the architect Sostratus of Cnidus; the painters, Mecophanes, Artemon, Clessides, and Theodorus (Bryan).

"264 B. C." (Polyb., and Clint.), war first carried beyond the limits of Italy by the Romans: who now enter Sicily, inaugurating war with the Carthaginians; called the "First Punic" war, — and continuing "twenty-four" years.

"The same year" (Liv. ep. 16, Val. Max. ii. 4. 7, and Clint.), *gladiatorial combats* instituted by D. Junius Brutus. — Whose name seems perpetuated in the changed meaning of the word "brutal" in English.

"261 B. C." (Clint. iii. p. 346), Antiochus Soter slain in battle against the Gauls; and succeeded by Antiochus II. Theus, third Greek king of Syria. Antiochus II. married Berenice, daughter of Ptolemy II. of Egypt.

"In this year" (Lalande, Delambre, and Humb. cosm. iv.), observation on the planet Mercury; the first — of fourteen, partly belonging to the Chaldeans, employed by Claudius Ptolemy.

"260 B. C." (Polyb., Blair, and Clint.), the Carthaginians defeated in *naval combat* by the first fleet built by the Romans; commanded by Duilius.

"In or about this year" (Sm. b. d.), Zenodotus succeeded by Callimachus as chief librarian of the Alexandrian library.

Trifolium fragiferum of Europe and the adjoining portion of Asia. Called in Britain *strawberry-clover* (Prior), in Germany "erdbeerkelee" (Grieb): and the running ΩΚΥΘΟΟΝ: ΤΡΙΠΕΤΗΛΑΟΝ of Callimachus, — may be compared: *T. fragiferum* was observed by Sibthorp, and Fraas, abounding from the Peloponnesus throughout the Greek islands to Caria and mount Athos; by Griesebach p. 34 along the seashore of Macedonia. Westward, is termed "t. fragiferum friscum folio cordato flore rubro" by Tournefort inst. 406; was observed by Forskal near Marseilles; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 1042, and Pers.).

Cynara horrida of the Mediterranean countries. A species of *wild artichoke*; and the thorny ΚΥΝΑΡΑ, pubescent according to Callimachus around the Aeaniticum sea, growing also in Khorasan and as far as the Indus — (Ruel iii. 14), may be compared: *C. horrida* is described by Aiton iii. 148, the leaves "subtus tomentosis;" was observed by Sibthorp on Sicily, and apparently also on Crete and Naxos (J. E. Smith), by Dænzer, near Navarino in the Peloponnesus (Chaub.).

In this year (= 288 — "28 years reign" in the Mahavamsa v., Avadana asok., and Buns. iv. 7.

2), Bindusara (Allitrochathes) succeeded by his son Priyadase or Asoka, now king at Pataliputra on the Ganges.* — He reigned "thirty-seven," or according to the Mahavamsa xx. "forty" years.

"256 B. C. = 59th year of Nan-wang" (Chinese chron. table), end of the Tcheou dynasty.

"255 B. C. = 52d year of Siang-wang II.," now head of the new dynasty of the Thsin — (Chinese chron. table).

"The same year" (Polyb., Zonar., and Clint.), in Africa, Regulus defeated and taken prisoner by the Carthaginians under the Spartan general Xantippus.

"253 B. C." (Sm. b. d.), at Rome, Cn. Servilius Caepio and C. Sempronius Blaesus consuls, the first plebeian pontifex maximus Tib. Coruncanius.

251 B. C. (= his "tenth year" in the 8th inscription at Girnar, Burnouf ii. 732), king Asoka already a Buddhist. He is said to have been converted by Nigrodha (Max Müll. p. xx). The *inscriptions* bearing the name of Asoka on Buddhist cave-temples not earlier than his conversion, and he is said to have erected the greatest monuments of Buddhism.

"In this year" (Burm. hist., and Mason 40), Ranman succeeded by his son Rekkhan, now Burmese king. — Rekkhan reigned "thirty-one" years, is said to have had many wives, and to have been a remarkable shot with a cross-bow.†

"250 B. C. = 1st year of Hiao-weng-wang, of the Thsin" or Sixth dynasty (Chinese chron. table).

The same year (Euseb., Blair, and Clint. iii. p. 315), revolt against the Greek king of Syria of the Bactrians under Theodotus and Parthians under Arsaces. Recovering their independence, the Parthians — (Persians) ruled for the succeeding "475 years" by the Arsacidæ; a dynasty of "thirty-one" successive kings, whose numerous coins all bear *Greek inscriptions*.

"249 B. C. = 1st year of Tchoung-siang-wang, of the Thsin" or Sixth dynasty — (Chinese chron. table).

The same year (= his "twelfth year" in the 4th inscription at Girnar, Lassen, and Burn. ii. 731), king Asoka publicly professing Buddhism. An inscription of the same date dedicating a cave-temple (Burnouf ii. 779).

One of the inscriptions at Girnar contains the name "Tambapanni," — regarded as the "Taprōvanē" of the Greeks (Sm. geogr. dict.) or island of Madagascar.

Thylachium sumangui of Madagascar. A Capparideous bush called there "voua sumangui," and growing in the Emirne district. — By European colonists, carried to the Mauritius Islands, and cultivated there in the Botanic garden (Boj.).

Abutilon angulosum of Madagascar. A bush called there "hafou poutsì." — Carried to the Mauritius Islands, and cultivated there (Boj.).

Hilsenbergia cannabina of Madagascar. A tree called "hafoutra," growing in the extensive forests and on high mountains in the Emirne district. — Carried repeatedly to the Mauritius Islands, but not cultivated there with success (Boj.).

Shakua excelsa of Madagascar. Called there "shakoua," fruit-tree, growing on the Northwestern side of the island in the Saccalava district, — and observed by Bojer around St. Augustin Bay. Carried to the Mauritius Islands, and cultivated there (Boj.).

Shakua minor of Madagascar. A shrub, growing around St. Augustin Bay and called "shakoua keli." — Carried to the Mauritius Islands, and cultivated there (Boj.).

Sorindeia Madagascarensis of Madagascar and the neighbouring portion of Africa. Called on Madagascar "voua sourindi" (Boj.); and known there as early probably as this date: — observed by Grant in East Africa, on the "banks of rivers 7° S.," a tree with mango-tasting fruit, large as a

* *Jonesia asoca* of Tropical Hindustan and Burmah. A flowering tree called in the environs of Bombay "jassoondie" (Graham), in Sanscrit "vanjula" or "asoca" (W. Jones): the name not older than the accession of Asoka, although according to Hindu mythology Guadama was born under this tree — (Klapr., and Mason v. 403): the "asoca" is mentioned in the Avadana Asoka (Burn. i. 365); also by Valmiki ramayan.; in the Mrichchhakati iv. as planted in gardens and having rich crimson flowers; its flowers ornamenting curls, by Kalidasa kum. iii. 26 and ragh. viii. 61; and is prescribed medicinally by Susrutas (Hessl.): *J. asoca* was observed in Hindustan by Rheede v. pl. 50, W. Jones as. res. iv. p. 274, Roxburgh, and Wight; by Graham, in gardens and near caves "evidently planted," found by Law "wild in jungles at the foot of the Ram Ghaut." Farther East, is enumerated by Mason as indigenous in Burmah and called "a-thau-ka-pho." By European colonists, was carried to the Mauritius Islands, where it continues under cultivation (Boj.).

† *Dalbergia*? of Southern Burmah. The *Maulmain lance-wood*, a tree found all over the Tenasserim provinces (Mason), possibly furnished the material of Rekkhan's cross-bow: — at the present day according to Mason 530, its wood is sometimes used by the Karens to "make bows of."

sparrow's egg and in bunches two feet long. Carried to the Mauritius Islands, and cultivated there (Boj.).

Clitoria lasciva of Madagascar. Perennial, twining, growing around the village of Foulepointe, and called "vahé embouritsika." — Carried to the Mauritius Islands, and cultivated there (Boj.).

Galactia diversifolia of Madagascar and the Comoro and Mauritius Islands. Perennial, twining, — observed by Bojer in the savannas and on the mountains in almost all parts of Mauritius.

Desmodium umbellatum of the shores of Madagascar, Hindustan, and the Malayan Archipelago. A bush called "toudinga-damvoa" in Madagascar. Eastward, — observed by Burmann pl. 51 on Ceylon; by Wight, in Southern Hindustan; and by Graham, and Law, in "districts south east of Surat" and in the environs of Bombay, always "on the banks of streams." Farther East, enumerated by Mason as indigenous in Burmah; known to grow on Java (Rumph. iv. pl. 52, and Pers.). By European colonists, carried to the Mauritius Islands, and cultivated there (Boj.).

Desmodium caespitosum of Madagascar, the Seychelles, and Mauritius Islands. Perennial, growing in tufts or beds — (Poir., and Pers.); observed by Bojer throughout Mauritius, in savannas and even on lofty mountains.

Desmodium scalpe of the Comoro and Mauritius Islands. Suffrutescent; — discovered by Commerson; observed by Bojer in shaded situations on the culminating mountain on Mauritius.

Erythrina versicolor of Madagascar. A tree called there "hazou-bohi," the flowers yellow and red. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Dalbergia Telfairii and *D. Hookeri* of Madagascar. Two shrubs growing around Tananarivou in Interior Madagascar; the first called "hara-heitra," and the second "hara-heitra-lava." — Both of them carried to the Mauritius Islands, and cultivated there (Boj.).

Mimosa latispinosa of Madagascar. A bush growing in the district of Betanimena, and called "fama-hou-foutsi" or "rouhi-mena." — Carried to the Mauritius Islands, and cultivated there (Boj.).

Acacia (Stachydris) pterosperma of Madagascar. A bush growing around Tananarivou in Interior Madagascar, and called "fannou." — Carried to the Mauritius Islands, and cultivated there (Boj.).

Poinciana regia of Madagascar. A tree called "fannou," — discovered by Bojer growing around the village of Foulepointe. Carried to the Mauritius Islands (Boj.); recently to Hindustan and Burmah, and further described by Mason v. p. 411 as "gorgeous," bearing "a most magnificent and graceful flower."

Cassia (Chamaecrista) brevifolia of Madagascar. Annual, called "mandri-arivou," — growing around the village of Tamatave. Carried to the Mauritius Islands, and cultivated there (Boj.).

Cassia (Chamaecrista) filipendula of Madagascar. Annual, called "indriena manitra keli," and growing in the Emirne district. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Hymenaea verrucosa of Madagascar. A tree called there "tanrouk-rouhi." — Carried to the Mauritius Islands, and cultivated there (Boj.). From transported specimens, described by Gaertner ii. pl. 139, and Lamarck ill. pl. 330 (Pers.).

Tristemma verusatum of Madagascar and the Comoro and Mauritius Islands. A perennial Melastomaceous plant called "voua-touka" in Madagascar. — Described by Commerson; and observed by Bojer in the sombre and humid forests of the central portion of Mauritius.

Bryophyllum calycinum of Madagascar and the Mauritius Islands. Perennial, called "soutou-fafan" in Madagascar; — observed by Commerson on Mauritius; and according to Bojer, growing there on arid hills in the gorges of Black river. Introduced by Lady Clive (about 1765) "from the Moluccas" into Hindustan, and thence into Burmah, where it continues "growing around old pagodas like a wild plant" (Mason v. p. 434): observed in Hindustan by Roxburgh, and Wight; by Graham, "common in gardens Bombay, and throughout Giergaum woods but probably planted," found by Law "wild in abundance within ten or twelve miles of Belgaum and also on the Ram Ghaut." The "*Kalanchoe Brasiliensis*" observed by myself naturalized along the Bay shore opposite Rio Janeiro, may be compared.

Siphomeris lingun of Madagascar. A climbing shrub called "lingouna," — growing around the village of Majungay in Bombetok Bay on the Western coast. Carried to the Mauritius Islands, and cultivated there; and in 1826 carried to Britain (Sweet hort. app., and Boj.).

Vernonia appendiculata of Madagascar. A shrub called "ampiadi" growing on the mountains in the Emirne district. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Microglossa altissima of Madagascar. A bush called "toudinga." — Carried to the Mauritius Islands, and cultivated there (Boj.).

Tabernaemontana Noronhiana of Madagascar. A bush called "voua-pandaka" or "loubvourou," growing in the forests along the river Naman-Rahan, — near Foulepointe. Carried to the Mauritius Islands, and cultivated there (Pet. Th., and Bojer).

Bignonia (Colea) floribunda of Madagascar. A bush called "rei-rei," growing in the forests

along the whole Eastern coast, — around Foulepointe, in Anton-Gil Bay. Carried to the Mauritius Islands, and cultivated there (Boj.).

Bignonia (Colea) Telfairia of Madagascar. A tree or bush called "voua-kidzi-kidzi-ka," growing in the Temperate portion of Interior Madagascar on the Angave mountains. — Carried to the Mauritius Islands and long cultivated there, but destroyed by the hurricane of 1825 (Boj.).

Bignonia (Arthrophyllum) Madagascarensis of Madagascar. A tree called "zahane," growing in the extensive forests called "Béfourouna," in the districts of Betani-mena and on the lofty Angave mountains, at Tananarivou. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Cordia monoica of Equatorial East Africa, Madagascar, and Hindustan. — Observed by Roxburgh cor. i. pl. 58 wild in Coromandel; and by Graham, "a shrub of no beauty," in "gardens Bombay." Westward, according to Bojer, growing on Zanzibar. And carried to the Mauritius Islands, and cultivated there.

Cordia subcordata of the shores of the Seychelles, Madagascar, and other East African islands. — Termed "novella nigra" by Rumphius v. pl. 75: and further according to Bojer, growing in coral soil on Zanzibar, Pemba, Galega, and along the West side of Madagascar. Carried to the Mauritius Islands, and cultivated there.

Buddleia diversifolia of Madagascar and the Comoro and Mauritius Islands. Suffruticose, growing abundantly on Mauritius — (Vahl, Lam., and Boj.).

Centranthera prostrata of the Seychelles and Galega. Perennial. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Plectranthus ternatus of the Comoro Islands and Madagascar. Perennial, called in Madagascar "omime," and growing among rocks on lofty mountains on Johanna. — Carried to the Mauritius Islands, where it is cultivated as a potherb (Sims bot. mag. pl. 1460, and Boj.).

Calpidia macrophylla of Galega Island. A tree, — called by the colonists "bois mapou." Carried to the Mauritius Islands, and cultivated there (Boj.).

Celosia spathulata of Galega Island. Perennial. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Phyllanthus stipulaceus of Galega and Diego Garcia. Suffruticose, — called "herbe à balais" by the colonists on Galega. Carried to the Mauritius Islands, and cultivated there (Boj.).

Euphorbia splendens of Madagascar. Suffruticose, growing in the Interior, and called "sougou-sougou." — Carried to the Mauritius Islands, and cultivated there (Hook. bot. mag. pl. 2902, and Boj.).

Ficus avi-avi of Madagascar. A bush called there "avi-avi." — Carried to the Mauritius Islands, and cultivated there (Chapelier and Boj.).

Boehmeria frondosa of Galega and Diego Garcia. A shrub, — called "bois cendré" by the colonists on Galega (Don fl. Nep., and Boj.).

Celtis Madagascarensis of Madagascar. A tree called "andrarizouna," growing in the Emirne district. — Carried to the Mauritius Islands, and growing there spontaneously in some districts (Boj.).

Pandanus hoffa of Madagascar. A shrub called "hoffa," growing in marshes along Ivoundrou river and the margin of Nosi-Bé lake. — Carried to the Mauritius Islands, and cultivated there (Chapelier and Boj.).

Areca Madagascarensis of Madagascar. A palm of the stature of a tree, called "voua sira" and growing in the extensive forests called "be-fouroun," in the Betanimena district and around Foulepointe. — Carried to the Mauritius Islands, and cultivated there (Stadtman, and Boj.).

Borassus Madagascarensis of Madagascar. A palm of the stature of a tree, growing along Marou-Voai river in Bombetok Bay, and called "dimouka." — Carried to the Mauritius Islands, and cultivated there (Boj.).

Hyphæne schatan of Madagascar. A palm of the stature of a tree, growing along the whole Western coast, and called "schatan." — Carried to the Mauritius Islands, and cultivated there (Boj.).

Angræcum pectinatum of Madagascar and the Comoro and Mauritius Islands. A perennial epidendric Orchideous plant — (Pet. Th., and Boj.).

Urania speciosa of Madagascar. A tree called there "ravin-ala." — By European colonists, carried to the Mauritius Islands, and cultivated there (Sonnerat voy. pl. 124 to 126, and Boj.); also to Hindustan, and Burmah (Roxb., Graham, and Mason).

Curculigo Seychellensis of the Seychelles. Perennial, — called by the colonists "coco marron," and the leaves employed for cordage. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Aloe glauca of Austral Africa and Madagascar. Perennial, growing on mountain-summits at St. Augustin Bay, and called "vahoun." — Carried to the Mauritius Islands, and cultivated there (Spreng. syst., bot. mag. pl. 1278, and Boj.).

Aloe sahundra of Madagascar. A bush called "sahoundra," growing on the sandy shores

of St. Augustin Bay, and often forming considerable forests in the Interior, especially in the Emirne district. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Tacca Madagascarensis of Madagascar. Perennial, growing in the forests in the Interior, and called "tavoulou." — Carried to the Mauritius Islands, and cultivated there (Boj.).

Mariscus glandulosus of Galea Island. Perennial. — Carried to the Mauritius Islands, and cultivated there (Boj.).

Lomaria grandis of Galea Island. A perennial vine, the young shoots tender and edible. — Carried to the Mauritius Islands, and cultivated there (Boj.).

"The same year" (Liv., Blair, and Clint.), the Romans defeated in *naval combat* at Drepanum on the Sicilian coast by the Carthaginians under Adherbal.

"247 B. C. (Porphyr., and Clint. iii. p. 15), Ptolemy II. succeeded by his son Ptolemy III. Euergetes: the inherited kingdom consisting of "Egypt, Lybia, Syria, Phoenicia, Cyprus, Lycia, Caria, and the Cyclades" — (inscript. adul., and Cosm. Ind. ii. p. 141). Hieroglyphic ovals of Ptolemy III. occur on temples at Dakkeh, Philæ, Esneh, and Thebes. His coins are dated from the death of Alexander, and an "astronomical era" was employed during his reign (Leps. eg. and sin. p. 110).

With a naval force and the elephants brought by his father and himself from Adulë, Ptolemy III. invaded Asia: and after rendering tributary "Cilicia, Pamphylia, Ionia, the Hellespont, and Thrace," crossed the Euphrates and extended his conquests over "Mesopotamia, Babylonia, Susiana, Persia, Media, and as far as Bactria" (inscript. adul., and Cosm. Ind. ii. p. 141).

Rhamnus catharticus of Europe and the adjoining portion of Asia. Called in Britain *buckthorn* (Prior), in Germany "kreuzdorn" (Grieb), in France "nerprun" (Nugent), in Greece "lēukagkatha," in which we recognize the AKANΘAI bearing round fruit of Demetrius reb. ægyp. — (Athen. xv. 24), "lēukēn akanthan" identified by Antigonus with the "leukas" (schol. Nic. 849), of which two kinds are distinguished by Dioscorides, the "lēukas ōrēinē" having broader leaves than the "emērōu" and more acrid and bitter but weaker fruit, both kinds employed against poisonous animals, those especially of the sea: *R. catharticus* was observed by Sibthorp in the Peloponnesus. Westward, the "rhamnus" called by the French "neprum" or "burgam spinam" is mentioned by Ruellius i. 123; *R. catharticus* is termed "cervi spina" by Valerius Cordus; is described also by Tragus, and Tournefort inst. 593. and is known to grow in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 850, Pers., and Lenz). By European colonists, was carried to Northeast America, where it continues under cultivation, chiefly for hedges, and escaping to wild situations in the forest has become naturalized (Barratt, Torr., and A. Dec.). The fruit according to Lindley is "violently purgative," but producing colic and "only given in some kinds of dropsy."

Rhamnus oleoides of the Mediterranean countries. An allied spinescent species called in Greece "xulagkatha" or "mauragkathia" (Fraas), and possibly the "akanthai" of Demetrius, — and one of the two kinds of "lēukas" distinguished by Dioscorides: *R. oleoides* was observed by Sibthorp, D'Urville, Chaubard, and Fraas, frequent in mountainous situations from the Greek islands to the Peloponnesus. Westward, is termed "*r. hispanicus oleæ folio*" by Tournefort inst. 593, and is known to grow in Barbary, Portugal, and Spain (Desf., Pers., Brot., and Steud.). Is enumerated among medicinal plants by Lindley.

Probably about this time (Sm. b. d.), the inventions of Ctesibius of Alexandria. He is said to have been the first to discover the elastic force of air and apply it as a moving power.

"246 B. C. = 1st year of Wang-tching, of the Thsin" of Sixth dynasty (Chinese chron. table). He is identified with "Tching-wang" or Chi-hoang-ti, "son of Tchouang-siang-wang" (Pauth. p. 212).

"The same year" (Clint. iii. p. 346), Antiochus II. Theus succeeded by Seleucus II. Callinicus, fourth Greek king of Syria.

"In this year" (Max Müll. p. xviii to xxxvii, the Mahavamsa giving "17th year of Asoka" = 244), Third Buddhist council, king Asoka reminding the assembled priests that "What had been said by Buddha, that alone was well said." Apocryphal writings being carefully excluded, the Dhammapada, believed to consist of teachings actually uttered by Gautama or Buddha, was adopted. — Mahinda, son of Asoka, was dispatched to Ceylon, where he converted Devanampriya Tishya then reigning (Mahavams.).

Santalum myrtifolium of mountainous coasts in Southern Hindustan and the Malayan archipelago as far as Timor. Called in commerce *sandal-wood*, in Hindustanee "sandal" or "chandam" (D'roz), at Bombay "chundun" (Graham); and the fragrance of "sandal-wood" is mentioned in the Dhammapada 54 to 56, — the "santalōn" by Aetius, and Actuarius, and "sandal" by J. B. Amran. Rhazes, Avicenna, Edrisi, and Ebn Baitar: *S. myrtifolium* is described by Rumphius ii. pl. 11; was observed in Hindustan by Roxburgh cor. i. pl. 2; by Graham, "in gardens about Bombay and in the Deccan;" and according to Royle, is indigenous on the mountainous Malabar coast. Farther East,

"sandal" is said by Serapion to come from China; "sendal" or "sandoint" was seen by Marco Polo 157 and 170 in both "Melibar" and China; "sandal-wood imported from Hindustan" was found by Mason v. p. 500 "constantly for sale in the bazars" of Burmah, "being a favourite cosmetic with" maidens; *S. myrtifolium* is mentioned also by Loureiro cochinch. i. p. 87, and is known to grow as far as the island of Timor (Marsd. sum. p. 129, and Lindl.). Westward, was observed by myself in gardens at Bombay, as well as in Egypt, where it is enumerated by Clot-Bey as recently introduced. By European colonists, was carried to the Mauritius Islands, and was observed there under cultivation by Bojer.*

* *Nymphaea rubra* of Tropical Hindustan and Burmah. The *red water-lily* is called in Telinga "yerra kulwa," in Hindustanee "rukhta-chunduna," in Bengalee "buro-rukto-kumbal" (Drur.), in the environs of Bombay "kummul" (Graham), in Burmah "kya-nee" (Mason); and the "autumn lotus" of the Dhammapada 285 — may be compared: a tank glowing with water-lilies like the dawn with the fiery beams of the rising sun, is mentioned in the Mrichchhakati (transl. H. H. Wils.): the "padma" of the Hitopadesa, and Vetala panchavinsati 1., may also be compared: *N. rubra* was observed by Graham in the environs of Bombay, "in tanks particularly in the neighbourhood of caves or temples," its flowers "of a dark crimson colour, very beautiful," appearing "about the close of the rains;" by Roxburgh, and Wight, in other parts of Hindustan as far as Tanjore and Bengal, its capsules seeds and roots eaten by the natives, a kind of arrowroot prepared also from the roots and underground stems (Drur.); by Mason, indigenous in Burmah.

Sinapis dichotoma of Northeastern Hindustan. A species of *mustard* called in Hindustanee "sarsori" (Pidd.), in Assam "sarsu" (Robinson); and "mustard seed" is mentioned in the Dhammapada 401 to 407: — the "sarshapa" or "kshava" of the stanzas of the Ayurvedas, prescribed as an external application (Susrut. chik. 5), is referred here by Hessler: *S. dichotoma* is described by Roxburgh (Steud.), and is one of the kinds enumerated by Drury as extensively cultivated in India "for the oil yielded by the seeds, as well as for dietetical purposes." (See *S. juncea*.)

Sinapis ramosa of Hindustan. Annual; and from early times, extensively cultivated for dietetical purposes, the oil from its seeds used also medicinally: — observed by Roxburgh (Steud., *madr. exh. rep.*, and Drur.).

Sinapis glauca of Hindustan. Also from early times cultivated for dietetical purposes and the oil from its seeds — (Steud., *madr. exh. rep.*, and Drur.).

Tabernaemontana coronaria of Tropical Eastern Asia. A flowering Apocynous shrub called in Sanscrit "tugura," in Hindustanee and Bengalee "tugura" (J. F. Wats.), in the environs of Bombay "tuggai" (Graham); and the fragrant "tagara" of the Dhammapada 54 to 56 — may be compared: the "tagara" prescribed by Susrutas chik. 15 to kalp. 5, is referred here by Hessler: *T. coronaria* was observed by Rheede ii. pl. 54 in Malabar; by Graham, at Bombay, very common "in gardens," the "flowers generally double;" by Roxburgh, and Ainslie, in other parts of Hindustan; by Burmann pl. 59, on Ceylon; by Mason v. 412 to 799, "exotic" in Burmah, cultivated and its "large blue-white double flowers" worn in garlands, the original single-flowered kind comparatively rare.

Justicia (Adhatoda) vasica of Tropical Hindustan and Burmah. A tall shrub called in Sanscrit "vasika" or "vasooka" or "singhee" or "singhashya" or "uturoosha" or "vajiduntuka," in Bengalee "bakus" (J. F. Wats.) or "arusa," in Tamil "adatodai," in Telinga "adasaram" (Drur.), in the environs of Bombay "adulsa" or "bakus" or "vasooka" (Graham); in which we recognize the fragrant "vassika" shedding its withered flowers of the Dhammapada 55 to 377, — also the "vasika" or "sinhi" or "sinhasya" or "atarusha" or "vajidanta" prescribed by Susrutas sutr. 46 to chik. 37: *A. vasica* was observed by Graham in the environs of Bombay, "common as a hedge plant about villages;" by Stewart, in the Punjab; by Roxburgh, Ainslie, and Wallich, as far as Bengal and Nepaul, the leaves flowers and root employed medicinally (Drur.); by Hermann lugd. pl. 643, and fl. Zeyl. 16, on Ceylon; by Mason, in Burmah, enumerated as indigenous. Transported to Europe, is described by Plukenet alm. pl. 173; and from Europe was carried to Northeast America, where it continues in greenhouses.

Andropogon muricatus of Tropical Hindustan. The *cuscut grass* is called in Sanscrit "virana" or "viritara" (W. Jones), in Tamil "viranam" or "vetti-ver" or "vizhal-ver," in Telinga "vatti-veru" or "ouru-veru," in Bengalee "shandaler-jar" or "bala," in Hindustanee "balah" (Drur.); in which we recognize the sweet-scented "usira" root of the "birana" grass, mentioned in the Dhammapada 337: — the "asmantaca" of the Institutes of Manu ii. 43, supplying in case of need a cincture for Brahmans, is referred here by Deslongchamps: roots were brought by Gautami to her pupil Sakuntala (W. Jones as. res. viii. 306): the "usira" is mentioned also by D'hanvantari (Susrut. sarir. iii. 2), and Kalidasa: *A. muricatus* was observed by Graham in the environs of Bombay; by Ainslie, Retz, W. Jones, and Roxburgh, in other parts of Hindustan as far as Bengal, its roots interwoven in screens

"245 B. C." (Kitt. cycl. bibl.), returning from his victories in the East, Ptolemy III. entered Jerusalem; where he offered sacrifices, and "made magnificent presents to the temple."

Continuing homeward, Ptolemy III. brought back to Egypt the sacred objects carried away by the Persians. He also gave great attention to the increase of the Alexandrian Library and encouragement of learning.

A Greek inscription containing the name of Ptolemy III. presents the following form of the letter ϵ , and the "earliest" example known of ω (Franz. 81). "Complications of" *hieroglyphic* signs also began during his reign (Glidd.).

"244 B. C." (Pauth. p. 208), the "Hioung-nou Tartars" now mentioned in Chinese history:—by some writers identified with the "Hunni" or Huns; who at a later period invaded Europe from the East.

"243 B. C.," the "eighth" year after his liberation of Sicyon (Polyb., and Clint.), Corinth liberated by the historian Aratus.

"The same year" (Strab., and Schlegel *journ. asiat.* 1828), Theodotus succeeded by Theodotus II., second Greek king of Bactria.

At this time (Plut. vit. Arat., and G. M. B. in Kitt. cycl. bibl.), a *banker* in Sicyon, "whose whole business consisted in exchanging one species of money for another."

242 B. C. = "19th year" of his reign in an inscription by king Asoka — (Burn. ii. 779).

"241 B. C." (Liv., and Clint.), the Carthaginians defeated in *naval combat* by the Romans at the Aegates Islets off the West end of Sicily; and suing for peace, the First Punic war brought to a close.

In the Description of Greece by Heraclides Creticus, the head-covering of the women of Boeotian Thebes is said to conceal the face all but the two eyes — (Apollon. mir. 19): to the present day, the fashion in Egypt (see figures in Lane's modern Egyptians). The Boeotians therefore may have derived the custom through the Cadmeans from Phoenicia?

Carpinus betulus of Europe and the adjoining portion of Asia. Called in Britain *hornbeam* or *horn-beech* or *yoke-elm* (Prior), in Germany "hainbuche" (Fraas), in France "charme" (Nugent), in Italy "carpine bianco o commune" or "carpino" (Lenz), in Greece "gaurōs" or "agriōtzōuk-nitha," in which we recognize the "carpinum" by some identified with the "zygiam" of the Greeks (Plin. xvi. 26): possibly therefore the ΖΥΓΙΑ frequent on mount Pelion according to Heraclides Creticus: — *C. betulus* was observed by Sibthorp, and Chaubard, from the environs of Constantinople to the mountains of the Peloponnesus. Westward, the "carpinus" is mentioned by Vitruvius ii. 9, by Columella as furnishing handles for agricultural implements, and by Pliny as growing in Italy both on the mountains and plains: *C. betulus* is described by Tragus p. 1109, and Gerarde p. 1479; is termed "carpinus" by Tournefort inst. 583, and is known to grow in Italy and throughout middle Europe as far as Britain (Engl. bot. pl. 2032, and Pers.). The wood being exceedingly hard and tough continues to be "used to yoke horned cattle" (Prior; see *Acer campestre*).

"240 B. C." (Cic., and Clint.), first dramatic exhibition of Livius Andronicus: regarded as the beginning of *Latin literature*. This writer or rather translator was by birth a Greek. — Seven years later, both he and four native Latin writers, Naevius, Plautus, Ennius, and Cato, were all living.

Scirpus lacustris of Northern climates. Called in Britain *bulrush*, in Old English "pole-rush," equivalent to the French "jonc d'eau," in Anglo-Saxon "ea-risc" (Prior): the "scirpus" having no knots according to a Roman proverb — (quoted by Ennius, and Terence), made into rafts in the days of Plautus, employed also on roofs (Isidor.), and for sails on the river Po and along the coast of Barbary in the days of Pliny xvi. 70, may be compared: *S. lacustris* occurs in debris of the lake-villages of Switzerland (Troyon); is described by C. Stephanus p. 520, Tragus, Gesner, Lobel, and C. Bauhin; is termed "*s. palustris altissimus*" by Tournefort inst. 528; and is known to grow in shallow water in Barbary, Italy, Portugal, and throughout middle and Northern Europe as far as Lapland and Iceland (Desf., Savi, Brot., Hook., and Wats.). Eastward, was observed by Sibthorp, and Chaubard, in the rivers of Crete and Greece and called "supha;" is known to grow along the Taurian mountains and throughout Siberia (Gmel., Bieb., Ledeb., and A. Dec.), and was observed by Thunberg about mount Fakon in Japan. Farther East, was observed by myself on the Hawaiian Islands and in California and Oregon, by Nuttall in Arkansas, by Pursh in Canada, by Baldwin along the Atlantic as far South as Lat. 29° in Florida; and doubtless furnished the "rushes" employed by the aboriginal women of New England for making baskets, witnessed by W. Wood ii. 20, and

or tatties to impart when dashed with water coolness and fragrance to the atmosphere; used also for covering palanquins and thatching bungalows (Drur.). Farther East, was observed by Mason v. 501 "exotic" in Burmah and called "pan-yen," little bunches cultivated by both Karens and Burmese for "its fragrant roots."

Gookin coll. 3. "S. lacustris" is attributed also to the Southern Hemisphere, to Australia and New Zealand (Wats., and J. D. Hook.), but as growing in Austral America I found the stem obtusely trigonal at base.

"237 B. C. = 10th year of Wang-tching" or Chi-hoang-ti (Chinese chron. table), beginning of the Forty-first cycle.

"235 B. C." (Liv., Eutrop., and Clint.), Second closing of the temple of Janus. The Romans having peace with all nations for the first time since the reign of Numa Pompilius.

The same year = "26th year of Asoka" in inscriptions on columns at Delhi and Allahabad — (Burnouf ii. 655 to 741).

One hundred and twenty-second generation. Sept. 1st, 234, mostly beyond youth: the Greek poets, Rhianus, Archimelus, Hegesianax of Alexandria, Samius, Alcaeus of Messene, and Dioscorides of Egypt; the comic poet, Epinius; the philosophers, Evander, Ariston of Ceos, Zenon of Tarsus, and Chrysippus; the astronomer Conon of Samos; the historians, Chares, Phylarchus, Philinus of Agrigentum, Mnesiptolemus, and Ptolemaeus of Megalopolis; the grammarian Aristophanes of Byzantium; the biographer Hermippus; other Greek writers, Apollonius of Perga, and Antigonus of Carystus; the Greek painters, Neacles, Cydias, and Antidotus (Bryan); the Latin writer Marcius; and the Roman painter M. Valerius Messala.

As early perhaps as this date, the first regular work on *pharmacy* composed by Mantias, a follower of Herophilus, and the preceptor of — Heracleides Tarentinus (Galen, and Sm. b. d.).

Rheum rhaponticum of Western Tartary. The PHON of Mantias — (Gal. sec. loc. viii. 3), Zopyrus, described by Dioscorides as a medicinal root brought from beyond the Bosphorus, mentioned also by Oribasius (Daremb.), Aetius, and Paulus Aegineta, is referred here by writers; and the "rawand" of Elhur, Serapion, Avicenna, and the earlier Arab physicians, is referred here by Ebn Baitar: *R. rhaponticum* is known to grow wild from the Volga North of the Caspian to Krasnojarsk on the upper Yenissei (Spreng, and Lindl.). Westward, the "rēōn" or "ra" is identified in Syn. Diosc. with the "rapōntikōum" of the Romans: the "radicis ponticae" is mentioned by Celsus v. 23, and Scribonius Largus; the "rhacoma," by Pliny xxvii. 105; the root of *R. rhaponticum* is distinguished by Matthaeus Sylvaticus pandect. 589; and the living plant introduced into Europe prior to 1612, is described by Alpinus libell. rhaon., and Parkinson. By European colonists, was carried to Northeast America, where it continues under cultivation for its esculent leaf-stalks, and is called *garden rhubarb*; also to Tropical Hindustan (Graham). Its root according to Guibourt is bitter, astringent, and aromatic (Lindl.).

"231 B. C." (Dionys., Blair, and Clint.), first divorce among the Romans, that of Spurius Carvilius.

"The same year" (Zonar., Blair, and Clint.), the Corsicans and Sardinians, who had been induced by the Carthaginians to revolt, subdued by the Romans.

"229 B. C." (Eutrop., Blair, and Clint.), war against the Illyrians on account of their piracies commenced by the Romans. — At the end of a year, the Illyrian queen Teuta sued for peace.

"228 B. C." (Polyb., Blair, and Clint.), at the invitation of the Achaean and Aetolian Leagues, Roman ambassadors first visit Athens, Corinth, and other cities of Greece.

227-6 B. C. (Polyb. v. 89, and Clint. iii. p. 425), the colossus at Rhodes about this time thrown down by an earthquake. Presents to the Rhodians to repair their losses, sent by the Greek kings of the East, Mithridates IV., Seleucus II. Callinicus, Prusias, Attalus, Antigonus Doson, and Ptolemy III. of Egypt.

"226 B. C. (Clint. iii. p. 346), Seleucus II. succeeded by Seleucus III. Ceraunus, fifth Greek king of Syria.

Hardly later than this year (Sm. b. d.), by invitation of Ptolemy III., Eratosthenes removing to Egypt to take charge of the Alexandrian library. *Parallels of Latitude* were applied to geographical maps by Eratosthenes. From the entrance to the Mediterranean, his celebrated "First parallel" extended through the island of Rhodes, and thence across the Euphrates and Tigris to the mountains of India, having been determined by observing where the longest day continued "fourteen hours and a half;" — therefore, as afterwards ascertained by Hipparchus, corresponding to "the Latitude of 36°" (Blair).

According to Eratosthenes (Strab. i. 3. 11), the current in the Strait between Italy and Sicily changes twice a day; corresponding in general to the *tides* of the Atlantic, but not so invariably following the moon. — Further details respecting the tides of the Atlantic, are given by Posidonius, and Athenodorus.

Eratosthenes (Strab. i. 3. 3, 4. 9, and xvii. 1. 19) maintained, That the Earth is $\text{C}\Phi\text{A}\text{I}\text{P}\text{O}\epsilon\text{I}\Delta\text{H}\text{C}$ spheroidal (compare Archimedes). He divided mankind into good and bad, a distinction existing throughout all nations; he admired the institutions of the Romans and Carthaginians; but states, that the Carthaginians would sink any vessel containing a foreigner sailing to Sardinia, or the entrance of the Mediterranean.

Inga mellifera of Tropical Arabia. Called in Yemen "dhoba" or "dobb" or "smurr" (Forsk.); and probably included in the ΜΕΛΙΤΟΥΡΓΕΙΑ plants suitable for bees abounding according to Eratosthenes at the Southern extreme of Arabia — (Strab. xvi. 4. 2): clearly the "akanthós" with fragrant flowers yielding the "aiguptiōn murōn" mentioned by Galen voc. hipp. 414 (compare *A. myrrhifera*): *I. mellifera* is termed "mimosa unguis cati" by Forskal p. 176; was observed by him in moist places in Yemen, the flowers yielding to bees white honey in abundance, the wood supplying fuel, and the masticated leaves applied to the eyes of bullocks to remove cloudiness.

Dobera glabra of Tropical Arabia. A large tree called in Yemen "dober" (Forsk.); and its fruit probably included among the ΕΥΚΑΡΠΙΑ abounding according to Eratosthenes in the Southern extreme of Arabia — (Strab. xvi. 4. 2): *D. glabra* was observed by Forskal p. 32 frequent along the base of the mountains of Yemen, the fruit eaten.

Isclaspia spiralis of Tropical Arabia. A shrub, not lactescent, and called in Yemen "schuntob" (Forsk.); and its follicles included perhaps in the "ēukarpia" of the Southern extreme of Arabia, mentioned by Eratosthenes — (Strab. xvi. 4. 2): *A. spiralis* was observed by Forskal p. 49 not far from Lohaia growing on the Desert plain, its follicles eaten, and the seeds sweet and relieving colic.

Stapelia? variegata of Tropical Arabia. A leafless sarmentose plant called in Yemen "draet el kelbe" (Forsk.); and its follicles probably among the "ēukarpia" of the Southern extreme of Arabia mentioned by Eratosthenes — (Strab. xvi. 4. 2): *S. variegata* was observed by Forskal p. xciii to 51 along the base of the mountains of Yemen, the follicles eaten crude.

Oncoba spinosa of Tropical Africa and Arabia. A large tree called in Yemen "onkob" (Forsk.); and its berries possibly among the "ēukarpia" of the Southern extreme of Arabia, mentioned by Eratosthenes — (Strab. xvi. 4. 2): *O. spinosa* was observed by Forskal p. 103 among the mountains of Yemen, the fruit eaten by boys. Westward, is known to grow as far as Senegal (Juss., and Pers.).

Marna crassifolia of Tropical Arabia. An arborescent shrub called in Yemen "mæru" (Forsk.); and its fruit possibly among the "ēukarpia" of the Southern extreme of Arabia, mentioned by Eratosthenes — (Strab. xvi. 4. 2): *M. crassifolia* was observed by Forskal p. 104 in arid situations throughout Yemen, its fruit eaten by boys.

Turia moghaddi of Tropical Arabia. Called in Yemen "moghadd" (Forsk.); and its fruit probably among the "ēukarpia" of the Southern extreme of Arabia, mentioned by Eratosthenes — (Strab. xvi. 4. 2): *T. moghadd* was observed by Forskal p. 106 along the base of the mountains of Yemen, the fruit eaten.

Ficus Forskali of Tropical Arabia. Called in Yemen "bæles" (Forsk.); and its figs probably among the "ēukarpia" of the Southern extreme of Arabia, mentioned by Eratosthenes — (Strab. xvi. 4. 2): *F. Forskali* was observed by Forskal p. 179 on the mountains of Yemen, its fruit not agreeable but eaten.

"224 B. C." (Blair), the Romans pursuing the Gauls, first cross the Po.

"223 B. C." (Clint. iii. p. 346), Seleucus III. succeeded by Antiochus III. Magnus, sixth Greek king of Syria.

Hardly later than this date (Sm. b. d.), the inventions of Heron of Alexandria, a pupil of Ctesibius. Applications of *steam* to mechanical purposes are described by Heron.

Anicyclus pyrethrum of the Mediterranean countries. Called in Spain "pelitre," and hence in English *pellitory of Spain* (Prior): the ΠΥΡΕΘΡΟΝ of Iolas — (schol. Nic. ther. 683), Andreas, Antipater (Gal. comp. med. gen. vii. 7), Nicander ther. 93b, P'aulus Aegineta, an herb according to Dioscorides having leaves like those of "thaukōs agrios" and its root fiery to the taste, is referred here by writers: *A. pyrethrum* was observed by Fraas near dwellings and in wooded mountain-ravines in Southern Greece. Farther South, the "purēthrōn" or "thōrukniōn" or "purōthrōn" or "purōtōn" or "purinōn" or "arnōs purites" is identified in the Syn. Diosc. with the "puritēs" of the prophets: "pyrethrum" root is enumerated by Alpinus as used medicinally in Egypt, imported according to Forskal mat. med. "from Barbary;" but according to Lindley *A. pyrethrum* occurs also in Syria and Arabia. Westward, the "purēthrōn" is identified in the Syn. Diosc. with the "salivaris" of the Romans; the "pyrethrum" is mentioned by Celsus, Scribonius Largus 9, Pliny xxviii. 42, Serenus Sammonicus, and as exotic by Macer Floridus: *A. pyrethrum* is described by Fuchsius p. 641. Tragus p. 173, Dodoens p. 347 (Spreng.), and Gerarde p. 758; and was observed by Shaw spec. n. 138, and Desfontaines ii. 287, wild in Barbary. The root according to Persoon induces salivation; and according to Lindley is "a powerful rubefacient and stimulant," and "is imported from the Levant."

"222 B. C." (Polyb., and Clint.), the Gauls defeated by Marcellus, and their leader Viridomar slain.

"In this year" (geogr. Chin., and Klajr.), the small kingdom of Yan, in the north of the Chinese province of Tchy-li overthrown, the last king Lou-wan seeking refuge among the Hioung-nou. At this time a man of Yan named Wei-man proceeding to Corea obtained possession of the government; dethroning Ki-tsum, the last of the Chinese dynasty.

"November" (Porphyr., and Clint. iii. p. 384 and 399), in Egypt, Ptolemy III. succeeded by Ptolemy IV. Philopator. — Who put to death his mother Berenice, his wife and sister Arsinoë, his brother Magas, and his uncle Lysimachus.

The hieroglyphic ovals of king Ptolemy IV. occur on buildings at Esneh and Karnak; on restorations at Luxor; and on the small temple to Athyr on the Western hill-slope at Thebes. He also built the temple at Akhmin, continued the one at Dakkeh in Nubia, and founded the great temple at Edfu.

Among the *Pali* inscriptions by king Asoka on columns at Delhi and along the Ganges, and on rocks in Guzerat and Cattac, one edict relates to establishing charitable institutions beyond his own territory "within the dominions of Antiochus the Greek (Antioko Yona), of which Antiochus's generals are the rulers:" and a subsequent edict contains "and the Greek king besides, by whom the Chapta (?) kings Turamayo, Gongakena, and Maga" (two of these names being Ptolemaios and Magas, according to Prinsep).

Hardly earlier than this year (Bunsen iv. 7. 2 giving 260 — "37 yrs." = 223), Asoka succeeded by his son Suyasas, now king at Pataliputra on the Ganges — (Bhagavata purana, Vichnu purana, and Burnouf ii. 778).

"221 B. C. = 26th year of Chi-hoang-ti, of the Thsin" or Sixth dynasty (Chinese chron. table). By Chi-hoang-ti, the year was made to commence with the conjunction of the sun and moon in Sagittarius, or two months earlier than under the Tcheou (Pauth.).

"In the 27th year of Ptolemy III." (Samuel Aniëns.), "ziunacanos" that "preserved snow in summer" (*ice-houses*) constructed in Armenia by Arsaces.

"As far back as the 3d century B. C." (Klapr. mem. i. 411), commencement of *Georgian history*. — Among several historical works, the most esteemed was procured by Vakhtang V. from the archives of the convent of Mzkheta and Ghelathi at the beginning of the Eighteenth century.

Archimedes (Strab. i. 3. 11) observing that fluids in solidifying tend to assume the spherical form, concluded, That it was so with the Earth.

"220 B. C." (Strab., and Schlegel journ. asiat. 1828), Theodotus II. succeeded by Euthydemus of Magnesia, third Greek king of Bactria.

"In this year" (Burm. hist., and Mason 40), Rekkhan succeeded by his son Khanloun, now Burmese king. — Who reigned "thirty-eight" years.

"The same year" (Polyb., Blair, and Clint.), in Greece, commencement of the Social war, between the Achæan and Aetolian Leagues; Philip IV. of Macedonia joining the Achæans.

"The same year" (Clint. ii. p. 269, and iii. p. 382), Cleomenes III. of Sparta seeking refuge in Egypt, put to death by Ptolemy IV. He is regarded as the last Spartan king in the Agid line (Pausan.).

A Greek inscription of about this date (Franz. 80) found on Corcyra, presenting the following form of the letter Π .

"218 B. C." (Polyb., Blair, and Clint.), from Spain, a Carthaginian army led by Hannibal through France and over the Alps into Italy: in this unexpected manner commencing the Second Punic war. An account of the journey is given by L. Cincius Alimentus; who was himself taken prisoner, derived many particulars from Hannibal's own lips, and principally wrote in Greek.

"The same year" (Polyb., and Clint. iii. p. 315 and 384), commencement of war for the possession of Palestine, between Antiochus III. and Ptolemy IV. — The war continued a year.

Not later than this date (C. Aurel., and Sm. b. d.), the treatise on *KYNOAYCOC hydrophobia* by Andreas.

Helminthia echioides of Europe and the adjoining portion of Asia. A Lactucoid herb called in Britain *oxtongue* (Prior), in Greece "hëirōvōtani" (Sibth.) or "agriōs sōhōs" (Fraas), in Egypt "libbæjn" (Forsk.), in which we recognize the "vöuglössōn mēga" identified through Syn. Diosc. with the *KIPCION* named from and prescribed against varices by Andreas, — two cubits high according to Dioscorides, with "vöuglössō"-like leaves spinescent around, and heads of purple-tipped flowers changing into pappus, referred here by Ruel iii. 126: *H. echioides* was observed by Forskal in Egypt; by him, Sibthorp. and Fraas, from Athens to Smyrna and Constantinople, its leaves eaten crude as well as cooked. Westward, the "kirsion" is identified in Syn. Diosc. with the "spina mollis" of the Romans; and the account of the "cirsion" having "spinae molles" by Pliny xxvii. 39, seems taken from Dioscorides: *H. echioides* is described also by Lobel pl. 557; is termed "*hieracium echioides capitulis cardui benedicti*" by Tournefort inst. 470; was observed by Forskal on Malta; and is known to grow from Italy throughout middle Europe as far as Britain (Curt. lond. iii. pl. 51, and Pers.).

Aloe Socotrina of Socotra and the countries around. The imported drug is called in English *aloes*, in Bengalee "musabbar," in Hindustanee "musabbar" or "elwa" (D'roz., and Royle), in which we recognize the $\Lambda\Lambda\text{OHC} : \text{IN}\Delta\text{IKHC}$ of Andreas — (Gal. comp. med. gen. vii. 7), "*aloe*"

of Celsus v. 1, Juvenal, and Plutarch, the concrete juice "ōpisma" imported according to Dioscorides from India, or according to Pliny xxvii. 5 the Indian kind is the best (brought of course by way of India originally from the district around the entrance to the Red Sea): "*A. officinalis*" was observed by Forskal p. 73 wild in Yemen and called "sabr," from the odour of its juice clearly the source of the Socotrine aloes of commerce; this according to Lindley is imported from Bombay and Smyrna, and "*Mocha aloes* and genuine *hepatic aloes* are supposed to be varieties of the same species." By European colonists, the living *A. Socotrina* was carried from Socotra to the botanic garden at Bombay (Graham): from transported specimens is described also by Miller 15, and Woodville pl. 202.

Aloe littoralis of the seashore of peninsular Hindustan. Yielding a good kind of *aloes* (Drur.), possibly the "alōēs intihikēs" of Andreas: — *A. littoralis* was observed by Koenig, and Ainslie, in Hindustan, the juice of its leaves applied externally in ophthalmia, and by the Mahomedans used for making ink (Drur.).

Aloe Indica of the arid sandy plains of Northwestern Hindustan. Yielding *aloes* (Drur.), and perhaps included in the "alōēs intihikēs" of Andreas, — and "*aloes indicæ*" distinguished by Marcellus 8: *A. Indica*, termed "*a. perfoliata*" by Roxburgh, was also seen in Hindustan by Royle.

Althea officinalis of Europe and the adjoining portion of Asia. Called in Britain *marsh-mallow* (Prior), in France "guimauve" (Nugent), in Germany "eibisch" (Fraas), in Italy "bismalva" or "buonvisco" or "altea" (Lenz), in Greece "nērōmōlōha" (Fraas); in which we recognize the "*althaia*" identified through Syn. Diosc. with the ΕΒΙΚΚΟΥ whose root is prescribed by Andreas — (Gal. c. med. gen. vii. 7): the "iviskōn" is further identified in Syn. Diosc. with the "althiōkōn;" and the "*althaia*" is described by Dioscorides as having a stem two cubits high, downy leaves, and a "rōthōēithēs" rose-like flower: *A. officinalis* was observed by Sibthorp, Chaubard, and Fraas, frequent in marshy situations from the Peloponnesus throughout Greece; is known to grow also in Siberia (Pers.). Farther South, seeds of "*althaea*" are enumerated by Alpinus as employed medicinally in Egypt, and the living *A. officinalis* according to Clot-Bey has been recently introduced. Westward, the "*hibisco*" is described by Virgil ecl. ii. 30 to x. 71 as green and slender, furnishing a switch for driving kids, and woven into wicker baskets "*fiscellam texere*;" is prescribed by Celsus; is identified by Pliny xx. 14 with the "*molochen agriam*" by some called "*pistolochiam*;" and "*agrestisque malva*" or "*althaea*" or "*eviscus*" is mentioned by Macer Floridus: *A. officinalis* is termed "*a. Dioscoridis et Plinii*" by Tournefort inst. 97; was observed by Lenz in Italy; and is known to grow "near the sea" as far as Denmark (fl. Dan. pl. 530, Pers., and Lindl.). Seeds may have floated across the Atlantic to New England, the plant observed by myself only along salt-marshes: but clearly by European colonists, was carried to Southeast Australia, where it has become naturalized (T. Corder, and A. Dec.); and to the Mauritius Islands, observed under cultivation by Bojer. The whole plant, especially the root, yields according to Lindley "a plentiful tasteless" mucilage, "very salutary in cases of irritation," and "a favourite medicine with the French." (See *Alcea acaulis*.)

Orchis undulatifolia of the Mediterranean countries. Called in Greece "sarkinōvōtani" or "ōura tōu alēpōu" (Sibth.): the ΚΑΡΑΤΙΑΔΑ of Andreas, — so called from the many uses of its root, is identified by Dioscorides with the "ōrhis ētērōs" having oblong "prasō"-like leaves curling at the axil, stems a span high and purplish flowers, and referred here by Fraas: the "*sarapiatha*" is also mentioned by Aetius: *O. undulatifolia* was observed by Sibthorp, Chaubard, and Fraas, from Cyprus to the Peloponnesus, not rare, and the root dried and used for food. Westward, the account by Pliny xxvi. 62 of the "*serapias*" or "*orchis herba*" seems chiefly taken from Dioscorides and the Greeks: *O. undulatifolia* is termed "*o. cercopithecum lusitanic.*" by Breynius pl. 42, is further identified by Chaubard with the "3d ophrys insectifera" of Linnæus 1343 and "*orchis longicruris*" of Link; is known to grow in Portugal (Brot., Pers., and Steud.), and was observed by Bivona ii. pl. 6 in Sicily.

"217 B. C." (Polyb. 81, and Sm. b. d.), attempt to assassinate Ptolemy IV.: in which his physician Andreas was slain.

Amanita aurantiaca of Europe. An *edible mushroom* called in Piedmont "*bole real*," and the "*boletos*" commended by Glaucias — (Plin. xxii. 47), Asellius Sabinus (Suet. vit. Tiber. 42), and Apicius, are referred here by Dierbach and others: *A. aurantiaca* is known to grow in various parts of Southern Europe.

"216 B. C." (Polyb., and Clint.), the Romans defeated by Hannibal at Cannæ. The swords of the Gallic or French allies of Hannibal are described by Polybius ii. 33 as easily bent, and straightened on the ground under foot; and by Livy xxii. 46, as "*prælongi ac sine mucronibus*," very long and not sharp-pointed: swords agreeing with this description, long, straight, double-edged, rounded at the extremity, and of untempered iron, are found in tombs apparently contemporaneous in Switzerland and Northern Europe (Trojan p. 347)

After the defeat at Cannæ, Q. Fabius Pictor sent by the Romans to consult the Oracle at Del-

phi. His last name Pictor, came from his paintings in the temple to Health (Bryan dict. paint.). He wrote in both Greek and Latin.

"215 B. C." (Liv., and Clint.), the envoys of Philip V. of Macedonia, on their way to Hannibal, captured by the Romans.

As early probably as this date, Moschus of Syracuse composing poetry. He was acquainted with Aristarchus — (Suid.).

Crocus luteus of the East Mediterranean countries. The $\Xi\text{AN}\Theta\text{I}\text{O}:\text{KPOK}\text{OY}$ of Moschus ii. 68 — may be compared: *C. luteus* is termed "c. vernus Mæsiacus primus" by Clusius pannon. 228; and was observed by Sibthorp near Sestus on the Hellespont. Transported to Britain, is described by Miller, and in a single park continues growing spontaneously (A. Dec.).

"214 B. C. (= 33d year of Chi-hoang-ti," Amyot, and Pauth. p. 222), the *Great wall* along the Northern frontier of China commenced. — It was finished in "ten years."

"213 B. C. (= 34th year of Chi-hoang-ti," Pauth. p. 221 to 227), a *comet*; and the decree ordering the *destruction of books* throughout the Chinese empire. At the same time, the minister Li-sse caused the different kinds of *alphabetic characters* to be reduced to a single kind, called "li-chou;" — the same that continues to be employed in Chinese writing.

"212 B. C." (Liv., and Clint.), during the capture of Syracuse by the Romans under Marcellus, Archimedes at the age of "seventy-five" slain. The first *paintings* and *statues* brought to Rome, were from the spoils of Syracuse.

"209 B. C. = 1st year of Eulh-chi-hoang-ti, of the Thsin" or Sixth dynasty — (Chinese chron. table).

"The same year (= 453 years after Synmu" Kaempf. i. 6), death of Sinosikwo in the "fiftieth" year of his age; and arrival in Japan of a colony of Chinese led by a physician.

"The same year" (Liv., and Clint.), Tarentum recovered by the Romans under Q. Fabius.

Polygonum aviculare of Europe and Northern Asia. Called in Britain *knot-grass* or *swine's grass*, by Treveris grete herbal "swynel grass" (Prior), in France "renouée" (Nugent), in Germany "knöterich" (Grieb): the $\Pi\text{OAY}\Gamma\text{O}\text{N}\text{OY}$ prescribed by Heraclides Tarentinus against blood flowing from the ear — (Galen comp. med. loc. iii. 1), mentioned also by Nicander ther. 901, Magnus of Philadelphia, and Charixenes, or the "pölugōnōn arrēn" described by Dioscorides as having numerous slender branches, jointed, creeping on the ground like grass, with fruit at each leaf, is referred here by writers: *P. aviculare* was observed by Forskal, Sibthorp, and Chaubard, everywhere in Greece and on the Greek islands. Farther South, the "pölugōnōn arrēn" is identified in the Syn. Diosc. with the "thēphin" or "mēmphin" of the Egyptians: *P. aviculare* was observed by Hasselquist in Palestine; by Delile, around Alexandria in Egypt; and was received from Abyssinia by Richard. Westward, the "ēraklēian" or "hiliōphullōn" or "pölugōnōn arrēn" is identified in the Syn. Diosc. with the "hōulōum" of the Numidians, and "prōsērpīnaka" or "saggōuinālis" of the Romans; the "herba sanguinalis" is mentioned by Celsus ii. 33, and Columella vi. 12 and vii. 5; the "polygonum," by Scribonius Largus 46, and is identified by Pliny xxvii. 91 with the "calligonum" or "sanguinaria;" *P. aviculare* is described by Fuchsius 614, Lobel, and Tabernæmontanus, is known to grow in waste places and along roadsides throughout Europe as far as Lapland (Pers., and Wats.). Eastward from Greece, is known to grow in Nepal and throughout Northern Asia (Wats., and A. Dec.), was observed by Thunberg on the seashore and elsewhere in Japan; and farther East, was observed by myself around Chinook villages on the American shore, clearly aboriginally introduced. By European colonists, was carried to Iceland and Greenland (Hook., and Wats.), to New England prior to 1670 (according to Josselyn), but has since multiplied throughout Northeast America, especially around dwellings and in places that have been trampled on; and to Southeast and Southwest Australia, where it has become naturalized (Corder, Drumm., and A. Dec.). According to Lindley, the "fruit said to be emetic and cathartic."

Polygonum maritimum of the seashore of the Mediterranean and North Atlantic: possibly a distinct species, the stems harder, more or less ascending, and leaves somewhat glaucous. — The "karkinēthrōn" or "pēthalion" of the Syn. Diosc. may be compared: *P. maritimum* called "argentina" was observed by Forskal, Sibthorp, and Chaubard, in the maritime sands of Cyprus, Crete, and Greece to the sea of Marmora. Farther South, was observed by Delile on the Mediterranean border of Egypt near Alexandria; by myself, on the sea-beach there, the same in every respect as on the sea-beaches of our Middle States; is known to grow at intervening stations, as on the Atlantic shore of Europe, Madeira, the Canaries and Azores (Barrel. pl. 560, Pers., Webb, Wats., and A. Dec.). In the Southern Hemisphere, observed by J. D. Hooker fl. Ant. ii. p. 340 in Patagonia and Southern Chili.

Berberis Cretica of the East Mediterranean countries. Called in Greece "muilkunia" (Sibth.) or "mulkini" or "ōxuakantha" (Fraas); in which we recognize the $\Lambda\text{YK}\text{I}\text{O}\text{N}$ of Heraclides Tarentinus, — Celsus v. 28, Scribonius Largus, the juice of a plant growing according to Dioscorides in

broken ground in Lycia Cappadocia and many other districts, its branches three cubits long crowded with leaves like those of box, and referred here by Honorius Beltus, and Alpinus exot. pl. 20: the "lukiōn" is identified in Syn. Diosc. with the "puxakanthan;" is mentioned also by Galen comp. med. iii. 2, Oribasius, and Paulus Aegineta; by Pliny xii. 15 as a "spina" growing on mount Pelion. and by some among the Greeks called "pyxacanthum chironium:" B. Cretica is described by Bauhin hist. i. 60; is termed "b. cretica buxi folio" by Tournefort cor. 42; and was observed by Sibthorp, and Fraas, from the mountains of Crete and Southern Greece to Cyprus.

"207 B. C." (Liv., and Clint.), the Carthaginians under Hasdrubal, defeated by the Romans.

"206 B. C. = 1st year of Tsou-pa-wang" (Chinese chron. table): an usurper as shown by title, his real name being Hiang-yu. Coins issued during his reign are extant (Pauth.).

"The same year" (Gaubil note to Chou-king ii. 1. 44) is regarded as the beginning of the Han dynasty; and maps and geographical lists of places (specially excepted by Chi-hoang-ti in his decree for burning the books) were now carefully collected.

"In this year" (Gildem. p. 28), expedition of Antiochus III. against India.

"In this year" (= L. Veturius and Q. Caecilius Metellus consuls, Sm. b. d.), the poet Naevius imprisoned for a disparaging verse on the Metelli, the laws of the Twelve Tables punishing libel with death. His imprisonment is alluded to by Plautus mil. glor. ii. 2. 56.

The TIPPVLA of Plautus, — so light as to run on the top of the water according to Varro, and a diminutive animal with six feet according to Pompeius Festus (Paul. Diac.), is clearly the insect tribe of *Gerris*.

Hypericum perforatum of Europe and the adjoining portion of Asia. Called in Britain *St John's wort* (Prior), in Germany "hartheu" (Fraas), in France "millepertuis" (Nugent), in Italy "perforata" or "iperico" (Lenz), in Greece "lēihēnōhōrtōn" or "valsamon" (Sibth.) or "valsamaki" (Fraas), in which we recognize the HYPERICON of Plautus, — a cubit high according to Pliny xxvi. 53, strong-scented, and ripening seed at the same time with barley: the "herba sancti iannis herba perforata" is mentioned by Symon Januensis sinon.: *H. perforatum* is described by Arnoldus de Villanova (Pouchet), Valerius Cordus, and Dodoens (Spreng.); is termed "h. vulgare" by Tournefort inst. 254; is known to grow in Italy and throughout middle Europe (Lam. fl. fr., and Smith); according to Prior, "gathered on the eve of St. John's day, the 21st June," as "a preservative against thunder and evil spirits, whence it was called 'fuga dæmonum,' and given internally against mania." Farther East, was observed by Sibthorp, Chaubard, and Fraas, throughout Greece and the Greek islands; is possibly included among the imported "hypericum leaves and flowers" found by Alpinus, and Forskal mat. med. employed medicinally in Egypt (see *H. crispum*); but seems altogether unknown in Eastern Asia (Ledeb., and A. Dec.). By European colonists, was carried to Northeast America, where it has become naturalized in open and sometimes wild situations. Its leaves according to Lindley are "astringent, an infusion has been used in gargles and lotions."

Cinnamomum iners of Tropical Hindustan and the Siamese countries. The *wild cinnamon* is called in Hindustanee "darchini," in Malabar "kat-carua," in Canara "cuddoo-lavanga" (Drur.), in the environs of Bombay "ohéz" or "bojevar" (Graham), in Burmah "heet-kyam-boo" (Mason), and the exported dried leaves "folia malabathri" (Lindl.); in which we recognize the PETALION of Plautus curcul, — "malabathrum" of Horace, Ovid, Celsus, Pliny xii. 50, Isidorus (Stapel, and Ainsw.), and "folium" of Apicius: the "malvathrōn" growing in India, is mentioned by Andromachus, Dioscorides, Claudius Ptolemy, and Paulus Aegineta; the "phullōn malavathrōu" or "phullōn inthikōn," by Nicolaus Myrepsus xxxiv. 22; the "sadsadsch," by Rhazes, and Ebn Baitar; aromatic "folio indico" is enumerated by Van Ghistele (Voyag. Belg.) among the ingredients of the Egyptian teriacle; and "sadedj hendi" or "malabathrum fol." imported from Hindustan, was seen in Egypt by Forskal. Southward and Eastward, the "kinnamōmōn" used for firewood among the Sabaeans according to Agatharchides 101, and Artemidorus (Strab. xvi. 4. 19), may be compared; also the "xulōkinnamōmōn" and importations into Mosul, mentioned by Dioscorides i. 12 to 13, and Pliny vi. 34: *C. iners* was observed by Rheede i. pl. 75 in Malabar; by Graham, along the "Ghauts, and in the hilly parts of the Concans," its bruised leaves having "a strong spicy smell," its bark put in curries "as a spice," but "billets from the tree are often sold together with other kinds of firewood;" by Buchanan, Roxburgh hort. calc. 30, Wallich, Wight, and Drury, as far as Travancore, its inner bark "capable of affording *cassia lignea* of good quality," and its dried buds used medicinally; according to Ainslie, Royle, and Lindley, its dried leaves constitute the principal part of the *folia malabathri* of commerce. Farther East, was observed by Mason wild in Burmah; by Blume rumph. xxxv. pl. 15, as far as Java. (See *C. tamala*).

Laurus sp. of the Canary Islands. The aromatic bark MACIS of Plautus, — "maceris" of the antidote of Antipater (Scrib. Larg. 167), "makër" brought according to Dioscorides from "varvarōu," yellowish, thick, astringent, and taken in potion against dysentery diarrhœa and spitting blood, is referred by Alpinus to the "selica seuda" bark imported from Barbary into Egypt and confounded

with the spice cassia : one or more species of *Laurus* are known to grow, if not on the Atlas mountains on the neighbouring Canary Islands. The "macir" is mentioned also by Pliny xii. 16, Galen fac. simpl. vii. p. 66, and Paulus Aegineta, but is attributed to India.

Tussilago petasites of Europe and the adjoining portion of Asia. Called in Britain *butterbur* (How, Skinner, W. Coles, and Prior), in Italy "petasite" or "tussilagine maggiore" (Lenz), in Greece "köllöpanna;" and the FOLIA-FARFERI of Plautus poen. ii. 1. 32, — "farfarum" or "far-fugium" or "chamaeleucen" of Pliny xxiv. 85 is referred here by Billerbeck : *T. petasites* is termed "petasites major et vulgaris" by Tournefort inst. 451, and is known to grow in Italy and throughout middle Europe as far as Denmark, flowering in the early spring (fl. Dan. pl. 842, and Pers.). Eastward, the "pētāsītēs" is described by Dioscorides as a sprout thick as the thumb and more than a cubit high, bearing a large leaf like a broad-rimmed hat : *T. petasites* was observed by Sibthorp along shaded rills in Greece and on mount Athos and the Bithynian Olympus.

Festuca ovina of Subarctic Climates. A grass called in Britain *fescue* (Prior), and the FESTUCA of Plautus, laid by the prætor on the head of a slave in freeing him, — may be compared (referred by Fée to "f. rubra") : *F. ovina* is termed "gramen loliaceum minus capillaceo folio spica brizæ longissima" by Tournefort inst. 517 ; is known to grow from Lapland to the Mediterranean (Pers., Engl. bot. pl. 585, and Wats.) ; was observed by Brotero in Northern Portugal ; by Scopoli, and Pollich, in Northern Italy and Carniola ; by Sibthorp, and Chaubard, frequent on the loftier mountains of Greece ; is known to grow also on the Taurian mountains and in Siberia (Bieb., and Kunth). Westward, was observed by Hooker on Iceland ; by Sabine, in Greenland ; and is known to grow from Lat. 65° at Bear Lake to the Saskatchewan, Lake Winnipeg (Hook.), and Lake Superior (A. Gray), also to the Pacific at Nootka Sound (Kunth). The viviparous variety is known to grow "on the alpine summits of the White mountains" of New England (A. Gray), on Iceland, the mountains of Britain and middle Europe (Ray syn. pl. 22, Engl. bot. pl. 1355, and Pers.), and on the mountains of the Peloponnesus. "*F. amethystina*" of Linnæus, observed by Chaubard in the Peloponnesus, is regarded by him, together with "*F. rubra*," Linn., as perhaps not distinct from *F. ovina*.

Festuca duriuscula of Northern Climates. Notwithstanding the flat leaves often confounded with the preceding, and probably included in the "festuca" of the Romans : — termed "gramen pratense panicula duriore laxa unam præcipue partem spectante" by Tournefort inst. 522 ; known to grow from Lapland and Russia to the Mediterranean (fl. Dan. pl. 700, Pers., and Wats.) ; observed by Ray pl. 19 in Britain ; by Lamarck, in France ; by Host, in Austria ; by Sibthorp, and Chaubard, in dry situations in the Peloponnesus. Westward, by Hooker on Iceland ; by myself, to all appearance indigenous on the coast cliffs of Eastern New England, and by Nuttall as far as the seashore of New Jersey ; but occurs also in fallow ground, perhaps introduced among grass seed : was observed by Short in Kentucky ; by Chapman, "around dwellings, Florida and northward, introduced."

"The same year" (Liv., and Clint.), a Roman army led into Africa by P. C. Scipio ; and a treaty negotiated by him with Syphax.

"205, November" (Porphy., and Clint. iii. p. 339), in Egypt, Ptolemy IV. succeeded by Ptolemy V. Epiphanes ; now about "five" years old — (Justin, and Hieron.). Hieroglyphic ovals of Ptolemy V. occur on the temple at Ombos, founded by him ; and during his reign, a large amount of building was accomplished, especially at Thebes, Esneh, Edfu, and Philæ. At the last named place, his name occurs in a Greek inscription, dedicating the small temple to Aesculapius.

"203 B. C." (Liv., and Clint.), departure of Hannibal from Italy.

As early perhaps as this date (Vishnu purana, and Burnouf ii. 778), Suyasas succeeded by his son Dasaratha, now king at Pataliputra on the Ganges. His name occurs at Budha Gaya, in an inscription dedicating a Buddhist cave-temple immediately after his accession — (Prinsep, and Burn.).

"202, Oct. 19th" (Blair), partial *eclipse of the sun*. And shortly afterwards, Hannibal defeated at Zama in Africa by P. C. Scipio — (from this time called "Africanus").

"The same year = 5th year of Tai-tsou-kao-hoang-ti ;" now, "in the twelfth month," head of the new dynasty of the Han (Chinese chron. table, and Pauth. 234). His original name is given as Lieou-pang, and he is also called Kao-tsou. He is blamed for giving in marriage a princess of the imperial family to the chief of the Hioung-nou Tartars : the first instance in Chinese history of an alliance with barbarians.

"In the reign of Tai-tsou-kao-hoang-ti" (Pauth.), and under the superintendence of his general Chang-liang, a road partly on pillars constructed at great expense among the mountains of Chensi.

"201 B. C." (Blair), end of the Second Punic war, in peace on ignominious terms granted to the Carthaginians.

One hundred and twenty-third generation. Jan. 1st, 200, mostly beyond youth : the Jewish historian Demetrius (Clint. i. p. 288) ; the Greek poets Seleucus, and Moschus ; the philosophers,

Sotion, and Hegesinus; the historians, Menodotus of Perinthus, Sosilus, Silenus, and Zenon of Rhodes; the grammarians, Demetrius of Scepsis, and Aristarchus; other Greek writers, Polemon, Adaeus, and Mnaseas of Patara; the painters, Nicias, and Athenion (Bryan); the Latin writers, Fulvius Nobilior the historian, and Caecilius Statius the comic poet.

VII. ROMAN DOMINION.

"The same year" (Liv., and Clint.), war commenced by the Romans against Philippus V. of Macedonia: and an embassy from Ptolemy V., proposing to remain neutral, unless the Romans should desire a different course.

"In this year" (according to Greek authority, "Megasthenes" in Drur.), teaching writing on school-boards introduced into Hindustan, — the method practised to the present day.*

"198 B. C." (Clint. iii. p. 316), the army of Ptolemy V. led by the Aetolian general Scopas, defeated at Panicum by Antiochus III. After inclining towards the cause of Antiochus III., the Jews now submitted voluntarily, and passed from the dominion of Egypt.

Meum athamanticum of mountainous situations throughout middle Europe. Called in Britain *spicknel* or *mew* (Ainsw., and Prior), in the drug-shops "radix mei" (Lindl.), in which we recognize the MHOY root of the theriac of Antiochus Philometor, inscribed on the temple of Aesculapius — (Plin. xx. 100, and Gal. antid. ii. 14), or the "mēōn athamantikōn" of Andromachus, Servilius Damocrates, Paulus Aegineta, described by Dioscorides as abounding in Spain and Macedonia, in stem and leaves resembling "anēthō," the roots warm to the taste and fragrant: named according to Pliny xv. 94 as if discovered by Athamas, or by another account found of the best quality in the Athamantian district (in Bœotia). Westward, the "meum" is further mentioned by Pliny as sparingly sown in Italy and only by physicians; *M. athamanticum* is termed "bervurtz" by Hildegard ii. 142, was observed by Bartholem. Urbetanus and A. Palla Juvenatiensis on the mountains of Nursia (Spreng.); is described also by Gesner hort. f. 274, and Dalechamp p. 1170 (Spreng.); and is known to grow in Northern Italy and throughout middle Europe as far as Britain (Jacq. austr. pl. 303, Pers., Engl. bot. pl. 2249, and Lenz). The roots according to Lindley "are aromatic and sweet, something like carrot," and "form an ingredient in Venice treacle." Seeds of "mu" or "mei" are enumerated by Alpinus as entering into the composition of the Egyptian theriac.

197 B. C. = "9th year of Ptolemy V.," the date of the *Rosetta Stone*: a decree in hieroglyphic characters, with a translation in demotic, and also in Greek: — thus affording the means of recovering the art of reading hieroglyphic writing.

"196 B. C." (Polyb., Liv., and Clint.), at the Isthmian games, Greece declared free by T. Quinctius Flamininus.

"195 B. C." (Plut., Trog., and Schlegel journ. asiat. 1828), Euthydemus succeeded by Apollodotus Soter, fourth king of Bactria; and (according to some authorities) also by Menander Nicator. — Coins of Apollodotus and Menander continued current in Barygaza (Baroach) in the time of the author of the Erythraean Periplus, and to the present day are found in great numbers from Cabul as far East as the Jumna (Sm. geogr. dict.).

"194 B. C. = 1st year of Hœi-ti or Hiao-hœi-ti, of the Han" or Seventh dynasty (Chinese chron. table, and Pauth. p. 235). He revoked the decree against ancient books.

"The same year" (Liv., Val. Max., and Clint.), at Roman spectacles, separate seats first assigned to senators.

"In or about this year" (Suid., and Sm. b. d.), Eratosthenes succeeded by Apollonius Rhodius in the charge of the Alexandrian Library.

* *Alstonia scholaris* of Tropical Eastern Asia and the Malayan archipelago. A tree called in the environs of Bombay "satween" or "shaitan" (Graham), in Bengalee "chhatin," in Telinga "edakula-ariti" or "edakula-ponna" or "edakula-pala" or "pala-garuda," in Tamil "ezhilaip-palai" (Drur.); and furnishing the school-boards in question: — the "saptaparna" with fragrant flowers according to Kalidasa ragh. iv. 23, prescribed medicinally by Susrutas, is referred here by W. Jones, and Hessler: *A. scholaris* was observed by Rheede i. pl. 45 in Malabar; by Graham, in "the hilly parts of the Concan pretty common" as far North as Bombay, employed by the natives medicinally but held in "superstitious fear," supposed to assemble "all the trees of the forest once a year to pay homage;" was observed by Roxburgh, Wight, Nimmo, and Drury, as far as Travancore, Coromandel, and Assam; and is termed by Rumphius ii. pl. 82 "lignum scholare" from boys learning to write on tablets of the wood (Pers.). Farther East, was observed by Blanco on the Philippines, and called in Tagalo "dita," in Ylocano "dallopaven;" and apparently the same species, observed by myself as far as the Feejee Islands.

"192 B. C." (Liv., and Clint.), by Philopoemen, Sparta joined to the Achæan League.

"The same year" (Porphyr., and Clint. iii. p. 399), marriage of Ptolemy V., with Cleopatra daughter of Antiochus III. of Syria.

"190 B. C." (Liv., and Clint.), *eclipse of the sun*. And at "Magnesia in Lydia," Antiochus III. defeated by L. C. Scipio; commanding the first Roman army led into Asia.

"189 B. C. (the plebeian M. Fulvius Nobilior and Cn. Manlius Vulso consuls," Cic. tusc. i. 2, and Sm. b. d.), Fulvius Nobilior, having "obtained Aetolia as his province," proceeding thither accompanied by the poet Ennius.

"188 B. C." (Liv., and Clint.), at Sparta, by Philopoemen again elected Achæan prætor, the *Laws of Lycurgus* abrogated.

"187 B. C. = 1st year of Liu-chi or Kao-hoang-heou-liu-chi, of the Han" or Seventh dynasty (Chinese chron. table); the first woman who ruled China — (Pauth. p. 236).

"The same year" (Polyb., and Clint.), embassies sent by the Achæan League to Rome and Egypt; and the alliance of Ptolemy V. with the Achæans renewed. Before the close of the year (Clint. iii. 346), Antiochus III. succeeded by Seleucus IV. Philopator, seventh Greek king of Syria.

"186 B. C. (= 326 — "140 yrs." of Masudi, Wilford as. res. ix. 181), in Hindustan, end of the dynasty of Phour (Porus who was overcome by Alexander).

"184 B. C." (Cic., and Clint.), at Rome, Cato appointed censor.

Smymnium perfoliatum of the Mediterranean countries. Called in Greece "tragōgōuli:" the MELANTHII-ACETABVLVM by physicians called SMYRNIVM according to Cato 102, — or the "smyrnion" of Pliny xxvii. 109 (whose account seems in great part taken from Dioscorides), is referred here by writers: *S. perfoliatum* is described by Morison ix. pl. 4; is termed "s. peregrinum rotundo folio" by Tournefort inst. 316; and is known to grow in Hungary, Italy, and Spain (Kitaib., Pers., and Lenz). Eastward, the "smurnion" is described by Dioscorides as growing mostly on mount Amanus and called in Cilicia "pētrosēlinōn," its stem "sēlinō"-like and umbel "anēthōēithēs" with round black seeds tasting like myrrh for which they can be substituted: *S. perfoliatum* is termed "s. creticum" by Matthioli p. 366; and was observed by Sibthorp, Chaubard, and Fraas, frequent on mountains from Cyprus to Crete and the Peloponnesus.

Asparagus officinalis of Western Europe. Called in Britain *asparagus* or sometimes *sparrow-grass* (Prior), in Germany "spargel" (Grieb), in France "asperge" (A. Dec.), in Italy "sparag-gio" or "asparago" (Lenz), in which we recognize the ASPARAGVS cultivated according to Cato 161 and especially succeeding in gardens at Ravenna, — mentioned also by Augustus (Suet. oct. 87), Pliny xix. 42, Palladius iv. 9. 10, and a bundle of the young shoots distinctly figured at Pompeii (Schouw 4): *A. officinalis* is described by Blackwell pl. 332, is known to grow wild in Italy and throughout middle Europe (Pers., and Lenz), is besides abundantly cultivated as far as Holland. Eastward, has not been observed in Greece: but "asparagus" is enumerated by Alpinus among the esculent plants of Egypt, and "asparagus" roots imported "from Europe" are according to Forskal mat. med. employed medicinally. Farther East, was observed by Thunberg under cultivation at Jeddo in Japan, and called "kikak kusi." Possibly by European colonists carried to Hindustan, where it was observed by myself in the botanic garden at Bombay, and by Roxburgh, and Graham, under cultivation, but no native name is given; and to Burmah, where it is enumerated by Mason as "exotic," and seems devoid of a native name. Clearly by European colonists was carried to North-east America, where it continues under cultivation, and occurs besides in wild situations perhaps fairly naturalized. (See *Asparagus tenuifolius*).

Glyceria fluitans of Temperate climates. Called in Britain *float-grass* or *flote-grass* (Prior), and the VLVA-OVIVM of Cato 37, — and "agrōstis pōtamiōs" of Dioscorides iv. 30 (?), are referred here by Thiebault de Berneaud (Fée): the "flot grese" is mentioned by Galfridus pr. pm.: *G. fluitans* is termed "gramen fluviatile" by Gerarde, "gr. paniculatum aquaticum fluitans" by Tournefort inst. 521; was observed by Desfontaines, and Munby, in Barbary; by Lemann, on Madeira (A. Dec.); by Brotero, in Portugal; and is known to grow throughout middle and Northern Europe as far as Sweden and Iceland (Hook., Fries. and Wats.). Eastward, was observed by Sibthorp from the Peloponnesus to Constantinople; is known to grow also in the Tauro-Caspian countries (Bieb.), and on the Ural in Siberia (Ledeb.). Farther East, was observed by Drummond at Cumberland House in Lat. 54° in central North America; by Nuttall, on the Arkansas; by myself, along the Atlantic from Lat. 43°; and is known to grow as far South as the Delaware peninsula (Muhl.) and Upper portion of Carolina (Ell.). In the Southern Hemisphere, is known to grow in Chili (Brogn. 1st voy. Astrol. p. 39), and was observed by R. Brown i. p. 179 in Australia.

Arundo festucoides of Barbary. The "arundinis italicae" used chiefly for vines, and directions for planting which are given by Cato, — or the "ampelodesmon" described by Pliny xvi. 67 to xvii.

35. 26 as employed in Sicily for tying vines, is referred here by Cyrillo: *A. festucoides* is termed "donax tenax" by Beauvois; was observed by Hogg on Sicily; is known to grow wild in dense "caespitae" cane-brakes in hilly situations in Barbary (Desf. pl. 34. and Pers.).

Avena fatua of Tartary. Called in France "folle avoine" (Fée), in Italy "avena salvatica" (Lenz), in Greece "agriōgēnēma" or "agriōsiphōnari" or "agriōvrōmō," in which we recognize the AVENA of Cato r. r. xxxvii. 5, — "sterilis avena" and "vana avena" of Virgil ecl. v. 35 and georg. i. 77, or the "avena" into which barley is supposed by Pliny xviii. 44 to degenerate: *A. fatua* was observed by Forskal in Southern France, is known to grow as a weed in grain-fields throughout middle Europe as far as Holland and Britain (Bauh., C. Bauh. pin. 10, Parkins. p. 1149, Pers., and Wats.). Eastward, the "vrōmōs" compared with the "aigilōpi" by Dioscorides iv. 138 is identified in the added synonyms with the "siphōniōn" or "akrōspēlōs," and with the "avēnam" of the Romans: *A. fatua* was observed by Forskal, Sibthorp, and Chaubard, frequent in grain-fields from Constantinople to the Peloponnesus; is called in Egypt "zommeyr" or "chafur," in which we recognize the "khafur" of Ebn Baitar; and was observed in the cultivated ground of Lower Egypt by Forskal, and Delile. Farther East, is known to grow wild in the Crimea, and probably wild also around Caucasus (Bieb., Ledeb., and A. Dec.); was observed by Thunberg here and there in Japan, growing spontaneously and called "tsusikusa." *A. sterilis*, regarded by some writers as not distinct, was also observed in Greece by Sibthorp, and Bory; and by Delile, growing around Cairo in Egypt.

"182 B. C." (Liv., Plut., and Clint.), while opposing the measures of T. Quinctius Flaminius, Philopoemen captured and slain. Lycortas was next elected Achaean praetor; and his son, the historian Polybius, carried the urn at the funeral of Philopoemen.

In this year (= "220 — 38 yrs.," Mason 40), Khanloungh succeeded by his son . . . as Burmese king.

"181 B. C." (Cass. Hemin., Plin., and Clint.), in Rome, the writings of Numa discovered; and being on "*philosophy*," publicly burned.

"The same year" (Schlegel, Bayer, and Wilson), accession of Eucratides as Greek king of Bactria. He conquered a portion of Hindustan — (Strab. xv. i. 3), a fact confirmed by the abundance of his coins, some of them bearing bilingual inscriptions, *Pali* and Greek; he is termed the "Great King" by Artemidorus.

"October" (Porphy., and Clint. iii. p. 399), in Egypt, Ptolemy V. succeeded by Ptolemy VI. Philometer. Who married his own sister Cleopatra. The hieroglyphic ovals of Ptolemy VI. occur on temples erected or continued by him at Antaeopolis, Koos, Edfu, Ombos, Philae, and Paremboleh in Nubia. His name occurs also on these temples in Greek inscriptions: and (according to Champollion-Figeac) he dedicated one or more Egyptian temples to the gods of Greece.

"179 B. C. = 1st year of Wen-ti or Hiao-wen-ti, of the Han" or Seventh dynasty (Chinese chron. table); the first Chinese emperor, who on the occasion of remarkable phenomena and public calamities demanded to be informed of his faults; and who gave orders for searching out men of merit for public employ (Pauth. p. 236).

Wen-ti also caused *money* to be coined outside of the capital, in the provinces: the coins being "all of copper, and round, with a square hole in the centre" for stringing them together (Pauth.).

"The same year" (Liv., and Clint.), death of Philip V., and the accession of Perseus, last king of Macedonia.

Asclepiades of Myrleia a "pupil of Apollonius Rhodius" (Sm. b. d.), and therefore hardly later than this date.

Cerasus chamaecerasus of the mountains of Eastern Europe and the neighbouring portion of Asia. The ΧΑΜΑΙΚΕΡΑCOC growing according to Asclepiades Myrleanus in Bithynia, — is referred here by Sprengel and others: "chamaecerasi" are mentioned by Pliny xv. 30 as growing in Macedonia, in cold situations towards the North, and the fruit dried and yielding profit to farmers; *C. chamaecerasus* is described by Jacquin rar. pl. 90, is known to grow on the Austrian Alps, and according to Persoon, is besides cultivated. Farther South, the "hamaikērasōs" was known to Athenaeus ii. 11 in Egypt.

"177 B. C. = 3d year of Wen-ti" (Chinese chron. table), beginning of the Forty-second cycle.

"In the first half of the second century B. C." (Humb. cosm. ii.), Szu-ma-thsian writing.

"In the time of the Western Han" (Topog. Cant., and Pauth. 472), arrival in China* of persons

* *Cocculus fibraurea* of Anam and Tropical China. A thick-stemmed woody climber called in Anam "cay vang dang," in China "tien sien tan" (Lour.); and from early times used medicinally and for dyeing yellow: — *C. fibraurea* was observed by Loureiro 769 in the woods of Anam and

"from Kan-tou, Lou, Hoang-tchi, and other nations of the South: the nearest about ten days journey, and the most distant about five months, their territories being large and populous (Siamese countries); and they had many productions and rare objects."

"176 B. C." (Pauth.), on application from the emperor Wen-ti, the Chou-king recited from memory by Fou-chen; having charge of Chinese literature thirty-seven years previously, at the time of the Burning of the books.

The same year (= 313 — "137 yrs." in the Vichnu purana, Burn. ii. 778), a date possibly marking the accession of Samgata, son of Dasaratha and now king at Pataliputra on the Ganges. He is called Sampada in the Avadana Asoka (Burn. introd. 430).

"175 B. C." (Clint. iii. p. 346), Seleucus IV. succeeded by Antiochus IV. Epiphanes, eighth Greek king of Syria.

"171 B. C." (Liv., and Clint.), invasion of Macedonia by the Romans, warring against king Perseus.

Hegesander of Delphi may have been at this time writing. He mentions Rhodophon of Rhodes, legate to the Romans on the occasion of the above outbreak (Polyb. xxvii. 6. 3 to xxx. 5. 4).

Astragalus glaux of the Mediterranean countries. A species of *milk-vetch*; and the ΓΛΑΥΚΙΚΟΝ according to Hegesander 35 not growing about the Hellespont — (Athen. ii. 62), may be compared: the "eugalacton" of the ancients is identified by Pliny xxvii. 58 with the "glau," described by Dioscorides as growing by the seaside, its five or six slender branches spreading on the ground a span from the root, leaves whiter beneath and resembling those of "kutisō" or "phakō," flowers "lēukōiōis" — like but smaller, purple, the plant in decoction restoring suppressed milk, and referred here by Clusius, and Sprengel: *A. glaux* was observed by Sibthorp on Cyprus, growing in the open country. Westward, the account of the "glau" by Pliny seems chiefly taken from Dioscorides: *A. glaux* was observed by Clusius hist. ii. 240 in Spain; is described also by C. Bauhin pin. 347, and Rivinus pent. irr. pl. 109.

"The same year" (Diodor., Blair, and Clint.), invasion of Egypt by Antiochus IV.; and between Pelusium and Mount Casius, the army of the youthful Ptolemy VI. defeated.

"170 B. C." (2 Maccab. v. 1, Blair, Clint. iii. p. 319, and Kitt. cycl. bibl. lit.) expulsion of the high-priest Menelaus, appointed by Antiochus IV.; the Jews being deceived by a false rumour. Returning alive from Egypt, Antiochus IV. plundered Jerusalem, and polluted the temple by sacrifices of swine.

"170–69 B. C." (Porphyr., and Clint. p. 387 and 399), Ptolemy Physcon associated with his brother Ptolemy VI. in ruling Egypt.

"168, June 21st" (Blair, and Clint.), *eclipse of the moon*. The first eclipse predicted by a Roman astronomer; by Sulpicius Gallus to the Roman army at Pydna, which on the following day defeated Perseus, bringing the Macedonian kingdom to a close. Gentius king of the Illyrians and ally of Perseus, was separately defeated and taken prisoner by the Romans.

Gentiana lutea of the high mountains of middle Europe. Called in Italy "gentiana maggiore" (Lenz), and the ΓΕΝΤΙΑΝΗ discovered by Gentius, king of the Illyrians — and growing according to Dioscorides on the loftiest mountains, the stem smooth as thick as the finger and two cubits high with leaves at intervals, mentioned also by Servilius Damocrates, Galen, and Paulus Aegineta, is referred here by writers: the "gēntianē" or "alōē gallikē" is identified in Syn. Diosc. with the "alōitis" of the Dardani (on the border of Illyria), and "gēnōus" or "kikēnthia" or "kuminalis" of the Romans: the "gentianam" is mentioned by Pliny xxv. 34 as growing chiefly in "subalpinis;" and *G. lutea* is described by Renealme spec. pl. 63, and is known to grow in and around Switzerland in Subalpine situations (Pers., A. Dec., and Lenz). Farther South, is mentioned by Serapion (Spreng.); its imported root is enumerated by Alpinus among the ingredients of the Egyptian theriac,

China, the root and lower part of the stem "resolvens deobstruens diuretica;" bitter in taste according to Lindley, and used by the Malays in intermittent fevers and liver complaints.

Commia Cochinchinensis of Anam. An Euphorbiaceous tree of medium size called in Anam "cay son gia" (Lour.); and from early times, its gum used medicinally: — *C. Cochinchinensis* was observed by Loureiro 742 wild near the seashore of Anam, its white tenacious gum emetic, purgative, deobstruent, useful in obstinate dropsy and obstructions (see also Lindley).

Muricia Cochinchinensis of Anam and Tropical China. A woody climbing Curcubitaceous plant called in Anam "cay goc" or "mouc biet tu," in China "mo pie su" (Lour.); and from early times, employed medicinally: — observed by Loureiro 732 wild in Anam and China, its berries used for tingeing food, its seeds and leaves given in obstructions of the liver and spleen, in tumours and malignant ulcers, and applied externally in prolapsus, dislocations, and fractures (see also Lindley).

and "djentiana" root was found by Forskal mat. med. imported by the way of Greece into Egypt. According to Lindley, the "gentian of the shops" is "a valuable bitter drug, employed extensively in certain forms of dyspepsia, in intermittents, and as an anthelmintic."

One hundred and twenty-fourth generation. May 1st, 167, mostly beyond youth: the Greek poet, Antipater of Sidon; the philosophers, Antipater of Tarsus, and Diodorus of Tyre; the historians, Heracleides of Oxyrynchus, and Sosicrates of Rhodes; the biographer Satyrus; the grammarians, Aristodemus of Elis, Ammonius of Alexandria, Menecrates of Nysa, and Callistratus; other Greek writers, Apollodorus, and Jason of Cyrene; A. Posthumius Albinus who wrote principally in Greek: the Latin writers, Pacuvius the tragic poet, and the three historians C. Fannius, Calpurnius Piso, and Cassius Hemina.

"The same year" (Blair), a *Library* first established in Rome; consisting of books brought from Macedonia by Paulus Aemilius.

Cleitophon of Rhodes possibly at this time writing: he mentions the betraying of Ephesus to Brennus, composed a history of the Gauls, and works on India, Italy, and the founding of cities — (Sm. b. d.).

Trichodesma Indicum of Tropical Hindustan and Burmah. The *Indian borage* is called in the environs of Bombay "chota-kulpa" (Graham); and the *КАПТЫКН* resembling according to Cleitophon the *ΒΟΥΓΛΩCCΩ*, and employed in India against jaundice — (Plut. fluv. 25. 3. and Stob. 98), may be compared: T. Indicum was observed by Gibson, and Graham, in the environs of Bombay and on the Deccan, an annual "very common in waste places during the rains;" by Roxburgh, and Drury, in various parts of the peninsula, held in repute against snake-bites, and emollient poultices made of the leaves by the natives; by Powell, in the Punjaub, used for purifying the blood and as a diuretic; and farther East, by Mason, indigenous in Burmah. Transported to Europe, is described by Plukenet alm. pl. 76 f. 3.

Trichodesma Zeylanicum of Tropical Hindustan and Ceylon. Included perhaps in the "karpukē" of Cleitophon: — T. Zeylanicum was observed by Gibson, and Lush, on the Deccan South of the Taptee (Graham); by Burmann ind. pl. 14, and Roxburgh, in other parts of Hindustan; is known to grow on Ceylon, and according to Lindley as far even as Tropical Australia. Transported to Europe, is described by Plukenet mant. pl. 335 f. 4, and is termed "borago Zeylanica" by Linnæus. The species of *Trichodesma* according to Royle are considered diuretic, and one of the cures for snake bites in India (Lindl.).

"164 B. C." (Clint. iii. p. 346), Antiochus IV. Epiphanes succeeded by Antiochus V. Eupator, ninth Greek king of Syria. A Greek inscription of this date (Sylvestre) presenting the following forms of the letters A, M.

"164-3 B. C." (Liv. and Clint. iii. p. 387), departure from Egypt of Ptolemy Physcon for Cyrene; disputing with his brother Ptolemy VI., who now set out for Rome.

"163 B. C. = 1st year of the 'heou' of Wen-ti" (Chinese chron. table). From this date, the years of the Chinese emperors are further defined by clusters, each bearing a separate name (Amyot).

The same year (H. S. in Kitt. cycl. bibl.), treaty with Antiochus V., the Jews led by Judas Macabaeus, recovering their independence. — The treaty was confirmed by the successor of Antiochus V., but the citadel of Jerusalem continued to be held by a Syrian garrison.

"162 B. C." (Polyb., and Clint. iii. p. 387), arrival of Ptolemy Physcon in Rome; seeking possession of Cyprus, and assistance against his brother.

"Sept. 27th" (C. Ptol., Blair, and Clint.), at Rhodes, the *Autumnal equinox* first observed by Hipparchus, "at sunset on the 30th Mesorë in the seventeenth year of the Third Calippic period." Recurring to a former Observation by Timochares, the star spica in Virgo was found by Hipparchus to have changed its position in reference to the Equinoctial point, though in its old place in reference to the middle of the zodiac or ecliptic; thus making known the *Precession of the equinoxes*. Besides determining the places of the stars, Hipparchus attempted to number them: — in the words of Pliny ii. 26, "ausus rem etiam Deo improbam, annumerare posteris stellas."

"The same year" (Clint. iii. p. 346, and H. S. in Kitt. cycl. bibl.), Antiochus V. put to death; and succeeded by his uncle Demetrius Soter, tenth Greek king of Syria.

"161 B. C." (Gell., Sueton., and Clint.), philosophers and rhetors excluded from Rome.

"160 B. C." (Sm. b. d.), at the funeral games of Paulus Aemilius, the Adelphi or last comedy of Terence acted, the author at this time in his "thirty-fifth" year. Terence was "born at Carthage," — and died in "B. C. 159," or according to Hieronymus in the year following.

Juncus effusus of Temperate climates. With other species called in Britain *rush*, in Old English "rash" or "rysch" or "rish," in Anglo-Saxon "risc," in Gothic "raus" (Prior), in Germany "rusch" or "binse" (Grieb), in France "jonc" (Nugent), at Constantinople "vôurla" (Forsk.): *VIRGINES-IVNCEAE* are mentioned by Terence; — "juncetum" where rushes grow, by Varro;

"vincla juncea" by Ovid; the "juncus" by Virgil, and its pith substituted for candles, by Pliny xxi. 69: "joncs" used perhaps for bedding or thatching, occur in debris of the ancient lake-villages of Switzerland (Troyon p. 44); *J. effusus* is termed "*j. lævis panicula sparsa major*" with a variety "*panicula non sparsa*" by Tournefort inst. 246; was observed by Forskal near Marseilles; and is known to grow in Barbary, Portugal, and throughout middle and Northern Europe as far as Lapland and Iceland (Desf., Brot., Hook., and Wats.). Eastward, was observed around Constantinople in both varieties by Forskal, and Sibthorp; is known to grow on Sinai (Decsne ann. sc. nat.) and on the Taurian mountains (Bieb.), also in Siberia (Wats.), and was observed by Thunberg in Japan. Farther East, was observed by Nuttall on the Arkansas, by Short in Kentucky; by myself, the glomerate variety in Nova Scotia, the usual form along the Atlantic from Lat. 45° to 39°; but by Baldwin, and Chapman, as far as 31° in Florida. In the Southern Hemisphere, is known to grow in New Zealand and Australia (R. Brown 258, A. Rich., J. D. Hook., and A. Dec.).

"159 B. C." (Blair), at Rome, measuring time by water invented by Scipio Nasica. (The *clepsydra* had long been in use in Greece, see above).

"Sept. 27th" (C. Ptol., and Clint.), "in the morning of the first day of the Epagomena, in the twentieth year of the Third Calippic period," the *Autumnal equinox* observed on Rhodes by Hipparchus.

In or about this year (Clint.), arrival in Rome of the grammarian Crates of Mallus, as ambassador from Attalus II. king of Pergamus.

"158, Sept. 27th" (C. Ptol., Blair, and Clint.), "about noon on the first day of the Epagomena, in the twenty-first year of the Third Calippic period," the *Autumnal equinox* observed on Rhodes by Hipparchus.

"156 B. C. = 1st year of King-ti or Hiao-king-ti, of the Han" or Seventh dynasty (Chinese chron. table, and Pauth. p. 240). The name "heou" continuing, included his first years.

"155 B. C." (Cic., Gell., Blair, and Clint.), arrival in Rome of the philosophers, Diogenes the Stoic, Critolaus, and Carneades, as ambassadors from Athens. The Roman Senate alarmed at the eloquence of Carneades.

"154 B. C." (Polyb., and Clint. iii. p. 387), Ptolemy Physcon again in Rome; and the assistance of the Senate again extended to him against his brother.

"153 B. C." (Liv., Cassiod., and Clint.), in Spain, war between the Romans and Celtiberians. — The Lusitani taking part against the Romans (Liv., and others).

"151 B. C." (Plut., and Clint.), return to Greece of the historian Polybius and the other Achæan exiles.

"150 B. C." (Clint. iii. p. 346 and 388), Demetrius Soter succeeded by Alexander Bala, eleventh Greek king of Syria: and the marriage of Alexander Bala with Cleopatra daughter of Ptolemy VI.

"In the middle of the Second century B. C." (Lubke and Lutrow), at Athens, building of the Tower of the winds by Andronicus Cyrhestes.

"About this time" (Amyot, and Pauth. 200), the *flattened form* of the Earth at the poles, mentioned by the Chinese philosopher Hoai-nan-tseu.

"149 B. C. = 1st year of the 'tchoung' of King-ti" (Chinese chron. table).

"In this year" (Armen. hist.), accession of Valarsace as king of Armenia. He was a brother of Arsace V. called Mithridate I. of Parthia, — and reigned until "127." He sent the historian Mar Apas Catina on a commission.

As early perhaps as this date (Avadan. Asok.), Sampadi succeeded by his son Vrihaspati, now king at Pataliputra on the Ganges. — He is mentioned in the Sama Veda adhy. 22, and called Salisuka in the Puranas (Burn. i. 430 to ii. 778).

Beef eaten by the ancient Hindus,* — as appears from the work of Arvalayana on Slaughtering cattle, and other evidence cited by Rajendralala Mitra (in Beng. asiat. soc. xli).

* *Gmelina arborea* of Tropical Hindustan and Burmah. A tree called in Nepal "gambhari," in Telinga "kasmaryamu" (J. F. Wats.) or "goomadee," in Bengalee "gumbaree," in Tamil "tagoomooda," in Hindustanee "joogani-chookur" (Drur.), in the environs of Bombay "sewun" or "she-wunee" (Graham), in Burmah "kywon-pho" male teak (Mason); in which we recognize the "kasmarya" wood used on such occasions — (Arval.), the "kasmari" or "kasmaryya" of Susrutas sutr. 44 to chik. 25, and the "gambhari" of Bhavabhuti mal. 9: *G. arborea* was observed by Rheede i. pl. 41 in Malabar; by Graham, "common throughout the Concans," its wood used by the natives for "cylinders of the drums called dholucks," also for "carriage pannels, as combining lightness with strength;" by Roxburgh, and Wight, as far as Coromandel and Oude; by Mason v. 526, indigenous in Burmah, according to McClelland affording "large remarkably strong tough timber."

Ficus infectoria of Tropical Hindustan. A tree call in Sanscrit "plucsha" (Pidd.) or "placsha,"

"The same year" (Cic., and Clint.), in Rome, the first law against bribery at elections.

"The same year" (Appian, Blair, and Clint.), commencement of the Third Punic war, between the Romans and Carthaginians. — the war continued three years.

"147, Sept. 26th" (C. Ptol., and Clint.), "at midnight on the third of the Epagomena, in the thirty-second year of the Third Calippic period," the *Autumnal equinox* observed on Rhodes by Hipparchus.

Towards the close of the reign of Ptolemy VI. (. . .), the temple at Bubastis sought and obtained by the Jews under Onias for a place of religious worship. — The spot continued in the possession of the Jews; is the "vicus Judaeorum" of the Itinerarium Antonini, and is called "Tel Jehudeh" to the present day (Leps. eg. and sin. 449).

"146 B. C." (Clint. iii. p. 34^o), Alexander Bala succeeded by Demetrius II. Nicator, twelfth Greek king of Syria. Who married his predecessor's widow, Cleopatra.

"The same year" (Schlegel journ. asiat. 1828), Eucratides slain and succeeded by his son, Eucratides II. now Greek king of Bactria.

"March 24th" (C. Ptol., and Clint.), "in the morning of the 27th of Mechir, in the thirty-second year of the Third Calippic period," the *Vernal equinox* observed on Rhodes by Hipparchus.

"Sept. 27th" (C. Ptol., and Clint.), "in the morning of the fourth of the Epagomena," the *Autumnal equinox* observed on Rhodes by Hipparchus.

"November" (Porphyr., and Clint. iii. p. 399), in Egypt, Ptolemy VI. succeeded by Ptolemy VII. Physcon. Who married his brother's widow and own sister Cleopatra; and afterwards another Cleopatra, his niece: and who appointed a Roman as one of his provincial governors. The hieroglyphic ovals of Ptolemy VII. occur on restorations in the Asasif, on the temple of Athyr at Thebes, on the small temple of Thoth built by him at Medinet-Abu, and on additions made by him to temples at Edfu, Ombos, Philæ, and Dakkeh in Nubia.

"The same year" (Clint.), capture and destruction of Carthage by the Romans under P. C. Scipio Africanus the younger. "Two months" afterwards, by the Romans under L. Mummius, Corinth captured, and the Achaean League and independence of Greece overthrown. Among the spoils of Corinth, Polybius witnessed the contempt of the Roman soldiers for works of art; playing at draughts on pictures thrown on the ground, as on the "Bacchus painted by Aristides," and the "Hercules tormented by the shirt." — To the time of Strabo, the finest and most numerous works of art in Rome, were those brought from Corinth; and he speaks in the highest terms of the "Bacchus," mentioning however that it had been recently destroyed by fire.

In the days of Polybius (Strab. iv. 6. 12), there were four passes across the Alps: First, through "Liguôn" (Liguria) along the sea: Second, "Taurinôn" (Mount Cenis to Turin) "followed by Hannibal:" Third, "Salassôn" (St. Bernard): and Fourth, "Raitôn" (St. Gothard).

145 B. C. (Campb., and Royle fibr. plants), the art of making *paper* from pulp, known to the Chinese as early at least as this date. — From China, the art was carried into Hindustan; and is supposed to have been learned by the Arabs in the "Eighth" century. By the Arabs, the art was introduced into Spain in the "Ninth or Tenth" century: and paper from pulp was first manufactured at Nuremberg in "1390," and in England in "1450."

"143 B. C. = 1st year of the 'heou' of King-ti" — (Chinese chron. table).

"The same year" (Cic., and Clint.), P. Scipio Africanus the younger, accompanied by the philosopher Panaetius, sent as ambassador to Egypt.

"September 26th" (C. Ptol., Blair, and Clint.), "about sunset on the fourth day of the Epagomena in the thirty-sixth year of the Third Calippic period," the *Autumnal equinox* observed on Rhodes by Hipparchus. "Two days later, from the new moon of September 28th," Hipparchus began his Cycle of 304 years = 111,035 days — 3760 lunations.

"The same year" (J. Nicholson in Kitt. cycl. bibl.), coined money first issued by the Maccabees. The inscriptions on these coins are the earliest examples known of *Hebrew writing*: the forms of the letters being in most instances identical with the Phœnician.

"142 B. C." (Kitt. cycl. bibl.), the Syrian garrison at Jerusalem forced to surrender and the citadel demolished by Simon. The Jews having now acquired complete independence, established in this year (Steinscheid. i. 4) the *Sanhedrim*, a Superior court of law.

or "jati" or "parcati," in Bengal "pacari" or "pacar" (W. Jones) or "pakoore" or "pakur," in Hindustanee "pakar" (J. F. Wats.), in Malabar "tsjakala" (Rheede), in which we recognize the "plaksha" leaves on which the roasted beef was served — (Arval.), and the "jati" of Susrutas: F. infectoria was observed by Rheede iii. pl. 64 in Malabar; by Graham, in the Concans; by W. Jones as. res. iv. 310, Roxburgh, Piddington, and Voight, as far as Bengal, the root yielding a red dye, and the bark of the root made into a peculiar kind of bow-string (Drur.).

As early possibly as this date (Graha Munjari tables, Puranas, and Bentr.), Subala reigning in Hindustan.

"141, Jan. 17th, Tuesday, two hours before midnight" (Blair), *eclipse of the moon*. Observed at Alexandria.

"The same year" (Blair, and Clint.), in Spain, commencement of war between the Romans and the Numantians under Viriathus. — The war continued eight years.

"140 B. C. = 'ian-youan,' 1st year of Wou-ti or Hiao-wou-ti, of the Han" or Seventh dynasty (Chinese chron. table). He abolished the law of *primogeniture* in the succession to principalities; and founded a national *library* (Pauth.).

Competent ambassadors were also sent by Wou-ti to different mercantile nations; where they were well received, and obtained "*pearls, precious stones, various curiosities, yellow gold, etc.*," since which time these articles have continued to flow into China (Topog. Cant., and Pauth. 472).*

"139 B. C." (Val. Max., and Clint.), "Chaldeans" or astrologers banished from Rome.

"138 B. C." (Clint. iii. p. 346), Demetrius II. leading an army into Persia, captured by Arsaces. The government of Syria now seized by Antiochus Sidetes, brother of Demetrius II.

"In this year" (Sm. b. d.), Attalus II. Philadelphus succeeded by his nephew Attalus III. Philometor, sixth and last king of Pergamus. Nicander dedicated his *georgica* to Attalus III. (Cic. de orat. i. 16, Suid., and Spreng.).

Nigella aristata of the Mediterranean countries. A species of *fennel-flower* called in Greece "*agriōn kuminōn*" (Fraas); in which we recognize the KYMINON: ΑΓΡΙΟΝ of Nicander ther. 710, — growing according to Dioscorides mostly in Lycia, Asiatic Galatia, and Carthagera in Spain, a span high, with leaves divided as in "*giggithiōn*," five or six round soft capitula containing chaffy fruit more acrid than in the "*ēmērōu*" kind: *N. aristata* is described by Sibthorp pl. 510; and was observed by him, and Fraas, frequent on the hills of Attica. Westward, the "*kuminōn agriōn*" is identified in Syn. Diosc. with the "*kuminōum agrēstēm*" or "*silvatikōum*" of the Romans; seeds of "*cumini silvatici*" are prescribed by Scribonius Largus 119; but the "*cuminum silvestre*" seems chiefly known to Pliny xx. 57 from its medicinal properties and the account of Dioscorides.

Nigella arvensis of the Mediterranean countries. Called in Greece "*aspērōlōllōugi*" or "*mēlanōhōrtarō*" (Forsk.); and included perhaps in the "*kuminōn agriōn*" of Nicander: — the "*kuminōn agriōn ētērōn*" of Dioscorides, resembling the "*ēmērō*" kind, and having horns arising from each flower, the contained seed like that of "*mēlanthiō*," is referred here by Valerius Cordus, and Sprengel: *N. arvensis* was observed by Forskal, and Sibthorp, from Imros and the Dardanelles to Cyprus; by Delile, on the Mediterranean border of Egypt near Alexandria. Westward, is termed "*n. arvensis cornuta*" by Tournefort inst. 258; and is known to occur in fallow ground as far as middle Europe (Pers.).

Dianthus arboreus of Greece and the Greek islands. A species of pink called in Greece "*agria garōuphala*" (Fraas); and the fragrant ΔΙΟC: ΑΝΘOC of Nicander — (Athen. xv. 31) may be compared: *D. arboreus* is termed "*caryophyllus arborescens creticus*" by Tournefort inst. 331; and was observed by Sibthorp, Chaubard, and Fraas, on the maritime rocks of the Isthmus and Greek islands. (See *D. fruticosus*.)

Hypericum barbatum of the mountains of Eastern Europe. The mountain ΥΠΕΡΙΚΟΝ mentioned as an antidote by Nicander alex. 603, — may be compared: *H. barbatum* was observed by Sibthorp on mount Athos; is known to grow also in Austria (Jacq. austr. pl. 259, Pers., and Engl. bot. pl. 1986); and according to Sprengel yields a strong-scented resinous exudation.

Scorpiurus sulcata of the Mediterranean countries. Called in Greece "*margōhōrtōn*:" the ΚΟΡΠΙΟΕΙC of Nicander alex. 145, — or "*skōrpiōēithēs*" of Dioscorides, a little few-leaved herb with "*spērmata*" resembling a scorpion's tail, applied externally against the sting of a scorpion, is referred here by Dodoens p. 71, and Sprengel: *S. sulcata* was observed by Sibthorp, and Fraas, in waste and cultivated ground from Caria and the Greek islands to the Peloponnesus. Farther South, was observed by Delile around cultivated fields in Lower Egypt. Westward, the account by Pliny xxii. 17 of the "*scorpio herba*" having few leaves with "*semen*" like a scorpion's tail,

* *Armeniaca Sinensis* of China. The "*kin-hing*" highly prized by the emperor Wou-ti of the Han — (Cibot in mem. Chin. v. . .), was perhaps the *Chinese apricot*. The apricots seen by Cibot, are described by him as of "nearly the same size, colour, form, and flavour as in France:" but among imported Chinese preserves, I have found a fruit agreeing with the apricot even to the shape of the stone, except only one or more excavated grooves on its surface, somewhat after the manner of the peach. In Japan, the "*kjoo*" or "*kara momu*," regarded as introduced from China, was seen by Kaempfer v. p. 798, and though not distinguished from *A. vulgaris* by Thunberg, is described by him as a very large tree "*arbor magna et vasta ramosissima*."

seems taken from Dioscorides: *S. sulcata* is termed "*scorpioides bupleuri folio*" by Tournefort inst. 402; was observed by Desfontaines ii. pl. 1 in Barbary (Pers.), and by Forskal near Marseilles.

Scorpiurus subvillosa of the Mediterranean countries. Possibly included with the preceding by ancient writers: — was observed by Chaubard in the Peloponnesus; and by Forskal, around Cairo in Egypt. Westward, is described by Morison ii. pl. 11; was observed by Forskal near Marseilles, and is known to occur as an exotic weed as far even as Britain (Wats., and A. Dec.).

Scorpiurus vermiculata of the Mediterranean countries. Possibly included with the preceding by ancient writers: — was observed by Sibthorp in the cultivated ground of Attica. Westward, is described by Columna ecphr. i. p. 156 (Spreng.), Morison, and Rivinus; is termed "*scorpioides siliqua crassa*" by Tournefort inst. 402, and is known to occur in various parts of Southern Europe (Pers.).

Valeriana tuberosa of the East Mediterranean countries. Called in Greece "*valērianē*" or "*muristikē*" or by the Wallachians "*agriōs sampōukōs*" (Fraas): the ΝΑΡΔΟΥ: ΘΥΛΑΚΙΤΙΔΟΣ of Nicander alex. 403. — identified in the Syn. Diosc. with the "*nēris*" or "*ōrēinē nārthōs*," growing according to Dioscorides in Cilicia and Syria and having two or more odorous roots smaller and more slender than those of asphodel, is referred here by writers: *V. tuberosa* was observed by Sibthorp, and Fraas, frequent on mountains from Cilicia to Cyprus, Crete, and the Peloponnesus. Westward, the nardum "*syriacum*" is enumerated by Pliny xii. 26 among the kinds known in Italy (apparently from the imported root): *V. tuberosa* is described by Camerarius epit. 16; is termed "*v. alpina minor*" by Tournefort inst. 132, and is known to grow in Dalmatia, Sicily, and Southeastern France (Gerard 218, and Pers.).

Ptychotis verticillata of the Mediterranean countries. The ΟΡΔΕΙΛΟΝ of Nicander ther. 841, — according to the scholiast an edible seed, may be compared: the "*tōrthulōn*" is described by Dioscorides as growing on mount Amanus in Cilicia, a little herb having a roundish shield like double seed subacrid and aromatic, and is identified in the added Synonyms with the "*tōrthulōn*" or "*sēsēli krētikōn*:" *P. verticillata* was observed by Link, and Fraas, from the Peloponnesus to Parnassus. Westward, the "*seselis cretici*" is prescribed by Julius Bassus against colic (Scribon. Larg. 121); the "*tordylion*" or "*tordylon*" is mentioned by Pliny xx. 87 to xxiv. 117 as the seed of "*seseli*" or "*silis*," or according to others an herb called "*syreon*:" *P. verticillata* is termed "*seseli verticillatum*" by Desfontaines (Bory); was observed by Tenore in Italy, and by Brotero in Portugal (Steud.).

Geropogon glaber of the Mediterranean countries. A Hieracioid annual called in Greece "*kōur-phēstōs*" (Sibth.); and the ΓΕΡΑΟΣ: ΠΩΓΩΝ of Nicander, — called in Etruria "*saxifica*," by the Romans "*petrae barba*," is referred here by Ruel ii. 138, and others: *G. glaber* is described also by Linnæus, and Jacquin hort. pl. 33; is known to grow about Nice and in Italy (Pers.); and was observed by Sibthorp, and Chaubard, from the Peloponnesus to Cyprus.

Anthemis tinctoria of the East Mediterranean countries and Uralian plains. Called on the Volga "*popafka*" (Pall.); coronary kinds of "*anthēmis*" are mentioned by Nicander fr. ii. 37: — *A. tinctoria* was observed by Sibthorp, and Chaubard, frequent in dry sandy situations in Greece; by Pallas trav. i. 95, used in dyeing on the Volga. Westward, the "*stephanomelis*" of Pliny xxvi. 84 is referred here by Fraas; *A. tinctoria* is described by Tragus 58, and Barrelier pl. 465; is termed "*buphtalmum tanacetum minoris foliis*" by Tournefort inst. 495; and is known to occur as far North as Sweden (fl. Dan. pl. 741, Pers., and Wats.), but is regarded by A. Decandolle as not indigenous in Western Europe.

Echium italicum of Europe and the adjoining portion of Asia. Called in Greece "*manōuni*:" the ΛΥΚΑΨΟΝ. ΟΡΜΕΝΟΕΝΤΑ of Nicander ther. 840, — or "*lukōpsis*" called by some "*aghōusan*" growing according to Dioscorides in the open country, the leaves lettuce-like but longer and rough, the stem upright and tall with rough branches a cubit in length bearing small purplish flowers, is referred here by writers. *E. italicum* was observed by Forskal, Sibthorp, Chaubard, and Fraas, in open situations as described by Dioscorides, and frequent from the vicinity of Constantinople to the Peloponnesus. Westward, the account of the "*lycapsos*" by Pliny xxvii. 73 seems chiefly taken from Dioscorides: *E. italicum* is described by the Bauhins, and Parkinson p. 519; is termed "*e. majus et asperius flore albo*" by Tournefort inst. 135, "*e. altissimum*" by Jacquin austr. ap. pl. 16; and is known to grow on dry hills in Pannonia, Italy, France (Pers.), and as far as the isle of Jersey, the flowers "*dilute violacei*" according to Sprengel. *E. pyramidatum* described as distinct, is known to grow in Spain, Algeria, Southern France, and Eastward as far as Asia Minor and the country South of Caucasus (Desf. i. p. 164, Lam. fl. fr., Pers., Steud., and A. Dec.).

Lithospermum purpureo-coeruleum of Europe and the adjoining portion of Asia. Called in Greece "*skulōglōssōn*," in which we recognize the ΚΥΝΟΓΛΩΚΚΟΣ of Nicander georg. . . , — stemless according to Dioscorides and prostrate on the ground in sandy places, the leaves like those of the broad-leaved plantain but smaller and downy: *L. purpureo-coeruleum* was observed by Sibthorp, and Chaubard, by no means rare in the shade of thickets in Greece. Farther South, the "*kunōglōs-*

sōs" was known to Athenaeus ix. . . in Egypt. Westward, is identified in Syn. Diosc. with the "phutōn" or "kavallatōn" or "splēniōn" or "skōlūmōs," and with the "liggōua kanis" or "liggōua kanina" of the Romans; the root of a "cynoglossos caninas imitans linguas" producing three thyrsi of seeds reputed good for tertian intermittents, and one with four thyrsi for quartan, according to Pliny xxv. 41: *L. purpureo-coeruleum* is termed "*l. minus repens latifolium*" by Tournefort inst. 137, and is known to grow in Austria and France (Jacq. austr. pl. 14, Lam. fl. fr., and Steud.; see *Cynoglossum officinale*).

Onosma stellulata of the East Mediterranean countries. Called in Greece "mēlihōrtōn" (Sibth.), in which we recognize the ΜΕΛΙΖΩΡΟΙΟ of Nicander alex. 351, — Eutecnius, and the scholiast; also the "nectaream" herb or "helenion" or "orestion" or "idaeam" or "medicam" identified by Pliny xiv. 19 with the "symphyton" and further mentioned as mixed in wine: the "sumphutōn pētraion" taken in wine according to Dioscorides, is described by him as sweet to the taste and fragrant, having a long ruddy root, "ōrganō"-like branches, "thumōu"-like capitula, slender leaves, and agglutinating recent wounds and even meat cooked with it: *O. stellulata* is described by Columna ecphr. pl. 183; is termed "symphytum echii folio angustiore radice rubra flore luteo" by Tournefort inst. 138; was observed by Sibthorp in Crete and the Peloponnesus; and by Pallas, and Bieberstein, along the Taurian mountains (Pers., and Steud.).

Anchusa tinctoria of the Mediterranean countries. Called in English gardens *alkanet*, in France "orcanette" (Prior), in Greece "vaphōrriza" (Fraas); and the ΑΓΧΟΥΡΟΙΟ : ΘΡΙΑΔΑΚΗΔΙΟC enumerated as medicinal by Nicander ther. 838, — growing according to Dioscorides in fertile soil, its root reddish and staining the skin, leaves resembling those of "thrithaki ōxuphullō" rough and prickly, and in the added Synonyms identified with the "kataghōusan" or "arhivēlliōn" or "ōnōphullōs" or "ōnōklēian," is referred here by writers: the "ōnōklēias" is mentioned also by Galen fac. simpl. v. p. 311: *A. tinctoria* was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus to Cyprus. Westward, the "aghōusa" or "kataghōusa" or "livukēn" is identified in Syn. Diosc. with the "vōuinēsath" of the Numidians; and "anchusa" root is mentioned by Pliny xxii. 23 as used for dyeing wool: *A. tinctoria* is termed "buglossum radice rubra sive anchusa vulgarior floribus cæruleis" by Tournefort inst. 134; was observed by Lenz in Italy; is known to grow in Barbary and Southern France (Pers.), and yields the alkanet dye of commerce (see *Lithospermum tinctorium*).

Celsia arcturus of Hindustan. Verbascum-like, called in Bengalee "kukshima" (Drur.); and the ΑΡΚΤΙΟΝ Nicander ther. 840, — of Dioscorides, identified with the "arktōurōn" in Syn. Diosc., Pliny xxvii. 16, Galen, and Oribasius xiv. 33, is referred here with hesitation by Honorius Bellus: *C. arcturus* was observed by him on Crete (Spreng.); by Sibthorp, along walls on Crete and Cyprus; is described by Pona bald. pl. 44, Columna ecphr. ii. pl. 82, Alpinus exot. pl. 122; and is termed "blattaria perennis cretica incana" by Tournefort inst. 148. Eastward, was observed by Law as far as Bombay, "common in the bed of almost every river," by Lush "wild about Dapooree" (Graham). "*C. Coromandeliana*," from early times employed medicinally in Hindustan, and observed by Roxburgh, Waring pharm. ind., and Drury, "on the banks of rivers and still waters" and often "a common weed in gardens," is regarded by Graham as probably not distinct.

Teucrium montanum of the mountains of Europe and the adjoining portion of Asia. The ΧΑΜΗΛΗΝ : ΠΙΤΥΝ of Nicander ther. 841 and alex. 56, — identified by the scholiast with the "ōnōgurōs" or "sithēritis" or "iōnia agria," may be compared; also the "ajuga idaeae" of the Antidote of Antipater as translated by Scribonius Largus 167: the "ētera hamaipitus" of Dioscorides, having incurred branches a cubit long, white flowers, and the odour of pine, is referred here by Sprengel: *T. montanum* was observed by Sibthorp on mountains from Delphi to Athos and the Bithynian Olympus. Westward, the account by Pliny xxiv. 20 of the kind with "cubitalibus ramis" seems taken from Dioscorides: *T. montanum* is described by Gesner hort. germ. f. 273, and Matthioli (Spreng.); is termed "*polium lavandulæ folio*" by Tournefort inst. 206; was observed by Gussone in Sicily, and is known to grow in dry mountainous situations as far as Ratisbon and Paris (Pers., and A. Dec.), but whether employed medicinally is not stated. "*T. supinum*," termed "*polium montanum repens*" by Tournefort inst. 206, and the flowers white (Pers.), is regarded by Sibthorp as not distinct. (See *Ajuga iva*).

Ajuga Chia of the East Mediterranean countries. Called in Greece "agriō livanō" (Fraas) or "livanōhōrtōn" or "thōthēkanthē" (Sibth. emend.); and possibly the ΧΑΜΑΙΠΙΤΥC of Nicander alex. 56: — the "hamaipitus tritē" of Dioscorides, a little herb having the odour of pine with slender hairy leaves and yellow flowers, is referred here by Fraas, and Lenz: the "hamaipitus" in the theriac of Andromachus corresponds to the "chamæfitos" in the Egyptian theriac copied by Alpinus, and "chamæpithys" was seen by Forskal mat. med. in the drug-shops of Egypt: *A. Chia* is termed "*c. chia lutea folio trifido flore magno*" by Tournefort cor. 14; was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Asia Minor and throughout the Greek islands. Westward,

the "chamaepitys" is prescribed by Celsus v. 5; is called in Latin according to Pliny xxiv. 20 "thus terrae" or "abiga;" and the "abiga" of the Italians or "ibiga" is mentioned by Apuleius Barbarus 27 (Rhod. lex. Scribon.).

Origanum onites of the East Mediterranean countries. Called in Greece "rigani" (Sibth.), and the ΟΝΟΥ: ΠΕΤΑΛΕΙΟΝ: ΟΡΕΙΓΑΝΟΝ of Nicander ther. 628 or ONITIC of alex. 56, having according to Dioscorides the leaves whiter and more "ussöpö"-like, and the seed as if in cohering incumbent corymbs, is referred here by Matthioli, and Sibthorp: O. onites is termed "majorana cretica origani folio villosa satüreia odore corymbis majoribus albis" by Tournefort cor. 13, and was observed by Sibthorp in Southern Greece and on the surrounding islands. Farther West, the medicinal use of the "onitin" is mentioned by Pliny xx. 67 and 69; and O. onites is known to grow in Sicily (Bocc. ii. pl. 38, Pers., and Spreng.).

Daphne alpina of the mountains of middle and Southern Europe and adjoining portion of Asia. Called in Italy "olivella" (Lenz), and the ΧΑΜΕΛΑΙΑ of Nicander al. 48, — described by Dioscorides as a shrub with branches a span long, crowded olive-like but more slender leaves, bitter, biting the tongue and purgative, mentioned also by Oribasius, and Alexander Trallianus, may be compared: the "knithiön kökkön" according to Dioscorides was by some supposed to be the fruit of the "hamēlaia," and the "kökkön knithiön lēptōn" is mentioned by Oribasius excerpt. 52 (Daremb.): D. alpina was observed by Sibthorp on Parnassus, the Bithynian Olympus, and the mountains of Crete; by Pallas pl. 35, on the Altaian mountains. Westward, the "hamēlaia" or "aknestōs" or "hamēlaian mēlainan" or "ēraklēiōn" or "vthēluran" is identified in Syn. Diosc. with the "ōlēas-tēllōum" or "ōleagō" or "kitōkakiōum" of the Romans: the drug euphorbium was supposed by Niger to be procured from the "hamēlaia" in Italy (Diosc. i. præf.), and an inferior kind from the "chamelaea" in Gaul is mentioned by Pliny xxv. 38; the "chamaelea" is further described by Pliny xv. 7 and xxiv. 72 as a shrub not more than a span high growing in stony places: D. alpina is described by Plukenet alm. pl. 229, is termed "th. alpina folio utrinque incano flore albo" by Tournefort inst. 594, and is known to grow on the mountains of Italy and Switzerland (Pers., and Lenz).

Chenopodium (Ambrina) botrys of the Mediterranean countries. Called in Italy "botri" (Lenz); in which we recognize the "vōtrus" identified by Dioscorides with the "artēmisian" or "amvrōsian" of the Cappadocians, the ΑΜΒΡΟCΙΟΝ of Nicander fragm., — and further described as growing in ravines formed by torrents, a yellow herb having many branches, "kihōriō"-like leaves, seeds all around the branches, and the whole so fragrant as to be placed among clothing: C. botrys was observed by Sibthorp, Chaubard, and Fraas, on the banks of rills from the Peloponnesus to Smyrna in Asia Minor; and by Gmelin on the Yaic river in Siberia. Farther South, was observed by Forskal on the upper portion of the mountains of Tropical Arabia and called "schokr el homar." Westward, the account of the "botrys" by Pliny xxvii. 31 seems taken from Dioscorides: C. botrys is described by Tragus f. 335 (Spreng.), and Dodoens pempt. 34; is termed "ch. ambrosioides folio sinuato" by Tournefort inst. 506; and is known to grow in sandy situations in Italy and other parts of Southern Europe (Pers., and Lenz). By European colonists, was carried to Northeast America, where it has become a weed in gardens and waste ground in our Middle States, was observed by Elliott at Columbia in upper Carolina, by Short in Kentucky, and by Nuttall to all appearance indigenous along the Mississippi and Missouri. "The whole plant" according to Lindley "is powerfully and agreeably fragrant," is reported "to be a valuable expectorant."

Urtica urens of Europe and the adjoining portion of Asia. A smaller kind of *nettle* called in Italy "ortica" (Lenz), in Greece "tziknitha" or "agria tziknitha" (Fraas), in Egypt "zaghlyleh" (Del.); and the ΚΑΤΑΚΝΙΔΗ: ΧΑΜΗΛΗ of Nicander ther., — and "akaluphē ētēra" of Dioscorides "lēptospermōs" and not so rough, are referred here by Fraas: U. urens was observed by Sibthorp, Chaubard, and Fraas, frequent in waste places from the Peloponnesus to Constantinople; is known to occur also in Siberia (Wats.); was observed by Delile as far as Cairo; and was received from Abyssinia by Richard (A. Dec.). Westward, the "akaluphē ētēra" is identified in Syn. Diosc. with the "ōurtika mōllis" of the Romans; and the "urtica silvestris" called "feminam" is described as "mitior" by Pliny xxi. 55: U. urens is described by Brunfels, and Tragus (Spreng.); is termed "u. urens minor" by Tournefort inst. 535; was observed by Lenz frequent in Italy; and is known to occur in waste and cultivated ground throughout middle and Northern Europe as far as Lapland (fl. Dan. pl. 739, Pers., Fries, and Wats.). By European colonists, was carried to Northeast America, where it continues about dwellings in our Atlantic and even our Southern States (Chapm.), observed also by Nuttall on the Arkansas; to Buenos Ayres in Austral America (Commers., and Pers.); to Austral Africa, the Mauritius Islands, and New Zealand (Drège, Boj., and Raoul); and perhaps to the Hawaiian Islands, for a species seemingly wild there appeared to me identical. "U. membranacea" of Poiret, known to occur in Portugal, Spain, Barbary, and Egypt (Brot., Desf., and Pers.), observed by Chaubard, and Fraas, in Greece, by Forskal at Barah in Yemen, is regarded by Chaubard as perhaps not distinct.

Scolopendrium officinarum of Northern Climates. Called in Italy "lingua cervina" or "fillitide" (Lenz), in which we recognize the "phullitis" of Dioscorides, perhaps the ΠΕΤΑΛΙΤΙΣ of Nicander ther. 864: — the "phullitis" is described by Dioscorides as growing in gardens and shaded places, stemless and having neither flower nor fruit, six or seven leaves resembling those of dock but longer and more verdant, upright, smooth in front with something like distant slender worms behind; and is identified in the added Synonyms with the "phullis" or "akaulôn" or "lapathôn agriôn." *S. officinarum* was observed by Forskal growing in the streets of Constantinople, and by Sibthorp, and Fraas, in mountain defiles and shaded situations in Greece, and called at present "glössa." Westward, according to Cremutius, a tree on which the "phyllis" suspends itself never flourishes (Plin. xvi. 45); *S. officinarum* is described by Matthioli p. 606 (Spreng.), and is known to grow in Italy and throughout middle Europe as far as Britain (Curt. lond. i. pl. 67). Farther West, was discovered by Pursh in 1807 in North America, on limestone rocks at Onondaga South of Lake Ontario.

Agaricus campestris of Northern climates. Called in Greece "manitari," in which we recognize the ΜΥΚΗΤΑΣ: ΑΜΑΝΙΤΑΣ of Nicander, — Athenaeus ii. 56, and Galen fac. alim. ii. p. 655: *A. campestris* was observed by Sibthorp around Athens. Westward, is called in Italy "pratajolo" or "pratolino" (Lenz), in which we recognize the "pratensibus optima fungis" of Horace satir. ii. iv. 20; is described by Tournefort inst. 556, and is known to grow throughout middle Europe (Schaeff. i. pl. 33, and Sowerb. pl. 305). Farther West, is frequent in North America in grass-grown clearings and around dwellings, seems as yet almost our only *edible mushroom*, is sometimes artificially multiplied, and the spores if not originally brought from Europe have doubtless in some instances been imported.

"135, March 23d" (C. Ptol., Blair, and Clint.), "a little after midnight on the 29th of Mechir, in the forty-third year of the Third Calippic period," the *Vernal equinox* observed on Rhodes by Hipparchus.

"134 B. C. = 1st year of the 'youan-kouang' of Wou-ti" (Chinese chron. table). "In the reign of Wou-ti" (Gaubil), books written in the obsolete Chinese character, including a copy of the Chou-king, discovered in the ruins of the family mansion of Confucius. The copy was written on *bamboo*, and was certainly not less than a century old.

"The same year" (Liv., and Clint.), commencement in Sicily of the Servile war. — The war continued two years.

One hundred and twenty-fifth generation. Sept. 1st, 134, mostly beyond youth: the Syrian writer Maribas: the Greek philosophers, Cleitomachus, Apollodorus the Epicurean, and Hecaton the Stoic; the historians, Dionysius Scytobrachion; the grammarian Herodicus of Babylon: the Latin writers, Sextus Turpilius the dramatist, L. Attius the tragic dramatist, the two historians Coelius Antipater and P. Sempromius Asellio, M. Antonius the orator, and M. Aemilius Scaurus statesman and orator.

The same year (= 103 y 2 mo. + "29 years" of Abyss. chron., and M. Russel p. 99 and 109), accession of Menilec as king of Abyssinia. As he is termed "son of Solomon," was accompanied by "the twelve doctors of the law that form the right-hand bench in judgment," and by an officer carrying "the Ten commandments and holy water," this may mark the commencement of Jewish ascendancy in Abyssinia.

"133 B. C." (Liv., Blair, and Clint.), Numantia captured and destroyed by P. C. Scipio Africanus the younger. And in Asia Minor, the kingdom of Pergamus bequeathed by Attalus III. to the Romans.

"The same year" (Clint. iii. p. 331), after nearly a year's siege, Jerusalem captured by Antiochus Sidetes, the usurping king of Syria.

"130 B. C." (Diodor., Liv., and Clint. iii. p. 389), Ptolemy VII. of Egypt, on account of his cruelties, compelled by popular indignation to take refuge in Cyprus.

"In or about this year" (Percev. i. 183), birth of Adnan, twenty-first progenitor of Mohammed, and the earliest descendant of Ishmael — known to the Arabs.

"129 B. C." (Clint. iii. p. 346), return of Demetrius II. from captivity among the Persians.

"128 B. C. = 1st year of the 'youa-choua' of Wou-ti" — (Chinese chron. table).

"March 22d" (C. Ptol., Blair, and Clint.), "about sunset on the 1st of Phamenoth, in the fiftieth year of the Third Calippic period," the *Vernal equinox* observed on Rhodes by Hipparchus. Afterwards, the star Cor-leonis was observed by him to be "29° 50' from the Summer solstitial colure."

"127, May 2d" = "35 years" after his first Astronomical observation (C. Ptol., and Clint.), an Observation made on Rhodes by Hipparchus. And on "July 7th," another Observation.

About this time (Thaalebi, and Percev. i. 61), Dhau-Sadad succeeded by Harith-Eraich, of the "sixteenth" generation from Himyar, and now first tobba of reunited Yemen. The new dynasty is distinguished as the "Himyarite Dynasty." — Homerites are first mentioned in the expedition of Aelius Gallus into Arabia (Strab.) "B. C. 24."

"126 B. C." (Wilford as. res. ix. p. 40), the Chinese general Tchang-kiao sent by the emperor Wou-ti to visit the Western countries, as Khorasan and Meru-al-nahar. Hearing of India, — he proceeded there also, and returned to China "in 115."

As early perhaps as this year, the Sanscrit medical writer Charaka. He preceded — Dhanvantari, according to the Vishnu purana iv. 8 (H. H. Wils., and Royle antiq. hind. med. 63).

Emblia officinalis of Tropical Eastern Asia. Imported *emblic myrobalans* are called in Arabic "amlaj" (. . .), and the tree producing them in Hindustanee "amlaka" or "arooli" or "aoongra," in Bengalee "amla," in Telinga "assereki," in Tamil "nelle kai" (Drur.), in the environs of Bombay "awla" or "aunlee" (Graham), in Burmah "hzee-phyu" (Mason); in which we recognize the "amvlæg" of Chariton (Charaka), — and Zosimus Panopolitanus, the "empelilez" of Actuarius; the "emblicis" of "Xarcha indus" or "Scarac indus" mentioned by Rhazes, Serapion, Avicenna (Royle), and the "amlaj" of Rhazes, and Mesue: importation of myrobalans by the way of Aden is mentioned by Edrisi; and the medicinal use of emblic myrobalans was witnessed by Alpinus iv. 13 in Egypt, and by C. Bauhin pin. 445 in Europe. Eastward, "amalaka" fruit is mentioned in the Avadana Asoka (Burn. i. 426); "amluka" fruit by Valmiki ram. i. 4; and the "an-mo-lo-ko" or "o-mo-lo-kia" seen by the Chinese traveller Hiouen-Tsang in Hindustan, is referred here by Stanislas Julien: *E. officinalis* is described by Rumphius vii. pl. 1; was observed by Rheede i. pl. 38 in Malabar; by Graham, "in gardens" and "wild throughout both the Concans and Deccan," its fruit "eaten by the natives;" by Ainslie, Roxburgh, Wight, and Drury, as far as Travancore and Bengal, its strongly astringent bark used both medicinally and for tanning; by Mason v. 458. "very abundant in the jungles from Mergui to Toungo" and "bearing an intensely sour plum:" by Bontius, wild on Java. By European colonists, was carried to the Mauritius Islands, where it continues under cultivation (Boj.).

Terminalia belerica of Tropical Hindustan and Burmah. Imported *belleric myrobalans* are called in Arabic "be-ley-ley," in Persian "be-ley-leh," and the tree producing them in Bengalee "buhira," in Sanscrit "vibhituka" (Lindl.), in Tamil "tani-kai," in Telinga "tadi" or "toandee" (Drur.), in the environs of Bombay "buhira" or "bherda" (Graham), in Burmah "ban-kha" (Mason); in which we recognize the "vëlilæg" of Chariton (Charaka), — Zosimus Panopolitanus, and the "belliricis" of "Xarcha indus" mentioned by Serapion, and Mesue (Royle antiq. hind. med.): *T. belerica* was observed by Rheede iv. pl. 10 in Malabar; by Graham, "a very large tree" "common along the foot of the Ghauts" as far as Bombay; by Buchanan, Ainslie, Roxburgh, Royle, Wight, and Drury, as far as Mysore and Bengal, its nuts used medicinally, the kernel "said to intoxicate if eaten in any great quantity, and its timber white and durable;" by Mason v. 491, in Burmah, "indigenous but not very abundant," its fruit "dried and sold among the drugs." By European colonists, was carried to the Mauritius Islands, where it continues under cultivation (Boj.).

Terminalia chebula of Tropical Hindustan and Burmah. A large tree called in the environs of Bombay "heerda" (Graham), in Telinga "kadukar," in Hindustanee "hur" or "harua," in Sanscrit "haritaka" (Lindl.); and probably included in the account of myrobalans by Charaka — quoted by Serapion, and Mesue: the three kinds, black, yellow, and chebolic, compose a medicine called in Sanscrit "tirphala" (Shakesp. dict.), in which we recognize the "tryphala" or "tryphera parva" of Actuarius. Eastward, the "triphala" is mentioned in the Amara-cosha, and by Susrutas (see Royle antiq. hind. med. 36, and Balanites Aegyptiaca): *T. chebula* was observed by Graham, "pretty common" at Mahableshwur and "all along the Ghauts," its fruit yielding blacking for harness makers; by Retz v. 31, Roxburgh, and Wight, as far as Bengal, the galls powerfully astringent, fit for making ink, and yield the best and most durable yellow of the chintz painters on the coast of Coromandel; by Mason v. 509 indigenous but "not very abundant" throughout Burmah, its fruit furnishing "all the native ink," some of which "in the course of a dozen years" has been found to fade.

"125 B. C." (Clint. iii. p. 346), Demetrius II. slain by his wife Cleopatra; and succeeded by Antiochus VI. Grypus, thirteenth Greek king of Syria.

"The same year" (Chinese hist., and Schlegel journ. asiat. 1828), the Greco-Bactrian kingdom overthrown by the Tartars and Scythians or Saca.*

The Buddhist hymns of the Lalita vistara probably adopted at the Council under Canishca, Tartar king of Cashmere — (Burnouf, and Foucaux). The first translation into Chinese was made about 76 A. D. (bibl. or. ii. p. 37).

* *Ficus excelsa* of Tropical Hindustan. Called in Malabar "attimeraloo" (Drur.); and a tree "traditionally reported to be two thousand years old" — growing twenty miles Southeast of Cochin, "fifty feet in circumference" when seen by Rheede iii. pl. 58: *F. excelsa* was observed by Graham in the environs of Bombay, "a tree with alternate bifarious leaves" and "fruit size of a gooseberry;" by Roxburgh, and Wight, in other parts of Hindustan, the root in decoction powerfully aperient in visceral obstructions.

Carissa carandas of Tropical Hindustan. A thorny shrub called in Sanscrit "avigna" or "avinga" or "crishnapacap'hala" or "sushenas" or "caramardaca" (W. Jones), in Tamil "kalapa" (Drur.), in Telinga "wakay," in Bengalee "kurumchee," in Hindustanee "kurunda" (Drur.), in the environs of Bombay "corinda" (Graham), in which we recognize the "kourounda" flowers presented to a Buddhist in the Lalita vistara 6:—*C. carandas* is described by Rumphius vii. pl. 25; was observed by Graham very common "throughout the Concans and on the Ghauts," its fruit "sold in the bazars" and "has somewhat the taste of the blueberry;" by myself, wild on the Ghauts; by Roxburgh, Wight, and Drury, as far as Coromandel, common everywhere, the berries universally eaten by the natives, black when ripe, when scarcely so employed to make tarts preserves and pickles. Farther East, was observed by Mason v. 455 "exotic" in Burmah, cultivated by European residents for the "berries, which taste when stewed like currants" and are called *Bengal currants*.

"124 B. C." (Liv., and Sm. b. d.), C. Cassius Longinus and C. Sextius Calvinus consuls for this year: a Roman army at the request of the people of Massilia (Marseilles), having been sent against the Salyes, a neighbouring Ligurian tribe; Calvinus completed the subjugation of the Salyes,—whom he sold in the following year, their king Teutomal with other chiefs taking refuge among the Allobroges, a people higher up the Rhone. The Romans thus acquiring foothold in France.

Myriophyllum spicatum of Northern climates. Called in Britain *water milfoil*, in which we recognize the "millêphôliôum" of the Romans identified in Syn. Diosc. with the "vêliôukanthas" of the Gauls,—and "muriôphullôn" of the Greeks; growing in wet places according to Dioscorides, its stem single and tender, surrounded with numerous "marathrô"-like leaves whence the name, and referred here by writers: *M. spicatum* was observed by Sibthorp frequent in Greece. Westward, the "muriôphullôn" or "mullôphullôn" or "stratiôtikê" or "ahillêôs" is further identified in the Syn. Diosc. with the "sôupêrkiliôum vênêris" of the Romans; by Pliny xxiv. 95 with the "millefolium" growing "in palustribus" and "magnifici usus ad vulnera," but his account seems chiefly taken from Dioscorides; *M. spicatum* is described by Matthioli p. 812: is termed "potamogeton foliis pennatis" by Tournefort inst. 233; and is known to grow in Italy, Sicily, Sardinia, Algeria, the Canary Islands, and throughout Europe as far as Lapland, the Orkney Islands, and Iceland (Hook., Desf., Guss., Moris, Webb, Fries, Wats., A. Dec., and Lenz). Eastward from Greece, is known to grow throughout Siberia as far as the Angara and Lake Baikal (Gmel., and Ledeb.): and farther East, from Bear Lake in North America and "Lat. 54°" to Arkansas and Lat. 41° on the Atlantic (Drumm., Nutt., Pursh, and myself).

Sambucus ebulus of Europe and the adjoining portion of Asia. Called in Britain *dwarf elder* or *wale-wort* or *dane-wort* (Prior), in France "hièble" (Nugent), in Germany "zwerg-holunder," in Italy "ebbio" or "sambuco erbale" (Lenz), in Greece "vôuzia" (Sibth.): the "ôlma" of the Dacians or "thôukônê of the Gauls—is identified in Syn. Diosc. with the "agria aktê" or "êlêiôs" or "êuvoikê" Euboean kind, or the "hamaiaiktê" described by Dioscorides as humble and more herbaceous with the same medicinal properties: is further identified with the "êvôulôum" of the Romans; and the "ebulus" is mentioned by Virgil ecl. x. 27, Columella, and Pliny xxvi. 49 to 73: *S. ebulus* is described in *Ortus Sanitatis* 95, also by Brunswyck ii. 20, and Parkinson th. 208 (Prior); is termed "s. humilis" by Tournefort inst. 606; was observed by Forskal, Sibthorp, Bory, and Fraas, in hedges and mountain thickets from the Peloponnesus to Smyrna and Constantinople; by Lenz, frequent in Italy: is known to grow also in Barbary (Pers.) and throughout middle Europe, occurring in waste and cultivated ground as far as Sweden (Linn., Wahl., and A. Dec.). The "roots cathartic" (Lindl.).

Nepeta glechoma of Europe and Northern Asia. Called in Britain *ground ivy* or *gill* or *haymaids* or *heyhowe* or *tunhoof* or *ale-hoof* (Prior), in Greece "kussôs:" the "halus" of the Gauls* or "coto-neam" of the Veneti,—mentioned by Pliny xxvi. 26 as "medetur lateri" and resembling "cunilae bubulae" or in the tops "thymo," sweet and alleviating thirst, "radicis alibi albae alibi nigrae,"—may be compared: "earth ifg" is mentioned in the Anglo-Saxon translation of Apul. 100; "hey howe" in the ballad of the Frere and the boye 50; and "edera terrestris" in the *Ortus sanitatis* pl. 163: *N. glechoma* is described by Brunfels i. p. 167 (Spreng.); is termed "calamintha humilior folio rotundiore" by Tournefort inst. 194; and is known to occur in waste places and along hedges throughout middle Europe (Scop., and Pers.). Eastward, was observed by Sibthorp from the Bithynian Olympus to the Peloponnesus; by Thunberg, along the margin of fields in Japan. By European colonists, was carried to Northeast America, where it continues in shady situations around dwellings in our Northern and Middle States. Used according to Prior "in fermenting beer;" and according to Lindley, "a favourite herb with country people for making a tea against pectoral and other complaints."

* *Erysimum cheiranthoides* of Northern Europe, Asia, and America. Called in France "velar" (Batard), in which we recognize the "velam" of the Gauls—mentioned by Pliny xxii. 75: *E. chei-*

123 B. C. = "24th year of Ptolemy VII.," inscribed at Philæ (Glid. analect.). A petition from the priests at Philæ addressed in Greek to Ptolemy VII. — is extant. Affording the means of verifying hieroglyphic interpretations derived from the Rosetta Stone.

Hardly later than this date (Agatharch. 85), Ariston sent by Ptolemy to examine Arabia along the sea. Beginning at the head of the Laeanitic Gulf, which he consecrated to Poseidon or Neptune, there was here a tract abounding in palms, and a very ancient stone altar inscribed with unknown letters (*Sinaitic*), under the charge of a man and woman who were obliged to take shelter at night in the tree-tops. — Posidium on the Aelanitic Gulf is mentioned by Artemidorus (Strab. xvi. 4. 18).

Beyond the Gulf were the Nabatean Arabs, and along the coast three islands, one of them consecrated to Isis and having remains of ancient stone buildings and columns inscribed with barbaric letters (*Sinaitic*).

The "Thamōuthēnōn" Arabs are also mentioned — (Agatharch. 92). They dwelt in caves or rock-excavations along the Northern border, and continued known to the Greeks and Romans in the days of Diodorus Siculus, Pliny vi. 28, Claudius Ptolemy, and as late as "425 to 453 A. D." (Steph. Byz., and Percev. i. 25); but the tribe of Thamud disappeared before the time of Mohammed kor.

The "thrakōntia mikra" penetrating among the muscles of the inhabitants along the Red Sea — (Agatharch. quoted by Plutarch qu. conv. viii. 9. 16), are clearly the *Guinea worm*, *Filaria Medinensis*. The affliction is mentioned by Niebuhr?, and I found it continuing to the present day.

Elaeagnus Orientalis of Arabia. Called in the gardens of Egypt "negdeh" (Del.); and the "ēlaiais" growing on the above-mentioned islands but differing from ours — (Agatharch. 91), or "ēlaiais aiithiōpikas" yielding a "thakruon" according to Artemidorus (Strab. xvi. 4. 18), and Dioscorides i. 136, is referred here by Sprengel: the "zakkum," mentioned by Mohammed kor. xxxvii. 60, very efficacious according to the Arabs against contusions and wounds (Maundrell, and Mariti), and offered to pilgrims on approaching Jericho, is according to Royle an oil obtained from the "olive-shaped nut" within the fruit of an *Elaeagnus* (Kitt. bibl. cycl. ii. 898): *E. Orientalis* was observed by Delile in the gardens of Egypt, according to Clot-Bey long known there: and as appears from Bieberstein (Steud.), is also cultivated in the Tauro-Caspian countries. (See *E. angustifolia*, and *Balanites Aegyptiaca*).

Lotus Forskali of the mountains of Tropical Arabia. The "lōtōn anthrōmēkē" supplying feed for cattle on the plain next to the Nabateans — (Agatharch. 89), may be compared: *L. Forskali*, decumbent, trifoliate, yellow-flowered, and differing from *Lathyrus* in the absence of tendrils, was observed by Forskal p. 140 on the middle mountain-region of Tropical Arabia; and "*Lathyrus terniflorus*" p. xcvi is enumerated by him as affording feed for camels, bullocks, sheep, and goats. Another species, *Lotus fruticosa*, was observed by Forskal near Musa, but no description is given.

Urtica heterophylla of Tropical Asia from Arabia to Burmah. An annual plant called in Yemen ironically "schadjaret el mehabbe" love-plant (Forsk.); and the "pōa allē" very pleasant to the eyes but its virtue transient, growing in the country of the Sabaeans — (Agatharch. 97), mentioned also by Artemidorus, may be compared: *U. heterophylla* was observed by Forskal p. 159 on the middle mountain-region of Yemen. Eastward, by Rheede ii. pl. 41 on mountains in Malabar; by Nimmo, and Graham, "in various parts S. Concan;" by Roxburgh, in other parts of Hindustan; by Mason, indigenous in Burmah, and called "bet-ya." The pain of the sting according to Lindley is "very severe, but not permanent."

Balsamodendron kafal of Tropical Arabia. A tree called there "kafal" (Forsk.); and the

ranthoides is described by Gerarde p. 213; and though a weed in cultivated ground, is regarded by A. Decandolle as indigenous in middle and Northern Europe (see also Jacq. austr. pl. 17, and Pers.). Eastward, has not been observed in Greece; but is known to grow throughout Northern Asia as far as Kamtschatka (Ledeb.), also in the neighbouring portion of America, and in Canada (Torr.), and is regarded by A. Gray as indigenous in Illinois, Pennsylvania, and New York.

Lycopodium selago of Subarctic climates and mountain-summits farther South. The "selago" regarded by the druids of Gaul as preventive against everything deadly, the smoke curing all maladies of the eyes, — further described by Pliny xxiv. 62 as resembling "herbae sabinæ," may be compared: *L. selago*, according to Lindley, is used medicinally by the highlanders of Scotland, taken internally and the ointment applied "to the neighbourhood of the eyes as a counter irritant;" and in Sweden, according to Linnæus, the decoction is used as a detergent lotion, and for destroying vermin on swine and other animals. The plant is known to grow throughout Northern and on the mountains of middle Europe (Engl. bot. pl. 233, and Lindl.); also in Iceland; and in North America from the Arctic sea to Lat. 54° (Hook.), and farther South on the Rocky mountains (Drumm.), and on the White mountains of New England.

"larimnan" fruit brought by the Sabaeans, exceedingly fragrant and said to possess medicinal properties — (Agatharch. 101), mentioned also by Artemidorus, may be compared: B. kafal was observed by Forskal p. 80 along the mountains of Yemen, its seeds and berries extremely fragrant, the pulp when wounded distilling balsam, the gum of the tree purgative, and the wood exported to Egypt to impregnate drinking-vessels with the smoke: at Mocha, I found water for drinking sometimes fumigated, a decided improvement where the water is brackish. Westward, a tree observed by Adanson in Senegal on the border of the Desert, is regarded by Lamarck as perhaps identical. Farther North, the "thurea virga" was known to Virgil geor. ii. 117; and specimens were brought by Arabian envoys to Rome in the days of Pliny xii. 31; the *frankincense-wood* occasionally imported into America, may also be compared.

"The same year" (Liv., Blair, and Clint.), Roman expedition under Metellus against the Balearic Islanders, "on account of their piracies;" or more probably, from these islands "settled by Phœnicians" having been in alliance with Carthage. According to Strabo iii. 5. 1, the fault of a very few individuals found in company with pirates was extended to a whole community devoted to peaceful pursuits: new cities were however built, and a colony left behind of "three thousand Romans from Spain."

"The same year" (Eutrop., Blair, and Clint.), by order of the Roman Senate, Carthage rebuilt, or rather a colony founded on its site.

"122 B. C. = 1st year of the 'youan-cheou' of Wou-ti" — (Chinese chron. table).

"In this year" (Yule cath. i. p. lxvi), return of the Chinese traveller Changkian from Bactriana.

Licualia acutifida of the Siamese countries. A small palm called in Burmah "sha-zoung," furnishing the *Penang lawyers* of commerce (Mason); possibly the walking-sticks seen by Changkian in Bactriana, brought by the way of Shintu (Hindustan) and recognized by him as like those grown in the mountains of Kiongshan — (Yule i. p. lxvi): *L. acutifida* is mentioned also by Royle fibr., and Drury; and is enumerated by Mason as indigenous in Burmah.

"The same year" (Liv., and Clint.), by C. Sextius Calvinus now proconsul, Aquæ Sextiæ (Aix in Provence) founded; the first settlement of the Romans beyond the Alps.

"120 B. C." (Appian, and Sm. b. d.), Mithridates V. succeeded by his son Mithridates VI. Eupator, now at the age of "eleven" years king of Pontus.

"118 B. C." (Vell., Blair, and Clint.), by the Roman consul Q. Marcius, a colony established at Narbonne in France.

Philadelphus coronarius of Central Asia. An ornamental shrub called in gardens *syringa* or *mock orange*; and the ΦΙΛΑΔΕΛΦΟΝ of Apollodorus of Artemita, used in Parthia for hedges or living fences — (Athen. xv. 29), is referred here by Bauhin and others: *P. coronarius* is termed "syringa" by Dodoens . . ; is described also by Lobel hist., Dalechamp 355, Cæsalpinus, and Clusius hist. i. 55; was observed by Lenz seemingly wild in Italy; is known to occur along hedges in other parts of Southern Europe, is besides cultivated for its fragrant flowers, one variety having numerous petals (Pers.). By European colonists, was carried to Northeast America, where it continues frequent in gardens.

"In this year" (Burm. hist., and Mason 40), accession of Therereet, great grand-son of Khanloun, as Burmese king; a good and learned man, in whose reign religion and the arts flourished. His six distinguished teachers wrote on history and mathematics, and taught religion.

"The same year" (Raja Tarangini, and Prinsep i. 40), in Cashmere, end of the reign of Abhimanya, successor of Canishca.

"D'hanvantari is named in the "slokæ" of the Ayurvedas, medical stanzas demonstrated by him * — (Susrut. sutr. 1 to sar. 4); is mentioned also by Valmiki ram. ii. 40, and in the Vishnu purana iv. 8.

* *Cissampelos hexandra* of Eastern Hindustan. The "sank'hini" or "sreyasi" prescribed in the stanzas of the Ayurvedas — (Susrut. sar. 2 to kalp. 3), is referred here by Hessler: *C. hexandra* was observed by Roxburgh in Hindustan, is described also by Fischer (Steud.).

Xylocarpus granatum of Tropical shores from Ceylon to Tongatabu. A submarine tree called in Sanscrit "puroosha," in Bengalee "puroosha" or "puroos" or "pussoor" (J. F. Wats.), in Cingalese "kadul-gaha," in Tamil "kandalanga" (Lindl.), in Burmah "pen-lai-ung" (Mason), in Tagalo "calumpang sa lai" or "nigui" or "tabigui," in Pampango "migui" (Blanco); in which we recognize the "parusha" of the stanzas of the Ayurvedas — (Susrut. sar. 2): *X. granatum* was observed by Koenig, Roxburgh, and Wight, as far as the mouths of the Ganges (Drur.); by Mason v. 494 to 539, in Burmah, "common in the mangrove swamps" the falling fruit floating out upon the sea, "exceedingly astringent and regarded by the natives as a specific in cholera;" the bark and other parts, according to Drury by the Malays; is described by Rumphius iii. pl. 61; was observed by Blanco on the Philippines; by myself, along the seashore of the Feejeean Islands and as far as Tongatabu.

Acacia catechu of Tropical Hindustan and Burmah. A thorny tree, thirty to forty feet high, called in Sanscrit "khadira," in Bengalee "khira" (Lindl.), in Telinga "khadirama" or "podali-manu," in Tamil "vodalai" or "vodalam" (Drur.), in the environs of Bombay "khadera" or "kair" (Graham),

Leea hirta of Eastern Hindustan. Called in Sanscrit "paravatu-pudee" (Roxb.); in which we recognize the "paravatapadi" of the stanzas of the Ayurvedas — (Susrut. v. 3): *L. hirta* is described by Hornemann (Steud.); was observed by Roxburgh ii. 469 in Eastern Hindustan (J. F. Wats.).

Rhynchostia rufescens of Southern Hindustan. Called in Telinga "chiri-ulava" (W. Ell.); and the "chiravilva" of the stanzas of the Ayurvedas — (Susrut. iv. 5), may be compared: *R. rufescens* was observed by W. Elliot 43 in the Telugu districts of the Northern Circars (J. F. Wats.).

Acacia ferruginea of Southern Hindustan. A small tree called in Sanscrit "kadeera" (Ainsl.), in Tamil "shimai-velvel," in Telinga "anasandra" or "vuni" (Drur.) or "woanee" (Lindl.); and the "k'hadira" of the stanzas of the Ayurvedas — (Susrut. sar. 2 to chik. 6), is referred here by Hessler. *A. ferruginea* was observed by Roxburgh, and Wight, from Courtallum and the Circars to Coromandel, its very astringent bark steeped in jaggery water is distilled as an intoxicating liquor, its wood very hard and useful (Drur.).

Pongamia glabra of Tropical Hindustan and the Siamese countries. A large tree called in Sanscrit "karanja" or "naktamala" (Pidd.), in Bengalee "kurunja," in Hindustanee "kurung," in Telinga "kanooogo," in Tamil "poongu marum" (Drur.), in the environs of Bombay "karunj" (Graham), in Burmah "tha-wen" (Mason); in which we recognize the "karanja" or "karanjaka" of the stanzas of the Ayurvedas, — "galedupe" of Valmiki ram. iii. 79 (transl. Gorr.), and "naktamala" trees of Kalidasa ragh. v. 42, and Susrutas chik. 5: the "galedupe" is mentioned by Valmiki iii. 79 (transl. Gorr.); the "karanja" or "karanjaka" of the stanzas of the Ayurvedas, "naktamala" trees by Kalidasa: *P. glabra* was observed by Rheede vi. pl. 3 in Malabar; by Gibson, and Graham, "very common throughout the Concan, also near rivers in the Deccan;" by Buchanan, flourishing "equally on the arid hills of the Carnatic and the muddy banks of the Ganges;" by Roxburgh, and Wight, as far as Travancore and Bengal, the oil from its seeds applied externally by the natives in eruptive diseases, used also in lamps, its wood light and valuable, and its leaves eaten by cattle (Voight, and Drur.): by Mason v. 504 to 523, indigenous in Burmah, abounding "from Tavoy to Toungoo;" was observed by Loureiro in Anam (Steud.).

Grislea tomentosa of Tropical Hindustan and the Siamese countries. A large shrub called in Sanscrit "d'haree" (Ainsl.), in Bengalee "dhari," in Hindustanee "d'hawe-ke-pol" (J. F. Wats.) or "dhaee-phool" (Drur.), in the environs of Bombay "dhauree" or "dhaitee" (Graham); in which we recognize the "dhava" or "dhataki" of the stanzas of the Ayurvedas — (Susrut. sar. 2 to kalp. 3), and "dhura" of Valmiki ram. i. 18: *G. tomentosa* was observed by Gibson, and Graham, very common "throughout the jungly tracts of the Concan and along the Ghauts," its flowers "a considerable article of commerce inland as a dye;" by Roxburgh, and Wight, as far as Oude and Dheyra Dhoon, an infusion of the leaves substituted for tea among the hill tribes near Ellichpoor, and its wood used for ploughs (Drur.); by McClelland, "very common in the Prome district" of Burmah (Mason v. 512): and is known to grow as far as China (Pers.).

Pentaptera tomentosa of Tropical Hindustan. A tree called in Sanscrit "usna" or "peeata-saluka," in Bengalee "usan" or "pee-sal," in Telinga "nella-madoo," in Hindustanee "aans" (Lindl.), in the environs of Bombay "ain" or "aycen" (Graham); in which we recognize the "asana" of the stanzas of the Ayurvedas — (Susrut. chik. 27 to kalp. 3), and "pentaptere" of Valmiki ram. iii. 79 (transl. Gorr.): *P. tomentosa* was observed by Gibson, and Graham, from "the jungly tracts of Guzerat" common "on the Ghauts and throughout the hilly parts of the Concan," its wood much used for "shafts to gigs," and for other purposes "where toughness of fibre is required;" by Roxburgh, Tennent, and Wight, as far as Ceylon and Oude, its bark astringent, employed medicinally, and yielding a black dye, the ashes so charged with calcareous matter as to be sometimes substituted for lime in chewing betel (Drur.).

Pentaptera glabra, by some regarded as distinct, is called in Hindustanee "urjoon" (J. F. Wats.), in Telinga "tella madoo" (Drur.), in Burmah "touk-kyan" (Mason); and the "arjuna" of the stanzas of the Ayurvedas (Susrut. iii. 2) is referred here by Hessler; *P. glabra* was observed by Roxburgh, and Wight, from the peninsula as far as Silhet and Monghyr, a valuable timber-tree, not touched by white ants (Drur.); by Mason v. 533, indigenous in Burmah, probably the tree affording according to McClelland "timber strong as teak," and that whose bark yields according to Berdmore a black dye used "in dyeing fish-nets."

Terminalia citrina of Eastern Hindustan. A tree called in Bengalee "hurituki" (Lindl.); and the "ab'haya" of the stanzas of the Ayurvedas — (Susrut. kalp. 3), is referred here by Hessler: the "abhea" is identified in the Taleef Shereef with the "hurr" (J. F. Wats.), an allied species: T.

in Burmah "sha" (Mason); in which we recognize the "k'hadira" or "kantaki" or "kapitana" or "mandana" of D'havantari — (Susrut. v. 3), the "khadira" club and staff for warriors in the institutes of Manu ii. 45 to viii. 313, and the "khadira" of Valmiki ram. i. 12: A. catechu was observed

citrina was observed by Roxburgh ii. 435 in the forests of Bengal; its fruit according to Lindley "a common article in the Hindoo materia medica, usually employed as a gentle purgative."

Trichosanthes cucumerina of Tropical Hindustan. The bitter gourd is called in Sanscrit "patola," in Telinga "patolas" (J. F. Wats.) or "aduvee-putla" (Lindl.) or "chaynd-potla," in Tamil "poodel" or "pepoodel" in Bengalee "bunputol" (Drur.), in Burmah "tha-bwo't-kha" (Mason); in which we recognize the "patoli" or "patolika" to be mixed in food according to the stanzas of the Ayurvedas — (Susrut. chik. 5): T. cucumerina was observed by Rheede viii. pl. 15 in Malabar; by Graham, "wild in hedges etc." in the environs of Bombay; by Roxburgh, Ainslie, and Wight, as far as Bengal, its unripe fruit very bitter but eaten by the natives in their curries, and its seeds, leaves, root, and young shoots employed medicinally; by Mason, "exotic" in Burmah, its fruit "eaten by the natives only; by Blume bijdr. 934, as far as the Malayan archipelago.

Trichothanthes dioica of Tropical Hindustan. Called in the Taleef Shereef "patole," in Hindustanee "pulvul" or "pulwul," in Bengalee "pulta" (J. F. Wats.); and the "patoli" or "patolika" or "ramyaka" of the stanzas of the Ayurvedas — (Susrut. chik. 5), is referred here by Hessler: T. dioica was observed by Roxburgh, Piddington, Royle, and Jameson, cultivated as an article of food in the region watered by the Ganges (J. F. Wats., and Drur.).

Luffa acutangula of Tropical Hindustan. A climbing Cucurbitaceous vine called in Bengalee "jhingo," in Tamil "peekun-kai" in Telinga "beer-kai," in Hindustanee "torooi" (Drur.), in the environs of Bombay "toorai" or "gosalee" (Graham), and species of Luffa in Sanscrit "kosataki" (J. F. Wats.): the "kosataki" or "koshataki" of the stanzas of the Ayurvedas — (Susrut. Chik. 5), may be compared: L. acutangula was observed by Rheede viii. pl. 7 in Malabar; by Graham, "commonly cultivated" in the environs of Bombay; by Roxburgh, and Wight, in other parts of the peninsula, in hedges and waste lands and besides cultivated, its half-grown fruit "one of the best native vegetables in India" and much used in curries (Drur.).

Randia dumetorum of Tropical Hindustan and the Siamese countries. A thorny arborescent shrub called in Sanscrit "madana" (Ainsl.), in Telinga "mangha," in Tamil "marukarung," in Hindustanee "myn" (Drur.), in the environs of Bombay "ghelah" or "gaerah" or "peiraloo" (Graham); in which we recognize the "madana" of the stanzas of the Ayurvedas — (Susrut. iii. 2): R. dumetorum was observed by Law, Murray, and Graham, from Guzerat "throughout the Concans and Malabar," its "fruit like a crab apple," and "used for poisoning fish;" by Retz, Roxburgh, Wight, and Drury, as far as Mysore and Coromandel, its fruit "very commonly used as an emetic by the poorer classes;" was observed by Mason in Burmah; by Blume bijdr. 981, as far as the Malayan archipelago.

Embelia ribes of Tropical Hindustan and Burmah. A large climbing shrub called in Telinga "vayu-velangam-chettu" (J. F. Wats.), in Tamil "vella," in Malabar "vishaul," in Bengalee "ba-berung" (Drur.), in the environs of Bombay "karkunnie" (Graham): the "vid'anga" of the stanzas of the Ayurvedas — (Susrut. kalp. 3), is referred here by Hessler: E. ribes was observed by Graham at "Mahableschwur, pretty common;" by Roxburgh, Royle, and Wight, as far as Silhet, its berries used medicinally, and sometimes fraudulently intermingled with black pepper, being almost indistinguishable and withal somewhat pungent (Drur.); by Mason, indigenous in Burmah.

Ichnocarpus frutescens of Tropical Hindustan and Burmah. A twining Apocynous plant called in Sanscrit "syama" (J. F. Wats.), in Malabar "paal-vully," in Telinga "nalla-tiga," in Bengalee "shyama-luta" (Drur.) or "syama-lata" (W. Jones); in which we recognize the "syama" of the stanzas of the Ayurvedas — (Susrut. iv. 6 to 37), mentioned also in the Amara-cosha, and by Kalidasa: I. frutescens was observed by Law, and Graham, in the Southern Mahratta country; by Wight, and Drury, as far as Travancore, "common in hedges;" by Burmann zeyl. pl. 12, on Ceylon; by W. Jones as. res. iv. 261, Roxburgh, and Royle, as far as Bengal, used sometimes medicinally (Lindl.); by Mason, indigenous in Burmah. (See Villarsia Indica).

Rottlera tinctoria of Tropical Hindustan and Burmah. A tree called in Sanscrit "punnaga," in Bengalee "poonnag," in Telinga "punnagamu" (J. F. Wats.) or "vassuntagunda," in Tamil "capilapodi," in Hindustanee "kamal," in the environs of Bombay "shendree" (Graham), in Mysore "cornuga-mungi-maram" *monkeys-face tree* from monkeys reddening their faces by rubbing against the fruit (Buchanan); in which we recognize the "punnaga" of the stanzas of the Ayurvedas — (Susrut. sar. 4), "poonnaga" of Valmiki ram. i. 25, the ape besmearing his female's face with flowery dust in Bhavabhuti mal. 9, and bees abandoning the trees in Kalidasa ragh. iv. 57: R. tinctoria was observed by Rheede v. pl. 21 in Malabar; by Graham, on "hills throughout the Concans, the "mealy powder" on the fruit "used by the natives to dye red;" by Roxburgh, Royle, and Drury, "common

by Gibson, and Graham, "common in Kandesh" and "in some parts of the Northern Concan," giving employment to a "curious tribe of people called Kuttoorees" (Mackintosh bomb. geogr. soc. 1838); by Ainslie, Roxburgh cor. ii. pl. 175, Royle, Wight, and Drury, from Malabar to Delhi and Bengal,

almost everywhere" as far as Madras, its dye called *kamila* used besides as a vermifuge; by Mc Clelland, and Mason v. 512 to 543, indigenous in Burmah, and the powder on its fruit "sold in the bazars." (See *Calysaccion longifolium*).

Macaranga Roxburghii of Tropical Hindustan and Burmah. A peltate-leaved Euphorbiaceous tree called in Canarese "chanda" (Bedd.), in the environs of Bombay "chanda" (Graham); and the "chanda" of the stanzas of the Ayurvedas — (Susrut. iii. 10) may be compared: *M. Roxburghii* was observed by Graham 1284 on the Ghauts and "in both Concans," the capsule "size of a pea" and together with the young shoots "covered with a clammy substance having a strong turpentine smell; by Beddome 55, as far as Madras; by Roxburgh iii. 755, in Eastern Hindustan; and by Mason 589, in Burmah. Farther East, is perhaps the species seen by myself in wild situations in the Malayan archipelago, and frequent in abandoned clearings on the Feejeean, Tongan, and Samoan Islands.

Ficus (Covellia) glomerata of Tropical Eastern Asia. A large tree called in the environs of Bombay "oombur" (Graham); and the "oudoumbara" of the stanzas of the Ayurvedas — (Susrut. chik. 7), furnishing a staff for merchants in the Institutes of Manu ii. 45; mentioned also in the Saddharma pundarika (Burn. ii. 25 to 37), is referred here by writers: the "ou-tan-po-lo" seen by the Chinese traveller Hiouen-thsang 3. in Hindustan is also referred here by Stanislas-Julien: *F. glomerata* is mentioned in the Ramayana i. 4 (transl. Carey and Marshm.); is described by Roxburgh cor. pl. 123; was observed by Graham "generally by the banks of water-courses throughout the Concans" and hence called "water tree" by the natives, who sometimes eat its fruit, outwardly "much like the common fig," but "in clusters from the large branches;" by Powell, in the Punjab, its bark and root employed medicinally (Drur.). Farther East, by Blanco on the Philippines, and called in Tagalo "tibig na lalaqui," in Bisaya "haguimit" or "aimit," water for drinking procured by cutting the root, and on Zebu in times of drought many of the inhabitants have no other resource.

Colocasia macrorhiza of the Malayan archipelago. The *large taro* is called on the Hawaiian Taheitian and Samoan islands "ape," on the Marquesas and Rarotongan islands "kape," on Tongatabu "kabe" (Hale); in Sanscrit "hasi-carni" (Pidd.), and the "hasikarna" is mentioned in the stanzas of the Ayurvedas — (Susrut. iii. 2): *C. macrorhiza* was observed by Hermann parad. 73 on Ceylon (Pers., and Spreng.); is known in Hindustan, and in the fresh state "is employed by the natives as an external stimulant and rubefacient" (Pharm. of ind., and Drur). Eastward, was observed by myself under cultivation on the Feejeean, Tongan, Samoan, Taheitian, and Hawaiian Islands, its long large root the growth of several years, serving therefore as a safeguard against famine; by Rich, and Hale, on the Vaitupan and Tarawan coral-groups. By European colonists, was carried to the Mauritius Islands, where according to Bojer it has become naturalized.

Curcuma reclinata of Eastern Hindustan. Called in Bengalee "kurboor" (Pidd.); and the "karbura" of the stanzas of the Ayurvedas — (Susrut. iii. 2), may be compared: *C. reclinata* is described by Roxburgh, as observed by him in Eastern Hindustan (Steud.).

Cyperus juncifolius of Hindustan. Called in Northern Hindustan "mutran" (Honigb.), and this or *C. pertenuis* in Sanscrit "musta" (Pidd.); possibly therefore the "musta" of the stanzas of the Ayurvedas — (Susrut. v. 3): *C. juncifolius* was observed by Honigberger 387 in Northern Hindustan (J. F. Wats.).

Panicum frumentaceum of Tropical Hindustan. A kind of millet called in Sanscrit "shyamaka" (Pidd.), in the environs of Bombay "shamoola" (Graham); in which we recognize the "syamaka" of the stanzas of the Ayurvedas — (Susrut. chik. 5): *P. frumentaceum* was observed by Graham "cultivated in the Deccan;" by Sykes, Roxburgh, and Drury, under cultivation in other parts of the peninsula.

Raphis acicularis of Tropical Eastern Asia. A low troublesome grass called in Malabar "kadira pullu" (Rheede), in Burmah "gnung-myeet" (Mason): the "sank'hini" or "chorapushpi" or "chanda" or "kesini" or "sveta" of the stanzas of the Ayurvedas — (Susrut. sar. 10), is referred here by Hessler; and the "sankhapushpi" of the Institutes of Manu xi. 147 is referred here by Deslongchamps: *R. acicularis* was observed by Rheede xii. pl. 43 in Malabar; by Graham, in the environs of Bombay; by Retz, and Roxburgh, in Eastern Hindustan; by Mason v. 477, in Burmah, "the most common grass on the coast;" by Loureiro, in Anam; by myself, throughout the Malayan archipelago, but not in wild situations; by Blanco, everywhere known to the natives on the Philippines under a Spanish name "amores secos." By Polynesian colonists, was carried throughout the Tropical islands of the Pacific, from the Feejeean and Tongan to the Taheitian and Hawaiian groups, observed by myself abounding in clearings along the coast and around native dwellings, but not seen on the widely-detached coral-islands.

yielding *terra japonica* or *catechu*; articles made of its wood used according to Stevenson pref. vi. by Brahmans to the present day in Vedic ceremonies. Farther East, was observed by Mason v. 487 to 525 "indigenous" in Burmah, and "so abundant on the Eastern side of the mountains" that the inhabitants of a "village of two hundred and fifty houses" were all "constantly engaged in making *cutch* for the Shan market," to be taken with betel. From transported specimens, is described by Plukenet pl. 329; and by European colonists, was carried to the Mauritius Islands (Boj.); also to Jamaica, where it has become frequent (Macfad., and Lindl.).

Coccinia grandis of Equatorial Africa. A Cucurbitaceous vine called in Sanscrit "jivaka" or "vimbika" or "vimba" (J. F. Wats.); in which we recognize the "jivaka" of the stanzas of the Ayurvedas, — "bimba" fruit of the Saddharma pundarika (Burn. ii. 273 to 617), "vimba" of Valmiki ram. v. 18, its fruit compared with lips by Kalidasa kum. iii. 67 to ragh. xiii. 16, and the "vimbika" of Susrutas sutr. 16 to chik. 22: *C. grandis* was observed by Rheede viii. pl. 14 in Malabar; by Graham, "common in every hedge and on old walls about Bombay during the rains," its fruit "when ripe red;" by Roxburgh, and Wight, in other parts of Hindustan, and by Burmann pl. 19 on Ceylon; by Mason, seemingly wild in Burmah. Westward, by Grant in Unyoro on the Nile, garlands made of its leaves by the Waganda.

Mimusops kauki of the Siamese countries. A tree called in Sanscrit "ksheerike," in Bengalee "ksheerni" (J. F. Wats.); in which we recognize the "kshirika" or "kshiri" of the stanzas of the Ayurvedas — (Susrut. sar. 4): *M. kauki* was observed by Rheede iv. pl. 25 in Malabar, cultivated according to Drury on account of its acid and esculent fruit; by Powell, in the Punjaub, the leaves bark and seeds employed medicinally; by Roxburgh, in other parts of Hindustan; but in the environs of Bombay, was seen by Graham only in gardens of European residents. Eastward, was observed by Mason v. 463 indigenous in Burmah, and raised besides from a dried fruit imported by Chinese from Singapore; is according to Drury "extensively cultivated in China;" was observed by Rumphius iii. pl. 8 around dwellings on Celebes, commonly planted for the elegance of its form and the grateful shade. Westward from Hindustan, a single tree brought from abroad and having no Arabic name, was seen by Forskal p. 82 at Beit el fakih in Yemen.

Plumbago Zeylanica of Tropical Arabia and Hindustan. Perennial and suffruticose, called in Yemen "hamsched" (Forsk.), in Sanscrit "chitraka" or "pathin" or "vuhni," in Bengalee "agnee" or "chitra," in Hindustanee "chita" (J. F. Wats.), in Tamil "chitramoolum" or "kodivaylie" (Drur.), in Guzerat "cheetruck" (Graham); in which we recognize the "chitraka" or "agni" or "pat'hi" or "vahni" of the stanzas of the Ayurvedas — (Susrut. sar. 3): *P. Zeylanica* was observed by Rheede x. pl. 8 in Malabar; by Vaupell, "common in Guzerat in hedges by the road side," by Graham, on "hills throughout the Concans," the "fresh bruized bark of the root" sometimes "used for raising blisters;" by Roxburgh, Ainslie, Wight, and Drury, as far as Travancore and Bengal, and used for other medicinal purposes; by Mason v. 432, "exotic" in Burmah and cultivated for its vesicatory root. Westward, the "khamischah" of Ebn Baitar is referred here by Sontheimer: *P. Zeylanica* was observed by Forsk. along the base of the mountains of Yemen. By European colonists, was carried to the West Indies (Sloane i. pl. 133).

Curcuma zedoaria of Tropical Eastern Asia. Called in Sanscrit "kinarista" or "sholee" or "sholika" (Lindl.), in Hindustanee "zaranbad" or "jadwar" (D'rozar.) or "kakhura" or "kuchoor," in Telinga "kuchoor" or "kichlie-gudda," in Tamil "cappoor-kichlie" or "pulang killungu," in Bengalee "shutee" (Drur.), in the environs of Bombay "kutchoora" or "katchoramu" or "satee" or "sotee" (Graham); in which we recognize the "sati" of the stanzas of the Ayurvedas — (Susrut. iii.), and "shuthi" enumerated by Carey and Marshman among the ten drugs in the "survoushudhee" of Valmiki ram. ii. 1: *C. zedoaria* was observed by Rheede xi. pl. 7 in Malabar; by Graham, as far as Bombay, producing "the real *zedoaria* of the *Materia Medica*;" by Ainslie, Roxburgh cor. iii. pl. 201, Wight, and Drury, as far as Ceylon and Chittagong, its root used medicinally, and an ingredient in the red powder thrown about by the Hindus during the licence of the Hooly festival. Farther East, is known to occur on "the Asiatic islands" and as far as China (Rumph. v. pl. 68, and Lindl.). Westward, the imported drug "zedoar" is mentioned by Macer Floridus 71; "zadawar" or "jadwar," by Rhazes, Ebn Sanhum, Avicenna, and Ebn Baitar; and "zedoar" was seen in Egypt by Alpinus.

"117 B. C. = 6th year of the 'youan-tcheou' of Wou-ti" (Chinese chron. table), beginning of the Forty-third cycle.

The Hawaiian Islands colonized "from Taheiti" "sixty-seven generations" before our visit: the colonists being acquainted with the largest Samoan island Savaii, whose name was transferred to a new island corresponding in relative size and in being actively volcanic, its North point receiving the name of the second Samoan island Upolu; while "a small rocky islet" was called Lefuka, — its current name "Lehua" being the form the word "would take in the Hawaiian language." Communication was regularly kept up with the Marquesas Islands, two of which, Nukuhiva and Fatuhiva,

are mentioned in traditional Hawaiian songs among the places visited by voyagers (Ellis tour 287 to 313, and Hale ethnog. expl. exp. 129). Of the "sixty-seven generations" of Hawaiian kings, the names of the last forty-five kings are regarded by Hale as authentic.

Evidence is also found in the names of accompanying plants, *Jambosa Malaccensis* being called on Taheiti "ahii," on the Hawaiian Islands "ohia," but on the intermediate Nukahivan or Marquesas Islands "kahika" (Hale), clearly from having been brought from Taheiti.

In like manner, *Colocasia macrorrhiza* on the Hawaiian Islands has preserved its Taheitian and Samoan name "ape," but is called "kape" on the Nukahivan and Rarotongan Islands, and "kabe" (Hale) on Tongatabu.*

Tacca pinnatifida of wooded Tropical shores from East Africa throughout the Malayan archipelago. The *East Indian arrow-root* is called in Telinga "cunda," in Tamil "carachunay," and its root in Travancore "chanay kalungoo" (Drur.), in Burmah "touk-ta" (Mason), in Ylocano "panarien" and its farina "gaogao" (Blanco), on Tongatabu "mahoa," on the Samoan Islands "masoa," on the Rarotongan Taheitian and Nukahivan Islands "pia," a name continued on the Hawaiian Islands — (Hale): was observed by myself seemingly indigenous on the Hawaiian Taheitian Tongan and Feejeean Islands, but unknown on secluded coral-islands, and by the Samoans regularly cultivated; is termed "*tacca littorea*" by Rumphius v. pl. 114: was observed by Blanco frequent in Ilocos and Zambales on the Philippines; by myself, apparently indigenous on the Mangsi coral-islets; by Mason v. 106, "indigenous" in Burmah, "abounding along the sea shore the islands and especially at Mergui," where a "kind of arrow root has long been made" from its tuberous roots; by Ainslie, Roxburgh, and Drury, in Hindustan as far as Travancore; by Nimmo, and Graham, "throughout the Concans" to and beyond Bombay; by myself, to all appearance wild on Zanzibar.

Dioscorea bulbifera of Tropical Eastern Asia. A climbing herbaceous vine called on Madagascar "voua-couviki" (Boj.), in the environs of Bombay "caroo carunda" (Graham), in Malabar "katukatsjil" (Drur.); on Taheiti "hoi" (Bertero), a name retained on the Hawaiian Islands — (Gaud.): observed by myself abounding in neglected clearings on Metia, Taheiti, the Samoan and Tongan Islands, its root not considered edible. Westward, "kurenga" yam in Feejeean (Hale) and "kuri" yam on Tobi (between Gilolo and the Pelew Islands) may be compared with "kuri" in Rarotongan and Mangarevan and "kiri" in Tarawan, names for dog: *D. bulbifera* is termed "*ubium pomiferum*" by Rumphius v. pl. 124. was observed by him, and Blume 20, seemingly wild in the Malayan archipelago (A. Dec.); grows wild in Nepal and Silhet (Kunth); was observed by Rheede vii. pl. 36 in Malabar; by Graham, in "both Concans" to and beyond Bombay, its flowers and roots "eaten by the poorer classes," the "very bitter" roots after "being covered over with ashes and steeped

* *Casuarina equisetifolia* of the Moluccas and neighbouring islands as far as the Feejeean: A pine-like tree called in Tagalo and Pampango "agoho," in Bisaya "agoho" or "malabohoc," in Ylocano "agoo" or "aro" or "caro" (Blanco), on Taheiti "aito" (Bertero) or "toa," on the Marquesas Samoan and Tongan Islands "toa" (Hale), and on the Hawaiian Islands in the absence of the tree the name "toa" is continued, perhaps from imported war-clubs: — *C. equisetifolia* was observed by myself naturalized and forming groves on the Taheitian and Samoan Islands, under cultivation on Tongatabu, to all appearance indigenous on the Feejeean Islands, and a single planted tree on the Mangsi coral-islets North of Borneo; by Blanco, frequent in Ilocos and other localities on the Philippines; is described also by Rumphius iii. pl. 57. By European colonists, was carried to the Mauritius Islands (Boj.); to Brazil, observed by myself planted for ornament at Rio Janeiro.

Dioscorea pentaphylla of Tropical Eastern Asia. A *kidney-rooted yam* called in the environs of Bombay "oolsee" or "shendervail-chand" (Graham), in Malabar "nureni-kelangu," in Bengalee "kanta-aloo" (Drur.), in Tagalo "limalima" (Blanco), on the Feejeean Islands "kawai" (C. P., compare "kywa" the Burman name of *D. dæmona*); on the Hawaiian Islands "pia" (C. P.) and carried there possibly by the first colonists: — observed by myself, often in wild situations, and its root said to be eaten in times of scarcity, naturalized also on the Taheitian and Samoan Islands, but on the Feejeean sometimes cultivated. Westward, by Rumphius v. pl. 127 abundantly cultivated on Amboyna, and by him, and Blume, "wild" in other parts of the Malayan archipelago (A. Dec.); by Blanco, common in Malinta and Bisayas on the Philippines, its root eaten by the natives; by Rheede vii. pl. 35, in Malabar; by Davies, and Graham, "common in the Ghauts and in both Concans" to and beyond Bombay, its male flowers "sold in the bazar and eaten," together with its large tubers which are "dug up in November;" by Roxburgh, in other parts of Hindustan, never cultivated so far as observed by Wight, though Drury "always found the natives dig the tubers whenever they had an opportunity to dress and eat them." (See *D. aculeata*).

in cold water" becoming edible, and there is a variety which is "naturally sweet." Farther West, was observed by Bojer growing spontaneously on Madagascar (see also Griseb. fl. bras. v. 28); by Grant, in "plantain-groves 2° N." on the Nile, its "bulbs Brazil-nut size and shape, eating pleasantly boiled."

"The same year" (Liv., and Clint.), Dalmatia conquered by the Romans under L. Caecilius Metellus.

"The same year" (Porphyr., and Clint. iii. p. 399), in Egypt, Ptolemy VII. succeeded by Ptolemy VIII. Lathyrus: his mother Cleopatra being the real ruler. The hieroglyphic ovals of Ptolemy VIII. occur on a propylon at Koos, on temples at Ombos and Edfu, on the temple of Athyr at Thebes, and on extensive restorations made at Medinet-abu with materials from Pharaonic ruins.

Cassia absus of Hindustan. Allied species are called in Yemen "kolkol" (Forsk.); and the ΑΚΑΚΑΛΛΙΔΑ called ΝΑΡΚΙCOC according to Eumachus of Corcyra, — described by Dioscorides as the fruit of a shrub growing in Egypt mixed in infusion in eye-salve, mentioned also by Athenaeus xv. 27, and Paulus Aegineta, is referred here by Royle: *C. absus* was observed by Alpinus, Hasselquist, and Delile, in the gardens of Egypt. Eastward, was observed by Burmann pl. 97 on Ceylon; by Royle, indigenous in Hindustan and the fruit employed for the medicinal purpose described by Dioscorides.

"116 B. C. = 1st year of the 'youan-ting' of Wou-ti" (Chinese chron. table).

"Under the Han dynasty," the "Mao-mim" having their bodies "covered with hair," described in the Chinese work "San-gai-kio (Chan-hai-king)" as "inhabiting the other side of the East sea:" the earliest notice of the *Ainos* of the Northern Japan islands,* — according to the San-kokf (transl. Klapp.), and Siebold (eluc. Vries).

* *Fucus (Alaria) esculenta* of the Northern Japan seas. A seaweed or kelp growing from the shore some fifty feet in length by a foot wide, called "kambou" or "koumbou (kuen-pou)," and eaten by the *Ainos* and surrounding nations: — also found drifting throughout the Sea of Okhotsk: and farther South, "generally eaten in Japan, has a very pleasant taste and is noted as being very wholesome and nutritive," and forms an important article of export to China (addit. San-kokf transl. Klapp. p. 206, and Siebold eluc. Vries p. 66 and 174): was observed by Vries along the shores of Yeso; by the Japanese traveller Toknai, along those of Krafu (Saghalien); by Erman, in the Okhotsk Sea; and is collected and dried through regular fisheries both on Yeso and the Kurile Islands (Sieb.); and farther East, is known to grow in the Arctic portion of Alaska (Rothr. and Harv. in Smith's report 1867). From transported specimens, is described by Linnæus, Agardh, and Ruprecht.

Fucus sp. Another seaweed, called by the Japanese "kouro-kouki" or black sprouts, is equally good to eat, — according to the addit. San-kokf (Klapp. transl.).

Rosa rugosa of Yeso and the neighbouring countries. Called "mau," or in Japanese "hama nasi," and the fruit generally eaten by the *Ainos* — (Sieb.): observed by Vries on Yeso; and by Thunberg p. 213, in Japan. Farther North, "*R. Kamtschatica*" whose fruit is eaten by the Kamtschatkans (Sieb.), may be compared.

Rubus palmatus of Yeso and the neighbouring countries. Called "imare fureppi," or by the Japanese "itsigo;" — and the raspberries observed by Vries on Yeso, are referred here by Siebold p. 41. Farther South, *R. palmatus* was observed by Thunberg in Japan. As transported to Europe, is described by the younger Linnæus suppl. 263 (Pers.).

Rubus triphyllus of Yeso and the neighbouring countries. Called in Japanese "myama asi kudasi;" — and enumerated by Siebold among the edible and useful plants of Yeso. Farther South, observed by Thunberg in Japan.

Xanthoxylon sikerebe of Yeso and the neighbouring countries. Called "wobakf," or by the *Ainos* "sikerebe," or by the Japanese "ki wada;" — enumerated by Siebold among the edible and useful plants of Yeso: the "woo-bek" enumerated in the San-kokf transl. Klapp. among the useful plants of the *Ainos*, is doubtless identical.

Juglans nesiko of Yeso and the neighbouring countries. Called "kurumi" by the Japanese, "nesiko" by the *Ainos*, and the nuts are called "ninum;" — enumerated by Siebold among the edible and useful plants of Yeso.

Brassica Chinesis of Yeso and the neighbouring countries. Called by the Japanese "tona;" — and enumerated by Siebold among the edible and useful plants of Yeso. Received from China by Linnæus.

Cochlearia sp. of Yeso and the neighbouring countries. Called "tsi" or "kiseseri," or by the Japanese "wasabi;" — enumerated by Siebold among the edible and useful plants of Yeso.

Vitis Yesoensis of Yeso and the neighbouring countries. Called "hats," or by the Japanese "Jeso buto:" — enumerated by Siebold as a "delicious black grape" growing on Yeso.

Among the edible and useful plants of the Ainos on Yeso, *Tilia parviflora* called "koberegeb" or by the Japanese "sinano ki," furnishing rigging and timber of good quality; *Coptis asplenifolia* called "seribano worn" by the Japanese (and observed in Japan by Thunberg); *Rubus Molucca-*

Aralia edulis of Yeso and the neighbouring countries. Called "itsijaribe" or "tsimakina," or by the Japanese "udo;" — enumerated by Siebold as growing on Yeso, and the root edible.

Apium seri of Yeso and the neighbouring countries. Called by the Japanese "seri," — and enumerated by Siebold as "a sort of cellery" growing on Yeso: "*A. petroselinum*" called "kin" or usually "seri," was observed by Kaempfer, and Thunberg, cultivated as a condiment in Japan.

Heracleum tsima of Yeso and the neighbouring countries. Called "tsima" by the Ainos; — and enumerated by Siebold p. 56 as edible, and as probably the "large screen plant" whose stems were collected by Vries' crew on Kunasiri near Yeso.

Sanicula elata of Yeso and the neighbouring countries. Called by the Japanese "naga sirami;" — and enumerated by Siebold among the edible and useful plants of Yeso.

Lappia edulis of Yeso and the neighbouring countries. Called "setakorokoni," or by the Japanese "kobo;" — the root enumerated by Siebold as edible.

Corylus sp. of Yeso and the neighbouring countries. Called "wohoba," or by the Japanese "hasibami;" — enumerated by Siebold as growing on Yeso, but referred to "*C. Americana*."

Fagus pira of Yeso and the neighbouring countries. Called "pira" by the Ainos, — and enumerated by Siebold as growing on Yeso.

Polygonatum Japonicum of Yeso and the neighbouring countries. Called "amatokoro" by the Japanese, and the root used: — enumerated by Siebold among the edible and useful plants of Yeso.

Allium uliginosum of Yeso and the neighbouring countries. Called "heroni," or by the Japanese "nira;" — and enumerated by Siebold among the edible and useful plants of Yeso. From transported specimens, described by Don.

Gen. Graminac. untsja of Yeso and the neighbouring countries. An edible grass called "untsja" by the Ainos, and "makomo" by the Japanese, — enumerated by Siebold as growing on Yeso.

Pteris? of Yeso and the neighbouring countries. An edible fern called "toha," or by the Japanese "warabi," — enumerated by Siebold as growing on Yeso.

Gen. Musc. of Yeso and the neighbouring countries. An edible moss called "ikkimaimai," or by the Japanese "koke," — enumerated by Siebold as growing on Yeso.

Boletus kuruma of Yeso and the neighbouring countries. An edible mushroom called "kuruma" by the Ainos, — enumerated by Siebold as growing on *Quercus beroni* on Yeso.

Betula betats of Yeso and the neighbouring countries. Called "betats" by the Ainos, and the bark used by them, — the "tatsbi" birch also furnishing good timber (Sieb. p. 41 and 170).

Betula asada of Yeso and the neighbouring countries. Called "asada" by the Ainos, and the bark used by them — (Sieb. p. 170).

Quercus beroni of Yeso and the neighbouring countries. Called "beroni" or "bironi" by the Ainos, — and the wood enumerated by Siebold p. 41 among the kinds especially fit for shipbuilding.

Acer sp. of Yeso and the neighbouring countries. Called "tobeni," or by the Japanese "kaide," — and according to Siebold p. 41 and 163, "sugar is prepared from the juice," and the wood is of good quality.

Acer fusini of Yeso and the neighbouring countries. Called "fusini" by the Ainos, and furnishing good timber, — according to Siebold p. 41 and 162.

Pinus pauciflora of Yeso and the neighbouring countries. Called "tsikafupp" or "inekereni," or by the Japanese "gojo mats," the wood used for houses — and masts (Sieb.). The "sapin à cinq feuilles acereuses" (Strobus) enumerated in the San-kokf transl. Klapr. among the useful plants of the Ainos, may be compared.

Abies Yessoensis of Yeso and the neighbouring countries. Called by the Ainos "fuppo," by the Japanese "Jeso mats," the wood — enumerated by Siebold among the kinds especially fit for shipbuilding, and supplying masts.

Phalaris sp. of Yeso and the neighbouring countries. A species with an ovoid pendulous panicle — enumerated by Siebold as used for roofs.

Smilacina bifolia of Subarctic climates. Called "maidsur" by the Japanese: — Described by Matthioli pl. 709 (Spreng.); observed by Gerarde in two localities in Britain; known to abound in the Scandinavian peninsula, and as far as Northern France and Germany, becoming rare as the forests become more restricted (fl. dan. pl. 291, and A. Dec.); was observed by Gmelin frequent throughout Siberia; by Pallas, between the Yenisei and Lake Baikal; by Chamisso, in Kamtschatka. Westward, by Lapylaie in Newfoundland; by Michaux, in Canada: by myself, from 45° to 40° along the Atlantic, frequent in the forest; by Chapman, on "high mountains of North Carolina;" by Short, in Kentucky; and by Drummond, at 54° on the Saskatchewan.

nus? called in Japanese "fuju itsiigo;" *Cannabis sativa* called "asakara" or by the Japanese "asa," for sewing thread; *Trapa incisa*; *Castanea vesca* called "jam," or by the Japanese "kuri;" and *Sagittaria sagittifolia* called "womo daka" by the Japanese, the root,—are enumerated by Siebold. And in the San-kokf transl. Klappr., "*Galium tuberosum* (houang-thsing);" the "kakouma-kousa" (in Chinese "houang-lian," *Chelidonium majus*, whose Japanese name is however given by Siebold as "kusanowo"); and the "pin de Yeso" (. . .), the wood very beautiful, employed for making utensils.

Among plants growing on Yeso, *Ervum tetraspermum* called "susume no Iento" by the Japanese; *Spiraea aruncus* called "sjoma" or "torino asikusa" by the Japanese; *Lythrum salicaria* called "mizo hagi" by the Japanese; *Geranium pratense* called "dai furoso" by the Japanese; *Euphorbia lathyris* called "portoso" by the Japanese; *Alsine media* called "hakobe" by the Japanese; *Viola canina* called "komeno asume" by the Japanese; *Capsella bursa-pastoris* called "nats na" by the Japanese; *Draba hirta*; *Thlaspi arvense* called "gunbai utsiwa" by the Japanese; *Papaver rhoeas* called "bizinso" by the Japanese; *Anemone parviflora*; *Caltha palustris* called "jen ko so" by the Japanese; *Cornus Canadensis* called "kakka," or by the Japanese "gozen tatsi bana;" *Hedera helix* called "ki dsuta" by the Japanese; *Vaccinium Chamissonis*? called "isusuka;" *Primula farinosa* called "konzumui," or by the Japanese "juki ware so;" *Veronica anagallis* called "kawatsisa;" *Physalis alkekengi* called "hokisei," or by the Japanese "hotsuki," and observed by Thunberg in Japan; *Physalis totorep*, called "totorep" by the Ainos; *Solanum Carolinense*? called "katakina;" *Solanum*, a species growing on Krafsto; *Calystegia soldanella* called "hama hirugaho" by the Japanese; *Brunella vulgaris* called "utsubo kusa" by the Japanese; *Clinopodium vulgare* called "kuruma bana" by the Japanese; *Lamium amplexicaule* called "hoto-keno so" by the Japanese; *Jasminum præcox* called "obai" by the Japanese; *Apocynum Vnetum* called "basikuromun;" *Calendula officinalis* called "urajenekina," or by the Japanese "kin sen kwa;" *Gnaphalium confusum* called "habako gusa" by the Japanese; *Taraxacum dens-leonis* called "inemuni," or by the Japanese "tan bobo;" *Plantago major* called "ohobako" by the Japanese; *Polygonum aviculare* called "niwa janagi" by the Japanese; *Rumex crispus*? called "stakamaro," or by the Japanese "kizigizi;" *Chenopodium album* and *rubrum* called "sirusikina," or by the Japanese "aka sa;" *Populus dero* called "dero" by the Ainos; *Salix toisjusju* called "toisjusju" by the Ainos, "inokoro janagi" by the Japanese; *Salix toppikara* called "toppikara" by the Ainos, "kojanaki" by the Japanese; *Humulus Japonica* called "kana mugura" by the Japanese; *Alnus incana* called "hanoki" by the Japanese, "nitats' kene" or in general "kene" by the Ainos; *Alnus jaja kene* called "jaja kene" by the Ainos; *Thuya? retinospora?* called "kara hila," or by the Ainos "sjungu;" *Typha angustifolia* called "sikina," or by the Japanese "gama;" *Dendrobium catenatum* called "sekikok" by the Japanese; *Convallaria majalis* called "setakito," or by the Japanese "kimikakeso;" *Paris quadrifolia* called "tsume tori gus-a" by the Japanese; *Polygonatum latifolium*? called "bebeukkina;" *Smilacina racemosa* var. *Iesoensis* called "juisasa;" *Narcissus tazetta* called "suizen" by the Japanese; *Uvularia sessilifolia* called "hotsjak" by the Japanese; *Iris Sibirica* called "ajame" by the Japanese; *Luzula campestris* called "ritenmuni," or by the Japanese "suzumeno jari;" *Hordeum jubatum*; and *Imperata pedicellata* called "nupkausi," or by the Japanese "tsigaja,"—are enumerated by Siebold. And in the San-kokf transl. Klappr., "matricaires de printemps à fleurs blanches" (called in Chinese "tchhun-kiu," in Japanese "soun-gikf" or sometimes "Korei-gikf" from having been introduced from Corea); "lys à fleurs noires" (*Fritillaria*?); "baton de tigre" fifteen to sixteen feet high (. . .); and "espece de bugle" called in Japanese "fouki," in Chinese "khouon-toung," with leaves attaining the dimensions of "ten" square feet (*Nardosmia Japonica*? called "makaje" or "korkoni," or by the Japanese "fuki").

Vyasa may have been at this time collecting the Vedas. — The Burmese king Ronmokkha is said to have been "skilled in the Vedas" (Mason 40).

Justicia ecboium of Tropical Arabia and Hindustan. A shrubby erect plant called in Malabar "carimcurim" (Rheede), in the environs of Bombay "oodoo jatee" (Graham), in Yemen "kossæjf" or "chasser" (Forsk.); and the "oudodjas" of the Rig Veda viii. 5. 3* — may be compared: J. ecbo-

**Barleria cristata* of Tropical Hindustan. An unarmed shrub, "very beautiful" when in flower (Graham): the "serya" of the Rig Veda ii. 5. 8 — is referred here by Langlois, and "sairiya" or "sairiyaka" prescribed by Susrutas chik. 15 to 25 is referred here by Hessler: B. cristata was observed by Graham "in gardens Bombay," flowers "of a blue colour with a dash of purple, appear in the rains;" by Roxburgh, in Eastern Hindustan. Probably carried to Manila, where it was observed by Blanco; was observed in Eastern Asia by Osbeck trav. pl. 8 (Pers.). Transported to Europe, is described by Morison iii. 11. pl. 23.

Vallisneria octandra of Hindustan. A grass-leaved aquatic called in Sanscrit "janalili" or

lium was observed by Forskal p. 5 among the mountains of Yemen ; by Graham, on "hills throughout the Concans" to and beyond Bombay, its flowers "greenish or azure-coloured;" by Rheede ii. pl. 20, in Malabar ; by Roxburgh, and Wallich rar. iii. pl. 108, in other parts of Hindustan, and according to Lindley "said to be diuretic."

Saccharum munja of Tropical Hindustan. A reed called in Hindustanee "munja" (Drur.) ; in which we recognize the "moundja" used for removing impurities from drink according to the Rig Veda ii. 3.4 ; "munja" cincture of Brahmans, mentioned in the Institutes of Manu ii. 42, — and by Kalidasa kum. v. 10 ; and "munja" grass of the Sutta Samanna Phala (Burn. ii. 477), Susrutas chik. 17 to 19, and the Vishnu purana iv. 6 : S. munja was observed by Roxburgh, and Royle, growing abundantly along the banks of the Ganges at Benares, its leaves twisted into strong tow-ropes by boatmen, and used besides for rigging on the Indus (Drur.).

The "risya" or white-footed antelope (*A. nilgau*), and the "gavaya" (gayal ox), mentioned in the Yajur Veda (Colebr. as. res. p. 500).

In the Sama Veda adhy. 12 and 22 Jamadagni, and Vrihaspati, are mentioned, also Kasyapa (prapath. i. 9), and the descendants of Angiras (adhy. i. 4).

The rishis or poets, whose stanzas are quoted in the prapathaka, are Puruhanman, Ahi, Virupa Vasu, Yata, Atri, Jeta, Kasyapa, Medha, Sumedha, Nrimedha, Trimedhas, Jamadagni, Prayaga, Mada, Gaupayana, Satya, Satyadhriti, Gopavana, Kanwa, Praskanwa, Trayukil, Upastuta, Vrihadukta, Vemada, Trisiras, Budhagarishti, Ullovatayana, Yutadakshna, Sakti, Ibhi, Devaja, Garbha, Puruchchhesa, Nodha, Twishta, Sasoka, Godha, Sahago, Gauriviti, Vena, Devajamy, Saya, Garga, Dwaita, Vasuyava, Puru, Gritsamada, Payu, Dirghatama, Trita, Trimati, Rigiswana, Haryata, Gauri, Tarkshya, Rinu, Vrismatili, Saunaka, Niranyaslupa, Sumitra, Nandhasa, Kaley, Ritu, Suhotra, and Kula :

Also Usana or Ushana, represented as reciting in adhyaya i. 10 to viii. 1, Bharadwaja, Medhatithi, Vatsa, Vamadeva, Madhuchhanda, Vasishtha, Saubhari, Viswamitra, Vatsapriya, Gautama, Gotama, Srutakaksha, Trisoka, Irimi, Sukaksha, Irisni, Soka, Kusidina, Priyamedhas, Pragatha, Sanyu, Purumidha, Rebhas, Kali, Miri, Devatithi, Aswina, Taurasravasa, Kutsa, Dyutana, Tiraschi, Viswamanas, Narada, Parvata, Sunahsepha, Bharga, Trinpani, and Manu.

Sarcostemma viminalis of Tropical Arabia and Hindustan. A leafless ascending many-branched Asclepiaceous plant called in Yemen "milæb" (Forsk.), in Telinga "tiga tshomoodoo," in Bengalee "bramee" or "shomluta" (Drur.) ; and the "soma," leafless according to the prapath. vi. 7. 12. its prepared juice first obtained by Ushana celebrated throughout the Sama Veda, — mentioned also in the Puranas, is referred here by writers : S. viminalis was observed by Lush on the "isle of Perim," by Graham, and myself, "throughout the Deccan," and, according to Gibson, water impregnated with the stems and common salt is employed by the natives to destroy white ants in sugar-cane fields ; by Roxburgh, and Wight, as far as Coromandel, its milky juice so mild that travellers suck the tender shoots to allay thirst (Drury). Westward, was observed by Forskal p. 50 near mount Melban in Yemen, eaten by cattle ; by Alpinus pl. 190, in Egypt. By European colonists was carried to Brazil, observed by myself naturalized at the base of the Organ mountains.

Butea frondosa of Tropical Hindustan and Burmah. Called in Sanscrit "pulas," in Bengalee "pulas," in Telinga "maduga" (Lindl.), in Hindustanee "palas," in Tamil "porasum" (Drur.). in Burmah "pouk" (Mason) ; in which we recognize the "palasa" named with honour in the Vedas, —

"saivala" (W. Jones) or "sivala" (Pidd.) ; and the "sipala" of the Rig Veda viii. 27, driven by the wind from the surface of the water, — is referred here by Langlois : the "shivula" is mentioned by Valmiki ii. 3 ; the "saivala" by Bhavabhuti mal. 6. and is prescribed medicinally by Susrutas sutr. 45 to chik. 18 : V. octandra was observed by Nimmo, and Graham, on "margins of tanks throughout the Concan ;" by W. Jones as. res. 275, and Roxburgh cor. ii. pl. 165, as far as Bengal.

Vallisneria alternifolia of Hindustan. Included apparently in the "sipala" — and "shivula" above-mentioned : observed by Nimmo, and Graham, "in tanks throughout the Concans," and "used for refining sugar ;" by Roxburgh, and Wight, in other parts of Hindustan.

Vallisneria spiralis of both continents. Included apparently in the "sipala" — and "shivula" above-mentioned : observed by Nimmo "in tanks" in the environs of Bombay (Graham) ; by Roxburgh, Gardner, and Wight, in other parts of Hindustan ; and known to grow as far as Australia (Graham). Westward, was observed by Ledebour iv. 46 in the Volga ; by Micheli gen. pl. 10, in Italy ; by La Peyrouse pyr. 594, in the Aude and Garonne, and is known to grow in the Rhone and other waters of Southern France (Pers., and A. Dec.). Farther West, was observed by Pursh in the Oswego river ; by myself, from Lat. 40° along the Atlantic ; is known to grow as far as the St. John's river in Florida and the Mississippi (Willd., and Pers.) ; was observed by Short in Kentucky ; and by Nuttall, from Lake Michigan to Arkansas.

and Institutes of Manu (W. Jones), and whose brilliant red flowers are celebrated by Kalidasa kum. iii. 29: Agni's "sacred wood illuminating" is mentioned in the Sama Veda v. 4, and the "sacred fire" of the Brahmins was found by Stevenson fed exclusively with the wood of *B. frondosa*; the same "venerable and holy tree gave its name to the celebrated plain of Plassey in Bengal" (asiat. res. iii. 469 to iv. 229): *B. frondosa* was observed by Rheede vi. pl. 16 and 17 in Malabar; by Graham, "common both in the Concans, Kandesh, and Goozerat," its flowers "used to dye with," applied also "to indolent tumours," and furnishing a powder that "enters into the composition of goolal;" by Roxburgh cor. i. pl. 21, and Wight, on the Circars and in other parts of Hindustan; yields according to Royle antiq. med. 41 and fibr. ind. the "pulas" or "dhak" fibre of commerce, and its ashes containing *carbonate of potash* are often commended by Hindu and Arab medical writers: its ruby-coloured exudation, also employed medicinally by the natives (Drur.), was recognized by Guibourt as the "original kino which had entirely disappeared from commerce and was once so much valued;" is now distinguished as *pulos kino*, and according to Drury "is an efficient substitute for the real kino." Farther East, *B. frondosa* was observed by Mason v. 485 abounding in the forests of Burmah; and by McClelland, in Pegu.

The Institutes of Manu hardly earlier than this date, mention being made of Buddhist nuns (Weber, and Buns. iv. 7. 3), and of "Tchinas" China (a name unknown before the Thsin dynasty according to Klaproth). Manu speaks of the "three Vedas," but elsewhere names the At'havana or fourth (Colebr. as. res. viii), and is himself mentioned in the Sama Veda prapath: i. 9 and 10* (transl. Stev.).

* *Sapindus detergens* of Eastern Hindustan. A species of *soapnut* called in Bengalee and Hindustanee "reetha" (Drur.); and the bruised fruit of the "savonier" used according to the Institutes of Manu v. 120 for cleansing woollen rugs from Nepal, — may be compared: *S. detergens* was observed by Roxburgh ii. 280 in Bengal, a tree twenty feet high, the pulp of its fruit used by the natives for washing linen (Drur.).

Careya arborea of Tropical Hindustan. A large tree called in Tamil "poottatanni-marum" or "ave-mavoo," in Telinga "kumbi," in Malabar "pelou," in Hindustanee or Bengalee "pilu" (Drur. index), in the environs of Bombay "koombah" or "kumba" (Graham); in which we recognize the "pilou" of the Institutes of Manu ii. 45, furnishing a staff for merchants: — *C. arborea* was observed by Rheede iii. pl. 36 in Malabar; by Gibson, Auld, and Graham, from Bombay to Kandesh and Guzerat; by myself, frequent in the forest on the Ghauts; by Roxburgh, and Wight, in other parts of Hindustan as far as Coromandel, its wood used by the cabinet-makers of Monghyr, also for hoops, and its bark twisted into cords for matchlock men (Drur.).

Rubia cordifolia of Subtropical Eastern Asia. Distinguished as *Indian madder*, and called in Hindustanee "munjittee," in Bengalee "munjith" or "aroona," in Tamil "manjittee" or "sawil codie," in Telinga "mandastie" (Drur.); and the madder-tinted garb of the military student is mentioned in the Institutes of Manu, — and by Bhavabhuti Uttar. 4 (transl. Wils.): embalming and cloth dyed with "manjistha" are mentioned in the Kasi khanda, practises according to Wilson (note Vishn. pur. iv. 5) that would be thought impure at the present day: the mandjuchakas is mentioned in the Saddharma pundarika (Burn. ii. 4), and the "manjisht'ha" or "manduka" or "mandukaparni" or "kala" by Susruta sar. 10 to chik. 16: *R. cordifolia* was observed by Graham "common at Mahableshwur;" by Ainslie, Roxburgh, and Wight, from the Neilgherries to Dindigul, cultivated according to Drury in Assam and Nepal, but seems chiefly produced in Kuchar, the root "in great demand in the adjacent countries for dyeing coarse cloths and stuffs red," and exported even to London. Farther East, *R. cordifolia* was observed by Wallich along the Irawaddy (Mason v. 512); by Thunberg, in different parts of the Malayan archipelago; by him, and Kaempfer, in Japan, growing spontaneously and used for dyeing; by Pallas trav. iii. pl. 50, as far as the border of Siberia; is known to occur also in China (Pers.). By European colonists, was carried to Austral Africa (Thunb.), and to Majorca (Pers.).

Vernonia anthelmintica of Tropical Hindustan and Ceylon. Annual, and called in Sanscrit and Bengalee "somraj" (Lindl.), in Hindustanee "buckche," in Telinga "adavie-zeela-kura," in Tamil "caat-siragum" (Drur.); and the "sami" of the Institutes of Manu viii. 247 — is referred here by Deslongchamps: the "somaraji" or "somavriksha" or "syama" is mentioned by Susruta sutr. 46 to chik. 25 and kalp. 7: *V. anthelmintica* was observed by Rheede ii. pl. 24 in Malabar; by Graham, "in waste places" around Bombay; by Hamilton, Roxburgh, and Wight, in other parts of Hindustan as far as Bengal: and by Burmann pl. 95, on Ceylon; the seeds according to Drury "very bitter" and "considered powerfully anthelmintic and diuretic," an ingredient also "of a compound powder" given in snake-bites.

Bassia latifolia of Tropical Hindustan. The *mowhra* tree is called in Sanscrit "madhaca," in

Crotalaria juncea of Tropical Hindustan. The *sunh-hemp* is an annual plant called in Bengalee "sunn," in Tamil "wuckoo" or "janupa nar," in Telinga "shanamoo" (Drur.), in the environs of Bombay "tag" or "ambaree" (Graham), in Burmah "pan" or "paik-hsan" (Mason); and the "sana" of the Institutes of Manu ii. 44, furnishing the sacrificial thread of the Kshatrya caste, — is referred here by writers: *C. juncea* was observed by Graham in the environs of Bombay, "much cultivated for the sake of its fibres;" by Burmann, Roxburgh cor. pl. 193, Royle fibr. 1, and Wight, under cultivation in other parts of Hindustan; and the exported fibres and "goni" or gunny-bags made of them have become well known in commerce. Farther East, the plant was observed by Mason v. 519 in Burmah, in "large fields" near the native villages.

Cordia latifolia of Tropical Hindustan. A small tree called in Sanscrit "shleshmatuka" (J. F. Wats.), in Bengalee "buro-buhooari," in Hindustanee "bhokur" or "buralesoor" (Drur.), in Guzerat "burgoond" or "vurgooond," in Arabic and Persian "pistan" or "sepistan" (Vaupell); in which we recognize the "slechmatuka" of the Institutes of Manu vi. 14, whose fruit should not be eaten: — the "sibistan" is mentioned by Honain, Ishak Ben Amran, Mosih, Elthabiri, Avicenna, and other Arab writers (meaning probably in most instances the allied *C. myxa*): *C. latifolia* is mentioned by Valmiki ramayan. vi. 74 (transl. Gorres.); was observed by Vaupel "common through-

Bengalee "mahwa" or "muhoora" or "muhoora," in Telinga "ipie" (Lindl.), in Hindustanee "moola," in Tamil "caat-elloorpei" (Drur.); in which we recognize the "madhuka" yielding according to the Institutes of Manu xi. 94 one of the three kinds of intoxicating drink, — mentioned also by Valmiki ramayan. ii. 43, Jayadevi, yellow garlands of its flowers by Kalidasa kum. vii. 14 to ragh. vi. 25, and prescribed medicinally by Susrutas: *B. latifolia* was observed by Gibson "very common in Guzerat," by Graham "throughout the Concans," by myself in the central portion of the Deccan, by Malcolm in Malwa; by Roxburgh cor. i. pl. 19, Hamilton, and Ainslie, from Mysore to the Circar mountains and Bengal, its flowers dried for food in quantities by the forest-tribes or Bheels, yielding besides the intoxicating spirit called *mowhka*, and the oil from its seeds used by the poorer classes in lamps and for frying (Drur.). By European colonists, was carried to the Mauritius Islands, where it continues in gardens (Boj.).

Strychnos potatorum of Tropical Hindustan and Burmah. The *clearing-nut* is called in Tamil "tettankotta," in Telinga "induga," in Bengalee and Hindustanee "nirmulee" (Lindl.), in the environs of Bombay "nirmulla" or "gagra" (Graham): and the "kataka" clearing water according to the Institutes of Manu vi. 67, — pale-leaved and yielding a powder according to Kalidasa ragh. iv. 55 to vi. 17, and prescribed medicinally by Susrutas chik. 1 to 20, is referred here by W. Jones as. res. iv. 128: *S. potatorum* was observed by Law, and Graham, on the "hilly parts of the Concans" and "the Ghauts generally," a "middle-sized tree;" by Gibson, as far as the "Adjunta jungles;" by Retz, near Madras (Pers.); by Ainslie, and Roxburgh cor. i. pl. 5, in other parts of the peninsula, the ripe seeds used for clearing muddy water, the pulp of the fruit eaten by the natives, but the pulverized dried fruit "reckoned emetic" (Drur.). Farther East, was observed by Mason v. 497 in Pegu and Toungoo, the use of its seeds being well known to the Burmese.

Cordia obliqua of Tropical Hindustan. A tree called in Sanscrit "selu" (J. F. Wats.); in which we recognize the "selu" of the Institutes of Manu v. 6, whose fruit should not be eaten: — *C. obliqua* was observed in Hindustan by Ainslie 183 to 228, and Balfour 87. From transported specimens, is described by Willdenow phytog. i. pl. 4 (Pers.).

Antiaris toxicaria of the Siamese countries and Malayan archipelago. The *bohun upas* is a large forest-tree, sometimes called "antsjar" (Lindl.); and knowledge of its exudation seems implied in the prohibition against poisoned arrows in the Institutes of Manu vii. 90 — (Elphinst. i. 2): clasping the poison-tree, is mentioned by Bhavabhuti i. (transl. H. H. Wils.): *A. toxicaria* is known to grow as far as Lat. 19° in the neighbouring portion of Burmah, and its exudation continues to be "used by the Karens to poison arrows" (Thomson, and Mason v. 489 to 876). Farther South, a tree in the Malayan archipelago according to Jordanus (transl. soc. Hakl.) is said when "in flower" to "kill every man that cometh near;" an account not strictly true, but *A. toxicaria* has been shown by Rumphius ii. pl. 87, Leschenault de la Tour, and Blume, to be virulently poisonous; is known to grow particularly on Java, Baly, and Celebes (Aepnel, and Lindl.).

Saccharum sara of Tropical Hindustan. A reed called in Bengalee "shur" or "saro" (Drur.); in which we recognize the "sara" of the Institutes of Manu viii. 247, to be planted for marking boundaries: — *S. sara* was observed by Roxburgh, Royle, and Stewart, from the lower part of the Punjab along the Ganges, its leaves twisted into strong tow-ropes by boatmen, made also into mats, its stems used for wicker-work and for rafting heavy timber, and the delicate pith towards the summit eaten by the poor; writing-pens from these stems are besides exported from Madras, chiefly to Bombay (Drur.). The "bhooroo" reed "of which the native pens are made" was observed by Graham "common in the Concans." (See *S. spontaneum*.)

out Guzerat," its young tender fruit "pickled, also eaten as a vegetable by the natives" (Graham); by Colebrooke as. res., and Roxburgh, as far as Silhet, its fruit larger and more mucilaginous than that of *C. myxa* (Lindl., and Drur.).

Achyranthes aspera of Tropical Asia. A weed called in Egypt "næajm," in Yemen "uokkes" or "höllem" or "mahot" (Forsk.), in Hindustanee "chikra" or "chirchira," in Bengalee "opang," in Tamil "na-yurioi," in Telinga "utta-reni" or "antisha" or "apa-margamu" or "pratyak-pushpi" (Drur.), in Tagalo "libai" or "docotdocot" or "hangor hangot," in Bisaya "hangor," in Pampango "angud" (Blanco); and the "kubdja" or "kubdjaka" of the Institutes of Manu viii. 247 — is referred here by Deslongchamps: the "taruna" or "apamarga" or "pratyakpushpi" is prescribed medicinally by Susrutas sutr. 16 to 36 and chik. 18: *A. aspera* was observed by Rheede x. pl. 78 in Malabar; by Graham, "a common weed" around Bombay, appearing "during the rains;" by Ainslie, Buchanan, Roxburgh, Wight, from Mysore to Bengal and Oude, and by Burmann Zeyl. pl. 50 on Ceylon, its seeds and flowering-spikes given in hydrophobia, scorpion-stings, and snake-bites (Drur.). Farther East, was observed by Mason in Burmah; by Blanco, and myself, on the Philippines; by myself, from the Feejeean throughout the Tropical islands of the Pacific as far as Clermont-Tonnerre coral-island, in some instances having an indigenous aspect. Westward from Hindustan, was observed by Forskal p. 48 in Tropical Arabia; by Drège, in Austral Africa (E. Meyer); by Grant, "about huts 4° 18' S. to 7° N." on the Nile; is known to occur also in Abyssinia and Senegal (Moq., and A. Dec.); was observed by Webb on the Cape Verd Islands; by Forskal, and Delile, around Cairo in Egypt; by Boccone pl. 9, and Sibthorp, in Sicily (Pers.); by Schousboe, in Morocco; and is termed "*amaranthus siculus spicatus radice perenni*" by Tournefort inst. 235. Probably by European colonists was carried to the Mauritius Islands, where according to Bojer it has become naturalized (A. Dec.); to Jamaica (Pers.), St. Croix (West), and other islands in the West Indies. (See *Agrostis alba*).

"114 B. C." (Burm. hist., and Mason 40), Thereret succeeded by Tæpah as Burmese king.*

* *Melanorrhæa usitatissima* of Burmah. A Terebinthoid tree called "theet-sæ" (Mason), yielding the *Burmese black varnish* celebrated from early times, used besides by the natives for a vermifuge, and mixed with bone ashes to stick glass on boxes and images; the timber also of fine quality, resembling *lignum-vitæ*, and affording a red dye: — observed by Wallich, Berdmore, and Mason v. 511 to 514, indigenous in the forests, and sometimes cultivated.

Bauhinia purpurea of the Siamese countries. A Leguminous tree called in the environs of Bombay "dewa kunchun" (Graham); in Burmah "ma-ha-hlæ-ga-nee" (Mason), and from early times familiarly known: — observed by Mason v. 771 indigenous in Burmah. Westward, is termed "b. triandra" by Roxburgh ii. 320; was observed by Rheede i. pl. 33 in Malabar; by Graham, in "gardens Bombay," its "fragrant flowers of a deep rose colour;" by Wight 915, in other parts of peninsular Hindustan. (See *B. variegata*.)

Pterocarpus Indicus of the Siamese countries and Malayan archipelago. A majestic ornamental Leguminous tree called in Burmah "pa-douk" (Mason), and from early times familiarly known: — observed by Mason v. 405 indigenous there, but "propagated by simply planting large branches in the ground:" described also by Rumphius ii. pl. 70 (Pers.), and Roxburgh.

Acacia rugata of Burmah. The *soap acacia*, its dry pods from early times a substitute for soap in cleansing the hair, and its leaves with turmeric affording a beautiful green dye: — observed by Mason v. 515 to 517: described also by Buchanan.

Bruguiera eriopetala, *Carallia lucida*, and *Ceriops Roxburghianus*, of the shores of Bengal and Burmah. Mangroves or tide-water shrubs and trees, from early times familiarly known, — their bark according to Mason v. 515 abounding "in tannic acid," suitable therefore for making leather.

Morinda bracteata of Burmah. A woody Cinchonaceous plant called "yai-yo," its fruit from early times a great favourite with the Burmese, served up in their curries: — enumerated by Mason v. 463 as indigenous, though "often seen" near native dwellings. Described also by Roxburgh.

Psychotria sp. of Burmah. A handsome Cinchonaceous shrub, known from early times for the bright yellow dye obtained from its root: — observed by Mason v. 414 to 512.

Diospyros mollis of the mountains separating Tavoy from Siam. A tree said to grow wild there, called by the Sgau Karens "ma-kleu," and the *Shan black dye* obtained from its fruit celebrated from early times: — the living tree observed by Mason v. 509 "in the gardens of Tavoy and Maulmain."

Daphne? hsæ-læ of the forests of Tenasserim. A large woody creeper, its bark from early times made by Tavoyers into a coarse paper thick as paste-board, which when blackened is written upon with a *steatite* pencil: — observed by Mason v. 521.

Arum furfuraceum of Burmah. Its esculent root known from early times, — and by McClelland termed *scaly yam* (Mason v. 465).

Colcus aromaticus of Tropical Asia. A shrubby Labiate plant, delightfully fragrant, and called in the environs of Bombay "pathur-choor" (Graham), in Bengalee "pathoor-choor" (Drur.); in Burmah "pen-bu" (Mason), and from early times in common use as a potherb: — observed in Burmah by Mason v. 474; by Loureiro 452, in Anam, employed in asthma, chronic coughs, epilepsy, and other convulsive affections; is termed "marrubium album Amboinicum" by Rumphius v. pl. 102. Westward, was observed by Roxburgh, and Long, in gardens in Bengal, the leaves eaten, used besides medicinally by the natives in colic and dyspepsia (Drur.), and a good substitute for borage when put into beer and other drinks; was observed by Law, and Graham, "common in gardens" as far as Surat. The "zatarhendi villosum" observed by Forskal p. cxv to 110 wild among the mountains of Yemen, exceedingly fragrant, and said to be edible and to please monkeys, may be compared.

As early perhaps as this date (Avadan. asok.) Vrihaspati succeeded by Vrichasena, now king at Pataliputra on the Ganges. — He is called Somasarman in the Puranas (Burn. i. 430 to ii. 778).

"113 B. C." (Clint. iii. p. 346), in Syria, withdrawal to Aspendus of Antiochus VI.; and Antiochus Cyzicenus associated with him in the government.

"In this year" (Liv., and Clint.), invasion of the Cimbri and Teutones; crossing the Alps into Illyria and Italy.

112 B. C. = "6th year of Ptolemy VIII.," in a papyrus showing that he had attained his majority and was now sole ruler of Egypt (C. Mull. geogr. min. i. p. lvii.).

About this time (Sm. b. d.), the orator L. Licinius Crassus as Roman quaestor visiting Asia, where he heard Metrodorus of Scepsis. On his return, he received instruction from the philosopher Charmidas at Athens. — He died "B. C. 91."

Larix Europæa of the mountains of middle Europe. Called in Britain *larch*, in Germany "lärche" (Prior), in France "mélèze" (Nugent), in North Italy "larice" (Lenz); and clearly the "picea" tree called according to Metrodorus of Scepsis "padus" by the Gauls, abounding at the source and giving its name to the river Padus, — in the Ligurian language called "Bodincum" (Plin. iii. 20, compared Cerasus padus): the "larix" is mentioned by Vitruvius ii. 9, Isidorus xvii. 7, and is described by Pliny xvi. 19 and 81 as a resin-bearing tree with pungent leaves and strong very durable wood: *L. Europæa* is described by Miller, is known to grow in Switzerland and Germany, and according to Lindley yields *Venice turpentine*. Eastward, this product imported from Subalpine Gaul where it is called "larika" is enumerated by Dioscorides i. 92; and to the present day the living tree continues unknown in Greece (Fraas, and others). By European colonists, *L. Europæa* was carried to Northeast America, where in our Northern States it continues sparingly cultivated for ornament.

"111 B. C." (Liv., and Clint.), war commenced by the Romans against Jugurtha in Numidia. — The war lasted five years.

"The same year" (Strab., and C. Mull. geogr. min. i. p. lvii), return of Eudoxus of Cyzicus from his voyage down the Red Sea to the Indian Ocean. The ship's prow surmounted with a carved horse's head found by him on the East coast of Africa, may be regarded as evidence of *commercial intercourse* with Hindustan (see below Socotra). — At the Braminical city of Toka on the Godaveri, I found river-barges having a figure-head of this pattern.

The "nēsōi thē ēuthaimonēs" fortunate isles (Agatharch. 103) is a translation of the Sanscrit "dvīpa sukhātara," — and hence the name Socotra, according to Bochart and others (C. Mull. geogr. min. p. 191). The Dioscoridis Island of the Greeks, is identified by writers; is said to have been colonized with Greeks by one of the Ptolemies (Cosm. Ind. iii. 179); contained a mixed population of Indians, Arabs, and Greeks in the days of the author of the Erythraean periplus p. 16; is mentioned also by Pliny vi. 32, and Claudius Ptolemy viii. 22; and Cosmas Indicopleustes conversed with some of the inhabitants speaking Greek, but did not land there.

That ships from the "mouth of the Indus" visited Socotra as early as this date, may be inferred from what has been above stated; and the "white cattle with the females hornless" on the "ēuthaimonēs" isles, — are regarded by Ritter, and C. Muller, as the *zebu* or Indian variety: cattle imported by Hindu merchants, were observed by myself in Southern Arabia.

As early possibly as this date, Hindu merchants proceeding farther Westward across the Desert to Meroe on the Nile. — There or in other localities along the river in Upper Nubia, "a figure unknown in Egypt" having "three lion's heads and four arms," was observed by Lepsius eg. and sin. p. 156 to 178 (probably Braminical); also "tanks;" a "small temple, with riders on elephants, lions, and other strange barbarous scenes;" and at Soriba, "Indian work in ebony."

"110 B. C. = 1st year of the 'youan-foung' of Wou-ti" — (Chinese chron. table).

In or about 109 B. C. (see Clint. iii. p. 535, and C. Mull. p. liv.), Agatharchides in his old age writing his account of the Erythraean Sea.

The KPOKOTTAC of East Africa described by Agatharchides 77 — is clearly the *spotted hyena*, *H. crocuta*.

Already in the time of Agatharchides 61, *circumcision* practised by the East African tribes; and in some instances among the Troglodytæ, total excision. "Blood and milk" also mixed together for food by the pastoral tribes; — as to the present day a little farther South among the Galla.

Beyond the agricultural Ethiopians bordering Egypt, the Rhizophagi on the Astaboras, are described by Agatharchides 50 as living on roots of ΚΑΛΑΜΩΝ growing in great abundance in the marshes: — *Phragmites communis*, eight feet high and called "matætæ," was observed by Grant "from 4° 55' N. to 9° N. the banks of the Nile to the horizon are a sea of this reed," and farther South, made into flutes by the Waganda, "said to grow arm-thickness at Lake N'yassa," used for huts.

Herminiera elaphroxylon of Tropical Africa. The *pith-tree* is a Leguminous tree called "ambash" (Grant); and the ΥΛΗC: ΑΠΛΑΛΗC grasped according to Agatharchides 30 by the Ethiopians inhabiting the marshes, — may be compared: *H. elaphroxylon* was observed by Grant from "3° to 8° N.," its light logs used by the natives in swimming across the Nile, and the tree growing "so rapidly that in three years it almost choked up the channel of the r. Bahr-el-Gazelle." Westward, was observed by Guillemain and Perrotet in Senegambia.

Beyond the Rhizophagi, according to Agatharchides 51, the Spermatophagi and Hylophagi much resemble each other; the Spermatophagi living in summer on spontaneous fruits falling from the trees, and during the remainder of the year on an herb BOTANHC growing in shady valleys and having a stem like that of BOYΝΙΑCIN.

Blepharis edulis of Nubia and Tropical Arabia. A Ruellioid plant called in Yemen "zogaf" (Forsk.); and possibly the BOTANHC in question: — *B. edulis* was observed by Grant, the only vegetation "on the firm sand desert behind Meroë, 16° 50' N.;" by Forskal p. 114, about Lohaja and Mor in Yemen, the leaves "sapida," eaten crude; is known to grow as far as Persia (Burm. ind. pl. 42, and Pers.).

Ruellia sp. of Eastern Equatorial Africa. Included perhaps in the "vōtanēs" eaten by the Ethiopians: — observed by Grant "about 2° N." on the steep banks of the Nile, and eaten by his attendants "at Chogwe hills," in 5° 30' S.

Sclerocarya birrea of Eastern Equatorial Africa. A forest tree called "m'choowee" (Grant); and its fruit probably included among those eaten by the Spermatophagi: — observed by Grant from "5° S. to 3° 15' N." on the Nile, the kernels of its fruit eaten, and its wood used for grain-mortars. Received from Africa, and described by Hochstetter.

Anacardiaceæ ?? of Eastern Equatorial Africa. A tree called "m'soowee" (Grant); and its fruit probably among the kinds eaten by the Spermatophagi: — observed by Grant from Turah nullah 5° S. to "Madi 3° N." on the Nile, its bullet-sized plums eaten, and its wood used for grain-mortars.

Detarium sp. of Eastern Equatorial Africa. A Leguminous tree called "bootoo" (Grant); and its pods probably included among the fruits eaten by the Spermatophagi: — observed by Grant at "3° 15' N." on the Nile, its fruit eaten.

Syzygium Guineense of Equatorial Africa. A small Myrtaceous tree called "m'sawa" (Grant); and its fruit probably among the kinds eaten by the Spermatophagi: — observed by Grant in "3° N." on the Nile, its fruit eaten. Westward, was received by Decandolle from Guinea.

Terminalia sp. of Eastern Equatorial Africa. A large tree called "m'foof'oo" (Grant); and its nuts probably included among the fruits eaten by the Spermatophagi: — observed by Grant from Unyanyembé to Gani, 5° S. to 3° N. on the Nile, its nuts eaten, and its wood used for building and for tinting bark-cloth yellow by the Wanyamuezi.

Rubiaceæ of Eastern Equatorial Africa. Called "m'koolookootoot'oo" (Grant); and its fruit probably included among the kinds eaten by the Spermatophagi: — observed by Grant in Madi on the Nile, its drupe pleasant-tasting.

Carissa sp. of Eastern Equatorial Africa. Resembling an orange tree, thorny and called "m'fombwah" (Grant); and its fruit probably among the kinds eaten by the Spermatophagi: — observed by Grant in "3° N." on the Nile, its fruit eaten, and its roots used to remedy coughs by the Wanyamuezi.

Vitex sp. of Tropical Africa. A very handsome umbrageous tree called "m'foo" (Grant); and its fruit probably among the kinds eaten by the Spermatophagi: — observed by Grant in "forests 3° 58' S. to 2° 30' N." on the Nile, its fruit eaten, and wood made into drums: by Livingstone no. 5, observed farther South; received also from Africa and described by Don.

Ficus sp. of Eastern Equatorial Africa. A large tree (Grant); and its fruit probably among the kinds eaten by the Spermatophagi: — observed by Grant "Jan. and Feb.," Madi to Gondokoro "4° 54' N." on the Nile, its figs half an inch in diameter, sweet.

Rhamnus sp. of Eastern Equatorial Africa. A shrub called by the Wanyamuezi "m'quætæ-quætæ" (Grant); and its fruit possibly among the kinds eaten by the Spermatophagi: — observed

by Grant growing by water at "3° N." on the Nile, its berries sweet, and a mash of them and its leaves used to bring fish to the surface.

On the other hand, the Hylophagi according to Agatharchides ascend trees in whole families, and eat ΑΠΑΛΩΤΑΤΗΝ: ΥΑΗΝ the tender parts of the extreme branchlets, and both men and women go entirely naked.

Cratæva Adansoni of Tropical Africa. A Capparideous tree; and its young shoots probably included among the ΑΠΑΛΩΤΑΤΗΝ: ΥΑΗΝ eaten by the Hylophagi: — observed by Guillemin and Perrotet in Senegambia; by Grant, in "3° 15' N." along the Nile, its "fresh shoots made into spinage and young branches into tooth-scrubbers."

Capparis tomentosa of Tropical Africa. Called in Madi "kowangwee" (Grant); and its leaves probably included among the "apalôtatên ulên" eaten by the Hylophagi: — received by Lamarck enc. 606 from Senegal (Pers.); observed by Grant on "Madi plains" on the Upper Nile, in famines spinage made from its leaves.

Afzelia Petersiana? of Eastern Equatorial Africa. A forest tree called "makola" (Grant); and its young leaves probably included in the "apalôtatên ulên" eaten by the Hylophagi: — observed by Grant from Uzaramo opposite Zanzibar to "Madi 3° N." on the Nile, its young leaves eaten as spinage, and its wood used for quivers drums and door-planks.

Leptadenia lancifolia? of Tropical Africa. An Asclepiaceous plant; and its flowers and tender shoots included perhaps in the "apalôtatên ulên" eaten by the Hylophagi: — observed by Grant in "3° N." on the Nile, spinage made of its flowers and tender shoots. "Cynanchum lanceolatum" was received from Africa by Poiret, and is termed "c. hastatum" by Persoon (Steud.).

Protea sp. of Eastern Equatorial Africa. A low tree called in the Kinyoro language "m'zaza," in the Kihiyow "king'eezee" (Grant); and its leaves perhaps included in the "apalôtatên ulên" eaten by the "Hylophagi: — observed by Grant in "Madi woods" on the Upper Nile, the leaves eaten as spinage in dearths, and where it abounds the natives say "copal is also found."

Zizyphus melanogona of Eastern Equatorial Africa. A species resembling *Z. jujuba* is called in the Kinyoro language "kalembo," in Suahili "m'konazee" (Grant); and the ΠΑΛΙΟΥΡΟΥ: ΚΑΡΠΤΟΝ mixed according to Agatharchides 34 in pounded fish by the Ichthyophagi along the sea-coast, — may be compared: also the "grape tree" with "fruit having a stone," seen by Ebn Batuta 9 at Makdashu on the African coast: observed by Grant in Ugani, and common everywhere, its branches made into fences, and its fruit mashed and thrown into the water to bring fish to the surface; observed by myself, a single tree planted on Zanzibar, the leaves glaucous beneath, and clearly the same species in Hindustan, planted around villages on the Deccan. *Z. melanogona* was observed by Bojer, a tree growing on Mombas isle, and specimens were carried to the Mauritius Islands and cultivated.

Zizyphus spina Christi of the Sahara or Great Desert and its continuation in Arabia. Called in Egypt "sidr" or "nabk" (Forsk.) and its fruit "nabqah" (Del.), in Yemen "sidr" or "ghasl" or "ælb," but the straight-branched variety "ardj" or "örredj" (Forsk.); and possibly furnishing the withs ΠΑΛΙΟΥΡΩΝ: ΑΥΓΟΙΣ used according to Agatharchides 63 by the Troglodytes (Galla) in binding up corpses: — *Z. spina Christi* is termed "*z. africana*" by Miller (Steud.); was observed by Alpinus pl. 19 in Egypt; by Forskal, in gardens at Cairo, the fruit eaten; and again by Forskal p. 204, in Tropical Arabia; is known to grow in Aethiopia, and as far as Palestine (Pers.). Westward, was observed by Desfontaines fl. atlant. in Algeria (Del.); is perhaps the species seen by myself not exceeding the dimensions of a shrub on the Cape Verde Islands.

Bassia Parkii of Tropical Africa. The *shea butter tree* is called "meepampa" (Grant); and the drink according to Agatharchides 61 made from a flower for the Troglodyte chiefs, and resembling poor must ΓΛΕΥΚΕΙ, — may be compared (sugar and an intoxicating liquor being obtained from the flowers of other species of *Bassia* in Hindustan): *B. Parkii* was observed by Grant only at "3° N." on the Nile, its thick bark cut away to cause the exuding of a hard white insoluble gum, but its wood too hard for the iron tools of the natives. Westward, was observed by Park in Senegambia, and is described by G. Don. According to Burnett, much of the *palm oil* of commerce is yielded by species of *Bassia* or other Sapotaceæ (Lindl.).

Salvadora Persica of Nubia, Abyssinia, and Tropical Arabia. Called in Nubia "rak" (Del.) or "arak" (Grant), in Yemen "rak" or "redif," or the tree "ork" and its fruit "kebath" (Forsk.); and the ΚΑΡΔΑΜΟΥ of incredible size, growing according to Agatharchides 84 on the plains extending from the extreme promontory of the Troglodytes (beyond the Red Sea) back to the Psebaean mountains, — may be compared: the "mustard-tree" of the parable (Matth. xiii. 31, Mark iv. 31, and Luke xiii. 19), or the "chardal" of the Talmudists affording timber "sufficient to cover a potter's shed," is referred here by Royle (Kitt. bibl. cycl.): and "rahôus" are mentioned by Pausanias ii. 32: "rack-trees" were observed by Bruce on the Taranta mountains in Abyssinia; *S. Persica*, celebrated in Arab song as an antidote against poison, was observed by Forskal p. 32 along the base of the mountains in Yemen; its fruit eaten, and bruised leaves applied to tumours; by Grant,

on the "Nile banks in any quantity at 7°," its wood used for tooth-scrubbers; by Delile, on mount Ghareb in Upper Egypt; by Irby and Mangles, at the Southern extreme of the Dead Sea; and is known to occur in the low valley of Engedi (J. D. Hook., and Sm. bibl. dict.). Farther East, "grows to be a very large tree" in Scinde and Northern Hindustan (Drur.); is called in Northern Hindustan "kharjal" (Royle) or "miswak" toothbrush tree (pharm. Ind.), in Telinga "ghoonia" or "peddavarago-wenki," in Tamil "ooghai" (Drur.); was observed by Roxburgh cor. i. pl. 26, Ainslie, and Wight, on the Circars and in peninsular Hindustan; by Graham, "near the sea, both Concans," but by myself, a large tree planted around villages on the Deccan; the berries according to Stewart punj. are sweetish and much eaten, the seed according to Royle having an aromatic pungency and substituted for mustard; and according to Lindley, and others, the bruised bark of the root is often used by the natives for raising blisters.

Mimusops kummel of Abyssinia. A tall tree called there "kummul" (Bruce), on the Nile "m'nyemvee" (Grant); and probably included by Agatharchides 84 among the various fruits unknown to the Greeks and having a feeble ΝΥΘΡΑΝ taste, growing in this region:—*M. kummel* was observed by Bruce xii. pl. 54 in Abyssinia; by Grant, at "3° 15' N." on the Nile, in the bed of a rocky stream, common.

Raphia vinifera of Equatorial Africa and Madagascar. A lofty palm called on Madagascar "raffia" or "ruffia" (Boj.), on the Upper Nile "nakhl-el-Faraon" Pharaoh's date palm (Schweinf.); and a ΦΟΙΝΙΚΟΣ of incredible size is mentioned by Agatharchides as growing in this region:—*R. vinifera* was observed by Beauvois pl. 45 frequent along the banks of streams in Oware and Benin; by Schweinfurth v. to xiv., in Lat. 5° on the Upper Nile, its fronds "twenty-five to thirty-five feet" long, their midrib "the most popular building material throughout Central Africa," and observed by myself substituted for house-ladders on Zanzibar; growing also according to Bojer in marshes along the East coast of Madagascar. By European colonists, was carried to the Mauritius Islands, where it continues under cultivation and growing spontaneously (Boj.). From transported specimens is described by Jacquin fr. pl. 4 (Pers.).

Thespesia populnea of Tropical shores from Africa to the Samoan Islands in the Pacific. The *bend*, or *portia* tree is called in Hindustanee "parsippu," in Bengalee "poresh," in Canara "boogooi," in Telinga "ghengheravie," in Tamil "poorasoo" or "porsung" (Drur.); and the ΜΑΛΑΧΗC of incredible size, growing according to Agatharchides 84 in the region in question, — may be compared: *T. populnea* was observed by myself planted in a court-yard in Mocha, its leaves used medicinally as a cooling application, while at Zanzibar the tree was growing wild along the seashore; is known to occur also in Guinea (Graham). Eastward, was observed by Rheede i. pl. 29 in Malabar; by Graham in the environs of Bombay, but by myself only under cultivation there; by Roxburgh, Ainslie, Wight, and Drury, in other parts of peninsular Hindustan and as far as Bengal, remarkable for its easy growth from cuttings and frequently used for roadside avenues, its wood making pretty furniture, and selected for purposes where closeness of grain is required; by Mason, "exotic" in Burmah; by myself, to all appearance indigenous in the Malayan archipelago; by Blanco, on the Philippines, and called in Tagalo "boboi gubat," and is figured by Rumphius ii. pl. 74 (Pers.). Farther East, was known to the first colonists of New Zealand, for its Polynesian name "miro" (Hale) was retained for a New Zealand tree (see *Podocarpus ferruginea*); was observed by myself sub-maritime and indigenous along the shores of the Feejeean, Tongan, and as far as the Samoan islands; by Rich, on the Tarawan coral-islands; but clearly by Polynesian colonists, had been carried to the Hawaiian Islands, where it continued under cultivation.

The "Isles of the Chelonophagi," — described by Agatharchides 47. as low, very numerous, and abounding in *sea-turtle*, seem to be the Laccadive and Maldivé Islands; this being the earliest Greek notice of *coral-islands*. The Chelonophagi are also mentioned by Artemidorus, Pomponius Mela, Pliny, Solinus, Claudius Ptolemy, and Marcianus.

The absence of *twilight* in this low latitude, and the disappearance during a portion of the year of the constellation Great Bear, — are mentioned by Agatharchides 104.

The "Isles of the Chelonophagi" (Maldivé Coral-islands) continuing devoid of useful plants in the days of Agatharchides, the American coast visited by Polynesians hardly earlier than this date.

Cocos nucifera of islands along the Pacific side of the Panama Isthmus. The *cocoanut palm* is called in Mexico "coyolli" (Hernand), at Tahiti the fruit "nia" and the palm "ari" (Forst. esc. 49), throughout the Polynesian islands "niu," but also at Tahiti "ha'ari," by the Pomotuans "here-rei," by the Mangarevans "erei," by the Marquesans "eei," by the Rarotongans "akari" (Hale), throughout the Philippines "niog" in Tagalo and Ylocano and Camarines, but in Pampango "ngongot" (Blanco), in Malay "nyor" (Crawf.), in Burmah "ung" (Mason), in Sanscrit "narikela," in Telinga "nari kudum" (A. Dec.), in Bengalee "narikel," in Hindustanee "nariyal" (D'roz.), in Tamil "taynga" (Drur.), in Yemen "nardjil" (Forsk.); and known to the Polynesians, if not before colonizing the Hawaiian islands, prior at least to their colonizing New Zealand, for on leaving the Trop-

ics they yet retained its name, "kakari" — in New Zealand signifying "feast : " *C. nucifera* throughout the Pacific occurs only on those islands to which it has been carried by the natives, a fact well known to traders ; was observed by myself only under cultivation throughout the islands of the Pacific and the Malayan archipelago. Farther West, three hundred and sixty different uses of a "phōinikōs" are enumerated in a Persian poem (Strab. xvi. 1. 14) ; nuts were seen by Apollonius of Tyana in Hindustan, such as in the days of Philostratus iii. 5 were kept as curiosities in the temples of Greece (Beckm.) ; the "karuōn mēgistōn tōn inthikōn" is mentioned in pseudo-Callisthenes iii. 8, "karustōn tō mēgistōn tō inthikōn" by Palladius brachm. 5 (C. Mull. fragm. Ctes.) ; "argellia" were growing on the Maldives and Laccadives in the days of Cosmas Indicopleustes xi. 336 ; "na-lo-k'i-lo" were seen in Hindustan by the Chinese traveller Hiouen-Thang ; the cocoanut palm is fully described by Ebn Wahab, and Abu Zaid, who speak of a class of devotees planting it on uninhabited islands (a seeming explanation of its presence on the Mauritius Islands "two centuries" before the time of Marcgraf) ; and imported nuts are mentioned by Rhazes, Haly Abbas, Avicenna, and Mesue : *C. nucifera* was observed by myself along the seashore of Western Hindustan and Eastern Equatorial Africa, cultivated for its crude sap or "toddy ;" at Muscat, was said to be cultivated "in the Interior country ; at Mocha, a locality given by Forskal, I found only one or two young shoots ; but in Egypt, nuts in quantities imported by the way of Mecca and the Thebaid. Eastward from the Polynesian islands, nuts were seen by Columbus on his fourth voyage, in Central America (Churchill coll.) ; the living *C. nucifera* is said by Oviedo to abound "in the province of the cacique Chimam," on the Pacific side of the Isthmus ; by Dampier, to grow not on the main land but on outlying islands ; was observed by Wafer, and Vancouver, covering the uninhabited not far distant Cocos Island. By European colonists, was carried to the West India islands in the life-time of Petrus Martyr i. 148 (Sloane ii. 9) ; afterwards to Brazil (Marcgr. and Pis. 65 to 138) ; to Congo and Benguela (Marcgr. 138, and Mart. 125) ; and to the Cape Verd Islands, observed there by myself.

Paritium tiliacum of wooded Tropical shores around the Globe. A straggling interlaced tree of medium size called in Malabar "paroottee," in Bengalee "bola" (Drur.), in Burmah "lyee-nyasha" (Mason), in Tagalo and Pampango "balibago," on Cebu "malabago" and Dagami "raguindi" (Blanco), on the Feejeean Islands "vau," on the Tongan Samoan and Nukahivan Islands "fau" (Hale), by the Mosquito tribe of Honduras "maho" (Damp.), in Carib "onagneii" (Descourtilz) ; and except on secluded coral-islands familiarly known to the Polynesians : — observed by myself forming groves along the seashore from the Hawaiian Islands and Metia to the Feejeean Islands and the Malayan archipelago, its bark everywhere used by the natives for making cordage, coarse and fine ; by Blanco on the Philippines, and by Rumphius ii. pl. 73, used for the same purpose ; by Mason v. 520 in Burmah, one of the three trees from which "ropes are more frequently made ;" by Rheede i. pl. 30, in Malabar ; by Roxburgh, Wight, and Drury, in other parts of the peninsula ; but by Graham, under cultivation only in the vicinity of Bombay. Westward, was observed by Drège in Austral Africa ; is known to grow along the Atlantic in Equatorial Africa (R. Brown, Hook., and A. Dec.) ; was observed by Lerijs, and A. Saint-Hilaire, in Brazil ; by Sloane, Macfadyen, and Descourtilz, in the West Indies ; by Dampier in Honduras, its bark furnishing cords and fishing lines. "P. tricuspe," a single tree observed on Taheiti, appeared to me only a remarkable deviation in the form of the leaf. *P. macrophyllum*, distinguished in Burmah and called "bet-mwæ-shau," is enumerated by Mason v. 520 as another of the three trees from which "ropes are usually made."

Siegesbeckia Orientalis of Tropical and Subtropical Australia? A weed called in the environs of Canton "chimag" (Osb.) ; and known to the Polynesians as early probably as this date : — received from Mexico (Pers.) ; observed by myself in cultivated and fallow ground on Metia, Taheiti, Tongatabu, New Zealand, and seemingly indigenous on the tide-water flat of the Hunter river in Australia ; observed by Thunberg, in Japan ; by Osbeck, in the vicinity of Canton ; by Roxburgh, and Wight, in peninsular Hindustan ; by Graham, and Lush, "common in the Deccan," but no native name is given ; by Forskal p. 151, in Tropical Arabia ; and received from the Caspian countries by Buxbaum cent. iii. pl. 52, and Bieberstein (Steud.) ; was observed by Bojer on Madagascar and the Comoro Islands. Probably by European colonists was carried to the Mauritius Islands, where it has become naturalized (Boj.).

Ageratum conyzoides of Tropical America. A weed carried to the islands of the Pacific as early perhaps as this date : * — observed by myself abounding seemingly indigenous on the Hawaiian

* *Adenostemma viscosum* of Tropical America? An herbaceous weed carried to Taheiti as early possibly as this date : — observed there by Forster prodr. 284 ; by myself, there and on the Hawaiian, Samoan, and Feejeean Islands, frequent in neglected clearings, also in the Malayan archipelago ; by Thunberg, in Japan ; by Burmann pl. 42, on Ceylon ; by Rheede x. pl. 63, in Malabar ; by Graham, "a common weed" as far as Bombay.

Bidens pilosa of Tropical and Subtropical America. A white-rayed species carried to the islands

Islands, and naturalized on the Taheitian and Feejeean; by Blume bijdr. 906, on Java; by Mason, in Burmah; by Hermann par. 161 (Spreng.), and Gardner soc. hort. iv. 40, on Ceylon; by Roxburgh, in Hindustan, but devoid of a Sanscrit or any ancient name (A. Dec.); by Law, and Graham, "one of the commonest weeds in gardens at Belgaum," also "in Bombay, and generally everywhere;" by Bojer, on Madagascar; by myself, on Zanzibar; by Grant, "common near fields 2° N." on the Nile; is known to occur as far as the Atlantic at Cape Verd (Perrottet) and Congo (R. Brown). Westward, was observed by Sloane i. pl. 152 in the West Indies; by myself, in Southern Brazil; and is known to grow from S. Lat. 37° in Chili along the Western coast as far as the Galapagos Islands (Beech. voy. 30, and J. D. Hook.) and Mexico (Kunth). By European colonists, was carried to the Mauritius Islands, where it has become naturalized (Boj.); to Austral Africa (Drège); to St. Helena and Madeira, observed by myself; to the vicinity of Savannah in Georgia (Torr. and A. Gray, and Chapm.). Transported to Europe, is described by Plukenet phyt. pl. 88.

Ipomoea pes-capræ of sandy Tropical shores around the Globe. A spreading prostrate vine called in Malabar "schovanna-adamboe," in Hindustanee "dopâte-luta," in Bengalee "chagulkhooree" (Drur.), in the environs of Bombay "dobutee-luta" or "chagul-koon" (Graham), in Burmah "pen-lay-ka-zwon" (Mason), in Tagalo and Bisaya "catangeatang" or "lagairai" or "lampayong," in Ylocano "lambayong" (Blanco); and, except on secluded coral-islands, familiarly known to the Polynesians all the way to the shores of America:—observed by myself in loose seaside sand from the Hawaiian Islands and Metia to the Feejeean Islands; by R. Brown, as far as the shores of Australia; is described by Rumphius v. pl. 159; is known to grow in China (Graham); was observed by Blanco frequent on the seashore of the Philippines, its leaves regarded by the natives as having the remarkable property of removing excrescences in wounds; by Mason v. 479, in Burmah, its leaves applied externally for medicinal purposes; by Rheede xi. pl. 57, in Malabar; by Roxburgh, and Drury, in other parts of Hindustan; by Graham, "common on sandy beaches as far as Bombay, its leaves boiled by the natives and applied externally in colic; by myself, on Zanzibar. Westward, is known to grow on the Atlantic side of Equatorial Africa (R. Brown cong., and Benth. fl. nigr.); was observed by myself on the seashore of Southern Brazil; is known to grow also in the West Indies and as far as St. Augustine and N. Lat. 31° on Cumberland isle (N. A. Ware, J. Read, Ell., and Chapm.); also from La Guayra to Porto Bello on the Panama Isthmus; and was observed by J. D. Hooker on the Galapagos Islands. Transported to Europe, is described by Hermann hort. lugd. pl. 175.

Physalis angulata of Tropical America. Called in Malabar "inota inodien" (Rheede), in Burmah "pung-ben" (Mason), in Ylocano "tuttullacac" (Blanco), on Taheiti "tamani" (Bertero), on the Hawaiian Islands "kamani" (. . .); and carried to the islands of the Pacific as early perhaps as this date:—observed by Bertero on Taheiti; by myself, a weed only, diminutive and smooth, on the Hawaiian, Taheitian, Samoan, Tongan, and Feejeean Islands, and the Malayan archipelago; by Blanco, on the Philippines; by Thunberg, in Japan; by Mason, in Burmah; by Grant, its "leaves used as a vegetable, by huts 2° N." on the Nile. Eastward, was observed by Ruiz and Pavon ii. 42

of the Pacific as early perhaps as this date:—observed by Mann on the Hawaiian Islands; by myself, a weed on the Taheitian, Samoan, Tongan, and Feejeean Islands; by Forster, on the Tongan Islands; and by him, and Lesson, on New Zealand (A. Dec.). Eastward, was observed by myself in the environs of Valparaiso and Lima; by Aublet 794, in Guayana; by Maycock, in the West Indies; and by Chapman, in "South Florida." By European colonists was carried to the Bay of San Francisco, where I was informed by Spanish residents it gave the name "Herba Buena" to the landing-place on the South side (now the city of San Francisco); was also carried to the Canary Islands (A. Dec.), Cape Verd Islands and neighbouring coast of Guinea (Webb in fl. nigr. 142), and to the Mauritius Islands (Dec.). Transported to Europe, is described by Dillenius pl. 43 (Pers.).

Dracontium (Arisama) polyphyllum of Tropical America. Called in Guayana "labaria," being one of the remedies against the bite of the labarri snake (Lindl.), observed by Descourtilz wild in the West Indies: carried to the Polynesian islands as early possibly as this date:—cultivated on the Society Islands and its roots eaten in times of scarcity, also in Japan where a medicine is prepared from them (Drur.); observed by myself frequent in cultivated ground on the Samoan Islands, rare on the Feejeean. Farther West, is called in Tamil "caat-karnay" or "caat-carnaykalung," in Telinga "adivie-kanda," in Hindustanee "junglai-kandi" (J. F. Wats.); was observed in Hindustan by Ainslie, Piddington, Speede, and R. N. Brown, the prepared root regarded as antispasmodic, a valuable remedy in asthma, and used by the natives in hæmorrhoids (Drur.).

Canna angustifolia? of Tropical America. A low yellow-flowered species that may have been introduced into the Hawaiian Islands as early as this date:—observed by myself only on Oahu, abundantly naturalized in the valley leading inland from Honolulu.

in Peru; is known to grow in the West Indies (Pers.); was observed by Baldwin as far as N. Lat. 30° in Florida, by Chapman in "fields and waste ground Florida and Northward," and by Elliot as far as Savannah. Transported to Europe, the "*helicacabum*" of Camerarius hort. med. pl. 17 is referred here by Sprengel, and *P. angulata* is described by Dillenius elth. xiii. pl. 12. "*P. minima*" observed by Rheede x. pl. 71 in Malabar, described also by Hermann lugd. pl. 571 (Pers.), "a common annual" around Bombay and "covered with clammy hairs" is yet regarded by Graham as probably not distinct.

Euxolus viridis of Tropical America. A weed called in Brazil "*caruru*" (Lindl.); and known to the Polynesians as early perhaps as this date:—observed by Lay and Collie on the Taheitian Islands; by myself, on Metia and the Samoan Islands; is known to grow on Java (Moq.); was observed by Roxburgh in Hindustan; by Graham, as far as Bombay, "a common weed in gardens and cultivated grounds," but he gives no native name; is known to occur also near dwellings in Abyssinia, North Africa, and as far as Europe and the Canary Islands. Eastward from the islands of the Pacific, was observed by Marcgraf and Piso 241 before 1658 in Brazil, where it continues to be used "for emollient poultices" (Lindl.); was received from Brazil and the West Indies by Moquin (Dec. herb. and prodr.).

Canna Indica of Tropical America. The scarlet-flowered *Indian-shot* is called in Malabar "*katoo-bala*," in Tamil "*kull-valei-munnie*," in Telinga "*krishna-tamarah*," in Bengalee "*surbo-jaya*" (Drur.), in the environs of Bombay "*dewa-keli*" or "*nana-keli*" or "*vana-keli*" or "*akulbuera*" (Graham), in Burmah "*bud-di-tha-ra-na*" (Mason), in Tagalo "*cacuentasan*" or "*ticas*" or "*ticas ticas*" or "*tiquis tiquis*" (Blanco), in Carib "*couroualy*" or "*balyry*" or "*bacucacanga*" (Desc.); and known to the Polynesians as early perhaps as this date:—observed by myself cultivated by the natives for ornament on the Taheitian, Samoan, Tongan, and Feejeean Islands, and found by Rich naturalized on the Samoan Islands; is termed "*cannacorus*" by Rumphius v. pl. 71; was observed by myself in gardens at Manih; by Mason v. 434 to 806 "*exotic*" in Burmah, much cultivated by the natives "for the seeds which they use for sacred beads;" by Rheede xi. pl. 43. in Malabar; by Roxburgh, and Drury, in other parts of Hindustan, its root given to cattle that have eaten poisonous grass; by Graham, "in gardens everywhere" in the environs of Bombay, and sometimes called *Indian bead*. Eastward from the islands of the Pacific, seeds were brought to Portugal from the West Indies in the early part of the Sixteenth century (C. Bauhin); "its leaves are used to thatch houses with in Cayenne" (Graham); and the living plant was seen in the West Indies by Descourtiz; by myself, seemingly wild in the environs of Rio Janeiro. By European colonists, may have been carried to the Hawaiian Islands, where I found it only in the gardens of resident Whites. Transported to Europe, is described by Gesner, Lobel, Camerarius, and Morison iii. pl. 14; has become naturalized on Sicily (Guss., Parlat., and A. Dec.); and was observed by Forskal, and Delile, in the gardens of Egypt, its seeds sold in the drug-shops.

Kyllingia pumila of Tropical and Subtropical America. A diminutive Cyperaceous weed called in Tagalo "*muthang anuang*" (Blanco); and except on secluded coral-islands, long familiarly known to the Polynesians:—observed by myself in moist situations, as though accompanying taro culture, on the Hawaiian, Taheitian, Samoan, and Feejeean Islands, and in the Malayan archipelago; by Blanco, frequent on the Philippines and known to the natives; is known to occur on Timor (Decaisne); is described by Rumphius vi. pl. 8; was observed by Mason in Burmah; by Rheede xii. pl. 53, in Malabar; by Roxburgh, in other parts of Hindustan; by Graham, as far as Bombay; by Forskal, "*schoenus dubius? spicar. capit. terminal.*" on the mountains of Yemen; by Bojer, on Madagascar and the Comoro Islands; and is known to occur in Western Equatorial Africa. (Benth. fl. nigr.). Eastward from the islands of the Pacific, was observed by myself in Peru and Southern Brazil; was received by Kunth from Caraccas; was observed by Baldwin at Bahia, and at Savannah in Georgia; by Pursh, and Elliot, in South Carolina; by Chapman, "wet places Florida to North Carolina;" by Nuttall, along the Mississippi; by Short, in Kentucky; and by Michaux, as far as the Scioto. By European colonists, was carried to St. Helena, observed there by myself; to the Mauritius Islands (enumerated by Bojer as indigenous).

Cenchrus echinatus of Tropical and Subtropical America. A spiked *bur grass* called in Yemen with other burs "*hobb el adjais*" (Forsk.), in Tagalo "*aguinai*" (Blanco), and carried to the islands of the Pacific as early perhaps as this date:—received by Cavanilles v. pl. 463 from Babao (Tongan Islands); observed by myself abundantly naturalized on the Hawaiian, Taheitian, Tongan, and Feejeean Islands; by Blanco, at Batangas, and received also from Luzon by Kunth i. 166; by Benth. from Hindustan; observed by Forskal p. 25 at Menejræ in Yemen; and known to occur in cultivated ground in Western Equatorial Africa (Benth. fl. nigr.) and Barbary (Pers.). Eastward from the islands of the Pacific, is known to grow in Mexico, Cumana, Brazil, the West Indies (Kunth); was observed by Elliot in South Carolina; by Chapman, in "fields and waste grounds. Florida to North Carolina." By European colonists, was carried to the Mauritius Islands,

where it has become naturalized (Boj., and A. Dec.). Transported to Europe, is described in 1696 by Plukenet alm. pl. 92.

"108 B. C. = 4th year of the war with Jugurtha, Q. Fabius Maximus Allobrogicus and C. Licinius Geta censors at Rome" (Sm. b. d.). Not earlier than this date, the Licinian sumptuary law, assigning a limit to "the expense of eating for each particular day." The law is attributed to P. Licinius Crassus, whose brother M. Licinius Crassus — became praetor in the following year; it was abolished "B. C. 98" (A. Gell. ii. 24, Val. Max. ii. 9. 5, Blair, and Sm. b. d.).

The law is mentioned by the poet Lucilius, — who died "B. C. 103" (Hieronym. chron.).

Chenopodium rubrum of Europe and the adjoining portion of Asia. Called in Britain with other species *goosefoot* (Prior), in Germany "gänsefuss" (Grieb); and the CHAENOPADAS of Lucilius, — and Macrobius, is referred here by writers: C. rubrum is described by Morison ii. pl. 31, is termed "c. pes anserinus primus" by Tournefort inst. 506, and is known to occur in waste and cultivated ground throughout middle Europe as far as Denmark (fl. Dan. pl. 1149, Curt. lond. vi. pl. 20, and Pers.). Eastward, was observed by Sibthorp along walls at Constantinople; and by Forskal around Cairo in Egypt. (Compare C. album.)

"107-6 B. C." (Porphyr., and Clint iii. p. 399). The hieroglyphic ovals of Ptolemy IX. Alexander, occur on the monuments: but his reign is included in that of his brother Ptolemy VIII. (see below).

"105 B. C.," date of a deed for the sale of a piece of land (discovered in Egypt and translated by Champollion-Figeac p. 439). The deed is accompanied with evidence, of the existence already of the system of *public Registry*.

"104 B. C. = 1st year of the 'tai-tsou' of Wou-ti" (Chinese chron. table). Sse-ma-thsian about this time commencing his great historical work, called the "Sse-ki" — (Pauth. p. 246).

The same year (= "109th Ol." of Marcian peripl. Menipp. 3), Artemidorus of Ephesus writing. He had visited "gathëira" (Cadiz) and "Iërou akrōtëriou" (Cape Sagra), and describes the Spanish women as equalling the men in manliness, a point "in common with the Celts, Thracians, and Scythians," working in the fields, and not quitting even during parturition.

The East African coast beyond "Nōtōu kēras" (Cape Gardafui opposite Socotra), unknown in the time of Artemidorus — (Strab. xvi. 4. 14).

Bambusa sp. of Equatorial Africa. A species of *bamb o*; and "kalamōn inthikōn" used for bows on the upper waters of the Nile, is mentioned by Artemidorus: — "kalamōus" like the "inthikōis" were sent home by Bogus to his wife (Strab. xvi. 4. 9 to xvii. 3. 5): B. sp. was observed by Grant near the Eastern coast on the "Usagara hills 6° 30' S., and not again till 3° 15' N." on the Nile, growing in thick clumps fifteen to twenty feet high, and used for houses, baskets, bows, and spear-handles.

*Dalbergia melanoxylo*n of Equatorial Africa. A small tree called in the Kinyoro language "m'teendee," in the Suahili "m'pingo," at Ugogo "m'gembeh" (Grant); and the arrows "pëpurak-tōmēnōis" hardened in the fire, used according to Artemidorus by the same naked people — (Strab. xvi. 4. 9), may be compared: D. melanoxylo was observed by Grant "from 5° S. to 5° N." on the Nile, its hard heavy wood, impervious to insects, used for rafters, arrow-tips, wooden hammers for beating bark cloths, and its "root a cure for toothache." Westward, was observed by Guillemin and Perrotet in Senegambia.

Acacia horrida of Tropical Arabia. Called in Yemen "ōrfota" (Forsk.): and the "sturax" produced according to Artemidorus on the African side of the entrance to the Red Sea — (Strab. xvi. 4. 13), may be compared: A. horrida was observed by Forskal p. 177 along the base of the mountains of Yemen, its wood and "resina" employed in epilepsy as a fumigation, also in curing *Guinea-worm*, a disease called "sora" and the worm "ōrk." Transported to Europe, the plant is described by Plukenet alm. iii. pl. 121, and Jacquin hort. iii. 75 (Pers., and Steud.).

Acacia populifolia of Tropical Arabia. A tree called in Yemen "mudah" or "vudah," but by resident Banyans "baresch" (Forsk.); and possibly the "iëron aigëirōna" already in the days of Artemidorus on the African side of the entrance to the Red Sea — (Strab. xvi. 4. 14): F. populifolia was observed by Forskal p. 180 among the mountains at Wadi Zebid, the dried leaves bruised and used for tanning, and matchlock cords made from the bark. Eastward, "F. cordifolia" called "pair" in the environs of Bombay (Graham), and "nyoung-gyat" in Burmah, where it is usually substituted for F. religiosa near "religious edifices" (Mason), may be compared. (See F. religiosa.)

Laurus (Oreodaphne) cupularis of Madagascar and the Mauritius Islands. A very large tree called in commerce "cinnamon of the Isle of France" (Lindl.) or by French residents "bois de canelle" (Aubl.); and the ΨΕΥΔΟΚΑCΙΑΝ attributed by Artemidorus to the African side of the entrance to the Red Sea — (Strab. xvi. 4. 14), may be compared: O. cupularis is known to grow in woods on the islands of Mauritius and Bourbon (Aublet i. 363, Lam., and Pers.), and on Madagascar, its wood "strong scented" (Lindl.).

Saccharum? *sp.* of Eastern Equatorial Africa. A grass five feet high (Grant); and the "phlōun" abundantly produced according to Artemidorus by a river on the African side of the entrance to the Red Sea — (Strab. xvi. 4. 14). may be compared: *Saccharum?* *sp.* was observed by Grant from the "Equator to 2° N." on the Nile, used by the Uganda and Unyoro for thatch (no flowers).

Pennisetum Benthami of Equatorial Africa. A reed ten feet high, called "maweengo-weengo" (Grant); and possibly the "phlōun" in question: — *P. Benthami* was observed by Grant "by water, Equator to 3° N., etc.," used in Uganda for fences and walls of houses, and slips as knives to cut meat. Received from Africa, and described by Steudel.

The river porpoise of the Ganges, *Delphinus Gangeticus*, mentioned by Artemidorus (Strab. xv. 1. 72): also, the presence there of crocodiles (the slender-beaked species, *C. Gang.*?).

"102 B. C." (Liv., Blair, and Clint.), the Teutones defeated at Aquæ Sextiæ (Aix in Provence) by the Roman army under Marius.

Descriptions of plants by Cratevas, Dionysius, and Metrodorus, were accompanied by figures — (Plin. xxv. 4). Plants of late painted "nēographa" are mentioned by Meleager cor. i. 55.

Corydalis tuberosa of Europe. The "mithridatium" named after Mithridates by Cratevas, its root giving out two "acantho"-like leaves and between them a stem bearing "roseum florem" — (Plin. xxv. 26). may be compared: *C. tuberosa* is described by Cæsalpinus vi. 75; has two leaves and a simple stem and purple flowers (Spreng., and Lindl.), and is known to grow in shady woods in France (Dec. fl. fr. iv. p. 627, and Pers.). The root according to Lindley is "hollow" also "very bitter and rather acrid," and with that of the next species constitutes the "radix aristolochiæ" of the shops, "principally employed as an external application to indolent tumours."

Corydalis fabacea of middle and Northern Europe. Sold with the preceding under the name "radix aristolochiæ" (Lindl.), and perhaps the "aristolōhia" prescribed against gout by Cratevas, — and Gallus, further described in the addition to Diosc. iii. 4 and identified with the "arariza" or "mēlēkaproum" or "ēphēstiōs" or "lēstītis" or "puxiōnux" or "tharthanōs" or "iōntītis" of the Greeks, and "sōpitis" of the Dardanians. Farther South, with the "sōphōēph" of the Egyptians. Westward, with the rustic "apsinthiōn" of the Dacians, "thēximōn" of the Gauls, "hamaimēlōn" of the Sicilians, and "tērrai mala" of the Italians: the external application of "pistolochiam" root was prescribed against gout by Celsus, and the "plistolochia" is distinguished from the "aristolochia" by Pliny xx. 14 and xxv. 55 and 90: *C. fabacea* is termed "pistolochia intermedia" by Bernhardi; is described also by Retz, and Ehrhart; and is known to grow in shady mountainous situations in Germany and other parts of middle Europe as far as Sweden (fl. Dan. pl. 1394, Pers., and Wahl.). The root according to Lindley is "solid," but like that of the preceding species "very bitter and rather acrid."

Papaver argemone of middle Asia. Called in Greece "agria paparōna" (Fraas): the "argēmōnē" of Cratevas, — and Dioscorides, resembling "agria mēkōni," but the leaves multifid "anēmōnē"-like, the flower scarlet, capsule longer than in "mēkōni rōiathi" and enlarged at the summit, and the plant or root exuding a yellowish acrid juice, is referred here by writers: *P. argemone* was observed by Sibthorp, and Chaubard, in cultivated ground from the Peloponnesus to the Greek islands; by Bieberstein, in the seaside sand of the Crimea. Westward, the "argēmōnē" or "ōinōnē" or "anthēmīs" or "anthōs pēthinōn" field flower or "ōmōnōia" is identified in Syn. Diosc. with the "kōrna" of the Gauls, and "livōrnia" or "kogkōrthialis" or "pērgalia" of the Romans: the "argemonia" is described by Pliny xxv. 56, and as occurring in cultivated ground in Italy: *P. argemone* was already in Britain in the days of Gerarde (Wats., and A. Dec.); is termed "p. erraticum capite oblongo hispido" by Tournefort inst. 238; and is known to occur in grain-fields and sandy soil in Southern and middle Europe as far as Denmark (fl. Dan. pl. 867, and Pers.).

Nasturtium armoracia of the Uralian plains. Called in Britain *horseradish* (Prior), in Germany "meerrettig" (Grieb), in Russian "chren" (Moritz), in old French "moutarde des Allemands" and in current French "cran" or "cranson" (A. Dec.), in Italy "armoraccio" or "rafano rusticano" (Lenz), by the Greeks of Constantinople "kranōs" (Fraas), in which we recognize the kind of ΘΛΑΠΤΙ called ΠΕΡΙΚΟΝ: ΚΙΝΗΤΙ described by Cratevas as having broad leaves and a great root which is mixed in washes for sciatica — (Diosc. ii. 185): the account is copied by Pliny xxvii. 113: *N. armoracia* was observed by Pallas trav. i. 308 on the Lower Volga; by Belon, at Constantinople; by Grisebach, seemingly wild in European Turkey; is known to grow wild from Finland to Astrakhan and the Desert of Cuman (Ledeb., and A. Dec.). Westward, is regarded by A. Decandolle as introduced into Britain prior perhaps to the visits of Romans; is described by Petrus Placentius, Fuchsius 660, Matthioli, and T. Johnson, and is known to occur cultivated and naturalized in Italy and throughout middle Europe as far as Norway and Sweden (Pers., Fries, and Lenz). By European colonists, was carried to Northeast America, where it continues under cultivation and

has become naturalized, occurring in wild situations in New England. The root according to Lindley "is stimulant, diaphoretic, and diuretic, and externally rubefacient: it is used in paralysis, rheumatism, dropsy, and some cutaneous affections."

Verbena officinalis of the Galapagos Islands and neighbouring continental America. Called in Britain *vervain* or *pigeon's grass* (W. Coles, and Prior), in Sweden "jernört," in Germany "eisenkraut" (Spreng.), in France "verveine" (Nugent), in Italy "berbena" (Targ.), in Greece "staurō-vōtani" (Sibth.) or "agria hamanthrua" (Fraas), in Japan "komatsutsura" or "babinso" (Thunb.); and the ΠΕΡΙCTΕΠΙΩΝΟC of Cratevas, its leaves divided in such a manner as to resemble a dove's foot — (schol. Nicand. ther. v. 860) may be compared: *V. officinalis* is figured in the illustrated ms. Diosc. at Vienna, also in Ort. Sanitat. pl. 486; is described by Braunsweig dist. f. 102, Brunfels, Fuchsius 593, Belon, Matthioli, Lobel; is termed "v. communis cæruleo flore" by Tournefort inst. 200; is known to occur in waste places from Sweden to Italy, Algeria, and the Canary Islands (fl. Dan. pl. 628, Pers., and Fries); was observed by Forskal near Marseilles; by Sibthorp, Chaubard, and Fraas, frequent around villages from the Peloponnesus throughout the Greek islands; by Delile, and myself, in Egypt; is known to occur in Abyssinia (A. Dec.), around Caucasus (Ledeb.), and in Nepal (Schauer in Dec. prodr.); was observed by Forskal in the mountainous portion of Yemen; by Graham, "in gardens" at Bombay; by Mason, "exotic" in Burmah; by Beechey 205 to 268, in Southern China; and by Thunberg, in Japan. Farther East, "virbena similar to that of Spain" was seen by Oviedo xi. 2 in the West Indies; and *V. officinalis*, if not indigenous, may have been carried Northward by the aboriginal tribes, remaining sparingly along "roadsides" in our Atlantic States (A. Gray, and Chapm.); was observed by Beechey in Mexico; by J. D. Hooker, on the Galapagos Islands; by A. Saint-Hilaire, in the outskirts of inland towns in Southern Brazil, and is known to occur as far as Buenos Ayres (Schauer). Clearly by European colonists, was carried to the Cape Verd Islands, Austral Africa, and Australia (A. Dec.; see *V. supina*, *Prasium majus*, and *Sisymbrium officinale*).

Lithospermum callosum of the Egyptian Desert. A bristly-leaved hoary plant called in Egypt "halamæ" (Forsk.); and the Egyptian ΕΛΕΝΙΟΝ of Cratevas, growing on hillocks and in places near the sea, its branches a cubit long thrown out upon the ground, leaves like those of the lentil, root as thick as the little finger and attenuated downwards (clearly a Desert plant), may be compared: *L. callosum* is termed "echium ægyptium asperius incano folio" by Lippi, "l. niveum" by Poiret; is described by Delile as branching from the base so as to form rounded tufts a foot to a foot and a half in diameter; was observed by him, Lippi, and Forskal p. 39, on sand-hills near the sea at Aboukir and Rosetta, also around the Pyramids and in other parts of the Desert about Cairo. (See *Thymus incanus*).

Echinops sphærocephalus of the Mediterranean countries. Called in English gardens *globe thistle* (Prior); and the ΚΡΟΚΟΔΕΙΛΙΟΝ resembling according to Cratevas ΜΕΑΝΙ: ΧΑΜΑΙΑΕΟΝΤΙ, its long acrid root having an odour like ΚΑΡΔΑΜΩ, — an account repeated by Dioscorides, is referred here by Lobel: *E. sphærocephalus* was observed by Sibthorp, and Chaubard, from the Peloponnesus frequent in Greece, the leaves in the wild plant more deeply incised. Westward, the account of the "crocodillon" by Pliny xxvii. 41 seems taken from the Greek: *E. sphærocephalus* is described by Lobel adv. 363 and obs. 481 (Spreng.); is termed "echinopus major" by Tournefort inst. 463; and is known to occur in waste ground as far as France (Lam. fl. fr., and Pers.).

Gnaphalium sanguineum of the East Mediterranean countries. The ΑCΑΡΟΝ of Cratevas — is referred here by Anguillara 27 (Spreng.): *G. sanguineum* was observed by Rauwolf in Syria; is described also by Barrelier pl. 34; and was received by Linnæus from Egypt.

Camphorosma Monspelica of the Mediterranean countries and middle Asia. Called by the Kirghis "jouschanu" (Pall.): the third kind of "alimon" having according to Cratevas its leaves longer and "hirsutioribus," with the odour of cypress "cupressi," and used medicinally — (Plin. xxii. 33), may be compared: *C. Monspelica* is termed "chamaepeuce" by Anguillara p. 202 (Spreng.); is described also by Buxbaum i. pl. 28; is known to grow in Spain and Southern France; was observed by Gittard in the Peloponnesus; by Pallas trav. i. 600, on the Yaik, supplying feed for cattle in winter.

Fucus palmetta of European seas. The ΘΕΡΗΤΙΔΙΟΝ of Cratevas, growing on shells and rocks in the sea, — is referred here by Anguillara 171 (Spreng.).

101 B. C. (= 543 — "441 y. 9 mo. 10 days" in the Mahavamsa xxxiii.), Callona succeeded by his brother Walakan-abha, now king of Ceylon. — He caused "the three precepts of the doctrine Trepittekā" to be committed to writing, and reigned "twelve years and five months."

One hundred and twenty-sixth generation. B. C. 100, Jan. 1st, mostly beyond youth: the Greek poets, Licinius Archias; the philosophers, Zenon the Epicurean, Diotimus the Stoic, and Philon of Larissa; the astronomer Geminus; the mathematician Theodosius of Tripoli; the historians, Alexander Polyhistor, and Apollodorus of Artemita; the geographer Scymnus of Chios; the grammarian

Dionysius Thrax; the rhetors, Hermagoras, Athenaeus, Apollonius of Allabanda, Apollonius Molon, Dionysius of Magnesia, Menippus of Caria, Aeschylus of Cnidus, and Xenophanes of Adramyttium; other Greek writers, Athenodorus Cordylion; the Latin writers, Pomponius Bononiensis the dramatist, Quinctius Atta the comic dramatist; the historians, Cornelius Sisenna, Claudius Quadrigarius, and Valerius Antias; the orators, Rutilius Rufus, and M. Antonius; the grammarians, Aelius Lanuvinus, Servius Claudius, and Aurelius Opilius; the rhetors, Plotius Gallus, and Otacilius.

In this year (= "170th ol.," Sm. b. d.), the Greek poet Meleager collecting the *Anthologia*. He wrote the epitaph of an elder contemporary poet Antipater of Sidon.

Centaurea cyanus of the mountains of Sicily. Called in Britain *b'uzbottle* or *corn-flower* (Prior), in Germany "kornblume" (Grieb), in France "aubifoin" or "bluet" (Nugent), in Italy "fior d'aliso" or "battisecola" or "ciano" (Lenz), in Greece "kuanós" (Scarlat.), in which we recognize the KYANOC of Meleager coron. i. 40, — unknown in the time of Alexander according to Pliny xxi. 24, and discovered by and named from the colour of the flowers by Greeks: *C. cyanus* was observed by Sibthorp, and Fraas, in the Peloponnesus; and is known to occur sparingly as far as Caucasus (Bieb.). Farther South, the "libah" of Ebn Baitar is referred here by Sontheimer; and *C. cyanus* is enumerated by Clot-Bey as recently introduced by way of France into Egypt. Westward, the "cyanus" is mentioned by Pliny xxi. 39 as occurring in Italy: *C. cyanus* has been found in the debris of ancient lake-villages in Switzerland: is termed "flores frumentorum" in the *Ortus Sanitatis* (Prior), "*cyanus segetum flore cæruleo*" by Tournefort inst. 446; is extensively cultivated in Italy (Ten., and Poll.); occurs as a weed in grain-fields from Algeria and Sardinia throughout Europe as far as Denmark (fl. Dan. pl. 993, Munby, Moris, and Boiss.); but seems indigenous only in sunny mountainous situations in Sicily, where it was observed by Gussone ii. p. 509 (A. Dec.). By European colonists, was carried to Northeast America, where it continues as a garden flower, and has besides been found along roadsides and in waste ground (Darl., and A. Gray); was also carried to Hindustan, where it was observed by Law "in gardens" (Graham).

Hardly later than this date, Armenia Minor ceded by its ruler Antipater to Mithridates VI.: who grown to manhood extended his conquests Eastward and Northward, over the whole of Colchis and even beyond Caucasus over wild tribes along the Tanais. — His protection sought in consequence by Paerisades king of Bosphorus and by the Greek cities of Chersonesus and Olbia, and through his generals Diophantus and Neoptolemus, the barbarians of the North, Sarmatians and Roxolani, were defeated; a success marked by "a fortress called the tower of Neoptolemus at the mouth of the river Tyras" or Dniester (Strab., and Sm. b. d.).

"The same year = 1st year of the 'thian-han' of Wou-ti" — (Chinese chron. table).

"98 B. C." (Clint). Lusitania (Portugal) conquered by the Romans under L. C. Dolabella.

"About the beginning of the first century B. C." (Gal. antid. ii. 8, and Sm. b. d.), an antidote composed by Zopyrus of Alexandria, and communicated by letter to Mithridates VI.

Clinopodium Plumieri of the East Mediterranean countries. The "zōpurōn" — or "ōkimōēithēs" or "klēōnikōn" identified in Syn. Diosc. with the "klinōpōthiōn" of Dioscorides, growing upon rocks and two span high, with flowers resembling the leg of a bedstead, is referred here by Fraas: the account by Pliny xxiv. 87 of the "zopyron" or "ocymoides" or "cleonicion" or "clino-podion," though disagreeing on some points, seems taken from Dioscorides: *C. Plumieri* was observed by Fraas on the high mountains of Greece.

Matthiola fenestralis of the East Mediterranean countries. The ΘΘΟΝΝΑ of Zopyrus — (Orib. xiv. 45), growing according to Dioscorides in the part of Arabia facing Egypt, yellow-flowered, its leaves "ēuzōmō"-like but often perforated, growing in Syria according to Pliny xxvii. 85, may be compared: *M. fenestralis* is described by Miller dict. 10, and Linnæus dec. pl. 16; was observed by Sibthorp on the maritime rocks of Crete.

Brassica incana of Sicily and Southern Italy. The ΚΡΑΜΒΗ: ΑΓΡΙΑ of Zopyrus — (Orib. xiv. 65), growing according to Dioscorides mostly in maritime and precipitous places, and resembling the cultivated kind but whiter and more hairy and bitter, identified in the added Synonyms with "vrassika rōustika" of the Romans, is referred here by Sprengel, and Fraas: *B. incana* is described by Tenore, and is known to be not uncommon in Sicily and the neighbouring portion of Italy (Spreng.).

Hypericum hircinum of Crete and the neighbouring portion of continental Greece. The ΤΡΑΓΙΟΝ of Zopyrus — (Orib. xiv. 65), growing according to Dioscorides only on Crete, exuding a gum-like juice, and resembling the "shinō" in leaves branches and fruit but all smaller, is referred here by Belon i. 17. p. 23 (ed. Clus.), and Honorius Bellus: *H. hircinum* was observed by them, and Sibthorp, along streams in Crete; and by Chaubard, in the Peloponnesus, though rare. Westward, the "tragion" was known to Pliny xiii. 3 as occurring only in Crete; *H. hircinum* termed "*h. foetidum frutescens*" by Tournefort inst. 225, is known to grow not unfrequently in Calabria and Sicily (Dillen. elth. pl. 151, Pers., and Spreng.).

Orob. tuberosus of Europe and the adjoining portion of Asia. Called in Britain *heath pea* (Prior), and the ΑΣΤΡΑΓΑΛΟΣ of Zopyrus — (Orib. xiv. 62), growing according to Dioscorides in shaded breezy and snowy situations and abounding around Pheneum in Arcadia, having “*ērēvinthō*”-like leaves and branches, small purple flowers, and a large rounded root with implicated appendages, is referred here by Sprengel: the name “*astragalōs*” continued extant in Greece in the days of Anguillara p. 267 (Spreng.): *O. tuberosus* was observed by Sibthorp in woods near Constantinople. Westward, the “*astragalōs*” or “*ōnux*” or “*gatalēs*” or “*hamaisukē*” is identified in the Syn. Diosc. with the “*phikōum tērai*” or “*glanthōulam*” or “*pinōum triviōum*” or “*tīōum*” or “*nōnar-ian*” of the Romans, and the account of the “*astragalus*” by Pliny xxvi. 29 is not altogether taken from Dioscorides: *O. tuberosus* is termed “*o. sylvaticus foliis oblongis glabris*” by Tournefort inst. 393; was observed by Viviani in Italy (Steud.); and is known to grow throughout middle and Northern Europe, the root according to Sprengel eaten in Sweden and forming an article of commerce (fl. Dan. pl. 781, and Curt. lond. i. pl. 53).

Pimpinella tenuis of Syria and Crete. The ΨΕΥΔΟΒΟΥΝΙΟΝ of Zopyrus — (Orib. xiv. 50), a span high in Crete according to Dioscorides, with leaves and branches “*vōuniō*”-like and acrid, is referred here by Sprengel: the “*pseudobunion*,” on Crete “*laudatissima*” of the best quality, is mentioned by Pliny xxiv. 96: *P. tenuis* is described by Sieber, as observed by him on Crete; and farther East, “*Tragium eriocarpum*” of Russel is regarded as probably identical (Steud.).

Trinia dioica of Europe and the adjoining portion of Asia. The “*psēudōvōuniōn*” of Zopyrus, — and Dioscorides, is referred here by Lobel, and Fraas: *T. dioica* was observed by Sibthorp, Bory, Grisebach, and Fraas, on high mountains from the Peloponnesus and Albania to Macedonia and the Bithynian Olympus; is known to grow also on the Taurian mountains (Bieb.), but has not been observed on Crete. Westward, is described by Lobel pl. 745 (Spreng.); is termed “*fœniculum minimum patulum*” by Tournefort inst. 312; and is known to grow in Italy and throughout middle Europe (Thuil., Lam. fl. fr., Jacq. austr. pl. 28, Steud., and Lenz).

Cressa Cretica of the shores of the Red Sea and neighbouring portion of the Mediterranean. Called in Greece “*almurithra*” (Fraas): the ΑΝΘΥΛΛΙΟΝ of Zopyrus — (Orib. xiv. 62), saltish to the taste according to Dioscorides and growing in sunny sandy places, its branches straight a span long with soft lentil-like leaves, is referred here by Alpinus exot. p. 156, and others: *C. Cretica* was observed by Sibthorp, Chaubard, and Fraas, on the seashore around the Peloponnesus and Greek islands. Farther South, was observed by Forskal, and Delile, at the head of the Red Sea and called at Suez “*nadaoueh*” dewy; and by Forskal, along the Arabian shore as far as Lat. 16°, where it is called “*ghorara*.” Westward, the “*anthullis*” or “*anthullōn*” is identified in the Syn. Diosc. with the “*sōlastrōum*” of the Romans; the account by Pliny xxi. 103 and xxvi. 51 of the “*anthyllion*” or “*anthyllum*” seems taken from Dioscorides; *C. Cretica* is described by Fuchsius p. 885 (Spreng.), and Plukenet alm. pl. 43; is termed “*quamoclit minima humifusa palustris herniariæ folio*” by Tournefort cor. 4; and is known to grow along the Mediterranean as far as Tunis, Malta, and France (Forsk., Desf. atl. i. p. 220, Lam. fl. fr., and Pers.).

Orobanchē grandiflora of the Mediterranean countries. Called in Greece “*lukōs*” (Fraas), in which we recognize the “*lukōs*” identified in Syn. Diosc. with the ΟΡΟΒΑΓΓΗ of Zopyrus — (Orib. xiv. 62), and others, described by Dioscorides as edible, leafless, and suffocating “*ōspriōis*” different kinds of pulse; also identified in the Synonyms with the “*kunōmōriōn*” or “*lēonta*,” and therefore probably the “*ōsprōlēōnta*” of Sotion, and Paxamus (geopon. ii. 42): *O. grandiflora* is described by Chaubard, as observed in the Peloponnesus; and was found by Fraas the most frequent kind in Greece. Westward, the “*lupum salictarium*” is enumerated by Pliny xxi. 50 among the edible plants of Italy; and *O. grandiflora* is known to grow on the nearest portion of the Pyrenees (Bory).

Orobanchē caryophyllacea of Europe and the adjoining portion of Asia. Also called in Greece “*lukōs*” (Sibth.), and perhaps included in the “*ōrōvaghē*” of Zopyrus, — and Dioscorides: *O. caryophyllacea* was observed by Sibthorp, and Chaubard, in cultivated ground in Greece and the neighbouring islands, according to Walpole mem. p. 244 fastening on bean plants and with difficulty eradicated. Westward, the account by Pliny xxii. 80 of the “*orobanche*” or “*cynomorion*” seems taken from Dioscorides: *O. caryophyllacea* is termed “*o. major garyophyllum olens*” by Tournefort inst. 176; and is known to grow in Italy and throughout middle Europe (Pollich, Pers., and Lenz).

Phelypaea lutea of Arabia and North Africa. Called in Egypt “*haluk*” (Forsk.), the origin possibly of the name “*lukōs*” given in Greece to the above allied plants: — *P. lutea* was observed by Forskal, and Delile, along the Mediterranean border of Egypt; and farther South, by Forskal p. 112 at Mor in Tropical Arabia, and called “*hōdar*” or “*zybb alkaa*.” Westward, was observed by Desfontaines atl. in Barbary; but though termed “*p. lusitanica flore lutea*” by Tournefort cor. 47, its presence in Portugal is questioned (Pers.).

Salvia disermas of the East Mediterranean countries. The ΕΛΕΛΙCΦΑΚΟC: ΛΕΥΚΟC of Zopyrus — (Orib. xiv. 65) may be compared: *S. disermas* is described by Barrelier pl. 187; is termed "sclarea syriaca flore albo" by Tournefort inst. 179; is known to grow in Syria, the odour grateful (Pers.); and was observed by Sibthorp in the environs of Constantinople.

Cytinus hypocistis of the Mediterranean countries. Called in Italy "ipocistide" or "ipocisto" (Lenz), in which we recognize the ΥΠΟΚΙCΤΙC of Zopyrus — (Orib. xiv. 61), Themison, Servilius Damocrates, and Andromachus, described by Dioscorides as leafless, yellowish and white, growing on the roots of "kistōu": *C. hypocistis* was observed by Sibthorp, and Chaubard, on the roots of different woody species of *Cistus* in Greece and Crete; and "hypocistis" juice from "Syria," was found by Forskal in the drug-shops of Egypt. Westward, the "upokistis" or "kutinōs" or "thruvêthrōn" is identified in Syn. Diosc. with the "phullēsathē" of the Numidians; the "hypocistis" is mentioned by Celsus, and is identified with the "orobethron" by Pliny xxvi. 31; *C. hypocistis* is termed "h. flore luteo" by Tournefort cor. 46; and is known to grow in Italy, and as far as Portugal (Brot., Pers., and Lenz).

Euphorbia chamaesyce of the Mediterranean countries and middle Asia. Called in Greece "hamotrivla" (Fraas): the ΧΑΜΑΙCΥΚΗ of Zopyrus — (Orib. xiv. 62), having according to Dioscorides prostrate branches full of juice and small lentil-like leaves upon the ground, identified in the added Synonyms with the "sukēn" or "mēkōna aphrōthē," is referred here by writers: *E. chamaesyce* was observed by Sibthorp, Chaubard, and Fraas, in arid stony situations from the Peloponnesus throughout Greece and the Greek islands; is known to grow also in Mesopotamia and Siberia (Pers.). Westward, the account by Pliny xxiv. 83 of the "chamaesyce" seems chiefly taken from Dioscorides: *E. chamaesyce* is described by Morison x. pl. 2; is termed "t. exiguus . . . nummulariæ folio" by Tournefort inst. 87; and is known to grow in Italy, Southern France, and Spain (Lam. fl. fr., Pers., and Lenz).

Equisetum fluviatile of Europe and the adjoining portion of Asia. Called in Greece "pōlutrihi" (Sibth.), in Italy "seola" or "setola" (Lenz), in which we recognize the "equisetum pinus foliis similem" called also "hippurin" or "ephedron" or "anabasin" according to Pliny xxvi. 83: the ΙΠΠΟΥΡΠΙC of Zopyrus — (Orib. xiv. 61), growing according to Dioscorides in watery places, its stems hollow roughish and rigid, of joints inserted one in another, and around them numerous slender rush-like leaves, identified in the added Synonyms with the "éphēthran" or "anavasis" called by the Romans "ēkunalis," is referred here by Sprengel: *E. fluviatile* was observed by Sibthorp, and Bory, in watery places around Constantinople and in the Peloponnesus. Westward, is described by Tragus f. 264; is termed "e. palustre longioribus setis" by Tournefort inst. 533; and is known to grow in Italy and throughout middle Europe as far as Britain (Engl. bot. 2022).

Peltidea aphthosa of Europe and the adjoining portion of Asia. The ΛΕΙΧΗΝ on rocks of Zopyrus — (Orib. xiv. 62), adhering according to Dioscorides to dewy rocks and by some called "vruōn," applied to stop hemorrhage, also healing cutaneous eruptions, is referred here by Sprengel, and Lindley: *P. aphthosa* was observed by Sibthorp around Athens and on mount Athos. Westward, the account by Pliny xxvi. 10 of the "aliud genus lichenis" adhering throughout to rocks like "muscus," seems in part taken from Dioscorides: *P. aphthosa* is termed "lichenoides digitatum læte virens verrucis nigris notatum" by Dillenius pl. 28. f. 106; and is known to grow throughout Europe as far as Britain (Engl. bot. pl. 1119), according to Lindley on "moist shady alpine rocks among moss," and "said to be purgative and anthelmintic."

Peltidea canina of Europe and the adjoining portion of Asia. Called in Britain *ground-liverwort* (Prior), yet regarded by Sprengel as possibly included in the "lēihēn" of Zopyrus, — and Dioscorides: *P. canina* was observed by Sibthorp from the Peloponnesus to Constantinople, growing upon the ground. Westward, *P. canina* is termed "*I. pulmonarius saxatilis digitatus major cinereus*" by Tournefort inst. 549, "*lichenoides digitatum cinereum lactuæ foliis sinuosis*" by Dillenius pl. 27. f. 102; and is known to grow throughout Europe as far as Britain (Engl. bot. pl. 2291).

Lecanora parella of Europe and the adjoining portion of Asia. The "lēihēn" of Zopyrus, — and Dioscorides, is referred here by Fraas: *L. parella* was observed by him, and Sibthorp, frequent on stones from the Peloponnesus to the Greek islands and Constantinople. Westward, is termed "*lichenoides leprosum tinctorium scutellis lapidum cancri figura*" by Dillenius pl. 18. f. 10; and is known to grow throughout Europe as far as Britain (Engl. bot. pl. 727).

"97 B. C." (Jap. centen. comm. 88), accession of Sujin, now tenth dairo of Japan. He is said to have placed "the sword of Amaterasu-on-kami, the heavenly ancestress of the actual dynasty," together with her "mirror and a rounded stone" in "the Shintoo temple of Ise."

"In or about 97 B. C." (Percev. i. 186), birth of Maadd, son of Adnan and twentieth progenitor of Mohammed.

"96 B. C. = 1st year of the 'tai-chi' of Wou-ti" — (Chinese chron. table).

New Zealand discovered and colonized by Polynesians after the introduction of the *cocoa-palm* into the islands of the Pacific, — but before the peopling of the Marquesas or Nukahivan Islands (Hale ethn. expl. exp. 148).

Phormium tenax of New Zealand. The *New Zealand flax*, from its abundance and the great strength of its fibre, doubtless attracted the attention of the first colonists: — *P. tenax* was observed by Cook and Forster ii. pl. 96 in New Zealand in 1773; by myself, frequent there in the Northern district, and much used by the natives. Transported to Europe, is described by the younger Linnæus 204; has been cultivated with more or less success, and according to Clot-Bey was introduced by the way of France into Egypt. From Europe, was also carried to Northeast America, where it continues in greenhouses.*

* *Barringtonia speciosa* of wooded Tropical shores from the Malayan archipelago to Metia and the Marquesas Islands. A showy flowering tree called in Tagalo "botong" or "botongbotong," in Bisaya "botong" or "bitung" or "bitoon" (Blanco), in Tahitian and Nukahivan "hutu" (Hale); known to the first colonists of New Zealand, for missing the accustomed material for seine-floats, they transferred the Polynesian name "hutu" to a kind of pine, *Phyllocladus trichomanoides*. — *B. speciosa* is known to grow on the Marquesas Islands (Pers.); was observed by myself along the seashore from Metia to the Feejeean Islands and Sulu, under cultivation on Tongatabu, and staked around and reserved on the Feejeean Islands, its large buoyant fruit universally used by the natives for seine-floats; by Blanco, frequent along the seashore of the Philippines, its fruit used as buoys on fishing-nets; by Rumphius iii. pl. 114, and Sonnerat, on the Moluccas; and is known to grow as far as China (Pers.).

Inocarpus edulis of wooded Tropical shores from the Moluccas to Tahiti. The *Tahiti nut* is a large tree called on Tahiti "lata?" or "rata" (Hale); was known to the first colonists of New Zealand, for in its absence they transferred the Polynesian name to *Metrosideros robusta*. — *I. edulis* was observed by Cook and Forster n. gen. 33 on Tahiti; by myself, clearly indigenous near the sea throughout the Tahitian, Samoan, Tongan, and Feejeean Islands, planted besides in some instances; is known to grow also on the New Hebrides and New Guinea, where "the natives smear the heads of their arrows with the expressed resinous juice" (Don); and was observed by Rumphius i. pl. 65 indigenous on the Moluccas. By European colonists, was carried to the Hawaiian Islands, young stocks "brought from Tahiti" seen by myself in the garden of a resident White; to Hindustan (Roxb. cor. iii. pl. 263), and by Nimmo in 1833 to the environs of Bombay (Graham).

Tetragonia expansa of New Zealand. The *New Zealand spinach*, herbaceous spreading and broad-leaved, doubtless met with by the first colonists: — observed in New Zealand by Forster, and termed "t. halimifolia;" by myself, frequent there along the seashore exclusively maritime, but I did not learn that any use was made of it by the natives. In the Northern Hemisphere, was seen by Thunberg in Japan (Pers., and Steud.). Transported to Europe, is described by Scopoli del. i. pl. 14, and Pallas hort. demid. pl. 1; and by European colonists was carried to Hindustan, observed by Graham "in gardens Bombay, rare," forming "a much better spinach than the *Amaranthaceæ* in common use among the natives."

Artocarpus incisa of the Malayan archipelago. The *breadfruit* tree is called on Tahiti "maiore" (Bertero), in Tahitian Mangarevan and Paumotuan "maiore," in Hawaiian "aeiore," in Nukahivan Mangarevan Tarawan and Tongan "mai?" or "mei" (Hale); known to the first colonists of New Zealand, for they transferred the name "mai" to the edible cones of a tree of the pine kind. — *A. incisa* was observed by Mendana in 1598 on the Nukahivan or Marquesas Islands (Dalrymp., and hist. coll. Am. iv. 238); by Forster, on other Polynesian islands: by Dampier, and Anson, on Tinian and the Ladrone Islands; by Sonnerat pl. 57 to 60, on New Guinea; by Rumphius i. p. 112, on Celebes and the Moluccas (*A. Dec.*): the seedless variety, by myself under cultivation on the Hawaiian, Tahitian, Samoan, Tongan, and Feejeean Islands; a variety, with leaves less-incised and large seeds that are "not known to ripen," under cultivation also on the Samoan and Feejeean Islands. Farther West, the "intercised" leaves and seedless fruit erroneously attributed by Nicolo Conti to the jack-tree may belong to the breadfruit: a tree growing wild on Banda is regarded by Rumphius i. pl. 34 as the origin: and a variety, "full of seeds" and "of no value," was found by Mason v. 462 "exotic" in Burmah, cultivated "in a few gardens at Tavoy and Maulmain." By Bligh "in 1793," the seedless breadfruit was carried from the islands of the Pacific to the West Indies; by Sonnerat voy. 100, to the Mauritius Islands; by Europeans also, to the environs of Bombay (Graham, and myself); to Bengal (Roxburgh); and to Burmah, "cultivated at Penang, and has recently been introduced into Mergui" (Mason).

Podocarpus ferruginea of New Zealand. A Coniferous or pine-like tree that soon attracted the

"The same year" (Clint. iii. p. 346), death of Antiochus VI.; his colleague becoming Antiochus VII. Cyzicenus, fourteenth Greek king of Syria.

"The same year" (Liv., and Clint.), Cyrene bequeathed to the Romans by Ptolemy Apion, an illegitimate son of Ptolemy VII.

"95 B. C." (Clint. iii. p. 346), death of Antiochus VII., the last Syrian king having the "years of the Seleucidæ" on his coins. War for the succession ensued, between his son Antiochus Eusebes and the five sons of Antiochus VI. — The war continued "twelve" years.

As early perhaps as this date (Graha Munjari tables, Puranas, and Benti.), Sudharma reigning in Hindustan. Puchyadharman about this time king at Pataliputra on the Ganges — (Avadan. asok.) called Satadhanvan in the Puranas (Burn. i. 430 to ii. 778).

"94 or 93 B. C. (= 17th year of king Tæpah" of Burmah, confirmed by Ceylon hist., Mason 40), the doctrines of Gaudama or Budha committed to writing in Ceylon. The transaction is referred to about this date by Mahanama, and in the Sara-sangraha (Max. Müll. p. xix).

The Mulamuli, written originally in Pali, possibly as early as this date. — It has been translated into Shan, and thence in "A. D. 1768" into Talaing (Mason 593).*

notice of the first colonists, for missing the *Thespesia populnea*, they transferred here its Taheitian name "miro." — (See Hale).

Piper methysticum of the Papuan archipelago? The *kava pepper*, upright and branching, is called on Taheiti "ava irai" (Bert.), on the Hawaiian Islands "awa" (Gaud.), in Hawaiian Taheitian and Samoan "ava," in Nukahivan Raratongan and Tongan "kava," the beverage from its root "kava" (Hale): known to the first colonists of New Zealand, for they transferred its name to *P. excelsum*, remarkable for being the only known species growing beyond the Tropics. — *P. methysticum* was observed by Forster esc. 76 on the Hawaiian Taheitian and Tongan Islands, by Gaudichaud on the Hawaiian Islands, and by Bertero on Taheiti; by myself, under cultivation on the Hawaiian and Samoan Islands, and stored roots and stems on the Tongan and Feejeean Islands. In the account of Magellan's voyage by a Genoese pilot "hava" was procured at the Moluccas, and according to the Lisbon comments "hava" or "ava" drink is known there.

Dracena terminalis of the Papuan archipelago. Called in Burmah "kwon-len-net" (Mason), in Tagalo "varas hari" or "varas ni Jose" or "toncod obispo" (Blanco), on the Hawaiian Islands and Taheiti "ti" (Gaud., and Bert.), universally by Polynesians "ti," and the cincture of its leaves in Samoan and Tongan "titi" (Hale): known to the first colonists of New Zealand, for in its absence they transferred its name "ti" to another species, *D. Australis*. — *D. terminalis* was observed by myself, an inedible sweet-rooted variety naturalized on the Hawaiian Islands and not seen elsewhere, an edible farinaceous-rooted variety naturalized on Taheiti and perhaps cultivated on Metia, some twenty varieties mostly edible distinguished and cultivated by the natives of the Samoan Islands, and one yellow-leaved variety furnishing the cinctures generally worn, one variety in cultivated ground on Tongatibu, and a very large-leaved banana-like variety on the Feejean Islands, near dwellings and also in wild situations: var. *ferrea*, the red-leaved variety, was first met with on Manua (the most secluded of the Samoan Islands), afterwards on the Philippines, where according to Blanco it is planted by the natives for ornament; is termed "terminalia rul-ra" by Rumphius iv. pl. 34; is known to occur in China (Pers.): was observed by Mason 420 to 814 "exotic" in Burmah, planted by the natives; by Roxburgh, in Hindustan; by Graham, as far as Bombay, "common in gardens, introduced from China." Transported to Europe, is described by Jacquin ic. ii. pl. 448, and Redouté liliac. pl. 91; and from Europe was carried to Northeast America, where it continues in greenhouses.

Bambusa nov. sp. of the Samoan Islands. The *Polynesian bamboo* is called in Feejeean "mbitu," by Polynesians "kofe" or "kohe" or "koe" or "ofe" or "ohe," a knife made from it in Tikopian "kofe," and an arrow in Taheitian "ohe" (Hale): known to the first colonists of New Zealand, for they retained its name "kohe" as the word for knife: — observed by myself near a plantation on the Feejeean Islands, in wild situations on the Hawaiian and Taheitian, and to all appearance indigenous in the deep forest on Savaii: the universal use of its stems as a substitute for water-casks, and its easy propagation, suggest the mode of transport from island to island. From growing in beds and its brittle stem, may prove a peculiar species, but I did not meet with it flowering.

* *Hopea parviflora* of Southern Hindustan. A large Dipterocarpous tree called in Malabar "irubogam" (Drur.); and the lone "hopea," under which according to the Mulamuli the good man took up his abode — (Mason 598), may be compared: *H. parviflora* was observed by Beddome pl. 6 in Malabar and Canara, in moist and dry forests as far as the elevation of "thirty-five hundred feet," and in south Canara its timber much valued for temple buildings (Drur.).

Hopea Wightiana of Southern Hindustan. A large tree called in Tamil "kongoo" or "kong"

"93 B. C." (Sm. b. d.), the two sons of Ariarathes VI. having been successively driven from the throne of Cappadocia by Mithridates VI.; through Roman influence, Ariobarzanes elected king by the Cappadocians.

Salvia verticillata of Europe and the adjoining portion of Asia. Called in Greece "plēmōnō-hōrtōn;" and the "chiliodynamam" of the Cappadocians called "polemoniam" or "philetaeriam" from kings contending for the discovery — (Plin. xxv. 27), described by Dioscorides as growing in rough mountainous situations and having its root a cubit long and above the leaves corymbs in which are black seeds, by Apsyrus hipp. as resembling "kalaminthē tē platēia" but more hoary and having a heavy odour, may be compared: *S. verticillata* was observed by Sibthorp, and Chaubard, frequent from Constantinople to the Peloponnesus. Westward, the "polemonium" is mentioned by Varro: *S. verticillata* is described by Rivinus monop. pl. 38; is termed "horminum sylvestre latifolium verticillatum" by Tournefort inst. 178; and is known to grow in Austria, Germany, and Switzerland (Pers.).

"92 B. C." (Liv., and Clint.), in Cappadocia, ambassadors received by Sulla from Arsaces king of Parthia; the first public transaction between the Romans and Parthians.

"In this year" (Sm. b. d.), at Rome, Rutilius Rufus on his return from Asia accused unjustly and banished. He retired to Smyrna, accompanied by his friend Opilius Aurelius.

Coriaria myrtifolia of the Mediterranean countries. The NAVTEA-HERBA bearing black berries and used by curriers, mentioned by Opilius Aurelius, — Pompeius Festus, and Paulus Diaconus, may be compared: *C. myrtifolia* is described by Duhamel pl. 73, and Linneus; is known to grow in Barbary, Spain, and Southern France (Pers.). Eastward, was observed by Chaubard in the Peloponnesus. The fruit according to Lindley is "a dangerous poison," and "senna adulterated with the leaves equally dangerous."

Sempervivum tectorum of Western Europe. Called in Britain *aye-green* or *sengreen* or *houseleek* (Prior), in Welsh "dislog" (A. Dec.), in France "joubarb," in Italy "erba da cali" or "sopravvivolo" or "semprevivo maggiore" (Lenz), in which we recognize the "sempervivum" identified by Pliny xix. 58 and xxv. 102 with the "aizoum" or "sedum" in whose juice seeds are soaked to prevent destruction by vermin: the "sedum" is identified by Pompeius Festus with the *SESVIVUM* planted on roofs of Opilius Aurelius, — and its seeds are commended for the above purpose by Columella ii. 9. 10 to xi. 3. 61, and Palladius x. 3. 2: the "iovis barba" of Isidorus etym., the capitularia of Charlemagne, Platearius, and the *Ortus sanitatis* 57, is referred here by writers; *S. tectorum* is termed "sedum majus vulgare" by Tournefort inst. 262; is known to grow wild as far as Luga in Russia (Gorter) and rocks on the Lower Loire; and is regarded by A. Decandolle as introduced into Britain probably before the Roman Conquest. Eastward, was observed by Sestini on roofs at Constantinople (Sibth.). By European colonists, was carried to Northeast America, where it continues to be cultivated for ornament. According to Lindley, "the leaves are cooling when applied externally and frequently renewed." (See *S. arboreum*.)

91 B. C. = "27th year of" Ptolemy VIII.), possibly the date of the Second inscription at Adulē. The author speaks of pacifying nations on the border of his kingdom and capturing "Gazē, Agamē" (possibly Agamia in Tigre), and "Siguēn;" also "Aua, Tiamō sometimes called Tziāmō" (Tzama in Tigre), "Gamvēla, Ziggavenē, Aggavē, Tiama, Athagaōus, Kalaa, and the Sēmēnai dwelling on snowy mountains beyond the Nile" (Samen beyond the Atbara branch); then "Lasinē, Zaa, and Gavala" (Galla?) "dwelling on mountains that emit hot springs; Atalmo, and Vēga; the Taggaitas as far as the Egyptian border, thereby opening a path from my kingdom to Egypt; then Anninē, and Métinē; Sēsēa dwelling on a very lofty mountain;" also, "Rausōn an inland nation of livanōtōphōrōn varvarōn" (Berbera), and the "Sōlatē to whom I committed the charge of the seacoast;" also, "sending a fleet and army across the Red Sea I subdued the Aravitas and Kinaithōkōlpitas, and compelled their kings to pay tribute and keep the travel safe by land and sea, extending my conquests from Lēukēs kōmēs to Savēōn" (Azab); and "of all my predecessors being the first and only king who has subjected all these nations I give thanks to the great god Mars, my father, by whose assistance I have extended my authority over all neighbouring nations from the East to the 'livanōtōphōrōu' country, and from the West to Aithiōpias and S:sōu;" and "peace being established, I have come

(Drur.); and possibly the "hopea" in question: — *H. Wightiana* was observed by Wight, and Beddome, common in the western forests at Tinnevely, its timber very valuable and similar to that of the preceding species (Drur.).

Vatica en-khyen of Burmah. A Dipterocarpous tree, in a grove of which according to the Burmese books Gaudama died, — believed also by the natives to have furnished "much of the petrified wood" along the Irawaddy (Mason 528 to 737): *V. en-khyen* was observed by Mason in Pegu and Tenasserim, "though not very abundant."

down to Athoulên to sacrifice to Jupiter, Mars, and Neptune on account of mariners, and here in the presence of all my military forces I dedicate this carved seat to Mars in the twenty-seventh year of my reign" (Cosm. Ind. ii. p. 142).

As early possibly as this date (Graha Munjari tables, Puranas, and Bentr.), Devanica reigning in Hindustan.

"90 B. C." (Liv., and Clint.), in Italy, the Marsian or Social war; and by the Romans, the freedom of the city granted to the States remaining in allegiance.

"89 B. C." (. . . Blair), commencement of war in Asia between Mithridates VI. king of Pontus and the Romans. — The war continued twenty-six years.

Scutellaria orientalis of the East Mediterranean countries. The "scordotin" or "scordion" growing according to Mithridates VI. in fertile humid plains in Pontus and bitter to the taste, a cubit high with the stem quadrangular and branchy "querna similitudine foliis lanuginosis" — (Lenaeus, and Plin. xxv. 27), may be compared: *S. orientalis* is described by Commelyn rar. pl. 30; is termed "cassida orientalis chamaedryos folio flore luteo" by Tournefort trav. ii. pl. 129; was observed by Sibthorp on the Bithynian Olympus, and is known to grow also in Armenia (Pers.; see *S. hirta*, and *Teucrium scordium*).

Agrimonia eupatoria of Europe and Northern Asia. Called in Britain *agrimony* (Prior), in Germany "odermennig" (Grieb), in France "aigremoine" (Nugent), in Italy "agrimonia" or "eupatorio" (Lenz), in Greece "phônôhörtôn" or by the Turks "cojun oti," in which we recognize the "eupatoria" known to Mithridates VI. — (Plin. xxv. 29), described by Dioscorides as suffruticose with a simple stem a cubit or more high, leaves divided into five or more parts and like those of "pēntaphyllōu" and "kannavēōs," seed disposed along the stem hairy and adhering to garments: *A. eupatoria* was observed by Forskal, Sibthorp, Chaubard, and Fraas, from Constantinople to Smyrna and the Peloponnesus. Farther South, the "gafet" is mentioned by Avicenna, Serapion, Ebn Baitar, and syrup of "ghafe" or "agrimonia" is enumerated by Alpinus, and Forskal mat. med., as employed medicinally in Egypt. Westward, the "ēpatōriōn" or "ēpatōriōn" or "ēpatitis" is identified in the Syn. Diosc. with the "ōūōlōukrōum maiōus" of the Romans: the "agrimonia" is mentioned by Celsus v. 27. 10; the "agrimonium" by Matthæus Sylvaticus pand. f. 9, and "egremoine" by Chaucer (Prior); *A. eupatoria* is termed "a. officinarum" by Tournefort inst. 301, and is known to grow along roadsides in Italy and throughout middle Europe as far as Sweden (fl. Dan. pl. 588, Pers., and Wats.). Eastward from Greece, is known to grow in Siberia (Wats.); was observed by Thunberg in Japan, and called "daikon so" or "binke so." Possibly by European colonists carried to Northeast America, but was observed by Josselyn prior to 1670 in New England, by myself from Lat. 45° to 39° beyond Philadelphia chiefly in bushy places along roadsides. According to Lindley, "is celebrated as a vermifuge," and is "a common ingredient in 'herb teas.'"

Geum coccineum of the East Mediterranean countries. — The "ēpatōriōn" by some called "argēmōnēn" from its scarlet flower (Diosc. ii. 207 and iv. 41), may be compared: also the "argemon" or "canaria lappa" discovered by Minerva, according to Pliny xxiv. 116 and xxv. 56, or the kind of "argemonia" whose root has the odour of "thus:" *G. coccineum* is termed "caryophyllata orientalis flore magno coccineo" by Tournefort cor. 20, and was observed by Sibthorp pl. 485 on the Bithynian Olympus.

Valeriana Dioscoridis of the East Mediterranean countries. The ΦΟΥ of the antidote of Mithridates, — and those of Marcianus, and Servilius Damocrates, mentioned also by Cassius ant., by Andromachus as from Pontus (Scribon. Larg. 170 to 177, and Gal. antid.), by Dioscorides as growing in Pontus and sometimes called "agrian narthōn," a cubit or more high with a hollow stem, leaves like those of "ēlaphōvōskō" or "ippōsēlinō," flowers purplish-white, and the root strong-scented (as might be inferred from the name), is referred here by Sibthorp and others: the "phu" is described by Pliny xii. 26 as imported from Crete, a root resembling birds' feet, in other respects his account seems taken from Dioscorides: *V. Dioscoridis* was observed by Hawkins, and Chaubard, from Lycia to the Greek islands; and is known to grow along the Taurian mountains (Bieb.). The odour of the root according to Lindley is "almost like that of *Valeriana officinalis*, but less unpleasant."

Boletus laricis of Europe and the adjoining portion of Asia. Called in Italy "agarico" or "agarico officinale" (Lenz), in which we recognize the ΑΓΑΡΙΚΟΝ of the antidote of Mithridates, — and those of Antipater, and Martianus (Scribon. Larg. 167 to 177, and Galen antid. ii.), or the "agarikōn arrēn" described by Dioscorides as growing in Agaria in Sarmatia, roundish and wholly concrete: the "agaricum" is described by Pliny xvi. 13 and xxv. 57 as a white fragrant "fungus" growing high up on trees and shining at night, the kind from Gaul being weaker than that from the Bosphorus: *B. laricis* is termed "agaricus sive fungus laricis" by Tournefort inst. 562: is known to grow in Switzerland, France, and throughout middle Europe (Michel. gen. pl. 61, Jacq. austr. i. pl. 20, Bulliard pl. 296, and Lenz); in the absence of the larch, was observed by Sibthorp in Bœotia

in Greece; and according to Sprengel, the best kind continues to be imported from the Ural mountains and Syria.

"The same year" (Porphyr., and Clint. iii. p. 390 to 399), in Egypt, Cleopatra put to death by her son Ptolemy IX. Who was driven into exile by the populace, and his brother Ptolemy VIII. restored as king.

In a *Greek inscription* at Talmis in Nubia, Silco styles himself king of the Ethiopians and "Noubadæ," and boasts of victories over the "Blemyes:" regarded as a branch of the Bischari. — A very late inscription in barbarous Greek also occurs here (Leps. eg. and sin. p. 242).

The Egyptian gods, Osiris, Isis, Nephthys, Atmu, and others on the pyramids at Meroe, not adopted "previous to the First century B. C.; and the same throughout the island of Meroe, Naga, and" other places in Upper Nubia (Leps. eg. and sin. 152).

The *Sinaitic inscriptions* the work of the inhabitants of the country during the first centuries before — and after our Era; some being cut over more ancient Greek names, and not unfrequently Christian crosses are in connexion (Leps. eg. and sin. p. 296 to 311, and 553). Cosmas Indicopleustes is quoted for evidence that at the time of his visit, "about 535 A. D.," the Sinai from which the law was given was believed to be the mountain called at the present day "Serbal." Ruppel mentions *sacrifices* on Mount Serbal by the Arabs, and found the highest point "6342 French feet" above the sea. Lepsius found on the mountain a place overgrown with "habak" (*Mentha?*) and other sweet-smelling herbs, and translates the name, "Serb Bal" palm-grove of Baal.

"88 B. C." (Liv., Blair, and Clint.), commencement of civil war among the Romans, between Marius and Sulla.

"In this year" (Mahanam. mahav., and Max Müll. p. xix.), accession of Vattagamani, now king of Ceylon. — He reigned until "76."

The Nukuhivan or Marquesas Islands colonized from Vavau by Oataia and his wife Ananoona; bringing with them *breadfruit* and *sugar-cane* and a great variety of other plants,* "eighty-eight generations before — their lineal descendant Keatanui; the chief who made this statement to captain D. Porter 49 (Hale ethnogr. Expl. Exp. 129).

About this time (Strab. xvii. 3. 5 to 7), expedition of Bogus king of Mauritania against the "Western Ethiopians," Negro tribes South of the Desert.

The ΠΙΖΕΙC met with, in shape resembling a bull and in size and strength an elephant, accord-

* *Spondias dulcis* of the Papuan archipelago. The *vi-plum* is a large tree called in Tongan, Samoan, Taheitian, and Nukahivan "vi" (Hale); carried to the Nukahivan Islands perhaps by the first colonists: — observed by Forster prodr. 198 on the Taheitian Islands; by myself, abundantly naturalized on Metia and Taheiti, also abundant and perhaps naturalized on the Samoan Islands, regularly cultivated on Tongatabu, and said to be cultivated in a single locality on the Feejeean Islands, discordant throughout from its deciduous foliage, and evidently exotic. Farther West, is described by Rumphius i. pl. 60, was observed also by Sonnerat ii. pl. 123. By European colonists, was carried to the Hawaiian Islands, stocks "brought from Taheiti" observed by Brackenridge in the garden of a resident White; to the Philippines, where it has become well known and is called in Tagalo "sirihuelas," from the Spanish "ciruelas" (Blanco); to the Mauritius Islands, planted around dwellings (Pers., and Boj.); and by Nimmo by the way of "Bengal" to the environs of Bombay (Graham).

Erythrina seu-pen-lai of the Papuan archipelago. — The only other deciduous tree observed on the islands of the Pacific; an unarmed *coral-tree*, sometimes forty feet high, naturalized near the sea on Taheiti and Aimeo, planted near dwellings on the Samoan and Tongan Islands, planted and also naturalized on the Feejeean Islands, and planted within the limits of the town on Sulu. *E. seu-pen-lai* is described by Mason v. 409 as "a small tree covered with large scarlet blossoms" and "very ornamental," "often seen in the neighbourhood of Karen villages from Mergui to the Red Karen country."

Ficus prolixa of the Papuan archipelago. A tree called in Taheitian "aoa," in Samoan "o'a," in Tongan "koka" (Hale): known to the first colonists of the Nukahivan Islands, for they retained its Tongan name "koka" as the word for black or blue, applied to cloth: — *F. prolixa* was observed by Forster on the Taheitian Islands (Pers.); by myself on the Samoan, Tongan, and Feejeean Islands, in all instances planted, from its bark according to Hale "a brown dye is obtained for staining cloth."

Ficus tinctoria of the Papuan archipelago? A tree called on Taheiti "mati" (Bertero), and probably known to the first colonists of the Nukahivan Islands: — observed by Forster prodr. on the Taheitian Islands (Pers.); by myself, on Taheiti, planted near the dwellings of the natives; and this or the preceding species seen by Rich on the Union and Tarawan clusters of coral-islands.

ing to Iphicrates — (Strab. xvii. 3), may be compared with “ha-risi,” from “arōu” and “risi,” given by Cosmas Indicopleustes xi. p. 334 as the Abyssinian name for the skin of the “rinōkērōs:” the “rinōkērōs” was seen in the distance in Abyssinia by Cosmas Indicopleustes, and is further described by him as so-named from the horns on its nose, the hide being thick enough to be employed as a plough; two horns are represented in the accompanying figure, and the species is clearly the *African rhinoceros*, known to inhabit Abyssinia as well as the more Southern and Western portion of the continent.

Asparagus sp. of Equatorial Africa. The “asparagōn” of great magnitude sent home by Bogus to his wife — (Strab. xvii. 3. 5), may be compared: A. sp. was observed by Grant near the Eastern coast in “7° S., and in every forest,” five feet high and very elegant, its roots used to cure sore eyes; “a variety climbs up trees with its opposite branches.”

“87 B. C.” (Liv., and Clint.), Second grant of the freedom of the city of Rome: now to the Italian States that had taken up arms.

“The same year” (. . .), after refusing for nearly three years to acknowledge the recalled Ptolemy VIII., Thebes in Egypt captured. On which occasion, the monuments are said to have sustained much injury.

Posidonius on his voyage remained “thirty days” in “Gathēira” (Cadiz); and from a house “four hundred stadia” distant, saw a star which he identified with Canopus; known to become visible “in the same climate” at Cnidus near Rhodes. He also witnessed mining operations in the South of Spain; the water being removed by means of “aiguptiōis kōhliais,” the Archimedes screw — (Strab. ii. 5. 14, and iii. 2. 9).

Dracæna draco of the Canary Islands. At Cadiz, Posidonius saw a tree with the branches deflexed to the ground, and sword-shaped leaves often a cubit long by four fingers broad; the branches when broken giving out a milky, and the roots a red juice — (Strab. iii. 5. 10). *D. draco*, the *dragon tree*, was observed by Bontier 66 to 69 frequent in the forest on Palma, Gomera, Teneriffe, and Grand Canary, “bearing *dragon’s blood*,” a drug according to Lindley at present “scarcely known,” the resin of *Pterocarpus* being substituted.

Posidonius mentions a small island at the mouth of the Lëigēr (Loire), on which the worship of Bacchus was established (doubtless through Greek or Carthaginian traders). The island was inhabited exclusively by “Samnite” women; who were accustomed to sail with their husbands in ships, and afterwards return to the island — (Strab. iv. 5. 6).

In visiting various parts of Gaul, Posidonius became accustomed to the sight of warriors returning from battle with the heads of their enemies suspended from the horse’s neck: heads of illustrious men were further exhibited to strangers, and could not be redeemed for their weight in gold. Smiting with a sword the back of a human victim, they divined by the convulsions; druids or priests being present during all sacred rites. Human sacrifices besides were made at other times: but from all these customs in conflict with “our” ideas, the people were being reclaimed by the Romans — (Strab. iv. 4. 5).

In returning from Spain, Posidonius landed on the Barbary coast; near a wood that proved to be full of *apes*, some in the trees, and others on the ground; and among them he remarked many of the same infirmities that afflict the human family — (Strab. xvii. 3. 4).

“86 B. C. = ‘chi-youan,’ first year of Hiao-tchao-ti, of the Han” or Seventh dynasty (Chinese chron. table).

“The same year” (Plut., and Clint.), in Rome during the last illness of Marius, Posidonius ambassador from the Rhodians; having already visited Spain, Gaul, and other countries.

Lotus edulis of the Mediterranean countries. Called in Greece “grizēllia” or “kapisōura” or “nēranizoura” (Sibth.) and the ΛΩΤΩ: ΚΕΡΟΕΝΤΙ of Thyillus — (anth. pal. vii. 223) may be compared: *L. edulis* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Caria and Cyprus. Westward, is termed “*L. pentaphyllos siliqua cornuta*” by Tournefort inst. 403: and is known to grow in Italy, Sicily, and Spain (Cav. ii. pl. 157, and Pers.).

“March 1st” (Sm. b. d.), the army of Mithridates VI. defeated by Sulla near Athens, that city captured, and its ruler the philosopher Aristion dragged from the altar of Minerva and put to death.

“84 B. C.” (Plut., and Clint.), the Library of the deceased Apellicon, containing the writings of Aristotle and Theophrastus, sent by Sulla from Athens to Rome.

“83 B. C.” (Justin, and Clint. iii. p. 346), by invitation of the people tired of internal wars, Syria occupied by Tigranes king of Armenia. — Governed by him peacefully “fourteen” years.

“83 to 82 B. C.” (Franz. 92), date of a Greek inscription on Aegina, presenting the following form of the letter M.

The Venus de Medici, by the sculptor Cleomenes, is referred by writers to the First century B. C. — (Lubke and Lutrow).

“82 B. C.” (Major edit. Bethenc.), Sertorius, fleeing from the ships of Anniius, landing near the

mouth of the Guadalquivir on the Atlantic. Meeting some Lusitanian pilots who had returned from the Fortunate Islands (Canaries), he had thoughts of retiring there — (Plut. vit.).

"At the end of the year" (Plut., and Clint.), Sulla dictator at Rome.

"81 B. C." (Porphyr., and Clint. iii. p. 400), in Egypt, Ptolemy VIII. succeeded by his daughter Cleopatra; who at the end of "six months" married her cousin Ptolemy Alexander II., now Ptolemy X. He reigned "nineteen days" only; and his name has not been found on the monuments, nor even on coins.

In a mummy unrolled at Bristol, a solution of silver was found employed in the hieroglyphic writing: and Herapath further ascertained, that the solvent was probably *nitric acid* (Philos. mag. July 1852).

Indigofera tinctoria of Tropical Eastern Asia. The *indigo* plant is called in Yemen "houer" (Forsk.), in Sanscrit "nili" (Roxb.), in Cingalese "nil" (Pidd.), in Bengalee and Hindustanee "neel," in Telinga "neelie," in Tamil "averie" (Drur.), in Burmah "mai-nay" or "shan-mai" (Mason); and bandages dyed with indigo encircling this mummy — were remarked by Herapath (philos. mag. July 1852): the "indicum" dye is mentioned by Vitruvius vii. 14. 68, Dioscorides v. 107, by Pliny xxxv. 27 as imported from India: *I. tinctoria* was observed by Forskal p. 137 (Steud.) cultivated for its dye in Yemen, and springing up spontaneously. Eastward, "ynde qe il se fait d'erbe" was observed by Marco Polo 180 in Quilon; the manufacture was witnessed also by Nicolo Conti; and indigo was found by Burnes under cultivation in Scinde, and even "exported in considerable quantities" (Graham): *I. tinctoria* was observed by Rheede i. pl. 54 in Malabar; by Nimmo, "wild in some parts of the Concan" (Graham); by Roxburgh, as far as Bengal, often springing up spontaneously, but not at a distance from places where it has been cultivated. Farther East, was observed by Mason "exotic" in Burmah; by Loureiro, cultivated and springing up spontaneously in Anam and China; by Blanco, cultivated on the Philippines by the natives, and called in Tagalo "tayom," in Pampango "tayung," in Bisaya "tagung." By European colonists, was carried to Africa (A. Dec.); and to our Southern States, where it was once extensively cultivated, and continues in "waste places" (Chapm.) although its cultivation has long ceased. (See *I. argentea*.)

"80 B. C." (Alex. chron., and Clint. iii. p. 398), accession of an "illegitimate son" of Ptolemy VIII.; a boy under the title Ptolemy XI. Auletes. He does not appear to have been acknowledged by the Egyptians, and his hieroglyphic ovals have not been found (Champoll.-Fig.): but his name occurs on coins, and in Greek inscriptions in red ink at Philæ.

Iambulus in visiting East African islands met with persons who "wrote in vertical columns" — (Diodor. ii. 55), perhaps Chinese; though it is true, vertical writing occurs on the eye-paint bottles "manufactured on the Persian Gulf." The deposition in Egyptian tombs of these eye-paint bottles and of real Chinese manufactures, is evidently more recent.

Flagellaria Indica of Tropical shores from Africa to the Samoan Islands. Called in Malabar "panambuvalli" (Rheede); and the pea-like seeds or grain seen by Iambulus on East African islands — may be compared: *F. Indica* was observed by myself on Zanzibar; by Grant, at the "Mgæta river 7° 20' S.;" and according to Persoon, occurs in Guinea. Eastward, was observed by Rheede vii. pl. 53 in Malabar; by Roxburgh, in other parts of Hindustan; by Mason, indigenous in Burmah; is termed "sirioides" by Rumphius v. pl. 29; and was observed by myself as far as the Feejeean and Samoan Islands. By Nimmo, was introduced into the environs of Bombay (Graham).

Cajanus flavus of Equatorial Africa. The *doll* or *pigeon pea* is called in Tamil "thovaray," in Telinga "candaloo," in Hindustanee "toor," in Bengalee "dal urur" (Drur.), in the environs of Bombay "toor" or "dhal" (Graham), in Suahili "baraz" (Grant); and possibly the pea-like grain seen by Iambulus: — *C. flavus* was observed by myself on Zanzibar, the seeds a principal article of diet with resident Banians, and the plant I further ascertained cultivated as far inland as the Unyamuezi country; by Grant, cultivated everywhere, the "Wahiyow strike a light by using friction with its wood and a reed." Eastward, the "arhaki" enumerated in the Vishnu Purana i. 6 among the seventeen kinds of useful grain, is referred here by H. H. Wilson; and the "ad'haki" or "tubari," yielding oil according to Susrutas sutr. 46 to chikits 33, is referred here by Hessler: "Indian peas" were seen by Nikitin at Calicut: *C. flavus* was observed by Rheede vi. pl. 13 in Malabar; by Graham, "commonly cultivated" in the environs of Bombay, observed there by myself; by Roxburgh, and Wight, in other parts of Hindustan as far as Bengal and Assam, the seeds according to Drury "much esteemed by the natives," the tender parts of the shrub eaten by cattle, while "the dried stem makes excellent fuel and is well adapted for producing fire by friction." Farther East, is known to occur on Java (Pers.); was observed by Mason "exotic" in Burmah and called "pai-yen khyung;" by Blanco, well known on the Philippines and called in Tagalo "caguio." Westward from Africa, is called in Carib "quingongi" or "bipicaa" or "ouandou" (Desc.), the first of these names resembling the Negro name of an allied plant; continues abundantly cultivated in the West

Indies, and is used for fencing sugar-plantations (Graham), the varieties of "pois-chiches" according to Humboldt iv. 9 known to the Aboriginal Americans from the earliest times, may also be compared: Clearly by European colonists, was carried to the Hawaiian Islands, observed there by myself. "C. pseudo-cajan" of Jacquin or "bicolor" of Decandolle is regarded as not distinct (Drur.).

"79 B. C." (Appian, and Clint.), at Rome, abdication by Sulla of his dictatorship. Besides enacting laws, Sulla wrote commentaries or historical memoirs. — He died in the following year.

As early perhaps as this date, Puchyadharman succeeded by Puchpamitra, now king at Pataliputra on the Ganges. He was persuaded by a Braminical priest in his household to attempt the overthrow of Buddhism — (Avadan. asok.). He is called Vrihadratha in the Puranas (Burnouf i. 430 and ii. 778).

A celebrated Sutra against Buddhism written as early possibly as this date. It contains legends — referred to by Fa-hian (Burn. i. 162 to 194).

Cinnamomum tamala of Eastern Hindustan. Called in Bengal "tai" or "tadsch", or "tedsch," and its exported dried leaves "folia malabathri, tamalapathri, or Indi" (Nees); in which we recognize the fragrant "tamala" leaves of this Sutra,* — and the Saddharma pundarika (Burn. i. 178 and ii. 145): C. tamala is described by Fr. Nees and Eberm. ii. 426; is known to grow wild in Derwanee and Gongachora, and is cultivated in the gardens of Rungpur, "the taste of the dried leaves warm, aromatic, at first like cinnamon, afterwards like cloves mixed with camphor" (Lindl.). The imported drug "tamalabathra" was found by Garcias to consist of dried cassia leaves; by Blume to include various species of Cinnamomum, but in all the samples he examined C. tamala was absent. (See C. iners).

"75 B. C." (Eutrop. and Clint.), from Macedonia, the Roman general Scribonius extending his conquests as far as the Danube.

"The same year" (Cic., and Clint. iii. p. 341), arrival in Rome of Antiochus Asiaticus, son of the deceased Antiochus Eusebes.

"The same year" (Javanese annals, and Elphinstone iii. 10), the Javanese Era. Said to have been established by "a numerous body of Hindus from Clinga," on the occasion of their arrival in Java, where they "civilized the inhabitants." The era continues in use among the Javanese.

Melaleuca cajuputi of the Siamese countries and Malayan archipelago. An elegant little Myrtaceous tree, its birch-like bark yielding *cajuput oil* procured from early times: † — indigenous according to Mason v. 491 "in the Karen forests" as far as 13° North; described also by Roxburgh, and Wight i. 326; and termed "arbor alba javanica" by Rumphius ii. 74. This green aromatic camphorate essential oil according to Lindley is "irritating or stimulating," used "in toothach" and for other medicinal purposes.

* *Pterospermum acerifolium* of the Siamese countries and Malayan archipelago. A large Sterculioid tree called in Burmah "toug-phet-won" (Mason); and the "karnikara" transplanted from a foreign country according to this Sutra, — mentioned also in the Sagitti sutta, is referred here by Burnouf i. 177 and ii. 826: *P. acerifolium* was observed in Hindustan by Roxburgh, and Wight: by Graham, in a garden at Colabah near Bombay, also in "Giergaum woods, not common;" by Mason v. 536 wild in Burmah, in company with two other species growing with teak. Transported to Europe, is described by Linnæus, Cavanilles iii. pl. 44, and in Bot. mag. pl. 620.

Erythrina suberosa of Tropical Hindustan. A tree with corky bark called in Telinga "mulumodagu," in Sanscrit "mundara" (Bedd.): "mandarava" flowers are mentioned in this Sutra, — and the Saddharma pundarika (Burn. i. 178 and ii. 3); the "erythrine" by Valmiki ram. iii. 79 (transl. Gorr.); the "mandara" fillet, and heaps of the flowers waving along the banks of the Ganges, by Kalidasa vikram. to kum. vi. 5: *E. suberosa* was observed by Gibson, Auld, and Graham, from Guzerat to Kandesh and "the Mahal districts East of the Ghauts;" by Roxburgh, Wight, and Beddome, in other parts of Hindustan.

Erythrina fulgens of . . . Called in Bengalee "mundaruka" (Pidd.); and possibly the "mandarava" in question: — the "mandari" prescribed by Susrutas, is referred here by Hessler: *E. fulgens* was seen in Eastern Hindustan by Piddington 175. Is known in the gardens of Europe, as appears from Steudel.

† *Melaleuca leucadendron* of the Malayan archipelago. An allied species, — so far as Roxburgh could discover, never employed in the distillation of cajuput oil, its leaves possessing little or no fragrance (Lindl.): is termed "leptospermum leucadendron" by Forster (Steud.). From transported specimens, is described by Linnæus mant. 105.

Polygala venenosa of Java. A shrub — found by Commerson so much dreaded by the Javanese that they are unwilling to touch it (Lindl.), "systemati nervoso valde infesta" (Pers.). From transported specimens, described by Jussieu enc. v. 493.

Uncaria gambir of the Malayan archipelago. A Cinchonaceous shrub, from whose leaves the extract called *gambier* prepared from early times by the Malays, — chewed with betel, and considered by Pereira one of the substances called “catechu” in commerce (Lindl.): *U. gambir* was observed in the Malayan archipelago by Rumphius v. pl. 34, Hunter, and Crawford; is described also by Roxburgh.

“74 B. C.” (Eutrop., and Clint.), Bithynia bequeathed by king Nicomedes to the Romans.

Cerasus vulgaris of the Armeno-Caucasian countries. The CERASVS in the “480th year of Rome” brought from Pontus by Lucullus — (Plin. xv. 30), seems to be the true *cherry*: “dulces cerasi” are mentioned by Propertius . . . ; the “sweet and black-fruited kersasia,” by Ebn Baitar; and

Hopea? *sp.* of Pulo Condore. A tree — seen only here by Dampier, much larger than any other on the island and yielding *tar*, is regarded by Mason v. 517 to 527 as probably belonging to the Dipterocarpaceous tribe.

Xylocarpus obovatus of the shores of Java. A Meliaceous tree, known from early times, — the bark of its root extremely bitter: observed by Blume bydr. 179 (Lindl.).

Mangifera foetida of the Equatorial portion of the Malayan archipelago. The *horse mango*, introduced from the Straits of Malacca at an early period, — is called in Burmah “la-mwot;” its large fruit in odour resembling the dorian continuing a favourite with the Burmese, and is cultivated as far as 13° N. at Mergui (Mason v. 448).

Cassia florida of the Malayan Archipelago. A slender graceful Leguminous tree introduced at an early period — and called in Burmah “ma-za-lee,” extensively cultivated, its wood said to be not inferior to ebony (Mason v. 404 to 532): is termed “Senna Sumatrana” by Roxburgh ii. 347. Westward, was observed by Wight in peninsular Hindustan; by Gibson, Law, and Graham, “in gardens” in the environs of Bombay, its growth “very rapid.” From transported specimens, is described by Vahl symb. iii. 57.

Strychnos tieute of Java. Woody, climbing eighty to a hundred and twenty feet before branching, the bark of its root yielding one of the most dangerous poisons known, — called “tshettik” or “tjettek” or “upas radja,” and acting like *nux vomica* only in a more violent manner: observed by Leschenault ann. mus. xvi. pl. 23, and Blume rum. i. pl. 24 (Lindl.).

Hasseltia arborea of Java. A handsome Apocynous tree, its milky juice from early times used to destroy tape-worm: — observed by Blume in the province of Buitenzorg (Lindl.).

Laurus (Sassafras) parthenoxylon of the forests of Sumatra. A lofty timber-tree called “kayo gadis” virgin tree, and from early times the oil from its fruit and infusion of the root employed medicinally: — observed by Jack, and Blume; described also by Roxburgh hort. (Lindl.).

Laurus (Caryodaphne) densiflora of the mountain-woods of Java. A tree eighty feet high, growing in Western Java at the elevation of from fourteen hundred to two thousand feet, called “kiteja” or “kitedja,” and from early times its gratefully aromatic leaves employed in infusion medicinally: — observed by Blume (Nees laur., and Lindl.).

Chloranthus officinalis of the mountain-woods of Java. A smooth shrub, three or four feet high, growing in moist woods at the elevation of from fifteen hundred to two thousand feet; its root from early times used medicinally by the mountaineers: — observed by Blume fl. Jav. pl. (Lindl.).

Chloranthus brachystachys of Java. A smooth upright shrub, three feet high, growing in woods along the coast, and known from early times, — its properties being like those of the last species: observed by Blume fl. Jav. pl. (Lindl.).

Ficus toxicaria of Sumatra. Growing near “pago Pandano” (Pers.), and its juice known from early times as a virulent poison — (Lindl.): *F. toxicaria* is termed “f. padana” by Burmann (Steud.). From transported specimens, is described by Linnæus mant. 305, and Vahl.

Piper siriboa of the Malayan archipelago. Climbing, and known from early times, — “used in the same way as” *P. betle*: observed by Rumphius v. pl. 117, and Blume (Lindl.). From transported specimens, described by Linnæus (Steud.).

Curcuma viridiflora of Sumatra. A Scitamineous herb entirely green known there from early times: — termed “tommon giring” by Rumphius v. p. 165. Westward, is described by Roxburgh res. as. xi. 341, and by Nimmo was introduced into the environs of Bombay (Graham).

Hedychium coronarium of the Malayan archipelago. A Scitamineous herb called in the environs of Bombay “sonetukkah” or “doolaba chumpa” (Graham), in Burmah “lan-thæ” (Mason); known to grow on Java, and from early times its large white fragrant flowers worn by Malay maidens in their hair: — observed by Rumphius v. pl. 69 (Pers.); by Mason v. 429 to 804 “exotic” in Burmah, cultivated for its flowers. Westward, was observed by Retz iii. 75 in Hindustan, according to Roxburgh the most charming plant of the order; by Graham, “in gardens” around Bombay, the flowers worn also in the hair by Hindoos.

Pliny states, that the cultivation does not succeed in Egypt; a fact confirmed by Abd-allatif, Clot-Bey, and others, and by experience in the same Latitude in Northeast America. Besides being cultivated, *C. cerasus* has been observed growing spontaneously in Macedonia and Bithynia (Griseb. spic. i. p. 87), Volhynia, Lithuania, and the Crimea; and apparently indigenous in the forest South of Caucasus (Ledeb. flor. Ross. ii. p. 6), and called there "bali;" corresponding therefore to "aloo-baloo," the name under which the cherry is cultivated in Cashmere (Royle ill. p. 85, and A. Dec.). Farther South in Hindustan, the tree was found by Lush under cultivation at Dapooree (Graham). From Europe, was introduced into the gardens of America, where, in our Northern States, it is now cultivated abundantly, the fruit though of good quality, inferior to some observed by myself at Venice.

Asclepiades of Prusa in Bithynia, founder of the Asclepiadean medical sect, teaching rhetoric at Rome in the time of Pompeius Magnus (Plin. vii. 37 and xxvi. 7), and therefore not earlier than this date.

"73 B. C. = 'pen-chi,' 1st year of Siouan-ti or Hiao-hiouan ti of the Han " or Seventh dynasty (Chinese chron. table, and Pauth. 249).

72 B. C. (Sm. b. d.), after a successful campaign against the Dardanians and Moesians, the Danube first reached by a Roman army; led from Macedonia by C. Scribonius Curio. — His triumph over the Dardanians celebrated on his return to Rome "B. C. 71."

"69 B. C." (Clint. iii. p. 342), by the Romans under Lucullus, Tigranes defeated and expelled from Syria; and Antiochus Asiaticus established there as king Antiochus VIII.

One hundred and twenty-seventh generation. B. C. 67, May 1st, mostly beyond youth: the Greek philosophers, Cratippus, Antipater of Tyre, Andronicus of Rhodes, and Jason the stoic; the historian Theophanes of Lesbos; the chronologer Castor; the medical writer Dioscorides Phacas; the orator Hybreas; the grammarians, Demetrius of Magnesia, Tyrannion, Demetrius of Erythrae, Asclepiades of Myrlea the younger, and Aristodemus of Nysa; the rhetors, Aeschines of Miletus, and Apollodorus of Pergamus: the Latin writers, the poets Catullus, Varro Atacinus, Calvus Macer, and Bavius; the satirist Furius Bibaculus; the mathematician L. Taruntius Spurina; the historians Sallustius, Lucceius, Aelius Tubero; the orators Hortensius, Q. Cornificius, Furnius, M. Calidius; the grammarians Valerius Cato, Orbilius Pupillus, Curtius Nicia, Ateius; the rhetors Antonius Gniphio; and other Latin writers, Cornelius Nepos, Publius Syrus, Pomponius Atticus, and Laberius Decimus.

Berberis lycium of the Himalayan mountains. The ΑΥΚΙΟΝ: ΙΝΔΙΚΟΝ of Nicostratus — (Gal. comp. med. ix. 6), Apollonius, Niceratus, Servilius Democrates, Aretaeus, and Paulus Aegineta, known to Dioscorides as the reported product of a thorny shrub called "loghitithōs" having many upright stems three or more cubits high and leaves resembling those of the olive, prepared according to Pliny xii. 15 and xxiv. 77 by cooking the bruised branches and roots in water and exported in bladders of the rhinoceros and camel, and employed medicinally among other purposes against "erosos angulos oculorum," is referred here by Royle (Linn. trans. xvii. p. 83): *B. lycium* is described by him as observed on the Himalayan mountains, an extract called "rusot" made by digesting in water slices of the root stem and branches of this and other species of barberry employed by the natives against ophthalmia (Lindl.).

"The same year" (Appian, and Clint.), after "two years" war, Crete subdued by the Romans under Q. C. Metellus.

"66 B. C." (Cic., and Clint.), in Asia, Lucullus succeeded by Pompey in conducting the Mithridatic war.

"65 B. C., Caesar being aedile" (Cic. in Rull. i. 1 and ii. 16, see Clint. iii. p. 392), envoys sent to recover money deposited in Tyre; the will of Ptolemy Alexander bequeathing Egypt to the Romans not having been found.

"The same year" (Appian, Blair, and Clint. iii. p. 342), the last of the Seleucidæ Antiochus VIII. dethroned by Pompey, and Syria reduced to a Roman province.

Salvia verbenaca of Europe and the adjoining portion of Asia. Called in Britain *wild clary* (Prior), in Greece "sarkōthrōphi" or "vōuturōhōrtōn" or "agriōs vasilikōs," in which we recognize the "agriōn vasilikōn" identified in Syn. Diosc. with the AKINOC, mentioned as coronary by the physician Andron — (Athen. xv. 26), by Dioscorides as a coronary herb resembling "ōkimō" but fragrant and more hairy, by some persons cultivated; *S. verbenaca* was observed by Forskal, Sibthorp, and Chaubard, frequent in pastures from Constantinople to the Peloponnesus. Farther South, the "acinon" is enumerated by Pliny xxi. 52 and 101 as cultivated both for food and as coronary by the Egyptians; was known to Athenaeus in Egypt; and *S. verbenaca* was observed by Delile on the Mediterranean border near Alexandria. Westward, the "akinōs" or "akōnōs" is identified in Syn. Diosc. with the "ōkimastrōum" of the Romans; the "silvestri ocimo" is mentioned by Pliny xx. 48; *S. verbenaca* is described by Brunfels ii. p. 26 (Spreng), and Triumfetti pl.

66; is termed "*horminum sylvestre lavendulæ flore*" by Tournefort inst. 178; and is known to grow in Barbary and throughout middle Europe as far as Britain (Desf. atl., Curt. lond. vi. pl. 1, and Pers.; see *Mesembryanthemum Copticum*, and *Salvia sclarea*).

"63 B. C." (Dio, Blair, and Clint.), suicide of Mithridates VI. after defeat by his son, now Pharnaces II.: terminating the Mithridatic war against the Romans. The work of Mithridates on poisons was delivered by Pompey to his own freedman Lænaeus, to translate into Latin (Sm. b. d.).

Tamarix Germanica of the plains of Tartary and Eastern Europe. A kind of *tamarisk* called in Italy "*tamerigio*" or "*tamerice*" or "*mirice*" (Lenz), and the *ERICEN* of Lænaeus, — regarded by some as the "*tamaricen*" (Plin. xxiv. 41), may be compared: the "*tamaris*" or "*tamarix*" is mentioned by Celsus ii. 33, Columella viii. 15. 4, and the "*tamarix scopis tantum nascens*" by Pliny xvi. 45: *T. Germanica* is described by Miller pl. 262; and is known to grow in North Italy (Scop., and Lenz) and middle Europe (Lam. fl. fr., Pers., and Moench). Eastward, is termed "*t. decandra*" by Pallas; is called "*balgou*" by the Mongols and Bouriates, and is used by them as a substitute for tea (Klapr.).

Cytisus scoparius of middle Europe. Called in Britain *broom*, in the Anglo-Saxon leechbook "*brom*," in Germany "*brame*" (Prior), in France "*genêt*" (Nugent), and possibly the *SCOPIS-AMERINIS* to which the *ERICEN* is likened by Lænaeus: — *C. scoparius* is described by Linnæus, and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 313, Engl. bot. pl. 1339, and Pers.). The young tops in decoction according to Lindley are "diuretic and cathartic, seeds said to be emetic."

"In the summer" (Dio, Jos., Clint., and Kitt. cycl. bibl.), after "three months" siege and on the anniversary day of the first overthrow by Nebuchadnezzar, Jerusalem captured by Pompey, and Jewish independence again overthrown. The Jews now passed to the dominion of Rome.

"October" (Sallust, Blair, and Clint.), at Rome, the conspiracy of Cataline detected by Cicero.

Some of the books in Cicero's library were written on *parchment* — (Pouchet).

Semecarpus anacardium of Tropical Hindustan. *ATRAMENTO-SVTORIO* is mentioned by Cicero, — and Pliny (Ainsw.); the "*halkanthōn*" is described by Galen comp. med. viii. 3 as composed in part of "*hrusōvalanōu*," the "*xanthōvalanōs*" is mentioned by Actuarius, and Nicolaus Myrepsus; the indelible ink-markings on mummy-cloth are derived by Mason v. p. 510 from imported nuts of *S. anacardium*; and the "*baladsir*" of Ebn Masawia, I. Ben Amran, Rhazes, I. Ben Ali, Avicenna, and Ebn Baitar, is referred to this plant by Sontheimer. Eastward, *S. anacardium* in Hindustan is sometimes called "*belader*" (ulfaz udwiyeh, Faulkn., Honigb., and J. F. Wats.); in which we recognize the "*balador*" identified by Ebn Baitar from the "*anakarthiōn*" of the Greeks (Royle antiq. hind., see *Cardiospermum*); is called in Sanscrit "*bhela*" or "*arushkara*." in Bengalee "*bhela*" or "*bela-tuki*" or "*bhola-tuki*," in Telinga "*nella-jedee*;" was observed in Hindustan by Roxburgh cor. pl. 12, and Wight; by myself, as far as the central portion of the Deccan; by Gibson and Graham, "common throughout the Concans and in Guzerat, whence a considerable quantity of the nuts are exported;" and according to Lindley, the "receptacles eaten like apples when roasted; the pure black acrid juice employed externally by the natives" to "remove rheumatic pains, aches and sprains;" also, "universally used to mark linen:" hence the English name *marking nut*. Farther East, is enumerated by Mason among the plants of Burmah, the nuts at least "constantly for sale in the bazars," and used for making indelible ink.

Rumex bucephalophorus of the Mediterranean countries. Called in Greece "*atzētōza*" (Sibth.) or "*agriōlapathō*" (Fraas); and the *LAPATHI-BREVIS-HERBA* of Cicero fin. ii. 8, — and Horace sat. 2, is referred here by Fraas: *R. bucephalophorus* is described by Columna ecphr. i. pl. 150; is termed "*acetosa ocymi folio neapolitana*" by Tournefort inst. 503; and is known to grow in Italy (Pers., Pollini, and Lenz). Eastward, was observed by Sibthorp, Chaubard, and Fraas, frequent in grain-fields at the opening of spring from the Peloponnesus throughout the Greek islands to Cyprus.

Aristolochia clematitis of the Caucasian countries. Called in Italy with other species "*stallagio*" or "*stallagio*" or "*aristolochia*" (Lenz), in which we recognize the long-rooted kind called "*erva aristolōhia*" by the Romans according to the Syn. Diosc. iii. 5: the *ARISTOLOCHIA* is mentioned by Cicero; — the "*pontica*" kind, by Pliny xxv. 54 as the most celebrated; and the "*aristolochiae masculae*" is described by him as having an oblong root as thick as a staff and four digits in length, supposed to impart the power of generating males: *A. clematitis* is termed "*a. clematitis recta*" by Tournefort inst. 162; and is known to grow in vineyards and hedges in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 1235, Pers., A. Dec., and Lenz): from its name *Saracen's birthwort*, is conjectured by Bromfield to have been introduced into Britain during the crusades, is mentioned by Gerarde, and Parkinson, as a cultivated plant only, but has since become naturalized (Wats.). Eastward, was observed by Sibthorp on mount Athos and along the

Black Sea near Constantinople; and is known to grow to all appearance indigenous in Southern Russia and around Caucasus. Was formerly in high repute for its medicinal properties (Merat dict. i. p. 411), the roots according to Lindley having "been chiefly employed as aids to difficult parturition." (See *A. rotunda*).

In or about 62 B. C. (= "20 yrs after the death of Sertorius," Major edit. Bethenc.), Statius Sebosus writing on the Hesperides Islands (Canaries), five of which were known to him.

Laurus Canariensis of the Canary Islands. A *laurel* called in Guanche "carisco" (Webb); and the trees on the Hesperides growing according to Sebosus to the height of "one hundred and fourteen feet" — (Plin. vi. 37), may be compared: *L. Canariensis* was observed by Webb on the Canary Islands. From transported specimens, is described by Willdenow (Steud.).

"61 B. C." (Clint. iv. p. 116), the *First era of Gaza*

"60 B. C. = L. Afranius and Q. Metellus Celer consuls," the last-named being proconsul of Gaul, "Indos" leaving "India" for trading purposes were driven by a storm to Germany, and were sent to him by the king of the Suevi — (Nepos, and Plin. ii. 67, possibly the earliest historical notice of America).

"In this year" (Liv., Blair, and Clint.), coalition of Pompey, M. L. Crassus, and Caesar, over the Romans; called the "First Triumvirate."

"The same year" = "180th Ol." (Diodor. i. 44 to 47, and Clint.), Thebes in Egypt visited by the historian Diodorus Siculus; the great syenite colossus of Ramessu II., as appears from his description, continuing entire.

The temple mentioned by Diodorus iii. 211 as venerated by all Arabs, is clearly the Caba on the site of Mecca. The Caba is known to have contained a statue of Abraham (Percev. i. 175), doubtless placed there by Ishmaelites, and from this time — has continued in the possession of Ishmaelite tribes.

Tanacetum vulgare of Europe and the adjoining portion of Asia. Called in Britain *tansy*, by Askham "tansye," in France "tanaïsie," in old French "athanaisie," in medieval Latin in the time of Lyte "athanasia" (Prior p. 35 and 223): the ΑΘΑΝΑΣΙΑ medicine discovered by Isis according to the Egyptians (Diod. i. 30), — mentioned also by Lucian dial. iv. as viper's medicine and high-priced by Galen (Orib. xliv. 4), is referred here by writers: *T. vulgare* has not been observed in Greece; but is known to occur in the Crimea (Lindl.); and according to Clot-Bey, has been recently introduced into Egypt. Westward, the "tanarita" of the capitularia of Charlemagne is referred here by Antony, and Sprengel: *T. vulgare* is called in Anglo-Saxon "helde" (leechb. i. 36. 41) or "ænglisc cost" (Lacn. 29, and Cockayne); is described by Tragus f. 61, and Dalechamp pl.; by Lobel, as cultivated in gardens; and at the present day, is known to occur along roadsides throughout middle Europe as far as Denmark (fl. Dan. pl. 881, Pers., and Lindl.). By European colonists, was carried prior to 1670 (Jossel.) to Northeast America, where it has become frequent around dwellings and along roadsides. The plant according to Lindley is esteemed "tonic and cordial," and Withering says "the flesh-fly will not touch" meat rubbed with the leaves.

Galactites tomentosa of the Mediterranean countries. Called in Greece "atrōgira" (Forsk.), and the ΓΑΛΑΤΥΒΟΝ described by Diodorus iv. as an edible thistle ΑΚΑΝΘΙΟΝ: ΤΙ: ΑΔΡΟΝ: ΚΑΙ: ΕΔΩΔΙΜΟΝ, — and by Dioscorides as eaten while young cooked with oil and salt, the leaves broad and resembling those of the "hamailēōnti leukō," may be compared: *G. tomentosa* was observed by Forskal in Asia Minor and around the Dardanelles, "flore tomentoso caule alato edulis tenera," a tomentose flower winged stem and eaten while tender; by Sibthorp, and Chaubard, from the Peloponnesus throughout the Greek islands. Westward, the "silybum" is described by Pliny xxii. 42 as growing in Cilicia, Syria, and Phoenicia, the cooking very troublesome. *G. tomentosa* is termed "carduus galactites" by Tournefort inst. 441, "unicus galactites" by Deslongchamps; was observed by Forskal on Malta; is known to grow also in Italy, Barbary and Southern France (All., Lam. fl. fr., Cav. iii. pl. 231, and Pers.).

"In this year" (Burm. hist., and Mason 40), Tāpah succeeded by his son Papeyan, now Burmese king: * — during whose reign of "sixty-six" years there were great religious dissensions in India.

* *Erythrina pen-lay-ka-theet* of Burmah. The *sea coral-tree* perhaps already "famous in Buddhist mythology as the tree around which the Devas dance till they are intoxicated in Sudra's heaven" — (Mason 531): *E. pen-lay-ka-theet* was observed by Mason indigenous and "common" at Toungoo, having "small thorns on the trunk," its flowers "reddish."

Fagraea fragrans of Burmah. A Loganoid tree, called in Burmah "a-nan:" perhaps already regarded by the Burmese "as too good for the laity," but "ought to be confined to sacerdotal purposes," — was observed by Mason 543 "used principally for the posts of Buddhist edifices" at Tavoy, its timber "very hard and excellent." *F. fragrans* is described also by Falconer, Roxburgh, Wallich, and Griffith, and according to O'Riley its timber is not subject to attacks of the *Teredo* or ship-worm.

"59 B. C." (Liv., and Clint.), at Rome, an *agrarian law* carried against all opposition by Caesar; one of the consuls for this year. The provinces of Illyricum and Cisalpine and Transalpine Gaul, assigned to Caesar for five years (Sm. b. d.).

About this time, the Danube crossed and the country North of the Adriatic ravaged by the Getae or Dacians; who under their king Boerebistas (compare Ariovistus) had acquired great power. Strabo vii. 3. 5 further states, that Caesar sent an expedition against "Vurēvistas."

Ornithopus compressus of the Mediterranean countries. The "karōpithla" of the Dacians, — identified in the Syn. Diosc. with the "katanagkē," having according to Dioscorides a slender root, long leaves as in "kōrōnōpōthōs," six or seven heads of "ōrōvō"-like fruit that in drying curve towards the earth like the talons of a dead kite, is referred here by Sprengel: the "katanagkē" is further identified in the Syn. Diosc. with the "arharas" or "arkōpōus" of the prophets; and the "catanancem" of Thessaly employed for amatory purposes and detecting magic, is mentioned by Pliny xxvii. 35: *O. compressus* was observed by Sibthorp, and Chaubard, from Caria to the Peloponnesus. Westward, the "katanagkē" or "thamnamēnē" or "thiōnusias" or "thursiōn" or "thēmōs" or "krōtiōn" is identified in the Syn. Diosc. with the "ērva philikla" or "thatiska" or "iōvis mathiōus" of the Romans; and the "pes milvinus" is mentioned by Columella. . . (Ruel ii. 62): *O. compressus* is termed "*ornithopodium scorpioides siliqua compressa*" by Tournefort inst. 400; and is known to grow in Italy, Sicily, Barbary, and Southern France (Bergeret ii. pl. 191, All. and Pers.).

Ornithopus ebracteatus of the Mediterranean countries. — The "katanaghē ētērōn" employed like the preceding for amatory philtres by the Thessalian women, and further described by Dioscorides as having a small root, leaves in form and colour like those of the olive but soft and divided spreading on the ground, and small fruit pierced into many parts "ērēvinthōn"-like, may be compared: of the added Synonyms, the "kēmōs" seems to belong here, for the "cemos" is distinguished by Pliny xxvii. 35 from the "catanancem," but is employed for the same purposes (compare "kēmōs = lēōn-tōpōthiōn" in Diosc. iv. 129): *O. ebracteatus* was observed by Chaubard in the Subalpine portion of the Peloponnesus. Westward, is described by Dalechamp p. 487; and is known to grow in Spain, Portugal, and Southern France (Brot., Vivian., Dec. fl. fr., and Pers.).

Aster tripolium of the European seashore, along the Atlantic and Mediterranean. Called in Britain *sharewort* (Prior), equivalent to the "iggunalis" of the Romans or "vōuvōniōn" identified in the Syn. Diosc. with the "rathivitha" of the Dacians: — the account by Dioscorides of the "astēr attikōs" may in part belong here: *A. tripolium* was observed by Sibthorp sparingly on the seashore of the Greek islands. Westward, the account of the "aster" or "dubonion" by Pliny xxvii. 19 seems chiefly taken from Dioscorides; *A. tripolium* is termed "*a. maritimus palustris cæruleus salicis folio*" by Tournefort inst. 481, "*a. pannonicus*" by Jacquin (Bieb.); and is known to grow on the seashore of France and Britain (Engl. bot. pl. 87, and Pers.).

Erythraea centaurium of Europe and the adjoining portion of Asia. Called in Britain *earth-gall* or *lesser centaury*, in Anglo-Saxon "eorth-gealle," in Germany "tausendgulden" from "centum aureos" or "centaurium" (Prior), in Italy "centaurea minore" (Lenz), in Greece "thērmōhōrtōn" (Sibth.) or "phlōuskōuni" (Fraas), in Egypt "kantarian" (Forsk.); in which we recognize the "kēntauriōn mikrōn" identified in Syn. Diosc. with the "tōulvēla" of the Dacians: — the "kēntauriōn mikrōn kai lēptōn" is described by Dioscorides as more than a span high with purplish-red flowers and a diminutive root: *E. centaurium* was observed by Sibthorp, Chaubard, and Fraas, frequent in open situations from the Peloponnesus throughout Greece; by Forskal p. lxiv, around Cairo in Egypt, and in frequent medicinal use. Westward, the "kēntauriōn mikrōn" or "limnaiōn" or "aima ēraklēōus" is further identified in Syn. Diosc. with the "phēuriphōugiam" or "aura mōulti rathix" of the Romans; the "centaurion lepton" or "fel terrae" or "libadion," by Pliny xxv. 31 with the "exacon" of the Gauls: *E. centaurium* is described by Io. Jac. Manliis de Bosco f. 72, and Brunfels (Spreng.); is termed "*centaurium minus*" by Tournefort inst. 122; and is known to grow from Italy throughout middle Europe as far as Denmark (fl. Dan. pl. 617, Rafn, and Pers.). By European colonists, was carried to Northeast America, where it continues at Oswego on Lake Ontario "near the old fort" (A. Gray). The plant according to Lindley continues to be "collected for use in rustic pharmacy," possessing "all the essential properties of the gentian of the shops."

Hyoscyamus niger of Europe and Northern Asia. Called in Anglo-Saxon "henne-belle," converted after the days of Gerarde into *henbane* (Prior), in Germany "bilse" or "bilsenkraut" (Grieb), in France "jusquame" (Nugent), in Italy "giusquiamo" or "josciamo nero" or "dente cavallino" (Lenz), in Greece "gērōs" (Fraas), in which we recognize the "uōskuamōs" identified in Syn. Diosc. with the "thiēlēia" of the Dacians, "vilinōuntia" of the Gauls, and "phavōulōnia" of the Tuscans; — also the kind of "*hyoscyamus*" described by Pliny xxv. 17 as "vulgare" and paler, the "jusquianus" of Palladius i. 35 and Vegetius ii. 12, the "hyoscyamon" identified by Beda tabernac. iii. 8 with the plant called "acharo" in Britain, and the "acharonia" or "jusquiamus" of Albertus

Magnus virt. herb.: *H. niger* is described by Lobel adv. . . ; is termed "h. vulgaris vel niger" by Tournefort inst. 118; was observed by Munby in Algeria, and is known to occur in waste places in Italy and throughout middle Europe as far as Sweden (Fries, and A. Dec.). Eastward, was observed by Sibthorp, and Fraas, in Greece and Bithynia somewhat rare; and is known to occur as far as Casan in Russia and throughout Siberia and Daouria (Wirtz, and Ledeb.). By European colonists, was carried to Northeast America, where it continues in waste places; to Hindustan, where it is sometimes cultivated by residents (Wall., Lush, and Graham). The capsules and seeds (in accordance with the commendation of other species by Scribonius Largus 53, and Dioscorides) "are a rustic remedy for toothach," and further according to Lindley "the leaves produce effects very similar to those of opium," and "the infusion dropped into the eye dilates the pupil like belladonna." (See *H. albus* and *H. aureus*.)

Lithospermum officinale of Europe and the adjoining portion of Asia. Called in Britain *grum-mil* or *growwell* or *pearl-plant* (Ainsw., and Prior), in Germany "perlkraut" (Grieb), in Italy "miglio al sole" or "litospermo" (Lenz), in which we recognize the "lithōspērmōn" identified in the Syn. Diosc. with the "gōnōlēta" of the Dacians, — called by some "ēraklēian" from the strength of its seeds: *L. officinale* was observed by Sibthorp in the environs of Constantinople. Westward, the "lithōspērmōn" is further identified in the Syn. Diosc. with the "kōlōumvam" of the Romans; is described by Pliny xxvii. 74 as growing in Italy though he had seen only a gathered specimen, having "margaritis" among leaves and very wonderful, an herb producing stones: *L. officinale* is called in an English manuscript of the Fifteenth century "lythewale," in the *Ortus sanitatis* 296 "miliū solis," identified with "granum solis" by Treveris grete herb., and hence the combined English name which according to Turner should be written "gray myle" (Prior); is termed "l. majus erectum" by Tournefort inst. 137; was observed by Gussone i. p. 216 in mountain woods in Sicily; and is known to occur along roadsides and in wooded situations in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 1084, Pers., and Lenz). By European colonists, was carried to Northeast America, where it continues to occur along roadsides from the St. Lawrence throughout our Northern States. The seeds or nutlets contain lime (A. Dec.).

Lithospermum tenuiflorum of the East Mediterranean countries. — Called in Greece "trahēa:" the "lithōspērmōn" growing according to Dioscorides in elevated rough situations and having leaves like those of the olive but longer and broader, upright branches with a terminal bifurcation and among leaflets the round white stony seed equalling a small "ōrōvō," identified in the added Synonyms with the "aigōnuhōn" or "thiōspōrōn" or "ēxōnuhōn" or "lēōntiōn" or "lithōs lēōntikē" or "gōrgōniōn" or "tantaktis," is referred here by Fraas: the "lithospermo" or "aegonychon" or "dios pyron" or "heracleos" growing on Crete is mentioned by Pliny xxvii. 74: *L. tenuiflorum* is termed "buglossum chium arvense annuum lithospermi folio flore cæruleo" by Tournefort cor. 6; and was observed by Sibthorp, and Fraas, from Cyprus to Attica. Farther South, by Delile on the Mediterranean border of Egypt near Alexandria.

"58 B. C." (Liv., and Clint.), "L. Piso and A. Gabinius" consuls, Switzerland abandoned by the Helvetii, who having burned all their towns and dwellings proposed acquiring dominion over wider territory in Western Gaul. They were prevented from crossing the Rhone by Caesar i. 2, who built a wall as far as the Jura; he afterwards followed them into Gaul and defeated them, compelling the surviving "one hundred and ten thousand" to return into their own country. They had left their homes "three hundred and sixty-eight thousand" in number, including "ninety-two thousand" fighting men, as appeared from tables written in Greek letters found in the camp.

Of animals and plants whose relics are intermingled and preserved in debris of the lake-villages of Switzerland, the following species (including those already-mentioned) have been discovered:

Of water and marsh plants, enumerated (by Heer, in Lee's edit. Keller), *Chara vulgaris* and *C. fatida*, *Phragmites communis*, *Scirpus lacustris*, *Carices*, *Scheuchzeria palustris*, *Iris pseudacorus*; *Potamogeton perfoliatus*, *P. compressus*, *P. natans*, and *P. fluitans*; *Ceratophyllum demersum*, *Alisma plantago*, *Polygonum hydropiper*, *Galium palustre*, *Menthanthes trifoliata*, *Pedicularis palustris*, *Penedanum palustre*, *Nymphaea alba*; *Nuphar luteum* and *N. pumilum*?; *Ranunculus aquatilis*, *R. hederaceus*, *R. flammula*, *R. lingua*, and

Hydrocotyle vulgaris of Europe and the adjoining portion of Asia. Called in Britain *white rot* or *sheep'sbane* (Prior), in Gothland "spikblad" (Linn.) — termed "cotyledon palustris" by Dodoens pempt. 113, "h. vulgaris" by Tournefort inst. 328, and known to grow from Iceland (Wats.) throughout Europe (Gerarde 528, Curt. lond. vi. 19, fl. dan. pl. 90, and Pers.), also in North Africa and as far as Eastern Asia (Wats.): was observed by Linnæus in Sweden; by Sibthorp, in marshes on Crete and Zacynthus. Possibly by European colonists carried to Jamaica (Pers.), and Australia (Wats.).

Of ferns, *Pteris aquilina*: of mosses, undoubtedly used for stopping holes in the walls of the huts and for bedding, *Antitrichia curtipendula*; *Nikera complanata* and *N. crispa*; *Thuidium delicatulum*, *Anomodon viticulosus*, *Leucodon sciuroides*, and *Hylocomium brevirostre*:

Of plants for procuring fire, or tinder fungi, *Polyporus igniarius*, *P. fomentarius*; and *Dædalia quercina*:

Of forest trees and shrubs, *Pinus sylvestris*, *P. montana*, *P. abies*, and *P. picea*; *Taxus baccata*, *Juniperus communis*, *Quercus robur*, *Carpinus betulus*, *Betula alba*, *Alnus glutinosa*; *Salix repens* and *S. cinerea*; *Fraxinus excelsior*, *Ilex aquifolium*, *Euonymus Europæus*, *Acer*, *Sorbus aucuparia*, and *Rhamnus frangula*; and at Robenhausen, twigs and remains of leaves of *Viscum album*, the sacred plant of the Gauls:

Rhamnus frangula of Northern Europe and Asia. — Called in Danish “spregner,” in Dutch “sporkenhout,” in German “sporkenholz” or “spreckenholz” (Cockayne); in which we recognize the “spracen” of the Anglo-Saxon leechbook i. 15. 4 and xxiii: *R. frangula* is called in Britain *black alder* or *berry-bearing alder* (Prior); is termed “frangula” by Tournefort inst. 612; is known to grow from Lat. 65° 30' in Lapland throughout Northern and Middle Europe (fl. Dan. pl. 278, Læstadius, and A. Dec.); was observed by Sibthorp in the environs of Constantinople; and farther East, is known to grow in the Oural and throughout Siberia (Gmel., and Ledeb.). According to Lindley, the berries are emetic.

Of berried fruits, *Pyrus malus*, the crab of considerable importance for food, everywhere diffused, and a larger round variety probably cultivated; *P. communis*, only a few specimens; *P. aria*; *Prunus spinosa*, sloes gathered in great abundance; *P. insititia*; *Cerasus padus*, bird cherries gathered in great abundance; *C. mahaleb*, and only at Robenhausen stones of the *sweet cherry*; *Rosa canina*, the seeds in abundance; *Rubus Idæus*, *R. fruticosus*, and *Fragaria vesca*, the rarest of the three; *Sambucus nigra*, and *S. ebulus*, seeds of both in abundance; *Vaccinium myrtillus*, the seeds rare; *V. vitis-idaea*, the leaves only met with; and *Viburnum lantana*, the berries in several lake-dwellings:

Of nuts, *Fagus sylvatica*, beech-nuts abundant and probably used as food; *Corylus avellana*, hazel-nuts including one from Robenhausen bored by the *nut-beetle*; and *Trapa natans*:

Of bast and fibrous plants, *Tilia grandifolia*, and *T. parvifolia*; *Linum angustifolium*, cultivated:

Of plants used for dyeing, *Reseda luteola* may probably have been used for dyeing the linen cloth:

Of aromatic plants, *Carum carui*, caraway seeds found at Robenhausen and probably used as condiments.

Of oil-producing plants, *Cornus sanguinea*; and at Robenhausen, a cake of seeds of *Papaver somniferum* var. antiquum, the seeds probably pressed for oil, or perhaps eaten scattered over bread:

Of culinary vegetables, *Pisum sativum* the only kind that can with certainty be traced as far back as the Stone age; *Faba vulgaris* var. *Celtica nana* appearing in the Bronze age of a strikingly small size, such as are never found afterwards; *Ervum lens* var. *microspermum*; *Pastinaca sativa* the parsnep; and *Daucus carota* the carrot:

Of cereals or different kinds of grain, *Hordeum vulgare* var. *hexastichum sanctum* with *Triticum vulgare* var. *antiquorum*, both of them small-grained, are the most ancient, most important, and most generally cultivated; next come *Hordeum vulgare* var. *hexastichum densum*, *Triticum vulgare* var. *compactum muticum*, *Panicum miliaceum*, and *Setaria Italica*, *two-rowed barley*, with *Triticum vulgare* var. *dicoccum*, *T. turgidum*, and *T. monococcum*, probably only cultivated in a few places as experiments; *T. spelta*, with *Avena sativa*, appearing later not till the Bronze age:

Of weeds of the grain-fields, *Centaurea cyanus*, at Robenhausen only; *Lolium temulentum*, *Lappa major*, *Agrostemma githago*, *Lychnis vespertina*; *Silene Cretica*, unknown at the present day in Switzerland and Germany; *Spergula pentandra*, *Galium aparine*, *Medicago minima*; *Chenopodium rubrum*, *C. sp.* with striped seeds, and

Arenaria serpyllifolia of Europe and the adjoining portion of Asia. A diminutive annual called in Britain *sand-weed* (Prior), remnants in the debris of the lake-villages of Switzerland: — described by Fuchsius 23; termed “alsine minor multicaulis” by Tournefort inst. 243; and known to occur in fallow ground from Britain throughout middle Europe (Curt. lond. iv. pl. 32, and Pers.); observed by Scopoli in Carniola (Steud.); by Sibthorp, and Chaubard, frequent on walls and in arid situations from the Peloponnesus throughout the Greek islands; by Bieberstein, along the Taurian mountains. By European colonists was carried to Northeast America, observed by Hooker on Iceland, by myself in fallow ground around Salem and Philadelphia, by A. Gray in “sandy waste places” in Central New York, by Short in Kentucky, and by Chapman in “waste places” as far as “Florida.”

Ranunculus repens of Europe and Northern Asia. Remnants of this *buttercup* in debris of the early lake-villages of Switzerland: — *R. repens* is described by Valerius Cordus 8 (Spreng. præf. h. h.); is termed “*r. pratensis repens hirsutus*” by Tournefort inst. 289; is known to grow in moist

places and cultivated ground from Denmark to the Mediterranean and Barbary (fl. Dan. pl. 795, and Wats.); was observed by Sibthorp in the Peloponnesus; and is known to grow around Caucasus and throughout Siberia as far as Daouria and Kamtschatka (Ledeb.). By European colonists, was carried to Madeira (A. Dec.); to Iceland (Wats.); to Northeast America, observed by Sheppard around Quebec (Hook.), by myself in moist grass-grown clearings and along river-banks in our Northern and Middle States, completely naturalized, and has been received by Torrey and Gray fl. i. 21 from Georgia and Oregon.

Stellaria media of Europe and Northern Asia. Called in Britain *chickweed*, in Anglo-Saxon "cicena-mete" (Prior emend.), by Hildegard ii. 174 "hunesdarm" (Spreng.), in Egypt "gezazeh" vitreous (Del.), in Japan "fan ru" or usually "fakobi" or "fagu iera" (Thunb.); and remnants in debris of the early lake-villages of Switzerland: — *S. media* is termed "morsus gallinæ" in the *Ortus sanitatis* 301, "alsine media" by Tournefort inst. 242, and Linnæus, "alsine avicularum" by Lamarck; is described also by Fuchsius; is known to occur in cultivated ground from Lapland to Algeria (Wats., and Munby) and the Canaries (De Buch); was observed by Sibthorp, and Chaubard, from the Peloponnesus to Asia Minor; by Delile, in Lower Egypt; is known to occur from Caucasus throughout Siberia (Ledeb.); and was observed by Kaempfer, and Thunberg, in cultivated ground everywhere in Japan. By European colonists, was carried to Northwest America, observed by Mertens around trading-posts on Norfolk Sound, by Beechey 135 in California, known to occur also between York Factory and Cumberland House (Hook.) and as a common weed throughout the cultivated portions of the United States; was also carried to Greenland (Wats.) and Iceland (Hook.); to the Azores (Wats.); to Southern Brazil (Saint-Hil.); to the Falkland Islands (J. D. Hook.); to Chili (C. Gay); to New Zealand (Raoul); to the Auckland or perhaps Campbell Island (A. Dec. 490); to Austral Africa (Drège, and E. Mey.); and possibly by European colonists to Ceylon, observed by Gardner naturalized in elevated situations, and by Wight on the Neilgherrie mountains farther North.

Chenopodium album of Northern Climates. Esculent, and called in Britain with other species *goose-foot* (Prior), in Egypt "fisah klab" (Del.), in Yemen "rockeb el djammel" (Forsk.), in Japan "rei" or usually "akasa" or "akadsa" (Thunb.); and remnants in the early lake-villages of Switzerland: — *C. album* is termed "atriplex sylv." by Fuchsius 119 (Spreng.), "ch. folio sinuato candicante" by Tournefort inst. 506; is known to occur in waste and fallow ground from the Feroe Islands and Lapland to the Mediterranean (Martins, Fries, and Pers.); was observed by Forskal, Sibthorp, and Chaubard, from the Peloponnesus to Constantinople; by Hasselquist, in Palestine; by Forskal, and Delile, in Egypt; by Forskal p. 2. frequent in Yemen; by Graham, and Roxburgh, under cultivation as a potherb in Hindustan, but having no Sanscrit name; is known to grow in Siberia (Wats.); and was observed by Kaempfer, and Thunberg, in Japan. Farther East, was observed by Mertens around trading posts on the American coast at Norton Sound; by myself, around Chinook villages on Puget Sound, also around the European trading-posts, and clearly indigenous throughout the Interior plains, probably indigenous also in the sands along the Atlantic; indigenous according to Lindheimer in Texas (A. Dec. 752); but a frequent weed in the cultivated portions of the United States, as far as Florida (Chapm.), and received by Moquin from Cuba. By European colonists, was carried to Chili (C. Gay); to the Hawaiian Islands (Moq.); and to Austral Africa (Drège).

Chenopodium polyspermum of Europe and the adjoining portion of Asia. Remnants of this allied weed also in the early lake-villages of Switzerland: — the "third blitum" of Tragus is referred here by Sprengel præf. h. h.; *C. polyspermum* is described also by Gerarde 325; is termed "blitum majus polyspermum a seminis copia" by Morison ii. pl. 30, "ch. betæ folio" by Tournefort inst. 506; is known to occur in cultivated ground from Denmark throughout middle Europe (fl. Dan. pl. 1153, Engl. bot. pl. 1480, and Pers.); and was observed by Sibthorp among rubbish at Constantinople. By European colonists, was carried to Northeast America, found by C. J. Sprague "a scarce garden-weed about Boston," and by Porter in "woods near Mercersburg and Reading, Penn., naturalized" (A. Gray).

Of quadrupeds, enumerated by Rüttimeyer, the brown bear *Ursus arctos*, badger *Meles vulgaris*; pine marten *Mustela foina*, at all stations of the Stone age; marten *M. martes* polecat *M. putorius*, and ermine *M. erminea*; otter *Lutra vulgaris*, fox *Canis vulpes*; wolf *C. lupus*, teeth as trophies of the chase; *C. familiaris*, from the beginning, var. *major* occurring only in the Western lakes; European wildcat *Felis catus*; hedgehog *Erinaceus Europæus*; beaver *Castor fiber*, at all stations of the Stone age; squirrel *Sciurus Europæus*, *Mus sylvaticus*, hare *Lepus timidus*; wild boar *Sus scropha*, and var. *palustris*, both in the wild state in the Stone age, and subsequently occurring domesticated; *Equus caballus*; *E. asinus*, at Wauwyl; *Cervus alces*, *C. elaphus*, and *C. capreolus*; *Capra ibex*, and *C. hircus*; *Ovis aries*, in the domestic state and from the beginning; *Antilope rupicapra*; *Bos primigenius*, *B. bison*; *B. taurus*, in the domestic state, with the varieties *primigenius*, *brachyceros*, *trochoceros*, and *frontosus*:

Of birds, *Aquila fulva*, and *A. haliætus*; *Falco milvus*, *F. palumbarius*, *F. buteo*, and *F. nisus*; *Strix aluco*, *Sturnus vulgaris*; *Corvus corax*, and *C. corone*; *Cinclus aquaticus*, *Columba palumbus*, *Tetrao bonasia*, *Ciconia alba*, *Ardea cinerea*, *Grus cinerea*, *Fulica atra*, *Larus* sp., *Cygnus olor*, *Anser segetum*; *Anas boschas*, and *A. querquedula*; *Mergus merganser*, and *Podiceps minor*:

Of reptiles, *Cistudo Europæa*, *Rana esculenta*, *R. temporaria*, and *Bufo vulgaris*:

Of fishes, *Salmo salar*, *Esox lucius*, *Perca fluviatilis*; *Cyprinus carpio*, *C. leuciscus*, and *C. dobula*; *Chondrostoma nasus*, *Lota vulgaris*, and *Scardinius erythrophthalmus*:

But there are no remains of mice, rats, the domestic cat, nor of the domestic fowl: and among plants, there are no traces of rye, *Secale cereale*; nor of hemp, *Cannabis sativa*.

"The same year" (Liv., and Clint.), before the close of the first campaign of Caesar in Gaul, extending as far as the Sequana (Seine), the German invaders under Ariovistus defeated and driven back beyond the Rhine.

"The same year" (Porphyr., and Clint. iii. p. 400), arrival in Rome of Ptolemy XI. of Egypt.

"57, Jan. 25th" (Forbiger, and Sm. b. d.), at Rome, P. Clodius, no longer tribune, endeavouring to prevent by armed bands the passage of a decree recalling Cicero from banishment. The ensuing dissensions seem alluded to by Lucretius de rerum natura: a poem dedicated to C. Memmius Gemellus, prætor in the previous year, — and noticed by Cicero in B. C. 55 as recently published.

Santolina chamæcyparissus of the West Mediterranean countries. Called in France "aurone" (Batard fl.); and possibly the ABROTONVM of Lucretius vi. 123: — "abrotonites" wine is mentioned by Columella; the "avrōtōnōn thēlu" is described by Dioscorides as a whitish shrub, with minutely-incised leaves and terminal corymbs of golden flowers, growing on Sicily; and according to Pliny xxi. 34 to 92 the Sicilian kind is the best, and the "abrotonum" with golden flowers is cultivated: *S. chamæcyparissus* is described by Matthioli comm. 513, and Clusius hist. 341 (Spreng.); was observed by Lenz in the gardens of Italy; and is known to grow wild in France and various parts of Southern Europe (Lam. fl. fr., and Pers.). "*S. incana*," regarded by Chaubard as not distinct, was observed by him near Mycene in the Peloponnesus. (See *Artemisia abrotanum*).

Cistoseira barbata of the coasts of the Mediterranean and North Atlantic. Probably included in the ALGA-DABAT-TORVM of Lucretius, — and "alga" of Horace iii. 17. 10, Virgil, Pliny, and Servius: *C. barbata* is mentioned by Bory as one of the most frequent seaweeds in the Mediterranean; was observed by him, and Sibthorp, from the Peloponnesus to the Propontis near Constantinople; and by Delile, near Alexandria in Egypt. Farther North, is known to grow in the Atlantic as far as Britain (Gooden. and Woodw. linn. trans. iii. 128, and Engl. bot. pl. 2170).

"The same year = 1st year of the 'ou-foung' of Siouan-ti" (Chinese chron. table), beginning of the Forty-fourth cycle.

"56 B. C." (Clint.), Caesar in Illyria, acquiring knowledge of the bordering nations, recalled by war breaking out in Gaul.

"The same year" (= 326 B. C. — "140 — 130 yrs." of Masudi, Wilf. as. res. ix. 181, and Colebr. alghr. ind. 43), the *Saca era* of the Hindus; the Saca or Scythians having entered Hindustan repelled by Vikramaditya king of Malwa at Ujayin. The death of Puchpamitra, last king of the Maurya dynasty, possibly coincident, the predicted "five hundred years" of Buddhist supremacy (Avadan. asok., Chinese writings, and Burn. i. 432 and ii. 365) having expired. — The era continues in use "through all the countries north of the Nerbadha" (Elph. iv. 1).

As early perhaps as this year, certain trees held sacred to three Budhas supposed to have lived before Gautama. Anterior Budhas — are mentioned in the Avadana asoka, and Saddharma pundarika (Burn. i. 388 to ii. 24).

Acacia (Albizzia) lebbek of the Siamese countries. An umbrageous tree called by Hindu residents in Yemen "serisch" (Forsk.), in Persian "sirish," in Sanscrit "sirish," in Bengalee "sirisha" (J. F. Wats.) or "sirish-gachh," in Hindustanee "sirish," in Telinga "dirisana," in Tamil "kattuvagai" (Drur.), in Burmah "seet" (Mason); and consecrated to the first Budha — (Burn. i. 388 to 396). The "sirisha" is mentioned by Bhavabhuti mal. 10; its flowers according to Kalidasa kum. v. 4 and ragh. xvi. 48 will sustain the foot of a bee but not of a bird; and is prescribed by Susrutas: *A. lebbek* was observed by Roxburgh, Wight, Graham, and myself, a common tree of rapid growth from Bombay to Travancore and Coromandel, planted in gardens and along roadsides, but in Northern India "considered unlucky to employ the timber in house-building" (Drur.); is enumerated by Mason v. 529 as indigenous in Burmah, its wood said to be "dark colored and very hard." Westward, was observed by Forskal planted at Beit-el-fakih in Yemen; by Bruce trav. vi. pl. 4, in Abyssinia; by Forskal, Delile, and myself, in the gardens of Egypt. By European colonists, was carried to the Mauritius Islands, where it has become naturalized (Boj.). From transported specimens, is described by Plukenet mant. pl. 331.

"55 B. C." (Cic., Dio, and Clint. iii. p. 395), with the concurrence of Pompey, Ptolemy XI. Auletes restored by a Roman army, entering Egypt under the proconsul A. Gabinius.

"September" (Oros., Blair, and Clint.), Caesar after defeating the Germans across the Rhine and entering Britain, returning to the main land.

The VRVS of Caesar has been already noticed ; but the name claims attention from being clearly *French* :—to the present day, notwithstanding the disappearance of the animal, the word "ure" is retained in French dictionaries, a record of the extinction of an idea (see *Bos urus*).

Lycopus vulgaris of Northern climates. The Gauls are described by Caesar bell. gall. v. 14 as colouring their bodies with VITRVM to strike terror into their enemies—(see also Marcell. Burdigal. ii. 23) ; and according to Pliny xxii. 2, the British matrons and bride preparing to walk naked in certain religious ceremonies, smear the whole body with "glastum" so as to imitate the colour of Ethiopians: the two names are evidently translations, one from the other: *L. vulgaris* according to Lyte is called *gipsy-wort*, because those people "colour themselves black with this herbe" (Prior) ; an account repeated by Withering, and Burnett states that the plant "is known to make a good black dye" (Lindl.). *L. vulgaris* is described by Matthioli p. 711, and Plukenet alm. pl. 45 ; is termed "*L. palustris glaber*" by Tournefort inst. 191 ; was observed by Forskal near Marseilles, and is known to grow in Barbary and Portugal and throughout middle Europe as far as Sweden (Desf., Brot., and Wats.). Eastward, was observed by Forskal, and Sibthorp, from the Peloponnesus to Smyrna and Constantinople, troublesome in gardens ; and is known to grow along the Taurian mountains and throughout Siberia as far as China (Gmel., Bieb., and Lindl.). Farther East, was observed by Scouler at the Straits of De Fuca, and is known to grow from the Saskatchewan and Arkansas throughout Canada and our Atlantic States as far as Florida (Ell., Nutt., Drumm., A. Gray, and Chapm.). According to Lindley, occurs also in the Southern Hemisphere, in Tasmania and Australia.

"54 B. C." (Cic., and Clint.), Second expedition of Caesar into Britain. And "in the winter," his war in Gaul against Ambiorix.

"53 B. C." (Dio, and Clint.), death of M. L. Crassus, defeated beyond the Euphrates by the Parthians. Taking advantage of the situation, Pharnaces II began to extend his authority beyond the limits assigned by the Romans ;—and on the breaking out of civil war, defeated the combined forces of the Romans and Galatians, and obtained possession of Colchis, lesser Armenia, and the whole of Pontus (Sm. b. d.).

"52 B. C." (Cic., Dio, and Clint.), after the death of P. Clodius, Pompey created sole consul.

"51, May" (Porphy., Clint. iii. p. 400 and Sm. b. d.), in Egypt, accession of Cleopatra, in conjunction with her brother Ptolemy XII. Her hieroglyphic ovals occur on various monuments ; as on the small temple built by her at Erment or Hermonthis. She also founded the temple at Dendera.

"50 B. C." (Cic., Blair, and Clint.), Caesar ordered by the Senate to disband his army, and refusing unless Pompey should do the same, commencement of civil war.

Hardly later than this date, the medical sect of Methodici founded by Themison, a pupil of Asclepiades of Bithynia. He is regarded as the first physician who employed *leeches*—(C. Aurel. morb. chron. i. 1. p. 286). He died "B. C. 43" (Sm. b. d.).

Plantago lagopus of the Mediterranean countries. The "minor" of two kinds seemingly included in the "vulgarem herbam plantaginem" celebrated by Themison, growing in meads and having narrower and blacker leaves closely resembling a sheep's tongue, its stem angular inclined towards the ground—(Plin. xxv. 39), or the "arnöglössön mikrön" having according to Dioscorides narrower softer smoother and more delicate leaves, its stem angular inclined towards the ground, flowers pale yellowish and seed at the top of the stem, is referred here by Sibthorp, and Fraas : *P. lagopus* was observed by them, and Chaubard, abounding in dry sunny situations from the Peloponnesus throughout the Greek islands. Farther South, the "radschil elarnab" is mentioned by Ebn Baitar ; and *P. lagopus* was observed by Rauwolf 6 in Syria, by Delile around Cairo in Egypt. Westward, the "arnöglössön" is identified in the Syn. Diosc. with the "plantagö minör" of the Romans : *P. lagopus* is described by Morison iii. pl. 16 ; is termed "*P. angustifolia paniculis lagopi*" by Tournefort inst. 127, and is known to grow in Spain and Southern France (Pers., and Bory).

Juniperus sabina of Europe and Northern Asia. Called in Britain *savine* from the Sabine district of Italy (Prior), in France "savinier" or "sabine" (Nugent), in Italy "sabina" (Lenz), in which we recognize the "erva savina" of the Romans identified in Syn. Diosc. with the BPAΘYOC of Themison—(Asclepiad., and Gal. comp. med. gen. vii. 12), and of the two kinds described by Dioscorides, the "vrathu ütērön" having tamarisk-like leaves : *J. sabina* was observed by Sibthorp, and Fraas, on the mountains of Greece, Parnassus, the Bithynian Olympus ; is known to grow also throughout Siberia as far as the mountains of Daouria (Gmel., and Pall. pl. 56), or according to A. Decandolle throughout two-thirds of the Subarctic circuit of the Globe. Westward from Greece, the "brathys" is mentioned by Scribonius Largus 154, is identified by Pliny xvii. 21 and xxiv. 61 with the "herba sabina" cultivated in Italy, mentioned also by Propertius iv. 3. 58, and Columella : the "savina" is enumerated among cultivated plants in the Capitularia of Charlemagne, and *J. sabina*

continues to be cultivated in Britain; is described by Bauhin . . . ; and is known to grow wild on the mountains of Italy, and as far as Portugal and middle Europe (Pers., Daub., and Lenz). "Oil of savin" according to Lindley "is a powerful local stimulant, acting when applied to the skin as a rubefacient and vesicant," and though dangerous and uncertain when swallowed, is employed in female complaints. (Compare *J. Phœnicia* var. *Lycia*.)

"48 B. C. = 'tsou-youan,' 1st year of Youan-ti or Hiao-youan-ti, of the Han" or Seventh dynasty — (Chinese chron. table).

Sinapis arvensis of Europe and the adjoining portion of Asia. Called in Anglo-Saxon "cerlice," in a manuscript of the Fourteenth century "szerlock," in Scotland "skelloch," in current English *callock* or *carlock* or *charlock* or *wild mustard* (Prior), in Greece "lampsanē" or "lapsana," in which we recognize the "lapsana" on which Caesar's army was obliged to live at Dyrrachium — (Plin.), and the "lampsanē" of Dioscorides, a wild potherb whose stem and leaves are cooked and eaten and are more nutritious than "lapathōu:" *S. arvensis* was observed by Forskal, and Sibthorp, frequent from Constantinople to the Peloponnesus. Farther South, the "lampsanē" is identified in the Syn. Diosc. with the "ēuthmōi" of the Egyptians. Westward, with the "napiōum" of the Romans: the "lapsana" or "lapsana" is mentioned by Varro ii. 16, and Columella, by Celsus as esculent, and by Pliny xx. 37 as among "silvestres brassicas," a foot high with hairy leaves closely resembling those of "napi:" *S. arvensis* is described by Matthioli (Spreng.); is termed "*s. arvensis præcox semine nigro*" by Tournefort inst. 227; was observed by Gussone ii. p. 202 in Sicily, and is known to occur in waste and cultivated ground throughout middle Europe as far as Denmark (fl. Dan. pl. 753, Pers., and A. Dec.). By European colonists, was carried to Northeast America, where it has become a weed in grain-fields; and to the Mauritius Islands, observed by Bojer naturalized.

Sinapis incana of the Mediterranean countries. Called in Greece "vrōuva" or "lahana tōu vōunōu" (Fraas) or "lapsana tōu vōunōu" (Sibth.), and the "lampsanē" in question — is referred here by Fraas: *S. incana* was observed by him frequent in Greece. Westward, is described by Hermann parad. pl. 115; and is known to grow in Switzerland, France, Spain, and Portugal (Pers.).

"Aug. 9th" (Blair, Clint., and Sm. b. d.), Pompey defeated by Caesar at Pharsalia in Thessaly, and sailing to Egypt, put to death "Sept. 29th" by the guardians of the young Ptolemy XII.; then engaged in war with the expelled Cleopatra at Pelusium.

"In autumn" (Clint. iv. p. 274), the Cilician era of *Aegae*.

"47, January" (Blair, Clint., and Sm. b. d.), Mithridates of Pergamus with an army from Cilicia and Syria having reached Pelusium, landing of Caesar; who joining forces defeated the Egyptians under Ptolemy XII., and obtained full possession of Alexandria. Caesar next proceeded to Zela in Pontus, where he defeated Pharnaces II.; and returning in "July" to Rome, was made annual dictator.

"December" (Sm. b. d.), at Rome, Q. Fufius Calenus and P. Vatinius appointed consuls for the remainder of the year by the dictator Caesar. The poet Catullus at this time writing (carm. 53 and 113).

Pinus mughus of middle Europe. The *torch-pine* of the French; the *TEDA* of Catullus, — Virgil geor. ii. 431, Ovid, and Juvenal, described by Pliny xvi. 19 to 30 as growing on the mountains, more abounding in resinous juice than other pines, and used for fire and light in religious ceremonies, may therefore be compared: *P. mughus* is known to grow on the Alps, from Switzerland to Austria and Silesia (Jacq. rar. i. pl. 193, Pers., A. Dec., and Daub.). "*P. pumilio*," regarded as not distinct, affords *Hungarian balsam* (Lindl.).

"46 B. C." (Censorin., Blair, and Clint.), the calendar corrected by Caesar through the aid of Sosigenes of Alexandria: and this so-called "Year of confusion" made to consist of "fifteen months and four hundred and forty-five days."

"44 B. C." (Appian, and Clint.), after his victory in Spain, Caesar made "dictator for life and consul for ten years;" an appointment soon followed by his death by the hands of conspirators. In his honour, the month Quintilis received the name of "Julius" through the surviving consul Antony (Cic., and Censorin.).

Departure of Cleopatra from Rome after the death of Caesar (Cic., and Clint. iii. p. 397).

"43 B. C." (Sen. ep. 91, and Clint. iv. p. 41), by Plancus, a Roman colony established at Lugdunum in Gaul (the founding of the city of Lyons).

"April" (Sueton., Tac., and Sm. biogr. dict.), battle at Mutina. The consul C. Vibius Pansa dying of his wounds, his physician Glycon was imprisoned on suspicion.

Aristolochia longa of the Mediterranean countries and middle Asia. Called in Greece "ampēlōklathōriz," in which we recognize the "*aristolochia clematidis*" and its "*sarmentorum*" used by ointment-makers according to Glycon — (Scribon. Larg. 206), and Dioscorides: *A. longa* was observed by Sibthorp in the Peloponnesus. Westward, a kind of "*aristolochia*" called "*clematidis*"

or by others "cretica" is described by Pliny xxv. 54 as having a root "longissimae tenuitatis vitis novellae:" A. longa is termed "a. longa vera" by Tournefort inst. 162, and is known to occur in Carniola, Italy, and as far as Portugal (Mill. pl. 51, and Pers.). Eastward from Greece, was observed by Thunberg in Japan. The plant according to Lindley continues in medicinal use.

"Nov. 27th" (Blair, and Clint.), the "Second Triumvirate" over the Romans; established by Octavius, Antony, and Lepidus, to continue "five years."

"42 B. C." (Blair, and Clint.), defeat and death of Brutus and Cassius at Philippi in Macedonia.

"41 B. C." (Appian, and Clint. iii. p. 216 and 228). first visit of Antony to Egypt.

The earliest *Latin inscriptions* in Egypt, are perhaps those on coins issued by Antony and Cleopatra.

"38 B. C." (Liv., and Clint.), unsuccessful naval warfare of Antony and Octavius against Sextus Pompeius.

"37 B. C." (Dio, and Clint. iii. p. 220), the Jews having been conquered by Sossius, Herod appointed by Antony king at Jerusalem.

"The same year" (Dio, and Clint. iii. p. 220), return of Antony to Italy; and the renewal of the Triumvirate between him, Octavius, and Lepidus, for "another five years."

"36 B. C." (Liv., and Clint.), renewal of *naval war*, and Sextus Pompeius defeated. The fall also of Lepidus, who had taken part against Octavius. And in the East, the Parthian war and disastrous retreat of Antony from Media.

In this year, Varro "eighty" years old writing on Agriculture "re rustica." — He died "B. C. 28" (Sm. b. d.).

Liburnum opulus of middle and Northern Europe. Called in Britain *water-elder* (Prior), in France in the time of Ruel "opierus" or "obierus," in current French "obier" (Nugent): the OPVLVS of Varro i. 8, — and Columella v. 6, a shrub resembling the cornel, is referred here by Ruel i. 105, and others: V. opulus is described also by Cordus, Tragus, Matthioli, Gesner, Dodoens, Thalius, and Tabernæmontanus; is termed "opulus Ruellii" by Tournefort inst. 606; and is known to grow in the woods of France and middle Europe as far as Denmark (fl. Dan. pl. 661, Lam. fl. fr., Engl. bot. pl. 332, and Pers.). Eastward, was observed by Forskal, and Sibthorp, in the environs of Constantinople. The cultivated variety called *guelder-rose* or *snowball tree* (Prior) from the enlarged and barren flowers, is figured by C. Bauhin; and by European colonists was carried to North-east America, where it continues under cultivation for ornament.

Acer opalus of the West Mediterranean countries. Possibly the "opulus" of Varro, — and Columella: A. opalus is described as an arborescent shrub (Pers.); is termed "acer opalum" by Crescenzo (Spreng.), "a. italum" by Lauth, "a. hispanicum" by Pourret, "a. opulifolium" by Villars, and is known to grow in Italy (Pers., and Steud.).

Triticum monococcum of the Tauro-Caspian countries. Single-seeded wheat is called in Germany "einkorn" (Grieb), in France "locular" (Fée), in Italy "farragine" (Targ.), in which we recognize the FARRAGO of Varro, — Virgil, Columella, and others: the "zēia aple" single-seeded kind of Dioscorides clearly belongs here: T. monococcum is enumerated by Link as frequent in Greece (Chaub.), but according to Fraas is no longer cultivated there. Westward, occurs in the debris of the ancient lake-villages of Switzerland (Troyon): is described by Morison viii. pl. 6, and Haller helv. 1425 (Pers.), but its cultivation in middle Europe continues unimportant (A. Dec.). In its wild state, is said by Bieberstein to grow from the Crimea to Eastern Caucasus, but this has not been confirmed by other observers (See T. spelta).

Scirpus (Isoplepis) setaceus of Temperate Climates. A diminutive annual kind of *rush*; and the SCIRPICVLVS mentioned by Varro as made into a little wheel — (Ainsw.), may be compared: I. setaceus is termed "s. omnium minimus capitulo brevior" by Tournefort inst. 528, "s. filiformis" by Savi as observed by him in Italy; and is known to grow throughout middle and Northern Europe as far as Denmark and Iceland (Hook., fl. Dan. pl. 311, and Pers.). Eastward, was observed by Sibthorp in marshy ground on the island of Seriphus. In the Southern Hemisphere, is known to grow in Australia (Wats.).

"35 B. C." (Sm. b. d.), the Illyrians defeated by Octavius. According to M. Antonius (Sueton. aug. 63). Octavius had sought in marriage the daughter of the Dacian king Cotiso.

"34 B. C." (Liv., and Clint.), expedition of Antony into Armenia, and king Artavasdes imprisoned.

One hundred and twenty-eighth generation. B. C. 34, Sept. 1st, mostly beyond youth: the historian Ptolemaeus of Mendes; the Greek philosophers, Boethus of Sidon, Athenaeus of Seleucus, Nestor of Tarsus, and Pollio of Tralles; the physicist Athenodorus of Tarsus; the historians, Timagenes, Nicolaus of Damascus, and Dionysius of Halicarnassus; the grammarians Tyrannion the younger, Conon, Demetrius of Adramyttium, and Didymus; the rhetors, Timagenes of Alexandria, Theodorus of Gadara, Caecilius, Hermagoras the younger, and Dionysius of Pergamus; other

Greek writers, Parthenius : the Latin writers, the poets Tibullus, Propertius, Quintilius Cremonensis, Varius Rufus, Aemilius Macer ; the historian Livius ; the orators Munatius Plancus, Atratinus ; the grammarian Caecilius Epirota ; the editor Plotius Tucca ; the rhetors Porcius Latro, Cestius of Smyrna, Passienus, Albutius Silo, M. Seneca Rhetor ; other Latin writers, C. Melissus, Tullius Tiro, C. Asinius Pollio, Messala Corvinus ; the Roman actors, Pylades, and Bathyllus ; the Roman painter Arellius (Bryan).

"33 B. C." (Dio, and Clint.), Media and Armenia conquered by the Parthians (Persians).

"32 B. C. = 'kien-chi,' 1st year Tching-ti or Hiao-tching-ti, of the Han " or Seventh dynasty (Chinese chron. table, and Pauth. p. 253).

"In this year" (Jap. centen. comm. 95), a ravine dyked in Japan by the emperor Sujin ; forming a *reservoir* * from which water was drawn as required to irrigate rice-fields. — Similar constructions, some resembling small lakes, "are now to be met with in many parts of Japan."

"At this time" (Plut., and Clint.), the *Libraries* at Pergamus said to contain "two hundred thousand volumes."

About this time (see Percev. i. 186), Conos son of Maadd, seeking to expel his brother Nizar from the Mecca territory, driven away by the people. Nizar was elected chief, and is reckoned the nineteenth progenitor of Mohammed.

"31, Sept. 2d" (Dio, Blair, and Clint.), at Actium, Antony and Cleopatra defeated in *naval combat* by Octavius.

"30 B. C." (Porphy., Oros., and Clint.), death of Antony ; and on "Sept. 30th," of Cleopatra ; the independence of Egypt ceasing, and Octavius becoming the undisputed master of the Roman world. — From this time *gold* disappears from the Egyptian coinage.

The *removal of obelisks* from Egypt, initiated by Octavius. He also continued the temple at Dendera ; and his hieroglyphic ovals occur at Talmis, Kalabsheh, Debot, Dendur, Philæ, and on the temple to Isis at Thebes.

Cornelius Gallus, appointed by him prefect over Egypt, is accused of permitting statues of himself to be erected, and of having pillaged the city of Thebes.

"In this year" (Jap. centen. comm. 88, see also Art de verif.), end of the reign of Sujin. He was succeeded by Suinin or Synin, third son of the daïro Siunsin, and now eleventh daïro of Japan.

"B. C. 29, and under Suinin" (Jap. centen. comm. 59), "human figures were formed of clay to be buried together with the deceased members of the imperial family, and in this manner to replace the servants who were otherwise obliged to accompany their masters into the grave."

"In this year" (Dio, and Clint.), Third closing of the temple of Janus, the Romans being at peace among themselves and with all nations.

Reseda luteola of Europe and the adjoining portion of Asia. Called in Britain *weld* or *woold* or *yellow-weed*, in Spain "gualda" (Prior), in Greece "ōhistra," in Egypt "uæhæ" or "blyhah ." the LVTVM of Vitruvius, — Virgil, used for dyeing according to Pliny xxxiii. 26, is referred here by Fée : *R. luteola* is termed "*luteola herba salicis folio*" by Tournefort inst. 423, is known to occur along roadsides and in waste ground throughout middle Europe (Engl. bot. pl. 320, and Pers.), and continues to be employed for dyeing yellow. Eastward, was observed by Forskal, Sibthorp, and Chaubard, from the Dardanelles to the Peloponnesus. Farther South, was observed by Forskal, Delile, and Clot-Bey, in gardens and growing spontaneously around Cairo. By European colonists, was carried to Northeast America, where it has been observed "along roadsides in W. New York etc." (A. Gray).

Salix caprea of Europe and Northern Asia. The "erratica" willow distinguished from the cultivated kind by Vitruvius viii. 13, — mentioned also by Pliny xix. 8, is referred here by Billerbeck : *S. caprea* is termed "*s. latifolia rotunda*" by Tournefort inst. 591 ; is known to grow in Italy and throughout Northern and middle Europe as far as Lapland and Iceland (Vaill., Thuill., fl. Lap. pl. 8, Hook., Pers., and Pollini) ; and according to Lindley, all the *sallows* should probably be comprehended under this species. Eastward, was observed by Sibthorp, and Chaubard, frequent in certain localities in the Peloponnesus ; by Pallas, on the Ural mountains ; and is known to grow throughout Subarctic Asia (Wats., and A. Dec.). The species is officinal in the Dublin pharmacopœa, and in that of London for 1824 (Lindl.).

* *Pinus densiflora* of Northern Japan. Called by the Ainos "kui," by the Japanese "aka mats" (Sieb.), and from early times used by them in hydraulic constructions "in very damp ground" — (Jap. centenn. comm. 95) : described by Sieb. and Zucc. ; known to grow throughout Japan as far as Yeso ; and enumerated by Siebold p. 41 and 170 among the kinds especially fit for shipbuilding and supplying masts. The "kouai" of the Chinese and "finoki" or "saki-kousa" of the Japanese, enumerated in the San-kokf transl. Klapp. among the productions of Yeso, may be compared.

Carex acuta of Europe and Northern Asia. Called in Britain with other species *segs* or *sedge*, in Anglo-Saxon "seg" (meaning also a small sword, Prior), and the CARECTVM of Vitruvius, — and Virgil ecl. iii. 20, and "carice pastus acuta" of geor. iii. 231, are referred here by Billerbeck: the "segg" is mentioned in a Wycliffite translation of Ex. iii. 2 (Prior): *C. acuta* is known to grow from the Mediterranean throughout middle and Northern Europe as far as Lapland and Iceland (Curt. lond. iv. pl. 62, Hook., Pers., and Wats.). Eastward, was observed by Sibthorp, and Chaubard, on the mountains of the Peloponnesus; and is known to grow about Caucasus and in Siberia (Bieb., and Wats.).

The NIGRVM · INDICVM of Vitruvius, — and Pliny, is referred by Beckmann to *India ink*: and Pliny xxxv. 25 expressly mentions a kind of ink imported from India. The "mêlan" of Paulus Aegineta is also referred here by F. Adams. "India" ink, notwithstanding the name, is a Chinese manufacture.

"28 B. C." (Hieronym., and Clint.), the Pythagorean and Magian Anaxilaus of Larissa, expelled from Rome and Italy by Octavius.

Valerianella olitoria of Sicily. Called in Britain *corn salad* or *lamb's lettuce*, classed formerly with lettuces and called in medieval Latin "lactuca agnina" (Prior), called in France "doucette" or "mache" (Nugent): the "lactuculae thyrsus" eaten habitually by Augustus to allay thirst — (Sueton. 77), or "teneris frondens lactucula fibris" of Columella, may be compared: *V. olitoria* is termed "sallade de chanoine" by Lobel hist. 412; is described also by Tabernæmontanus i. 475, and Gerarde em. pl. 348; is known to occur in cultivated ground from Barbary throughout middle Europe as far as Sweden (Linn. fl. suec., and Pers.): and only in Sicily in mountain meads and the open country (Gussone i. 30, and A. Dec.). Eastward, was observed by Bory and Chaubard in cultivated ground in the Peloponnesus. By European colonists, was carried to Northeast America, where it continues in cultivated and fallow ground in our Middle States, and is brought to market in the early spring.

"27, January" (Blair, and Clint.), the *Augustan era*. The title "augustus" conferred by the Roman Senate on Octavius, accompanied with the power of imperator for ten years, the censorship, and absolute exemption from the laws.

Proceeding to Spain, Augustus wrote to Virgil, who in reply states that the *Aeneid* is not in a fit state to send, hardly begun — (Macrob. sat. i. 24, and Sm. b. d.). The death of Marcellus in "B. C. 23" is alluded to in *aen.* vi. 883, and the poet died "Sept. 22d, B. C. 19."

Cissus vitiginea of Hindustan. The AMOMVM · ASSYRIVM of Virgil georg. iv. 25, — attributed to Mesopotamia by Strabo xvi. p. 290, to Media and Pontus by Dioscorides, to Carduene by Josephus antiq. xx. 2, "indica vite labrusca" according to Pliny xii. 28, is referred here by Plukenet and others: the similar "amômithi" with which according to Dioscorides it was adulterated, seems in some respects to correspond: *C. vitiginea* was received from India by Plukenet mant. pl. 337; was observed by Graham in the environs of Bombay, in "Kennery jungles etc. common in the rains," by Wight in other parts of the peninsula, and by Roxburgh in Bengal, but no known uses are recorded.

Gossypium arboreum of Abyssinia and Yemen. A shrub called in Egypt "cotn el sadjar" tree cotton, in Yemen "otb" or "ôdjas" (Forsk.), and possibly the cotton-plant attributed by Virgil georg. ii. 120 to Ethiopia: — a shrub "fruticem quem aliqui gossypion vocant plures xylon," small and growing in the higher part of Egypt towards Arabia, is mentioned by Pliny xix. 2. 3, but the fibres of *G. arboreum* are not known to have been woven into cloth: the shrub was observed by Forskal, and Delile, in the gardens of Egypt; by Foiskal, p. 125, under cultivation in Yemen, and var. rubrum wild on the mountains; is known to grow wild also in Abyssinia (A. Rich. p. 64). Eastward, is described by Rumphius iv. pl. 13; was observed by Graham in the environs of Bombay, "generally to be met with about houses and in gardens as an ornamental shrub;" in other parts of Hindustan according to Royle him. 99 only near temples, occurring beyond as far as Celebes (A. Dec.).

Arctium lappa of Europe and Northern Asia. Called in Anglo-Saxon "clate," by Chaucer, and by Galfridus pr. pm. "clote," in current English *clot-bur* or *burdock*, in Germany "klette," in France "bardane" (Prior), in Italy "bardana" (Lenz), in Greece "platêa" or "platumantulitha;" in which we recognize the LAPPA of Virgil georg. i. 153 to iii. 385, — "tenax lappa" of Ovid, or "personatam" bearing according to Pliny xxv. 58 "grandes lappas" and leaves than which none are "latius:" *A. lappa* is termed "l. major arctium Dioscoridis" by Tournefort inst. 450; and is known to occur in waste ground in Italy and throughout middle Europe (Curt. lond. iv. pl. 55, and Pers.). Eastward, the "persolata" known to all is identified by Pliny xxv. 66 with the "arcion" of the Greeks; and the "pêrsônakêam" or "lappan" of the Romans, in Syn. Diosc. with the "prôsôpiôn" or "prôsôpitha" or "arkêiôn;" described by Dioscorides as having hairy leaves resembling those of "kôlôkunthês" but larger, a large root, and employed for various medicinal purposes: *A. lappa* was observed by Sibthorp, and Fraas, in shaded waste ground in Northern Greece, more rare in Attica and on the Greek islands. Farther South, the "arkthion acher" of Ebn Baitar is referred here by

Sontheimer. Farther East, is known to occur in Siberia (Lindl.); was observed by Kaempfer, and Thunberg, everywhere along roadsides in Japan and called "gobo" or "uma bufuki." By European colonists, was carried to Northeast America, where it has become frequent in waste ground. The root according to Sprengel is esculent; and according to Lindley, is employed medicinally, and "reckoned tonic, aperient, sudorific, and diuretic."

Viburnum lantana of Europe and the adjoining portion of Asia. Called in Britain *lithy-tree* (Prior), in France "viorne" (Nugent), in Italy "lentaggine" or "lantana" or "viburno" (Lenz), in Greece "klēmaxitha" (Sibth.); in which we recognize the *VIBURNA* termed *LENTA* by Virgil ecl. i. 25, — mentioned also by Columella v. 6: the "lythwyr" is mentioned in the Anglo-Saxon transl. Apul. 29 and 127: *V. lantana* is described by Dodoens pempt. 769; is termed "wayfaring tree" or "wayfarer" by Gerarde, "viburnum" by Tournefort inst. 607; and is known to grow in Italy and throughout middle Europe, occurring in hedges in Britain (Jacq. austr. pl. 341, Lam. fl. fr., Pers., and Prior). Eastward, was observed by Sibthorp, and Chaubard, in the Peloponnesus.

Valeriana saluunca of Switzerland. Called in Celtic "saluunca" (Val. Cord. p. 2, and Spreng.); in which we recognize the *SALIVNCA* of Virgil ecl. v. 17, — growing according to Pliny xxi. 20 and 83 in Pannonia and "Norici alpiumque aprica," used medicinally, and placed among clothing on account of its pleasant odour; also the "saliougka" so-called according to Dioscorides by the natives of the Ligurian Alps where it grows: *V. saluunca* is described by Dalechamp p. 982, Allioni, Villars, and is known to grow on the Southern prolongation of the Alps, on mount Meri in Savoy, and on mount Ventoux (Reuter, Martins, and A. Dec.). The root, according to Wulffenius, and Sprengel, is exported from Trieste Eastward in large quantities to mix in ointments. (See *V. celtica*.)

Vaccinium vitis-idaea of Subarctic Climates. A depressed small shrub called in Britain *cow-berry* (Prior); in which we recognize the *VACCINIA* gathered according to Virgil, — mentioned also by Vitruvius vii. 14, and Ovid trist. i. 5, by Pliny xvi. 31 as cultivated by slaves in Italy, but in Gaul used to dye garments purple: "red whortle-berries" were adopted as the badge of the M'Leod clan in Scotland (Vincent's ed. Haydn): *V. vitis-idaea* is termed "myrtillus exiguus" by Tragus (Spreng.); was observed by Savi on the Appenines; is known to grow in Switzerland, and Northern Europe as far as Lapland and Greenland (fl. Dan. pl. 40, Pers., and Wats.). Eastward, on the higher portion of Caucasus (Bieb.) and throughout Siberia to Kamtschatka (Gmel., and Pall.). Farther East, was observed by Mertens at Norfolk Sound in Alaska; by Drummond, in Lat. 54° on the Saskatchewan; by Richardson, near the Arctic Sea in Lat. 65°; by myself, from the Lower St. Lawrence throughout the neighbouring portion of New England; by Oakes, as far as Lat. 42° 30' along the Atlantic; and is the *upland cranberry*, whose berries are brought in quantities to the Boston market.

Osyris alba of the Mediterranean countries. Called in Italy "ginestrella" or "osiride" or "casia poetica" (Lenz), in Greece "plēurōtōxulōn" or "nēurōtōxulōn;" in which we recognize the *CASIA* of Virgil ecl. ii. 49 and georg. ii. 213; — also the "osyris" described by Pliny xxvii. 88 as having fruit at first black, changing afterwards to reddish. and used by women for "smegmata" scouring: *O. alba* is described by Lobel pl. 433, and C. Bauhin pin. p. 212; is termed "casia poetica mospeliensium" by Tournefort inst. 664; and is known to grow in Italy and other parts of Southern Europe (Pers., and Spreng.). Eastward, the "ōsuris" is described by Dioscorides, is written "ōsis" by Galen fac. simpl. viii. p. 93; and *O. alba* was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent from the Dardanelles to the Greek islands and the Peloponnesus.

Rosmarinus officinalis of the West Mediterranean countries. Called in Britain *rosemary* (Prior), in Germany "rosmarin" (Grieb), in France "romarin" (Nugent), in Italy "ramerino" or "rosmarino" (Lenz), in Greece "thēnthrōlivanōn" or by the Turks "biberic," in Egypt "klil" or "aselban," in which we recognize the *MARINVS - ROS* commended for bees by Virgil, — and Columella, mentioned also by Horatius od. iii. 23, Ovid, Servius, Apuleius 79, and as cultivated in Italy by Pliny xvii. 21: *R. officinalis* is termed "r. spontaneus latiore folio" by Tournefort inst. 195; is known to grow in Italy and other parts of Southern Europe (Lindl., and Lenz), and is besides cultivated both here and farther North. Eastward, the "rōsmarinōum" of the Romans is identified in the Syn. Diosc., and by Pliny, and Galen, with the "livanōtis" used for garlands, having according to Dioscorides slender twigs with crowded narrow leaves, green above and white beneath: the "thēnthrōlivanōn" is mentioned in the Geoponica xi. 16: *R. officinalis* was observed by Forskal, Sibthorp, Chaubard, and Fraas, in uncultivated places from the Greek islands to the Peloponnesus, and under cultivation from Constantinople throughout. Farther South, was observed by Forskal, Delile, Clot-Bey, and myself, a favourite in the gardens of Egypt. By European colonists, was carried to Northeast America prior to 1670 (Joss.), and continues under cultivation; to the Philip-pines, where it is called in Tagalo "romero" (Blanco); and probably also to Hindustan where it was observed "in gardens" by Graham, and to Japan where it was found by Thunberg cultivated

for medicinal use, no native names being given. According to Lindley, "the admired flavour of Narbonne honey is ascribed to the bees feeding on the flowers," but the plant is principally remarkable for its undoubted power of encouraging the growth of hair, causing "the green colour of the best pomatums," is employed besides in manufacturing "Hungary water, the French vinaigre aux quatre voleurs, and eau de Cologne."

Cerinth the major of Siberia. An annual called in Italy "cerinta" or "cerinte" (Targ.), in which we recognize the CERINTHA of Virgil, — white leaved and sought by bees according to Pliny xxi. 41: C. major is termed "c. glauca" by Moench; is known to grow in Siberia, and to occur also in Switzerland (Roth cat. i. 32, and Pers.).

Ligustrum vulgare of Eastern Asia? Called in Britain by Tusser "privy" and in current English *privet* (Prior), in France by Ruel "troena" and in current French "trêne" (Nugent), by the Turks "lilak" (Sibth.), in Italy "ligustro" (Lenz), in which we recognize the ALBA · LIGVSTRA of Virgil ecl. ii. 18, — "nigrum ligustrum" of Columella x. 300, "candidum ligustrum" of Martial i. 117, and the "ligustrum" described by Pliny xvi. 31 and xxiv. 45 as supposed by some to be identical with the "cypros" (henna) of the East, as "tesseris utilissima," the juice used for "nervis articulis algoribus," and the leaves and berries also employed medicinally: L. vulgare is described by Ruel i. 94, Turner, is termed "ligustrum" by Tournefort inst. 596; and is known to grow along hedges throughout middle Europe (Curt. lond. v. pl. 1, and Pers.). Eastward, was observed by Sibthorp, and Chaubard, along hedges and in uncultivated places from Constantinople to Smyrna and the Peloponnesus; is known to grow around Caucasus (A. Dec.); and was observed by Thunberg in mountainous situations everywhere frequent in Japan and called "ibuta" or "ibota." By European colonists was carried to Northeast America, where it has been observed by myself in gardens as far South as Charleston, and through seeds carried by birds (A. Gray) has become naturalized in our Northern States.

Fraxinus rostrata of the Mediterranean countries. The FRAXINVS mentioned by Virgil as IN · SYLVIS · PVLCHERRIMA, very beautiful in the forest, — may be compared with this species of ash: Pliny xvi. 30 also speaks of the "fraxinus" as a forest-tree of Italy, growing "aquosis montibus," in wet places on the mountains. F. rostrata is described by Gussone, and is known to grow in Southern France, Sardinia, Algeria, Sicily, and Persia; but has not been found in Roumelia, nor on Caucasus (Griseb., Ledeb., and A. Dec.).

Salix triandra of Europe. The MOLLE · SILER of Virgil georg. ii. 11, — growing according to Pliny xvi. 31 in watery places, is referred here by Fraas: S. triandra is termed "s. folio amygdalino utrinque aurito corticem abjiciens" by Tournefort inst. 591; is described as a tree thirty feet high that sheds its bark like Platanus (Smith, and Pers.); and is known to grow along river-banks in Italy and throughout middle Europe as far as Britain (Curt. lond. vi. pl. 72, and Pollini). Eastward, was observed by Sibthorp, and Chaubard, in the Peloponnesus, and called there "étia."

Salix murina of Italy. The AMERINA · RETINACVLA of Virgil georg. i. 265, used for tying grape-vines, — mentioned also by Columella iv. 30, and Pliny xxiv. 38, are referred here conjecturally by Sprengel (comm. Diosc. i. 135).

Salix argentea of Western Europe. The GLAVCA willow of Virgil georg. iv. 183 — is referred here by Sprengel: S. argentea was observed by Linnæus it. goth. in Southern Sweden (Steud.); by Lightfoot, and Hudson, in Britain; by Thuillier, near Paris; and is termed "s. lanata" by Roth.

Alnus oblongata of the West Mediterranean countries. The ALNVS · PROCERA of Virgil ecl. vi. 33 to georg. ii. 110 — is referred here by Sprengel: A. oblongata is distinguished by Aiton, and Willdenow, and is known to grow in Southern Europe (Pers.).

Hyacinthus Orientalis of the West Mediterranean countries? Called in Britain *hyacinth* (Prior), in Italy "giacinto" (Lenz), in which we recognize the SVAVE · RVBENS · HYACINTHVS of Virgil, — the "coelestis luminis" and "coceruleus hyacinthus" of Columella ix. 4. 4 and x. 100, and the "hyacinthus" enumerated by Pliny xxi. 38 and 97 as growing wild in Italy, employed by slave merchants to delay puberty in boys, and in Gaul to tinge "hysginum," a purple dye (compare Syn. Diosc., and Vaccinium myrtillus): H. orientalis is described by Gesner, Matthioli, and was first seen by Lobel "in 1562;" is described also by Dodoens, Castor Durantes, and C. Bauhin, is cultivated as an ornamental plant throughout middle Europe; and was observed by Gittard near Nisi in the Peloponnesus (Chaub.). By European colonists, was carried to Northeast America, where it continues a favourite flower in parlours and gardens.

Hyacinthus Romanus of the East Mediterranean countries. — Possibly the "niveus hyacinthus" of Columella x. 100, for Pliny xxi. 38 speaks of "hyacinthis," implying more than one kind growing in Italy: H. Romanus is known to occur there in cultivated ground (Pers., and Gawl. in Curt. mag. pl. 939). Eastward, is termed "muscaria byzantinum flore candicante" by Tournefort inst. 347; and was observed by Sibthorp in the Peloponnesus and on Cyprus.

Conserua sp. of fresh water. The VLVA·VIRIDIS of Virgil aen. ii. 135 — and Ovid, or “ulva palustris” of Horace sat. ii. 4. 24, is referred by Billerbeck to one or more species of *Conserua*.

“The same year” (Sm. b. d.), at Rome, building of the Pantheon by M. Vipsanius Agrippa, consul for this year. — The edifice is remarkable for having remained unutilated, in a perfect state of preservation to the present day.

“26 B. C.” (Dio, Hieronym., and Clint.), in Egypt, death of the Roman prefect Cornelius Gallus. And through the influence of Augustus, the “Julian year” adopted there; the moveable calendar stopping with New year’s day, 1st of Thoth, fixed to August 29th (Blair). C. Petronius was appointed second prefect over Egypt (Strab., and Sueton.).

Inula helenium of middle Asia? Called in Anglo-Saxon “hors-helene” and in current English *hors-hele* or *elecampane* (Prior), in Germany “alant” (Grieb), in France “aunée” or “enule” (Nugent), in Italy “elenio” or “enula campana” (Lenz); in which we recognize the “inula,” the cooking of which was first taught by Horatius, — and the prepared article of diet adopted by Julia Augusta (Cels. iv. 9, and Plin. xix. 29) the “inula” is mentioned also by Columella, Palladius, Vegetius, and Apuleius 95; the “elnan helleniumque” by Macer Floridus 44, and the “enula campana” by Joannes de Sancto Amando: I. *helenium* is described by Anguillara p. 89 (Spreng.); is termed “aster omnium maximus helenium dictus” by Tournefort inst. 483; and is known to occur in waste ground in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 718, Pers., and Lindl.). Eastward, the “ēnōula kampana” or “tērminaliōum” of the Romans is identified in Syn. Diosc. with the “ēlēniōn,” described by Dioscorides as having a stem two cubits or more high, yellow flowers, and a large odorous subacrid root: the “innōulam” is mentioned by Sotion (Geopon.): a “confiture” of the roots of “inula campagne” was found by Belon eaten at Constantinople; and I. *helenium* was observed by Sibthorp in Thessaly. Farther South, the “ēlēniōn” or “sumphutōn” or “pērsikēn” or “mēthikēn” or “ōrēstēiōn” or “nēktariōn” or “klēōnian” or “vatōn ithaian” or “phlōmōn ithaiōn” is identified in the Syn. Diosc. with the “lēnēs” of the Egyptians; “*helenium*” root is enumerated by Forskal mat. med. as employed medicinally in Egypt; and according to Sprengel comm. i. 15 is mixed with costus by the merchants of Commagenes. Farther East, I. *helenium* was observed by Thunberg under cultivation and growing spontaneously around Jeddo in Japan, but no native name is given. By European colonists, was carried prior to 1669 (Josselyn) to Northeast America, where it has become frequent along roadsides in our Northern States, perhaps fairly naturalized. The plant according to Smith, and Lindley, “is generally kept in rustic gardens, on account of many traditional virtues.”

Rosa eglanteria of Eastern Asia? The QUI·COLOR·PUNICEAE·FLORE·PRIOR·ROSAE of Horatius iv. — is referred by Cornuti p. 12 to the variety of the *yellow rose* having the inner surface of the petals red: “puniceis rosetis” are mentioned by Virgil ecl. v.; “punicas rosas luteolasque” by Columella ix; “rosae lutei floris” by Scribonius Largus 61, and Marcellus 1: the “rosa lutea” with petals altogether yellow, is described by Lobel adv., Dalechamp, Miller, and Linnæus. Eastward, “hrusa kai mōnōphulla” rōtha are mentioned in the addition to Dioscorides i. 130.

“25 B. C.” (Dio, and Clint.), Fourth closing of the temple of Janus; the Romans being at peace with all nations.

“24 B. C.” (Dio, Blair, and Clint.), expedition of Aelius Gallus down the Red Sea to Lēukē kōmē (El Haura in Lat. 25°); where he landed his army and proceeded into Arabia. After some days, he reached the territory of Aretas, who received him in a friendly manner; Continuing beyond, using “butter in place of oil” (the temperature rendering butter permanently fluid), he entered the city of Negrana (Nedjran); and “six days” beyond, defeated the Arabs armed with “bows, spears, swords, slings, and pole-axes.” He next captured the cities of Asca, Athrōla, and laid siege to Marsiava; belonging to the Rammanites under king Ilasar, and “two days” distant from the Incense country. From the want of water, he was compelled to abandon the siege; and return to the battle-ground in Negrana in “nine days;” thence to the Seven wells (El-Hasba) in “eleven;” and passing Haala (Kholeya?), and Malotha (. . .), in “sixty days” from Marsiava reached Egra on the sea; in the territory of Obodas, a kinsman of Aretas. He here embarked his army, having lost in battle only “seven” men; and crossing the Red sea to Muōsōrmōs, returned down the Nile to Alexandria.

Psoralea corylifolia of Arabia? Herbaceous, called in Bengalee “hakooch,” in Telinga “bapunga,” in Tamil “karpooogum,” in Malabar “kaurkoal” (Drur.), in the environs of Bombay “bawurcheen” (Graham), in Yemen “lōbab el abid” (Forsk.); and from early times employed medicinally: — observed by Forskal p. 140 among the mountains of Yemen, near water at Taæs. Eastward, by Graham, “a common weed in the Deccan, also in Bombay;” by Burmann ind. pl. 49, Ainslie, Roxburgh, and Wight, in other parts of the peninsula and as far as Bengal, its seeds considered by the natives “stomachic and deobstruent,” prescribed also in “leprosy and other cutaneous affections” (Drur., and Lindl.); was observed by Mason “exotic” in Burmah.

Acalypha Indica of Equatorial Africa? Herbaceous and annual, called in Telinga “moorkanda,”

in Bengalee "shwet busunta" (Lindl.) or "mukto-juri," in Tamil "cupamani" (Drur.), in Malabar "cupa meni" (Rheede); and from early times employed medicinally: — observed by Grant in Equatorial Africa, "by cult. 5° S. and 2° N." on the Nile; by Forskal p. cxxi and 161, in moist places along the base of the mountains of Yemen. Eastward, by Graham, a "common weed during the rains" in the environs of Bombay, and according to Nimmo, "cats are as much affected by the roots" as "by those of the valerian;" by Rheede x. pl. 81, in Malabar; by Ainslie, Roxburgh, and Wight, in other parts of the peninsula as far as Bengal, employed in decoction as cathartic and for other medicinal purposes (Drur.); was observed by Mason in Burmah, enumerated as indigenous.

"23 B. C." (Tacit., Dio, and Clint.), the tribuneship for life conferred on Augustus, now in his Eleventh consulship.

Perhaps about this time, an ambassador sent to Augustus by the Hindu king Pandion (Strab.). Probably not the first of the name, the kingdom of Pandya including * — the districts of Madura

* *Helicteres isora* of Tropical Eastern Asia. The *screw tree*, small and hazel-like, called in the environs of Bombay "kawun" or "kewannie" or "dhamnee" (Graham), and from early times used medicinally in diseases of the ears: — observed by Rheede vi. pl. 30 in Malabar; by Gibson, and Graham, "common throughout the hilly jungly parts of the Concan and on the Ghauts" as far as Bombay, "rope may be made from the fibres of the bark;" by Ainslie, and Wight, in other parts of Hindustan. Farther East, its twisted pods in the dried state and called "thu-gnay-khyæ," were seen in Burmah by Mason v. 502 among "drugs in bazar." used medicinally by the natives; observed by Rumphius vii. pl. 17 on the Moluccas (Pers.). Transported to Europe, is described by Plukenet alm. pl. 245

Leea macrophylla of Tropical Hindustan. Herbaceous, four feet high and allied to the grape-vine, called in Bengalee "toolsoo-moodryia" (Drur.), and from early times reputed to be a remedy for the Guinea worm, or according to Roxburgh "ringworm:" — observed by Law, and Nimmo, in the Concans or Low country North and South of Bombay common in jungles towards the Ghauts (Graham); by Roxburgh, and Wight, as far as Bengal, the root astringent and mucilaginous (Drur.). Farther East, by Mason v. 503 "exotic" in Burmah and called "kya-bet-gyee," cultivated for its "astringent" root, used by the natives to stop "effusion of blood in wounds."

Pygeum acuminatum of Tropical Hindustan. A Terebinthoid tree known from early times: — observed by Graham at "Mahableswur and Kandalla, but rare;" by Colebrooke linn. trans. xii. pl. 18, in other parts of Hindustan; by Mason v. 398 to 540, in Tenasserim; and the same or an allied species by McClelland at Toungoo, becoming a tree of "five or six feet girth."

Momordica charantia of Tropical Eastern Asia? A climbing Cucurbitaceous plant called in Tamil "pava-kai," in Malabar "pandipasel," in Bengalee "kurula" (Drur.), in the environs of Bombay "karaila" or "purwud" (Graham), and from early times used medicinally and the fruit eaten: — observed by Rheede viii. pl. 9 and 10 in Malabar; by Gibson, and Graham, "very commonly cultivated about Bombay in the rains," the "fruit twelve or fifteen inches long," notched and ridged like a crocodile's back, and requiring "to be steeped in salt water before being cooked;" is described also by Rumphius v. pl. 151; was observed by Ainslie, Roxburgh, Wight, and Drury, cultivated everywhere in the peninsula; by Mason v. 471, "exotic" in Burmah and called "kyet-hen-kha," used in curries.

Luffa acutangula of Tropical Eastern Asia. The *ridged gourd* is called in Tagalo "patola" (Blanco), in Burmah "tha-bwot-kha-wai" (Mason), in Tamil "peekunkai," in Telinga "beer-kai," in Bengali "jhingo," in Hindustanee "torooi" (Drur.), in the environs of Bombay "toorai" or "gosalee" (Graham); cultivated from early times: — observed by Rheede viii. pl. 7 in Malabar; by Graham, "commonly cultivated" around Bombay; by Roxburgh, Wight, and Drury, in "hedges and waste lands" as far as Bengal, its half-grown fruit one of the best native vegetables, much used in curries, and when boiled and seasoned "little inferior to green peas;" by Mason v. 471, "exotic" in Burmah and esculent; by Blanco, on the Philippines, its fruit cooked and eaten; and is described by Rumphius v. pl. 149. Transported to Europe, is termed "l. foetida" by Cavanilles i. pl. 9 and 10.

Nauclaea cordifolia of Tropical Hindustan and Burmah. A Cinchonaceous tree forty to fifty feet high called in Burmah "hteing" (Mason), in Tamil "manja cadamba," in Telinga "daduga," in Bengalee "kelikudum" (Drur.), in the environs of Bombay "edoo" or "eydee" (Graham); its exceedingly beautiful wood, durable if kept dry, used from early times for furniture: — observed by Graham "common throughout the Concans," the wood used at Bombay "for planking etc.;" by Roxburgh cor. i. pl. 53, Wight, and Drury, as far as Travancore, the Coromandel mountains, and Bengal; by Wallich, on the banks of the Irrawaddy in Burmah (Mason v. 534).

Bignonia (Spathodea) Rheedii of Tropical Hindustan, Burmah, and as far as Java. A small

and Tinivelly, with the capital at Madura in the days of Claudius Ptolemy, and continuing there "till within a century of the present day" (Elph. iv. 2).

"22 B. C." (Strab., Dio, and Clint.), invasion of the Ethiopians under queen Candace, repelled at Elephantine by the Second Roman prefect C. Petronius.

Dalbergia sissoo of Tropical Hindustan. A tree called there "sissoo" or "sheeshum," in which we recognize the "sisam" of the Chaldee-Samaritan translation of Gen. vi. 14, — of the Koran, and various Arab writers (Royle in Kitt. bibl. cycl.), and the "schischam" wood found by Forskal p. xcvi. imported from India into Yemen: "sēsamina xula" is described by Dioscorides as sometimes sold for ebony, but purplish; is mentioned also in the Erythraean periplus, and by Cosmas Indicopleustes xi. *D. sissoo* was observed in Hindustan by Roxburgh, and Wight; by Graham, in the environs of Bombay, and found by Gibson as far as Goozerat; its timber according to Royle "one of the most valued woods of India," remarkably "strong, of a light greyish hue, with darker coloured veins."

Dalbergia latifolia of Tropical Hindustan. A tree called there "sit-sal" (Royle), or by residents *blackwood* (Graham): its timber probably imported with the preceding into the Mediterranean countries: — *D. latifolia* was observed in Hindustan by Roxburgh cor. pl. 113, and Wight; by Graham, in the Southern Concan, and found by Law in the Southern Mahratta country, its wood "used for making furniture;" being according to Royle "heavy, close-grained, of a greenish black colour with lighter veins," and "highly valued." *D. yen-daik*, "very abundant at Toungoo" in Burmah and used by the Karens "for spear handles," is regarded by Mason v. p. 530 as perhaps identical.

"18 B. C." (Dio, and Clint.), the "empire" or authority of imperator, accepted by Augustus for an additional "five years."

Globularia nudicaulis of the Pyrenees and Switzerland. The CANTABRICA discovered in the reign of Augustus by the Cantabrians of Spain — (Plin.), mentioned by Celsus v. 27, and described by Pliny xxv. 47 and 55 as "caule junceo pedali in quo sunt flosculi oblongi veluti calathi in his semen perquam minutum," stem a foot high and rush-like on which are oblong florets like baskets and in these very minute seed, may be compared: *G. nudicaulis* is described by Morison vi. pl. 15, and is known to grow on the Pyrenees and mountains of Switzerland as far as Austria (Pers., and A. Dec.). According to Lindley, like other species it possesses purgative properties.

"15 B. C." (Dio, Blair, and Clint.), Augustus in Gaul, and the Rhaeti and Vindelici subdued by Tiberius and Drusus.

Marrubium Creticum of Crete. The MARRVBII · TENVIS of the antidote of Antipater against the bite of the asp — (Scribón. Larg. 167), may be compared: *M. Creticum* was observed in Crete by Sibthorp. From transported specimens, is described by Dalechamp pl. 962; is termed "*m. album angustifolium peregrinum*" by Tournefort inst. 192; and was observed by Roth ii. 35 growing spontaneously in Germany.

Verbascum blattaria of Europe and the adjoining portion of Asia. Called in Greece "spuri:" the VERBASI of the antidote of Antipater — (Scribón. Larg. 167) seemingly corresponds; for the "phlōmis" with golden flowers is described by Dioscorides as useful against scorpion-sting, employed also for dyeing the hair, and wherever placed attracting "silphas" (the small cockroach, *Blatta Germanica*): *V. blattaria* was observed by Forskal, Sibthorp, and Chaubard, around Constantinople and in the Peloponnesus. Westward, the "blattaria" herb is described by Pliny xxv. 60 as resembling and often mistaken for "*verbascum*," with more stalks and the leaves not so white; *V. blattaria* is described by Lobel obs. pl. 304; is termed "*blattaria lutea folio longo laciniato*" by Tournefort inst.

and elegant tree called in Burmah "tha-khwot" (Mason), in Telinga "woody" (Drur.), in Malabar "nir pongelion" (Rheede), in the environs of Bombay "mersingee" (Graham); and from early times, nets made of its fibres, and its strong timber used for agricultural and building purposes: — observed by Rheede vi. pl. 29 in Malabar; by Law, and Graham, in "the vale of the Nagotnah river," the Southern Mahratta country, and "in gardens Bombay;" by Roxburgh cor. ii. pl. 144, Wight, and Beddome, in other parts of Hindustan; and is known to grow on Ceylon. Farther East, was observed by Mason v. 543 indigenous in Burmah, its wood according to Berdmore of "excellent quality for building purposes;" is known to grow also on Java, and is described by Rumphius iii. pl. 46 (Pers.).

Artocarpus hirsutus of Tropical Hindustan and Burmah. A large tree called in Tamil "anjelie," in Malabar "ansjeli" or "ayenee" (Drur.), and from early times its fruit eaten, yielding also *birdlime*, and its trunk hollowed out into fishing-canoes: — observed by Rheede iii. pl. 32 in the forests of Malabar; by Drury, as far as Travancore, its fruit of "the size of a large orange," and its timber under the name of *anjely wood* "well known on the western coast for house-building, ships, frame-works etc.;" was observed by Roxburgh, and Wight, in other parts of Hindustan; by Mason v. 462, "indigenous" in Burmah. By Nimmo, was introduced into the environs of Bombay (Graham).

147; and is known to grow in Southern Europe and in Britain (Pers., and Engl. bot. pl. 393). By European colonists, was carried prior to 1670 (Jossel.) to Northeast America, where I have met with it along roadsides; was also carried to Southern Brazil, where it was observed by Aug. Saint-Hilaire (A. Dec.), and myself, in the environs of Rio Janeiro.

"13 B. C." (Sm. b. d.), Herod accompanied by his friend Nicolaus of Damascus visiting Rome and Augustus. *Dates* of superior quality presented by them were termed by Augustus "nicolai," — a name that continued in use in the middle ages.

Euphorbia simplex of Tropical Arabia. The "barba jovis" consisting according to Nicolaus of Damascus plant. ii. 9 of a stem without leaves or fruit, — may be compared: *E. simplex* was observed by Forskal among the mountains of Yemen, and called "dahan;" by myself, on the Desert hills at Aden and Muscat, a green cylindrical sprout, like a terminal twig of *E. tirucalli*, but upright, a foot or more high, and sometimes with a few branches.

Sodada decidua of Tropical Arabia. The fruit of the "myrobalanorum arboris" described by Nicolaus of Damascus plant. ii. 17 as at first "dulces, consequenter pontici, et in completionem amari," — may be compared: *S. decidua* was observed by Forskal p. 81 everywhere in Yemen, a thorny shrub called "sodad," its fruit "ruber nuce coryli major," and before ripening cooked and eaten by the Banyans.

Leptadenia reticulata of Tropical Hindustan. A large twining Asclepiaceous plant with corky much-cracked bark (Graham); and the "mediannus" described by Nicolaus of Damascus i. 13 as a plant all bark, — may be compared: *L. reticulata* was observed by Law, and Graham, "common in hedges about Surat and in the Southern Mahratta country;" by Retz obs. ii. 15, Roxburgh, and Wight, in other parts of Hindustan; is termed by Roxburgh "asclepias suberosa."

"12 B. C." (Dio, and Clint.), Lepidus succeeded as "pontifex maximus" by Augustus; and the pontifical books numbering about "two thousand" burned, with the sole exception of the "Sybilline Oracles."

C. Julius Hyginus of Spain, a pupil of Alexander Polyhistor, and freedman of Augustus, having charge of the Palatine library (Sueton., and Sm. b. d.).

Daphne cneorum of the West Mediterranean countries. Called in Italy "neoro" (Lenz), and possibly the "cneoron" identified by Pliny xxi. 29 with the CASIAM of Hyginus, — and further enumerated as coronary: the "casiae daphnitidis" is mentioned by Marcellus 25. *D. cneorum*, is described by Linnæus; and is known to grow on the mountains of Austria, Italy, and Southern France (Poll., Jacq. austr. pl. 426. Lam. fl. fr., and Pers.; see *D. Gnidium*).

"In or about B. C. 10" (Sueton., and C. O. Muell. edit. Fest.), the grammarian Verrius Flaccus appointed tutor over the two grandchildren of Augustus. — Verrius died in the reign of Tiberius (Sm. b. d.). A portion of his lexicon has been preserved through abridgments by Pompeius Festus, and Paulus Diaconus.

"9 B. C." (Abyss. chron., and C. Mull. geogr. min. p. xcvi), accession of Za-Bazen as king of Abyssinia. — He reigned "sixteen" years.

"8 B. C." (Dio, and Clint.), the empire for another "ten years" accepted by Augustus; and the name of the month Sextilis changed by the Senate to "augustus." The Calendar also corrected by Augustus (Blair), "by ordering the twelve ensuing years to pass without intercalation."

"6 B. C. = 'kian-ping,' 1st year of Gai-ti or Hiao-ngai-ti, of the Han" or Seventh dynasty (Chinese chron. table).

"The same year" (Dio, and Clint.), the tribunician power for "five years" conferred on Tiberius; and his retirement to Rhodes, — where he remained "seven years."

Apollonius before the time of Archigenes lived long at Alexandria, perhaps Apollonius Mus a cotemporary of Strabo. Apollonius Herophileus — is quoted by Andromachus (see Sm. b. d.).

Pluchea Dioscoridis of the Upper Nile. Called in Egypt "barnuf" (Forsk.); and the KONY-ZHC: ΕΥΔΑΟΥC prescribed by Apollonius for pain in the head — (Galen comp. med. ii. 1), may be compared: the "barnuf" is mentioned by Eltamini, and Ebn Baitar: *P. Dioscoridis* was observed by Forskal p. 148, and Delile, cultivated for its fragrance in Lower Egypt, and escaping from gardens naturalized along the Nile; by Rauwolf pl. 54, at Tripoli in Syria.

"5 B. C." (according to Clinton iv. p. 14, see also Matth. ii. 16 to 22, Luke i. 5 to ii. 39, and Sulpic. sacr. hist. ii. 39), "the most probable" date of the Nativity.

To Strabo xvii. i. 34 visiting the Pyramids, the *nummulites* abounding in the subjacent rock were pointed out as the "food of the workmen." — The same legend that is repeated by the Arabs to travellers to the present day.

Ascending the Nile in company with Aelius Gallus now third Roman prefect, Strabo heard the sound uttered by the broken colossus on the plain of Thebes. This statue of Amenophis III. — some seventy years later, became an object of pilgrimage; as recorded in history, and shown by Greek and Roman inscriptions covering the base; certificates of visitors who had "heard *Memnon*."

In the reign of Septimius Severus, the colossus was repaired with separate blocks of stone, and has since remained silent. (see Champ.-Fig. p. 76).

Continuing on to Syene and the Red Sea, Strabo ii. 5. 12 found in the harbour of Myosshormos "one hundred and twenty ships" engaged in voyages to India.

The ΓΑΛΛΑΚ: ΑΓΡΙΑΚ described by Strabo iii. 2. 6 as imported from Lybia into Spain, and sent with the mouth tied into rabbit-burrows to expel the inmates,—were of course the *ferret*, *Mustela*.

Oenanthe crocata of Western Europe. The Spanish are described by Strabo iii. 4. 18 as having in readiness a poison producing death without trouble, prepared from a plant resembling smallage *CEΛΙΝΩ: ΠΡΟCΟΜΟΙΑΚ*—(a substitute for the "kōnēiōn" of the Greeks): *O. crocata* is described by Matthioli 628 (Spreng.); is known to grow in "wet places common in the west of Europe" as far as France, and Britain, where it is called *dead-tongue* or *hemlock-dropwort* (Pers., Engl. bot. pl. 2313, and Lindl.). Further according to Lindley, "a dangerously poisonous plant, the cause of many fatal accidents."

Quercus humilis of the West Mediterranean countries. One to two feet high; and the small oak growing according to Strabo iii. 2. p. 388 within the Pillars of Hercules, its fruit eaten by tunny-fish,—is referred here conjecturally by Sprengel: *Q. humilis* is described by Lobel ic. ii. p. 157, and is known to grow in sandy situations in Portugal and France (Pers.).

Stipa tenacissima of the Mediterranean countries. The *ΧΧΟΙΝΟΠΤΑΟΚΙΧΗΝ: CΤΑΠΤΟΝ* described by Strabo iii. 4. 9 as abounding near Saguntum in Spain and exported to Italy,—is referred here by Sprengel: Pliny xix. 9 and xxiv. 40 speaks of the "africanum vel hispanum spartum" as unknown in the time of Homer, and of the "spartum" having come into use since the days of Theophrastus: *S. tenacissima* is termed "spartum" by Clusius hist. ii. 220, "gramen spicatum quod spartum Plinii" by Tournefort inst. 518; and is known to grow in Barbary and Spain (Desf. pl. 30, and Pers.). Eastward, was observed by Sibthorp on the hills of Attica in Greece.

Papyrus Pangorei of Tropical Hindustan. A species of *paper-rush* called in Bengalee "ma-doorcati" (Drur.); and the *ΒΥΒΑΟC* is attributed by Strabo xvii. 2. 4 to both Egypt and India:—*P. Pangorei* was observed by Graham in the environs of Bombay; is termed "cyperus tegetum" by Roxburgh, and was observed by him, Wight, and Drury, "common in ditches and borders of tanks" in the peninsula and Bengal: the floor-mats so common at Calcutta are made of the split stems, and according to Mason v. 520 are imported into Burmah.

Rumex Abyssinicus of Eastern Equatorial Africa. A species of *dock*, perhaps included in the *ΠΟΑ* eaten according to Strabo xvii. 2. 2 by the Ethiopians:—*R. Abyssinicus* was received by Jacquin hort. iii. pl. 98 from Abyssinia; was observed by Grant from "2° N." on the Nile to "1° 42' S.," the "people of Fipa at 8° S. are said to eat its leaves."

Aerva lanata of Tropical Africa and Arabia. Called in Yemen "schadjaret el athleb" (Forsk.); and possibly included in the "pōa" of Strabo, eaten by the Ethiopians:—*A. lanata* was observed by Grant from "7° 30' S. to 2° N." on the Nile, a "potherb, grows prettily over huts like an ivy;" by Forskal p. 48, along the base of the mountains of Yemen. Farther East, by Rheede x. pl. 29 in Malabar, and called "scherubula;" by Graham, "a common weed" around Bombay, where also it appeared to me only naturalized; by Retz, and Roxburgh, in other parts of Hindustan, and by Burmann pl. 60 on Ceylon; by Mason, "exotic" in Burmah; by Blanco, little known to the natives on the Philippines, but called in Tagalo "bonga bonga." Through European colonists, was carried to Brazil, observed by myself frequent in the outskirts of Rio Janeiro.

Corchorus . . . *sp.* of Eastern Equatorial Africa. Included perhaps in the "poa" of Strabo, eaten by the Ethiopians:—observed by Grant common from "1° to 2° N." on the Nile, a foot high, its leaves used for making a stringy spinage.

Crotalaria glauca of Equatorial Africa. Called there "m'cæwæ" (Grant); and perhaps included in the "pōa" of Strabo, eaten by the Ethiopians:—observed by Grant in "plantain-groves Unyoro," near the Equator, three feet high and its flowers pods and leaves eaten as spinage by "the people of Madi." From transported specimens, described by Willdenow (Steud.).

Celosia trigyna of Tropical Africa. Included perhaps in the "pōa" of Strabo, eaten by the Ethiopians:—received by Linnæus from Senegal (Pers.); and observed by Grant from 2° to 3° N. on the Nile, "by huts Nov. 1862," eaten as a potherb.

Narcissus? *sp.* of Eastern Equatorial Africa. Included perhaps in the "pōa" of Strabo, eaten by the Ethiopians:—observed by Grant in "sandy moist places about 6° S.," eight inches high, its leaves tasting of onions and made into spinage.

Veltheimia *sp.* of Eastern Equatorial Africa. Included perhaps in the "pōa" eaten by the Ethiopians:—observed by Grant in swamps from "6° S. to 1° N." on the Nile, its flowers collected for spinage.

Urginea? *sp.* of Eastern Equatorial Africa. Included perhaps in the "pōa" eaten by the Ethi-

opians : — observed by Grant in “rocky ground $3^{\circ} 15' N.$ ” on the Nile, three feet high, its leaves and stems cooked as spinage by the Wanyamuezi.

Commelyna sp. of Eastern Equatorial Africa. Included perhaps in the “pōa” eaten by the Ethiopians : — observed by Grant on Zanzibar, spinage made of its leaves.

Commelyna latifolia of Eastern Equatorial Africa. Probably included in the “pōa” eaten by the Ethiopians : — received and described by Hochst. ; observed by Grant “every where on rich soil near huts,” and used as a potherb.

Dombeya multiflora of Eastern Equatorial Africa. A tree called “keenga” (Grant) ; probably in some instances furnishing the wooden bows four cubits long used according to Strabo xvii. 2. 3 by the Ethiopians : — *D. multiflora* was received from Africa by Endlicher ; was observed by Grant frequent in “ $3^{\circ} N.$ ” on the Nile, its wood tough and used for bows.

Grewia sp. of Eastern Equatorial Africa. A large tree called “mkomo” (Grant) ; and probably furnishing some of the bows in question : — observed by Grant diffused generally from “Unyanymbe $5^{\circ} S.$ ” to Madi on the Upper Nile, its wood used for building, for bows and arrows, and its bark for ropes, “no insect is said to touch it.”

Sterculia sp. of Eastern Equatorial Africa. Probably furnishing some of the bows in question : — observed by Grant in “ $3^{\circ} 58' S.$,” a “shrubby tree,” bows made of its wood, and the sultan of Ukuni (in the Unyamuezi country) “has his hut-lashings made from its bark.”

Kigelia pinnata of Tropical Africa. Called in the Kinyoro language “m’sankwa,” in Suahili “malegæa” (Grant) ; and possibly furnishing some of the bows in question : — received from Africa by Decandolle ; and observed by Grant “everywhere,” its wood used by the Wanyamuezi for bows, its leaves with sand for polishing spear-handles, and its roasted seeds eaten in famines.

“4. March 13th” (Jos., and Clint.), at Jerusalem, *eclipse of the moon*, and death of Herod before the passover. He was succeeded by his son Archelaus ; another son, Herod Antipas, being appointed tetrarch of Galilee. The accession of Herod Antipas is fixed to this year by coins, Jos., and Clint. iv. p. 22.

The apocryphal book of Enoch written after the death of Herod ; whose reign is included in the condemnation lxxxix. 25. The book is quoted by Jude, Justin Martyr, Clemens Alexandrinus, and other Christian writers down to the time of Syncellus and the patriarch Nicephorus ; and has been preserved in an Abyssinian version, manuscripts of which have at different times been brought to Europe (Stuart in bibl. repos. for 1840, and S. Davidson in Kitt. cycl. bibl.).

“2 B. C. = 1st year of the ‘youan-cheou’ of Gai-ti” — (Chinese chron. table).

Bubon Macedonicum of Northern Greece. The PETROSELINUM of the antidote composed for Augustus by Marcius, — of Celsus v. 23, Cassius the physician, Scribonius Largus 120, Pliny xx. 47, or the “pētrōsēlinōn” of Andromachus, growing according to Dioscorides on crags in Macedonia, according to Galen antid. i. p. 76 also in Epirus and sold by the Macedonians to all nations, mentioned too by Paulus Aegineta, and termed “the chief condiment” in Geopon. xii. 1, is referred here by writers : the “makēthōnisiōn spērma” is enumerated by Nicolaus Myrepsicus i. 1 : *B. Macedonicum* was observed by Belon in market at Constantinople ; and by Forskal, under cultivation there in gardens. Westward, is described by Blackwell pl. 382 ; and is known to occur in Mauritania (Pers.), probably cultivated, as in various parts of Europe where the seeds are sold in the shops (F. Adams). Eastward from Greece, is known to occur in Cochinchina (Pers.), probably cultivated.

Lavandula stoechas of the Mediterranean countries. Called in English gardens *cassidony* from “stoechas sidonia,” or *French lavender* (Prior), in Germany “stōchas” (Grieb), in Greece “hamō-livanō” or “levantha” (Fraas) or “maurōkēphali,” or by the Turks “cara bach” (Sibth.) ; in which we recognize the STOECHADOS of the antidote of Marcius, — Celsus viii. 9, Andromachus, Pliny xxvii. 107, Galen, Paulus Aegineta, named according to Dioscorides after the Stoechades isles near Marseilles, and in the added Synonyms identified with the “skiōlēvina” of the Romans, “ōphthalmōs puthōnōs” of the prophets, and Egyptian “sōuphlō :” the “isthuchudus” of Mesue simpl., and Ebn Baitar, is clearly the “estachudes” imported according to Forskal mat. med. from Barbary and Syria into Egypt, and referred by him with a mark of doubt to this species of *Lavandula* : *L. stoechas* is enumerated by Alpinus among the ingredients of the Egyptian theriac ; has long been employed by the Arabs as “expectorant and antispasmodic” (Lindl.) ; but the living plant according to Clot-Bey has only recently been introduced into Egypt. Farther North, *L. stoechas* is described by Fuchsius 778 (Spreng.) ; is termed “stoechas purpurea” by Tournefort inst. 201 ; was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus and Greek islands to Northern Greece ; is known to grow also in Italy, Southern France Barbary, and Spain (Pers., and Lenz).

“1 B. C.” (Dion. ind., Ephiphan., Cassiodor., and Clint.), at Rome, “Cn. Cornelius Lentulus Cossus and L. Calpurnius Piso” consuls for this year.

"In this year" (Sm. b. d.), Caius Caesar on his way to the East: to whom Juba II. dedicated his history of Arabia. — A coin dated in the "48th year" of his own reign (= A. D. 1) is extant, and the revolted Gaetulians were subdued with the assistance of Cossus Cornelius Lentulus in "A. D. 6."

Ficus vasta of Yemen. Called there "talak," or in Arab botanical books "delb" (Forsk.), and fruit of *Arbutus unedo* being called by the Arabs "altin aldeb" wolf figs (Spreng.), the "arbutus" trees fifty cubits high in Arabia enumerated by Juba II. — (Plin. xv. 28) may be compared: *F. vasta* was observed by Forskal p. 179 everywhere among the mountains of Yemen, an immense tree "vastissima arbor" with a composite trunk and spreading rafter-like branches. Eastward, may have been carried by Arabs, or by Banyans, to Hindustan; for "*F. Bengalensis*" of Rheede i. pl. 28, and Linnæus, is regarded by Dryander as identical (Pers., and Steud.).

Euphorbia regis Jubaæ of Morocco and the Canaries. A cactiform *spurge* called in Morocco "dergmuse" (Jacks.), and the ΕΥΦΟΡΒΙΟΝ discovered by Juba II. on Atlas and named after his physician Euphorbus, — "specie thyrsi foliis acanthinis" according to Pliny xxv. 38, is referred here by Webb: the drug "εὐφὸρβιον" is mentioned by Niger (Diosc. praef.), Rufus Ephesius, Aetius, and Paulus Aegineta; as the product of a plant growing in Mauritania, by Dioscorides iii. 86, and Galen comp. med. loc. ix. 271; forms an article of commerce along the Tropical margin of the Sahara, according to the Arab account of Ghanat (Jaubert rec. soc. geogr. ii); and in Egypt, "feriun" or "gum euphorbiæ" was found by Forskal mat. med. imported from Barbary. The plant producing it is described by Leo Africanus ix. 300; by Jackson, as "with its branches" having the general form "of a goblet," the stem "at first soft and succulent, but after some years becomes hard, the branches are scalloped and have on their sides small knots from which grow five extremely sharp-pointed thorns," and each branchlet bears "on its top a vivid crimson flower" (med. gaz. xx. 745). *E. regis Jubaæ* is distinguished by Webb; was observed by him, and Lowe, "common" on the Canary Islands (Major edit. Bethenc. p. 138); but according to Pereira, the *euphorbium* of commerce all comes from Mogador (Lindl.).

An expedition sent by Juba II. to explore the "Fortunatae insulae" (Canaries) found there stone buildings and a little temple; one of the islands being called "Nivaria" from the perpetual snow (Teneriffe), and another "Canaria" — (as to the present day: Latin names recorded by Pliny vi. 37, indicating intercourse with the Northern side of the entrance to the Mediterranean).

Rocella purpura-antiquorum of the Canary Islands and Madeira. One of the lichens yielding the *archal* or *orchil* of commerce; and the dyeing of "Gaetulicam purpuram" established by Juba II. on islands in this vicinity — (Plin. vi. 36), may be compared: *R. purpura-antiquorum* is distinguished by Bory.

Echium giganteum of the Canary Islands. Woody-stemmed and called "taginaste" (Webb); possibly affording the "Gaetulicam purpuram" of Juba II.: — the "ligna rubra tingentia," distinct from "verzino" (*Caesalpinia sappan*) but dyeing almost as well, is referred here by Webb: *E. giganteum* was observed by him on the Canary Islands; was received by the younger Linnæus from Teneriffe, growing on rocks (Pers.).

Euphorbia balsamifera of the Canary Islands. A woody-stemmed *spurge*, but its milky juice sweet and innoxious: the "arbores similes ferulae, ex quibus aqua exprimatur, ex nigris amara, ex candidioribus potui jucunda" — (Plin. vi. 37), may be compared: *E. balsamifera* is known to grow on the Canary Islands (Aiton ii. 137, and Pers.), its juice is thickened to a jelly and eaten by the natives (lond. soc. tract. geogr. plant.).

Laurus till of the Canary Islands. A large tree called "til" (Major); and possibly the "arbores" in question yielding water to drink: — certain til trees in elevated situations on Ferro, exposed to fogs, are continually dripping "clear delicious water" that forms a pool near the trunk (Bont. 65); especially one gigantic tree called the "Garoe" or "Arbre Santo," of unknown antiquity, overthrown by a hurricane before "June 12th, 1612," but which is mentioned by Galindo, Nieremberg, Garcia del Castillo, and Von Buch (Major edit. Bont. p. 125): *L. till* is distinguished by Poiret (Steud.).

"The same year = 2d year of the 'youan-cheou' of Gai-ti" — (Chinese chron. table).

One hundred and twenty-ninth generation. A. D. 1, Jan. 1st, mostly beyond youth: the Greek philosophers, Sextius, and Sotion the younger; the medical writer Niceratus; other Greek writers, Philistion, Thrasyllus, and Apollonides of Nicaea: the Latin writers, the poets Pedo Albinovanus, Cotta; the satirist Cassius Severus; the historian Fenestella; the orator Asinius Gallus; the rhetors Votienus Montanus, Haterius, Junius Gallio; other Latin writers, Macer the younger, and Tuticanus; the Roman painter Ludius (Bryan).

"In this year, Caius Caesar and L. Aemilius Paulus" consuls (Clint.), Caius Caesar being absent in the East. A letter to him is extant (Gell. xv. 7), in which Augustus names "ix. kalend. octobr." as his own "sixty-fourth" birth-day.

Micropus erectus of the Mediterranean countries. The CENTVN CVLVM called by the Greeks "gnaphalitha," prescribed by Julius Bassus, — Scribonius Largus 121, and the "herbam incoctam" by Marcellus 29, described by Pliny xxiv. 88 as lying in cultivated ground, its leaves like "capitis penularum" woolen caps, may be compared: *M. erectus* was observed by Lœffing pl. 1 f. 5 in Spain; and is known to occur in cultivated ground in France (Lam. fl. fr., and Pers.). Eastward, the "kên-tôugklôum" of the Romans is mentioned in Syn. Diosc. iii. 120; and *M. erectus* was observed by Sibthorp frequent on Cyprus and other Greek islands.

Santolina maritima of the seashore along the Mediterranean and Atlantic as far as Britain. Called in Greece "vamvatzitha;" and the "gnaphalitha" in question — according to Syn. Diosc. should be the "gnaphaliôn" of Dioscorides having soft white leaves substituted for down, and infused in wine against dysentery: *S. maritima* was observed by Sibthorp, Chaubard, and Fraas, frequent on the seashore of the Greek islands. Farther South, the "gnaphaliôn" or "irês" or "ampêtôkôs" or "anaxêtôn" or "anaphalis" is identified in Syn. Diosc. with the "sêmêôn" of the Egyptians; and *S. maritima* was observed by Delile on the Mediterranean shore of Egypt. Westward, with the "gêlasônên" of the Gauls, and "tôukôularis" or "alvinôus" of the Romans; and the account by Pliny xxvii. 61 of the "gnaphaliôn" or "chamaezelon" seems in part taken from Dioscorides: *S. maritima* is described by Matthioli p. 625, Lobel, Dodoens, and Clusius; is termed "gnaphalium maritimum" by Tournefort inst. 461; was observed by Desfontaines ii. p. 161 in Barbary, and is known to grow on the Atlantic shore of France and as far as Suffolk in England (Engl. bot. pl. 141, Pers., and Spreng.).

"The same year = 'youan-chi,' 1st year of Hiao-ping-ti," one hundred and seventh Chinese emperor (Chin. chron. table, and Pauth.); "nine" years old, and under the regency of Wang-mang.

"2 A. D." (Vell. ii. 101, and Clint.), on an island in the Euphrates, interview of Caius Caesar with the Parthian king Phraates; witnessed by the historian Velleius Paterculus.

"3 A. D." (Clint.), the empire for "ten years," for the fourth time accepted by Augustus.

The author of the poem interpolated as the "Third book of Tibullus" is styled Lygdamus, and by his own account should be in this year 45 years old (Sm. b. d.).

Amaranthus caudatus of Subtropical Eastern Asia? Called in Britain *love-lies-bleeding*: the AMARANTHVS of Lygdamus 4, — and Ovid . . . , a purple spike according to Pliny xxi. 23 rather than a flower, coming in August and continuing into autumn, plucked and kept in "alexandrino palma" and when moistened reviving for winter garlands, may be compared: *A. caudatus* is described by Miller (Steud.), is well known in the gardens of Europe, and escaping occurs in some localities growing spontaneously (A. Dec.). Eastward and Southward, is known to occur in Russia and Persia (Pers.); in waste ground in Abyssinia (A. Dec.); in the gardens of Hindustan, but devoid of a Sanscrit name (Roxb., Pidd., and Graham), in Ceylon, and in Nepaul (Pers., and A. Dec.). Probably by European colonists carried to Peru (Pers.), but no American specimens seen by Moquin, nor by A. Decandolle. (See *Sedum eriocarpum*.)

"4 A. D. = 4th year of the 'youan-chi' of Hiao-ping-ti" (Chinese chron. table), beginning of the Forty-fifth cycle.

"The same year" (Vell., and Clint.), death of Caius Caesar in Lycia, and Tiberius adopted by Augustus. Tiberius now in command of the Roman armies was sent into Germany, accompanied by the historian Velleius-Paterculus as praefectus equitum (Sm. biogr. dict.).*

"6 A. D. = 1st year of the interregnum of Jou-tseu-ying," under the protectorship of Wang-mang — (Chinese chron. table, and Pauth.).

"The same year" (Jos., Dio, and Clint. iii. p. 256), Archelaus successor of Herod, banished from Jerusalem.

About this time (Percev. i. 77 to 292), Yacer-Younim, a descendant of Himyar, ruling Yemen. — He undertook an expedition into the West, and advancing as far as the Wadi-rraml, Valley of sands, set up a statue inscribed with mousnad or *Himyarite characters*. These characters — continued in use until the time of Mohammed, when they were supplanted by the modern Arabic.

Hypericum (Androsæmum) officinale of Europe and the adjoining portion of Asia. Called at Padua "ciciliana" (Anguillara), in other parts of Italy "androsemo" (Lenz), in which we recognize the ANΔΠΟCΑΙΜΟΝ of Niger, — identified by Dioscorides i. præf. and iii. 163 with the "thiōnu-

* *Asparagus tenuifolius* of middle and Western Europe. The HERBAM SIMILLIMAM ASPARAGO observed by Tiberius Caesar in the plains of upper Germany, — or the "incultius asparago" growing on mountains and milder than the "corruda" according to Pliny xix. 42, or the "êlêiôs asparagôs" of Galen . . . , may be compared: *A. tenuifolius* is described by C. Bauhin pin. 594; and is known to grow on mountains and in marshy situations in Hungary and Southern France (Waldst. and Kit., Lam. encl., and Pers.).

siatha," a shrub with red branches, leaves thrice as large as those of "pēganōu," terminal yellow flowers, fruit marked with lines, the bruised inflorescence exhaling a resinous odour, and the plant applied to restrain the flow of blood: *A. officinale* was observed by Sibthorp in the Peloponnesus. Westward, the "androsaemon" is described by Pliny xxvii. 10 as growing in vineyards, and applied to wounds: the "cecilianae" is mentioned by Belon obs. i. 17 (ed. Clus.); *A. officinale* is described by Anguillara p. 92 (Spreng.), and Dodoens p. 78; is termed "*a. maximum frutescens*" by Tournefort inst. 251, and is known to grow in woods in Italy, Southern France, and even in Britain (All. ped. 1440, Curt. lond. iii. pl. 48, and Pers.). The dried plant is called "*androsāmum*" in the drug-shops of Italy (Lenz); and according to Lindley, "the leaves once much esteemed as vulnerary, and still employed with great confidence in cases of recent wounds by rustic nurses."

Hypericum perforatum of the East Mediterranean countries. The "*anthrōsaimōn*" — is however described by Dioscorides as having "*anthēlia mikra*" small flowers, and is referred here by Sibthorp, Sprengel, and Fraas: *H. perforatum* is termed "*h. creticum amplissimo folio nitido*" by Tournefort cor. 18; was observed by Sibthorp, and Fraas, on *Zacynthus* and throughout Greece to the vicinity of Constantinople, in shaded situations and called at present "*lēihēnōhōrtōn*" or "*murōthia*." Farther West, was observed by Columna ecphr. i. p. 78 in Apulia in Southern Italy, and is termed "*androsemum sambac perfoliato folio*" by Boccone mus. pl. 127.

Aloe vulgaris of Abyssinia. Yellow-flowered and called in Egypt "*sabbarah*," on Cyprus "*alōē*," and seemingly connected with the mistake of Niger in supposing the drug "*alōē*" dug out of the ground in Judea; — clearly the "*alōē*" of Dioscorides praef. and iii. 22 growing in Asia and by the seaside on Andros and other islands, its thick leaves spinulose and spreading backwards: *A. vulgaris* was observed by Sibthorp on Cyprus. Farther West, the "*alōē*" or "*amphiviōn*" or "*ēruggiōn*" or "*ērminōn*" or "*tragōkērōs*" is identified in the Syn. Diosc. with the "*alōam*" of the Romans; the "*aloe*" is described by Pliny xxvii. 5 as somewhat resembling "*scillae*" but larger with the leaves more fleshy, the stem not unlike "*antherico*;" *A. vulgaris* is described by C. Bauhin pin. 286, and Tournefort inst. 366, and is known to continue under cultivation in Italy, Malta, Sicily, and Barbary (Lindl.). Southward and Eastward, was observed by Forskal, and Delile, in the gardens of Egypt; by Forskal p. 73, at the port of Lohaja in Tropical Arabia; by Rheede xi. pl. 3, and Roxburgh, in Hindustan, by Graham "common in gardens" at Bombay and called "*kuar pur*," and by myself, growing spontaneously on the Deccan. By European colonists, was carried to the West Indies, where it continues under cultivation, and its product is exported under the name of "*Barbadoes aloes*" (Pers., and Lindl.).

"7 A. D." (Burm. hist., and Mason 40), Papeyan succeeded by his son Ronmökkha, now Burmese king; "a good man skilled in the Vedas," — and who reigned "fifteen" years.

"Probably about A. D. 7" (Sm. b. d.), P. Quintilius Varus, having returned from Syria, sent into Germany as governor, the first one having civil as well as military power. — In attempting to introduce Roman institutions, he was opposed by the people, who found a leader in Arminius chief of the Cherusci.

Armeniaca vulgaris of the Tauro-Caspian countries. Called in Britain *apricot* or by old writers *abrecocke*, in Spain "*albaricoque*" (Prior), in Germany "*aprikose*" (Grieb), in France "*abricot*" (Nugent), in Italy "*albicocco*" or "*arbricocco*" or "*armeniaco*" (Lenz), in Greece "*prikōkkia*" or "*vērikōkkia*" (Fraas), by the Arabs of Spain and Barbary in the time of Ebn Baitar "*barkouk*" but by Eastern Arabs "*mishmish*" (as to the present day in Egypt and Yemen), but at Mocha as heard by myself sometimes "*bertoud*," in which we recognize the "*vērikōkkia*" of Varro and Quintilii (Geopon. iii. 1), or the "*praecocia*" ripening in summer and known to the Romans for "thirty" years — according to Pliny xv. 11.: the "*praecoccia*" or "*praecoqua*" or "*armeniaca*" is mentioned also by Columella v. 10, Palladius xii. 7. 6, and Rutilius; the "*armēniaka*" or "*praikōkia*" by Dioscorides, and the "*prēkōkkia*" by Galen fac. alim. ii. 20: *A. vulgaris* was observed by Chaubard, and Fraas, under cultivation in Greece, and is known to be cultivated throughout middle and Western Europe. Farther South, was observed by Forskal, and Delile, in Egypt; and by Forskal, under cultivation on the mountains of Yemen. Eastward, is known to occur in Persia (Roxb. ii. p. 501); is cultivated in the valley of Cashmere, besides springing up spontaneously on the site of abandoned villages (Royle him. p. 205), has been observed under cultivation within the Tropics as far as the environs of Bombay (Graham), is called in Hindustanee "*khubani*," in Bengalee "*phal bishesh*" (D'roz.), but has no Sanscrit name (Pidd., and A. Dec.). By European colonists, was carried to Northeast America, where the product continues uncertain on account of spring frosts; to Oregon, prior to the visit of our Expedition; and to the Mauritius Islands, where according to Bojer it is cultivated but never flowers.

"8 A. D. = 1st year of the 'tsou-chi' of Jou-tseu-ying" (Chinese chron. table).

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcviij), Za-Bazen succeeded by Za-Senatu, now king of Abyssinia. — He reigned "twenty-six" years.

"9 A. D. = 1st year of the open usurpation of Sin-mang" or Wang-mang — (Chinese chron. table).

"The same year" (Vell., Dio, and Clint.), the Romans under Quintilius Varus defeated in Germany.

"The same year" (Clint.), the poet Ovid, at the age of "fifty," banished to Pontus on the Euxine.

Artemisia procera of the Uralian plains. The country North and East of the Black Sea TRISTIA · PER · VACVOS · HORRENT · ABSINTHIA · CAMPOS according to Ovid epist. i. 3; — and Benedict of Poland with Plan Carpin found "plurimum absincium" in the country North of the Caspian: *A. procera* is described by Lobel ic. 768; and is known to grow from France and Italy to Siberia (Pers.). Is besides enumerated by Lindley among the species which have been used medicinally.

Satureja hortensis of the West Mediterranean countries. Called in Britain *savoury*, in France "savorée," in Italy "savorreggia" (Prior) or "santoreggia domestica" (Lenz), on Malta "sarriette" (Forsk.), in which we recognize the SATVREIA of Ovid, — mentioned by Celsus ii. 21 as esculent, by Pliny xix. 50 as a cultivated condiment, also mentioned by Columella xi. 3. 57, and Martial: *S. hortensis* was observed by Forskal on Malta, is known to grow wild in Italy and France (Pers., and Lenz), is besides cultivated throughout Western Europe. By European colonists, was carried prior to 1670 (Josselyn) to Northeast America, where it continues under cultivation, and has escaped therefrom to the prairies of Illinois and the rocky islets of the Falls of the Ohio (Short, and A. Gray).

Narcissus biflorus of the West Mediterranean countries. The NARCISSVS of Ovid, CROCEVM · PRO · CORPORE · FLOREM . . . FOLIIS · MEDIVM · CINGENTIBVS · ALBIS, — may be compared: *N. biflorus* is described by Marcellus Virgilius, and is known to grow wild on the Apennines (Spreng.) and in Spain (Pers.). As a garden flower farther North is described by Dodoens pl. 223, is termed "n. poeticus" by Hudson (Pers.), but has become naturalized in various parts of Europe, and from at least the time of Gerarde 110 to 112 in Britain (Park. th. pl. 75, Ray, Wats., and A. Dec.).

A. D. 10, beyond the Lower Rhine, Germanicus found in a maritime district a solitary spring of fresh water; the use of which for drinking caused the teeth to fall out within two years, and the knee-joints to be loosened; a malady called by the physicians "stomacacen" and "sceletryben" *scurvy* (Plin. xxv. 6).

Cochlearia officinalis of extreme Northern Climates. Called in Germany "löffel-kraut," in Britain *spoonwort* or *scurvy grass* or more properly *scurvy cress* (Prior); and the "britannica" herb pointed out by resident Frisians as a remedy, its juice expressed even from the root, and its flower called "vibones," — may be compared: the "oscedinem herba britannica viridis sumpta in cibo lactucae modo," according to Marcellus 11, heals the mouth, is also dried: *C. officinalis* is known to grow on the seashore from Spitzbergen and Lapland to Ireland and Denmark, and in mountainous wet situations inland as far as Switzerland (fl. Dan. pl. 135. Wats., and Lindl.); also in Siberia, as far as 67° on the Oby (Pall.). Westward, was observed by Hooker on Iceland; is known to grow in Greenland (Wats.), Labrador (Colmaster), and along the Arctic Sea to Mackenzie river and beyond (Hook.); was observed by Chamisso on Unalaska. Recently, according to Clot-Bey and Figari, has been introduced from the gardens of France into Egypt.

Rumex aquaticus of Europe and the adjoining portion of Asia. Called in Britain *water dock* (Prior), in Italian drug-shops "erba britannica" (Lenz), in Greece "nērōlapathō" (Fraas) or "agriō lūpathōn" (Sibth.); and possibly the "britannica" in question: — the "ippōlapathōn" of Dioscorides, large, growing in marshes, and agreeing with the four other kinds in medicinal properties, is referred here by writers; together with the "hydrolapathum" of Pliny xx. 85 said to grow in water: *R. aquaticus* is described by Lobel pl. 285, and Camerarius 232; is termed "lapathum aquaticum folio cubitali" by Tournefort inst. 504; is known to grow in the marshes of the district visited by Germanicus (Lips., and Spreng.); also throughout middle Europe as far as Italy (Huds., Pers., and Pollini); and was observed by Sibthorp, and Fraas, not rare in marshes from the Peloponnesus to Cyprus.

Betonica alopecurus of the mountains of Southern Europe. Called in Greece "vētōnikē" (Sibth.); and the BPETANNIKH mentioned about this time by Niceratus — is perhaps the "vrētannikē ē vēttonikē" of Dioscorides, having a short and slender root, a stem not large, leaves like "lapathō agriō" but more hairy and larger, their inspissated juice astringent and used for ulcers in the mouth: the "vrētannikē" is mentioned also by Damocrates, and Galen antid. ii. 2. p. 453; and the "vēttonikē," by Paulus Aegineta: *B. alopecurus* was observed by Sibthorp frequent on Parnassus. Westward, is described by Dalechamp 1358 (Spreng.); is termed "b. alpina latifolia major villosa flore luteo" by Tournefort inst. 203; and is known to grow on the mountains of

Carniola, Austria, Italy, and Southern France as far as the Pyrenees (Scop. carn. pl. 28, Pers., A. Dec., and Lenz).

"13 A. D." (Dio, and Clint.), the empire for "ten years" accepted for the fifth time by Augustus.

As early probably as this date, an instrument for crushing the stone within the bladder invented by Ammonius; — together with the mode of using it, described by Celsus vii. 26. 3. The art was revived in 1813 by Gruithuisen of Bavaria, who having introduced a *straight catheter* into the bladder, proposed by means of a looped wire to draw up and destroy stony concretions (Salzburgh medicosurg. gaz. for March, and McEuen in litt.); but not until 1824 was *lithotrixy* successfully accomplished, Civiale at Paris employing a rotating or watchmaker's drill (Cuv. rapp. Inst.). Improved instruments for crushing were afterwards invented by Huerteloup, and Jacobson, and have led to the general adoption of the art.

"14 A. D. = 1st year of the 'thiang-foung' of the usurping Sin-mang" or Wang-mang — (Chinese chron. table).

"The same year," and "before the death of Augustus" (Clint. iv. p. 45), a *comet*. Observed by L. Seneca nat. qu. i. 1.

"August" (Sueton., and Clint.), Augustus succeeded by Tiberius, second Roman emperor. The hieroglyphic ovals of Tiberius occur at Dendera, Karnak, Esneh, Philæ, and on the temple continued by him at Debot in Nubia.

Rosa pumila of Eastern Europe. The NARDI·GALLICI·FOLIORVM·ROSAE·ARIDORVM mentioned by Celsus v. 23, — were probably of this species, whose petals according to Lindley "are astringent and tonic, and are dried for various official preparations;" *R. pumila* is known to grow wild in Italy (Lenz); is further described by Lindley as a "dwarfish stiff short-branched bush" growing in Austria and the Crimea; and was observed by Chaubard, and Fraas, frequent in Greece. Farther East, "*R. Gallica*" was observed by Thunberg at Dezima and elsewhere in Japan.

Athamantia Cretensis of the Mediterranean countries. Its imported fruits are called in drug-shops "*semina dauci cretici*" (Lindl.); in which we recognize the DAVCI·CRETICI·SEMINIS prescribed by Celsus v. 23, — clearly among the four kinds of Petronius Diodotus, "*probatissimi in Creta, mox in Achaia, et in siccis ubicunque nati*," the stem upright a foot high, and root "*suavissimi gustus et odoris*" (Plin. xxv. 64): the "*thaukōs krētikōs*" is described by Dioscorides as growing in dry stony places, its root thick as the finger and a span long, flowers white, fruits hairy white pungent to the taste and odorous: "*daucum*" seeds from Crete were found by Alpinus iv. 7 employed medicinally in Egypt: and *A. Cretensis* in its annual state is described by Fuchsius pl. 231, is termed "*myrrhis annua semine striato villosa incana*" by Tournefort inst. 315, and was observed by Sibthorp along the margin of fields on the island of Melo. Westward, *A. Cretensis* is described by Matthioli, and Lobel (Spreng.); is known to grow from Carniola to the Pyrenees (Jacq. austr. pl. 62, Pers., and A. Dec.); was observed by Lenz in North Italy, and by Lecoq in limestone districts as far as central France. Its fruits according to Lindley are "aromatic with a warm agreeable flavour," and "were used in the preparation of diaphoenix Venice treacle, and compound syrup of wormwood."

Euphorbia lathyris of Eastern Asia. Called in Italy "*cacapuzza*" or "*catapuzia*" (Lenz), in which we recognize the CATAPOTIVM pill of Celsus: — seven or eight seeds of "*lathuris*" taken in "*katapōtiō*," are prescribed by Dioscorides iv. 164; for a more violent purgative (according to Pliny xxvii. 71) the seeds of "*lathyris*" are taken in their follicles, and as they hurt the stomach are eaten with fish or chicken-pottage; the "*lathyr*" is mentioned by Serenus (Ainsw.); "*lacteridae*" by Charlemagne capit. for cultivation in every garden; *E. lathyris* is called "*cataputia minor*" in the old pharmacopœias (Lindl.); is termed "*t. latifolius cataputia dictus*" by Tournefort inst. 86; and besides growing spontaneously in waste ground, continues to be cultivated in Italy and throughout middle Europe as far as Holland (Pers., A. Dec., and Lenz); in Britain is called *capér-plant*, the "seed vessels being used in sauce for the buds of the real caper" (Prior). Eastward, the "*lathuris*" classed by some among "*tithumalōis*" is further described by Dioscorides as a cubit high, leaves resembling those of the almond, and three-seeded fruit rounded like capers "*kapparin*;" is mentioned also by Galen antid. ii. 17; *E. lathyris* was observed by Sibthorp, and Chaubard, in the Peloponnesus, but seems rare and has not been found by others: is enumerated by Clot-Bey and Figari as recently introduced into Egypt. Farther East, was observed by Thunberg in Japan, growing here and there and called "*soku suisi*." By European colonists, was carried to Northeast America, where it continues under cultivation and is sometimes found growing spontaneously (A. Gray). According to Lindley, the seeds are "drastic," and are said "to procure abortion."

Daucus gummifer of Sicily. The MARINA·PASTINACA prescribed by Celsus v. 27, — may be compared; and the liquid strax supposed by Matthæus Platearius f. 248 to be produced in Calabria, is referred here by Sprengel: *D. gummifer* is termed "*pastinaca tenuifolia gummi manans*" by Boccone pl. 20; and is known to grow on "dry stony hills" along the seashore of Sicily (Gussone

fl. sic. pl. 117, and Lindl.). Boccone further states, that the roots yield the "bdellium siculum" of the old pharmacopoeias; a substance according to Lindley having "a bitter balsamic taste and a weak but unpleasant odour."

Cyperus pertenuis of Hindustan. Called in Bengalee "naga," in the Taleef Shereef 981 "nagar-motha" (J. F. Wats.); and the aromatic IVNCI·QVADRATI identified by Celsus iii. 21 with the KYΠEIPON of the Greeks, — may be compared. Eastward, the "naga" is prescribed by Susrutas chik. 37: *C. pertenuis* was observed in Hindustan by Roxburgh, Piddington 180, Balfour 94, and Drury, its roots used medicinally, and besides "for perfuming the hair." (Compare *C. juncifolius*.)

"16 A. D." (Tacit. and Clint.), decree of Tiberius, expelling the "mathematicians and magians" from Italy.

Torilis anthriscus of the Mediterranean countries. An Umbelliferous weed called in Egypt "chellæ" or "gazar Sjëitani" (Forsk.); in which we recognize the "crowfoot" or "Satan's carrot" of Egypt identified by Ebn Baitar with the "daucus" of the Greeks: the "daucus" of Petronius Diodotus having seeds like "milio" — (Plin. xxv. 64) may be compared: *T. anthriscus* was observed by Forskal, and Delile, from Damietta to Cairo; by Forskal, and Sibthorp, along hedges from the Peloponnesus to Constantinople. Westward, "Satan's carrot" is further identified by Ebn Baitar with the "aatharilal" of Elzharawi (Abulcasis), and Edrisi, the name being Berber: *T. anthriscus* is termed "daucus annuus minor floribus rubentibus" by Tournefort inst. 308, "tordylium anthriscus" by Linnæus, "caucalis anthriscus" by Smith fl. br. 298; was observed by Scopoli in Carniolia; and is known to occur in waste places throughout middle Europe as far as Denmark (fl. Dan., Jacq. austr. pl. 261, and Pers.).

Seseli ammoides of the Mediterranean countries. Of the four kinds of "dauci" distinguished by Petronius Diodotus, the "tertium" — (Plin.) or "thaukōn tritōn" of Dioscorides, having coriander-like leaves, white flowers, an "anēthō"-like summit and fruit, the umbel carrot-like and full of oblong acrid seeds, is referred here by Sprengel: *S. ammoides* was observed by Sibthorp in the cultivated fields of Greece. Westward, is termed "fœniculum lusitanicum minimum acre" by Tournefort inst. 312, "sison ammi" by herbalists (Steud.); and is known to occur in Italy and Portugal (Jacq. hort. pl. 52, and Pers.).

"17 A. D." (Tacit., Blair, and Clint.), twelve cities in Asia thrown down by an *earthquake*; regarded by Pliny ii. 84 as the severest one on record.

At this time in or near Rome, Antonius Castor cultivating a *botanic garden* of his own — (Plin. xxv. 5). Probably the earliest one on record.

Lepidium cornutum of the East Mediterranean countries. A species of *pepper-wort*, and the PIPERITIS or SILIQVASTRVM having according to Castor white seeds tasting like pepper — (Plin. xx. 66), may be compared: *L. cornutum* is termed "bursa pastoris orientalis cardamines folio siliqua longissima quadrangula" by Tournefort cor. 15; and was observed by Sibthorp on Cyprus.

Potamogeton pectinatus of Northern climates, in water more or less brackish. A species is called in Italy "potamogeto" (Lenz), and the POTAMOGETON growing according to Castor in watery places, its leaves slender like horse-hair, a long smooth thyrsus, and the root healing "strumas" and "duri-tias" — (Plin. xxvi. 33), may be compared: *P. pectinatus* is described by Vaillant pl. 32, was observed by Forskal near Marseilles, and is known to grow along the European coast as far as Sweden and Iceland (fl. Dan. pl. 186, Hook., and Wats.). Eastward, was observed by Sibthorp, Chaubard, and Fraas, in the Peloponnesus; by Delile, along the Mediterranean border of Egypt; and is known to grow in Siberia as far as the salt lakes of the Irtisch (Pall.). Westward from Europe, is known to grow along our Atlantic coast, and inland throughout the chain of the Great Lakes (A. Gray) to Lat. 54° at Cumberland House (Drumm.; see *P. crispus*).

"18 A. D." (Clint.), the historian Valerius Maximus visiting Asia in company with Sextus Pompeius, a friend of Ovid

Glaucium rubrum of the East Mediterranean countries. Called on Tenedos "löllē" or by the Turks "hawa at" (Forsk.): the GLAVCEA·SVCCO·SALVBRI of Columella x. 103, — and Scribonius Largus 22, or "glaukiōn" described by Dioscorides as the juice of an herb, growing at Hierapolis in Syria and having leaves like "kēratitithōs mēkōnōs," expressed by the inhabitants and employed against maladies of the eyes, according to Pliny xxvii. 59 growing in Syria and Parthia and having further medicinal uses, may be compared: also the herb "bomnih" mentioned by Avicenna as yielding the "mamitsa" juice (Spreng.): *G. rubrum* is termed "g. orientale flore magno rubro" by Tournefort cor. 18, and was observed by Forskal, and Sibthorp, at Smyrna and on the nearer Greek islands.

Helleborus foetidus of Western Europe. Called in Britain *bear's foot* or *exhel* or *setterwort* or *fetid hellebore* (Prior); in which we recognize the CONSILIGO of shepherds, good according to Columella vi. 5 in all diseases of cattle; a discovery of "nostra aetas" in the Marsian mountains —

according to Pliny xxv. 48 to xxvi. 21: *H. foetidus* is described by Cordus, Ruel, Tragus i. pl. 83, Gesner, and Matthioli (Dierb.); is known to grow from "Lat. 51°" near Iena to Styria, the Tyrol, France, and Italy (Poll., Ten., and A. Dec.). Is probably exotic in Britain, though found seemingly wild by Gerarde 286, and Ray 272 (Hook., Bab., and Wats.): its root according to Prior inserted as a seton in the dewlap of cattle, and hence the name. Its medicinal properties according to Lindley are similar to those of *H. niger* and its "leaves are emetic and purgative."

Lepidium latifolium of the East Mediterranean countries. Called in Britain *pepperwort* (Prior), in Germany "pfefferkraut," in Portugal "herva pimentiera maior," in Italy "piperella" (Spreng.), in Greece "agria lahana" (Fraas) or "lépithi" (Sibth.), in which we recognize the *LEPIDIVM* of Columella — (Ruel ii. 105), applied externally as ulcerating in the antidote of Apuleius Celsus (Scribon. Larg. 174), and according to Pliny xix. 51 and xx. 70 a foreign plant cultivated in Italy, lasting two years, a cubit high with laurel-like but soft leaves: *L. latifolium* is described by Dodoens hist. p. 716, and Tournefort inst. 216; was in Britain before the days of Gerarde p. 187 (A. Dec.); and is at least naturalized in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 557, Pers., and Lenz). Eastward, the "lépithion" by some called "giggithion" is described by Dioscorides as a well-known herb whose acrid ulcerating leaves are applied externally in cutaneous and other diseases, and the root tied to the neck as a remedy against toothache; is mentioned also by Galen, and Paulus Aegineta; *L. latifolium* was observed by Sibthorp, and Fraas, frequent in Greece. Farther South, the "shitharaj" mentioned by Dioscorides according to Ebn Baitar, or "sheiteraj" of Serapion, is referred here by Sprengel, and Sontheimer; *L. latifolium* is enumerated by Clot-Bey and Figari as long known in Egypt, and was observed by Delile around Cairo.

Raphanus sativus of Eastern Asia. Called in Britain *radish*. In France "rave" (Nugent), in Germany "radieschen" (Grieb), in Italy "radicine" (Lenz), in Greece "rapania" (Fraas), in Egypt "fidjel," in Yemen "fidyl" or "bökel" (Forsk.); in which we recognize the *ASSYRIA RADIX* or *SYRIACAE RADICIS* of Columella xi. 3, — brought from Syria according to Pliny xix. 26 quite recently: the "radix" is mentioned by Palladius, Vegetius, and in the Capitularia of Charlemagne: the "fuyl" by Eldshuz, Ebn Masawia, Costus, Elthabari, Rhazes, and Ebn Baitar: *R. sativus* is described by Platearius, and in *Ortus Sanitatis* 383; is known to be cultivated from Italy throughout middle Europe, in some instances springing up spontaneously (A. Dec.); was observed by Fraas under cultivation in Greece; by Forskal, Delile, and myself, under cultivation in Egypt, where according to Clot-Bey the leafstalks are eaten as well as the root; by Forskal, in Yemen; by myself, a favourite object of cultivation at Mocha, Zanzibar, and Muscat. Eastward from Arabia, is called in Sanscrit "mooluka" (Roxb.), in Bengalee "mula," in Hindustanee "muli" or "murai" or "turb" (D'roz.), in the environs of Bombay "mohlee" (Graham); was observed by myself abundantly cultivated on the Deccan; by Mason, "exotic" in Burmah and called "mung-la;" by Loureiro, under cultivation in Anam; by Kaempfer, and Thunberg, along roadsides and everywhere cultivated in Japan. By European colonists, was carried to Northeast America, where it continues abundantly cultivated and "inclines sometimes to be spontaneous" (A. Gray); to the island of Tristan d'Acunha (Petit-Thouars, and Carmich.); and to the Mauritius Islands (Boj.). *Var. oleifer* long cultivated in China for the oil from its seeds (A. Dec.) seems to have accompanied the fleshy-rooted form into Egypt: for "elaiōn raphaninōn" is mentioned by Dioscorides i. 45, and Pliny, as used among the Egyptians; "fadjl oil" is mentioned by Elminhaj, Ebn Baitar, by Abd-allatif as manufactured in Egypt; and the plant producing it was observed under cultivation there and in Nubia by Lippi, and Granger (Del. see *Raphanistrum maritimum*).

Crambe maritima of Western Europe. Called in Britain *sea-kale* (Prior): the *BATIS* of Columella xii. 7. 13, — or "batin marinam" and "batin hortensiam" by some called "asparagum gallicum" enumerated by Pliny xx. 50 and xxvi. 50 among the indigenous esculent plants of Italy, is referred here conjecturally by Fraas: *C. maritima* is known to grow along the Atlantic shore of Europe as far as Denmark (fl. Dan. pl. 316, Pers., and Prior).

Trifolium pratense of Europe and the adjoining portion of Asia. Called in Britain *clover* or *meadow clover* or *honeysuckle*, in Anglo-Saxon "hunig-sucle" (Prior), in Germany "wiesenklee" (Grieb), in France "trèfle" (A. Dec.), in Greece "triphulli," and the *TRIFOLIUM* sown for geese or *TRIFOLIUM PRATENSE* of Columella vi. 17. 2 and viii. 14. 2, — and Scribonius Largus 163, is referred here by writers: "read clæfre" is mentioned in the Anglo-Saxon Leech book iii. 8, and glossary Laud. (Cockayne): *T. pratense* is described by Lobel hist. p. 493, Culpepper, and Parkinson; is termed "t. pratense flore monopetalo" by Tournefort inst. 404; and is known to grow in North Africa, Corsica, and throughout middle and Northern Europe as far as Lapland (Wats., Dec., and A. Dec.). Eastward, was observed by Forskal, and Sibthorp, in grassy situations everywhere from Constantinople to the Greek islands; is known to grow also from Armenia and Caucasus throughout the neighbouring portion of Siberia and as far as Cashmere (Ledeb., and Royle). Its cultivation in middle Europe according to Link, and A. Decandolle, having commenced in the Six-

teenth century, *T. pratense* may have been carried by European colonists to Iceland, where it was observed by Hooker: clearly by European colonists was carried to Northeast America, where it continues to be abundantly cultivated, has become naturalized, and is distinguished as *red clover*.

Medicago falcata of Europe and the adjoining portion of Asia. Called in Britain *yellow medic* or *horned medic*, in Germany "sichelklee" (Grieb) or "schwedischen luzern" (Lenz); and the wild *medica* alluded to by Columella ii. 11 — is referred here conjecturally by Fraas: *M. falcata* is termed "falcata" by Rivinus pl. 84, "*m. sylvestris*" by Tournefort inst. 410; was observed by Forskal near Marseilles; is known to occur cultivated and naturalized throughout middle Europe as far as Denmark (fl. Dan. pl. 233, Pers., Dureau de la Malle, and A. Dec.); and at least in Britain is regarded by Watson as exotic. Eastward, was observed by Forskal, Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Constantinople.

Bryonia alba of the West Mediterranean countries. Called in Italy "zucca selvatica" or "vite bianca" (Lenz), in which we recognize the *VITIS ALBA* of Columella vi. 4. 3 and xii. 7. 1, — *Paladius* i. 35, and *Apuleius* 66, identified with the "bryoniae" by Scribonius Largus 79: *B. alba* is described by Blackwell pl. 533, and is known to be frequent throughout Italy, growing as far even as middle Europe (Pers., Lindl., and Lenz). Eastward, was observed by Fraas in Greece, rare and called "agrioklēma." According to Lindley, the "properties like those of" *B. dioica*.

Ligusticum (Trochiscanthes) nodiflorum of the extreme Southern Alps. The *LIGUSTICUM* of Columella xii. 59, — and *Apicius*, described by Pliny xix. 50 and xx. 73 as wild on the mountains of Liguria, a condiment when cultivated sweeter but without strength, by Dioscorides as named from Liguria where it is chiefly produced, growing in shady places on the highest rough Appenines close to the Alps, the stem slender like that of "anēthō" and geniculate, leaves "mēlilōtōu"-like the uppermost ones much divided, seeds "marathrōu"-like acrid and aromatic, used for pepper by the natives who call the plant "panakēs," is referred here by Dierbach, and others: *L. nodiflorum* is described by Villars; and is known to grow on the Southern prolongation of the Alps separating France from Italy (Allion., and Pers. See *L. levisticum*).

Pastinaca sativa of Western Europe. Called in Britain *parsnep*, or in old herbals *pasnep* (Prior), in France "panais," in Italy "pastinaca" or "pastinaca domestica" (Lenz), in which we recognize the *PASTINACA* of Columella, — and *Macer Floridus*, and "pastinacae maiori" of Pliny xix. 28: *P. sativa* is described by Fuchsius pl. 751, Anguillara, and Columna (Spreng.); is termed "*p. sylvestris latifolia*" by Tournefort inst. 319; and besides being cultivated, is known to grow wild throughout middle Europe as far as Denmark (fl. Dan. pl. 1206, and Pers.). Eastward, was observed by Sibthorp, and Chaubard, along the margin of fields in the Peloponnesus and on the Greek islands. By European colonists, was carried prior to 1670 (Josselyn) to Northeast America, where it continues to be cultivated and has become naturalized: perhaps also by European colonists carried to Hindustan, where it was observed by Law "in gardens" in the environs of Bombay (Graham); and to Burmah, where it was observed by Mason, but no native name is given.

Carum carvi of Europe and the adjoining portion of Asia. Called in Britain *carraway* (Prior), in Welsh "carwass" or "carddwy" (Davies p. 20), in Germany "kummel," in Finland "kumina," in Polish and Bohemian "kmjn," in French Switzerland "cumin" (A. Dec.), in France "carvi" (Nugent), in Italy "comino tedesco" or "carvi" or "caro" (Lenz), in Egypt "karaoui," in which we recognize the *CAREVM* of Columella xii. 51, — and *Apicius* vii. 2, according to Pliny xix. 49 exotic in Italy and cultivated in the same manner as "*olusatrum*," the best produced in Caria whence the name, and the next best in Phrygia: seeds of *C. carui* have been found in debris of the ancient lake-villages of Switzerland (at Robenh., Heer); the term "*carui semina*" occurs in medieval Latin, and the herb "*carui*" is mentioned by Galfridus pr. pm. as growing abundantly in Britain (Prior); *C. carui* continues frequent there, has been long known on the neighbouring continent between "Lat. 50° and 60°," and is regarded by A. Decandolle as indigenous from Lapland to Siberia and Caucasus. Farther South, the "*karōn*" is described by Dioscorides as a well known little seed, warm, grateful to the taste and stomach and the root edible, is mentioned also by Galen, Oribasius, and Aetius; *C. carui* has not been found by modern travellers in Greece nor in Asia Minor, but was observed by Forskal, and Clot-Bey, in the gardens of Egypt, the seeds besides imported from "Babary and Andalusia" (Forsk. mat. med. and Del.). Eastward, is called in Hindustanee "karwiya" or "ajmod" (D'roz.); and is enumerated by Mason as "exotic" in Burmah and called "sa-mwot." By European colonists, was carried to Northeast America, where it continues under cultivation for its seeds; and to the Mauritius Islands, where it rarely flowers (Boj.). The more tender roots according to Sprengel are eaten in Germany.

Carduus personata of the mountains of middle Europe. The *PERSONATA* of Columella vi. 17. 1 — is referred here by Sprengel and others: *C. personata* is described by C. Bauhin prodr. 155: is termed "*arctium personata*" by Linnæus; and is known to grow on the Alps from Geneva and Tauerno to Austria (Jacq. austr. pl. 348, and Pers.).

Xeranthemum annuum of the Mediterranean countries and middle Asia. The IMMORTALIS-AMARANTVS of Columella x. 175—is referred here by Sprengel: *X. annuum* was observed by Sibthorp in Greece, in dry stony mountainous situations frequent; by Gmelin, in Siberia. Westward, is described by Morison vi. pl. 21; is termed “*x. flore simplici purpureo majore*” by Tournefort inst. 499; and is known to grow in Italy and as far as France (Jacq. austr. pl. 388, Lam. fl. fr., and Pers.). According to Sprengel, the flowers have no pungent odour.

Artemisia palmata of Western Europe. The SANTONICVM of Columella vi. 25,—and Pliny xxvii. 28, “*sandonica herba*” of Scribonius Largus 141, or “*tritōn apsinthiōu*” growing according to Dioscorides mostly in Gaul beyond the Alps, and called after the district producing it “*santōniōn*,” mentioned also by Galen fac. simpl. vi. p. 804, is referred here by Lobel obs. p. 436, and Sprengel: *A. palmata* is known to grow in Southern France and Spain, its seeds being the officinal “*seminis santonici*” (W., and Pers.).

Mentha gentilis of Europe and the adjoining portion of Asia. A species of *mint* called in Greece “*agriōethuōsmōs*” (Sibth.): the NEPETA-SYLVESTRIS of Columella vii. 5. 18—may be compared with the “*nēpētan*” of the Romans identified by Dioscorides with the “*ētēra kalaminthē*” called “*agrian glēhōna*” from resembling the “*glēhōni*” even in odour, and referred here by Fraas: *M. gentilis* is distinctly described by Linnæus 805; is known to grow in wet places and among rubbish throughout middle Europe as far as Britain (Sm. brit. ii. p. 621, Sole pl. 18, and Pers.); was observed by Sibthorp, and Fraas, not rare in Greece, among stubble late in the autumn.

Salix præcox of middle Europe. The GALLICA-SALIX of Columella iv. 30. 4—is referred here by Sprengel: *S. præcox* is described by Hoppe, Hoffmann, Villars, and Host (Steud.); is known to grow on river-banks in middle Europe as far as Britain (J. E. Smith), a tree with branches “*fragilissimis*” (Pers.).

Sorghum vulgare of Tropical Eastern Asia. Called in Greece “*kēghri*” or “*kalampōki*,” in Italy “*sorgo*” or “*saggina*” or “*melica*” (Targ., and Lenz), in which we recognize the MELICA-E-GALLINAE, a term applied by Columella to the MELEAGRIS *Guinea fowl*, about this time first served upon the tables of the Romans: a kind of “*miliun*” brought within ten years from India to Italy—is further mentioned by Pliny x. 38 and xviii. 10 as having a very large reedy stem seven feet high and called “*lobas*,” cultivated in moist places and the most productive of all grains, a single seed yielding “*terni sextarii*,” the “*melica*” is also mentioned by Palladius (Fraas p. 312); specimens of a kind of grain called “*meliga*” were brought from Natolia to Incisa in Piedmont in “*August 1204*,” the price of “*meliga*” or “*melya*” is mentioned by Uberto de Lucerna “*in 1298*,” the mode of cultivating “*milica*” is described by Crescenzo, the “*milica*” is identified with the “*sorghum*” by Cardanus, with the “*saggina*” by C. Bauhin, and the “*sorgo*” is also mentioned by Matthioli (A. Dec. p. 943). Eastward and Southward, *S. vulgare* was observed by Fraas under cultivation in Greece; stems intermingled with those of Papyrus were observed by myself in a bundle exhumed at Sakara, the “*dhorra*” continued in the days of Abd-allatif almost unknown in Egypt, but is at present one of the principal objects of cultivation (Alpin., Forsk., Del., and Clot-Bey); is called in Nubia “*mareh*” (Del.), in Southern Arabia “*taam*” or “*habb*” (Forsk.), in Hindustan “*jondla*” or “*jowaree*” (Graham); in which we recognize the “*jawars*” of Ebn Masah, Abu Hanifa, Rhazes, and Ebn Baitar; was observed by myself both in Arabia and in Equatorial Africa at Zanzibar, and through the Interior had reached Senegal on the Atlantic prior to the visit of Cadamosto; was observed in Hindustan by Apollonius of Tyana (according to Philostratus, and Beckmann), and continues to be extensively cultivated there, as witnessed by Rumphius v. pl. 75, Roxburgh, Graham, and myself. Farther East, was observed by Mason “*exotic*” in Burmah and called “*pyoung*,” and by Kaempfer, and Thunberg, under cultivation in Japan, and called “*sioku*” or usually “*kibi*.” By European colonists, a slender-stemmed variety has been recently brought “*from China*” to Northeast America, and continues to be cultivated along the Ohio and Mississippi for the sugar procured from the stems.

Morchella esculenta of Europe. An edible mushroom called in Britain “*morel*,” in France “*morille*” (Prior), in Italy “*spugnolo*” or “*spongiole*” (Lenz), in which we recognize the SPONGIOLI of Columella,—Pliny, and Apicius, described as a spongy ball on trees: *M. esculenta* is known to grow also in middle Europe.

Mucor mucedo of all climates? The MVCOR of Columella xii. 4 and 17,—and Pliny xiv. 26, is referred by writers to this minute fungus, called in English *mould*.

“19 A. D.” (Tacit., and Clint.), visit to Egypt of Germanicus; and his death on his way thence in Syria. At this time, a comet observed by L. Seneca nat. qu. i. 1 (Clint. iv. p. 45).

“The same year” (Tacit., and Clint.), at Rome, the religious rites of the Egyptians and Jews prohibited; and all persons following them banished from Italy.

“20 A. D. = 1st year of the ‘ti-hoang’ of the usurping Sin-mang” or Wang-mang—(Chinese chron. table).

"22 A. D." (Mason iii. 40), in Burmah, king Ronmokkha succeeded by his son Ranthinkha;—who "discouraged Buddhism," and reigned three years only.

Polygonum barbatum of the Eastern Himalayas. Three to four feet high with several stems, and called in Telinga "kunda-mallier," in Tamil "aat-alarie," in Malabar "velutta-modela-mucu" (Drur.); from early times furnishing feed for cattle, its leaves besides used by the natives in colic, and its seeds as carminative: *—observed by Rheede xii. pl. 77 in Malabar; by Ainslie, Roxburgh, and Wight, as far as Bengal; by Mason, in Burmah, enumerated as indigenous; and is known to grow in China (Pers., and Lindl.). Westward, was observed by Grant on the "coast range" of Equatorial Africa. Observed by Thunberg fl. 385 in Austral Africa; but clearly by European colonists, carried to the West Indies (Sloane i. pl. 3).

"23 A. D. = 'keng-chi,' 1st year of Ti-youan, of the Han" or Seventh dynasty—(Chinese chron. table).

"25 A. D. = 'kian-wou,' 1st year of Kouang-wou-hoang-ti" or Kouang-wou ti, of the Han or Seventh dynasty (Chinese chron. table, and Pauth.). He removed the seat of government from Singan-fou in Chen-si to Ho-nan-fou in Honan: and hence the name "Eastern Han" for the remainder of the dynasty.

"The same year" (Tacit., and Clint.), death of Cremutius Cordus. His annals "praising M. Brutus and calling C. Cassius the last Roman," were ordered by the Senate to be burned; but copies being concealed, the work continued extant.

"In this year" (Burm. hist., and Mason 41), in Burmah, Ranthinka succeeded by his son Ramunsalingda, an excellent and religious king—who reigned "fifteen" years.

"27 A. D." (Sueton., Tacit., Alst., and Clint.), fall of the amphitheatre at Fidenæ; in which "more than twenty thousand persons" perished.

Ficaria ranunculoides of Europe and the adjoining portion of Asia. Called in Greece "sphourthakula" or "zôhathôhörtôn" (Sibth.), and one of the plants called in Britain *swallow-wort* (Prior), in which we recognize the *CHELIDONIUM* applied as ulcerating of the antidote of Apuleius Celsus—(Scribon. Larg. 174): *F. ranunculoides* is termed "*r. vernus rotundifolius*" by Tournefort inst. 286; is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 499, and Pers.); and according to Sprengel, the roots so resemble grains of wheat as to have been cooked by mistake in times of scarcity, and from being left exposed in quantities after inundations have occasioned superstitious fear. Eastward, the "hêlithônîôn tō mikrôn" by some called "purôn agriôn" is described by Dioscorides as ulcerating the skin, growing near water, stemless, the leaves ivy-like, and roots like a cluster of grains of wheat; *F. ranunculoides* was observed by Sibthorp, Chaubard, and Fraas, frequent in moist shady places throughout Greece.

28 A. D. = "15th year of the reign of Tiberius" (Luke iii. 1, and Epiphan. haeres. p. 446), the Baptism. In the Jordan, by "John the son of Zacharias."

"29 A. D.," in the consulship of "Rubellius Geminus and Rufus Geminus" (Clem. Alex., Tertull. adv. Jud. 8, Augustin., and Clint.), the Crucifixion. After "forty days," the number of disciples being "about an hundred and twenty," Matthias elected apostle in place of the deceased Judas: and on "the day of Pentecost," the gift of tongues, and "about three thousand" disciples added (Acts i. 3 to ii. 41).

* *Ulmus alternifolia* of the mountains of Burmah. One of the two *elms* called "tha-lai" (Mason) known in Prome from early times:—observed by McClelland, "the largest trees" of the district (Mason v. 540. See *U. integrifolia*).

Fugians arguta of the Eastern Himalayas. Called in Burmah "theet-kya" (Mason), and known from early times:—observed by Wallich. *Walnuts* according to Mason v. 460 "are occasionally brought from above Ava, but it is not certain that they are the produce of the indigenous" tree.

Quercus *sp.* of the Eastern Himalayas and the mountains of Burmah. Seven different species of *oak*—observed by Wallich in Burmah: "three or four" according to Mason "are natives of" Tenasserim "and all afford useful timber."

Pardanthus Chinensis of the Eastern Himalayas. The *leopard flower*, *Moraea*-like, and called in Burmah "theet-sa" (Mason), in Malabar "canda-shular mini" (Rheede), cultivated from early times:—observed by Rheede xi. 37 in Malabar; by Graham, "common in gardens" around Bombay; by Roxburgh, in other parts of Hindustan; by Royle, "wild in the Doons of the Himalayas" (Graham); by Mason v. 431 to 807, "exotic" in Burmah, cultivated for ornament. Transported to Europe, is termed "*ixia chinensis*" by Linnæus.

Asparagus acerosus of Burmah. Called there "sheet-ma-tet" (Mason), and from early times:—found by Mason v. 468 "a passable substitute for" our *garden asparagus*, "to which however it is much inferior."

In or about 30 A. D. (Acts viii. 1, and ix. 19), martyrdom of Stephen; and the disciples, "except the apostles," scattered abroad "as far as Phenice, and Cyprus, and Antioch."

"31 A. D." (Sueton., Dio, and Clint.), disgrace and death of Sejanus, prefect of the praetorian guard and consul for this year. A comet visible at the time, witnessed by L. Seneca nat. qu. i. 1 (Clint. iv. p. 45).

In or about 32 A. D. (see Acts viii. 5 to 25), the gospel extended to Samaria by Philip the evangelist; Simon Magus being among those baptised. — Simon afterwards ("35 to 65" Clint. iv. p. 123) founded the Sect of Simonians; and is regarded by Tertullian haer. 46, as the first heretical Christian.

By Philip also (Acts viii. 27 to 39), conversion and baptism of "a man of Ethiopia, an eunuch of great authority under Candace queen of the Ethiopians, who had the charge of all her treasures:" and who was at least inclining to the Jewish faith, having "come to Jerusalem for to worship, was returning, and sitting in his chariot read Esaias the prophet." — Reasons have been found for suspecting, that the Nubian or Ethiopian kings "adopted both Christ and Jupiter among the gods" (Leps. eg. and sin. p. 210).

A Roman inscription at Naga in Upper Nubia: and at or near Meroe, a "temple of superior workmanship" perhaps built by Roman artisans, but is devoid of inscriptions (Leps. eg. and sin. p. 155 and 210).

33 A. D. (= 36—"3 years" of Galat. i. 18), conversion of Saul or Paul, on his way to Damascus.

Vinca minor of Europe and the adjoining portion of Asia. Called in Britain *periwinkle*, in medieval Latin "pervinca" (Prior), in Italy "pervinca" (Lenz), in Greece "agriōliza:" the KATHMATIK mentioned confusedly by Pamphilus—(according to Galen simpl. vii. 31), identified by Dioscorides with the "philētairiōn" or "thaphnōēithēs" or "mursinōēithēs" or "pōlugōnōēithēs," having shoots as large as "shōinōu" and laurel-like leaves but much smaller, is referred here by writers: *V. minor* was observed by Sibthorp, Chaubard, and Fraas, in the Peloponnesus. Westward, seems at least included in the "vincapervinca" of Pliny xxi. 39, and Apuleius 58: is called in Slavonic and Saxon by names turning on the syllable "vink," but totally different Welsh names are given by Davies (A. Dec.); is described by Brunfels (Spreng.), and Wigand; is termed "pervinca vulgaris angustifolia flore cæruleo" by Tournefort inst. 120; is known to grow wild in Italy and throughout middle Europe, but is regarded by Watson as exotic in Britain and only naturalized (Pers., A. Dec., and Lenz). By European colonists, was carried to Northeast America, where it continues under cultivation for ornament. (See *V. major*.)

One hundred and thirtieth generation. A. D. 34, May 1st, mostly beyond youth: the Greek philosopher Demetrius the cynic; the historian Pamphila; the grammarians, Pamphilus, Heracleides of Pontus the younger: the Latin writers, the poets Lucanus, and Persius; the orator Domitius Afer; the grammarians Palaemon Vicentinus, Probus of Berytus; the rhetors Clodius Quirinalis, Statius Ursulus; the commentator Asconius Pedianus; the Roman painters, Amulius, Turpilius, and Antisteus Labeo (Bryan).

"In this year" (Abyss. chron., and C. Mull. p. xcvi), Za-Senatu succeeded by Za-Les, now king of Abyssinia. — He reigned "ten" years.

"35 A. D." (Sm. b. d.), C. Cestius Gallus Camerinus, and the historian and orator M. Servilius Nonianus, consuls for this year. Considia, daughter of the consul M. Servilius, was healed by the physician Damocrates — (Plin. xxiv. 28).

Lepidium iberis of Western Europe. The KAPΔAMANTIKH growing according to Servilius Damocrates in waste places, a cubit high with root and leaves like KAPΔAMΩ and white flowers, discovered and named by him IBHPIC — (Pliny xxv. 49), is referred here by writers: *L. iberis* is described by Lobel pl. 223; was observed by Forskal near Marseilles, and is known to grow along roadsides in other parts of France and in Germany (Roth, Lam. fl. fr., and Pers.).

Lepidium graminifolium of the Mediterranean countries. Possibly included in the "ivēris" by Damocrates, — being apparently the "ivēris" known to the Greeks, and mentioned in the addition to Dioscorides: *L. graminifolium* is described by Bauhin hist. ii. pl. 918 (Pers.); is termed "thlaspi lusitanicum umbellatum gramineo folio flore albo" by Tournefort inst. 213; was observed by Forskal, Sibthorp, and Chaubard, in waste ground throughout Greece from the Peloponnesus to Constantinople; and is known to occur throughout Southern Europe (Pollich, and Pers.).

Teucrium marum of the West Mediterranean countries. Called in Germany "katzenkraut," in Italy "maro" (Lenz); and the MAPON of Damocrates — may be compared: "maron" inferior in quality to the Lydian was produced in Egypt in the days of Pliny xii. 53: "maru species sclareæ" was found by Alpinus employed there medicinally; and "marum" seeds, by Forskal; but according to Clot-Bey, the living *T. marum* has only recently been introduced. Farther North, was observed by Gittard in mountainous situations on Amorgos (Chaub.), but in Greece and Italy according to Lenz

occurs under cultivation only: is known to grow wild in Spain (Matthiol. comm. 537, Ludwig ect. pl. 14, Pers., and Spreng.). According to Lindley, the plant "seems to be a genuine feline aphrodisiac." (See *Origanum Sipyleum*).

"36, before the passover" (J. R. B. in Kitt. cycl. bibl.), Pontius Pilate, "sixth Roman procurator of Judæa," removed from office by the Roman general Vitellius.

The same year, (see Acts ix. 24, 2 Cor. xi. 32, Galat. i. 18, Alst., and Neand. in Kitt. cycl. bibl.), Damascus held by the Arabian king Aretas III. of Petra, and the return of "Saul" or Paul to Jerusalem; where he abode with Peter "fifteen days," but of the other apostles saw "none, save James the Lord's brother." Thence, "Saul" proceeded "into the regions of Syria and Cilicia" (compare Acts ix. 30).

"37, March 16th" (Tacit., and Clint.), Tiberius succeeded by Caius Caligula, third Roman emperor. From Egypt, Caligula removed an obelisk to Rome (Plin. xvi. 76. 2). His hieroglyphic ovals occur on temples at Dendera, Philæ, and Talmis in Nubia.

His prefect over Egypt, Publius Avilius Flaccus, is named in a Greek inscription at Dendera.

Lemna polyrhiza of Northern climates. Called in Egypt "ads-el-ma," and possibly known there as early as this year: — the "adschma" is mentioned by Gafeki, and Ebn Baitar; and *L. polyrhiza* was observed by Forskal, and Delile, at Rosetta. Westward, is described by Vaillant pl. 20, and Micheli xvi. pl. 11; and is known to grow floating on still or stagnant water from Switzerland to Sweden and Russia (Pers., and Wats.). Farther West, is known to occur in our Atlantic States from Lat. 43 to Florida, and inland as far as Arkansas (Ell., Chapm., Nutt., and myself), but according to A. Gray has not in America been found flowering. Probably by European colonists and through the cultivation of semi-aquatic plants introduced into Madeira (Lemann, and A. Dec.).

Lemna gibba of Northern climates. Its frond plano-convex, more resembling a lentil, and possibly the original "ads-el-ma," — becoming in English *water-lentil* (Prior), in Germany "wasserlinse" (Grieb), in France "lentille sauvage" (Nugent): *L. gibba* was observed by Delile around Rosetta in Egypt: known to grow also in Northern Asia. Westward, is described by Micheli xvi. pl. 11, and Wolf p. 26; and is known to grow in Switzerland and throughout middle Europe as far as Ireland and Sweden (Pers., and Wats.). Farther West, was observed by Webb phyt. iii. p. 297 on the Canary Islands; and is known to grow in North America from Western New York to Cumberland House in Lat. 54° (Pursh, and A. Gray), but according to A. Gray has not been found flowering. (See *L. minor*).

In or about this year (Acts x. 1 to 45, and xv. 7), at Cæsarea, in the presence of Peter, the Roman centurion Cornelius, and others, the gift of tongues and the gospel extended to the Gentiles.

38 A. D. (= 39 — "a whole year" of Acts xi. 26), the disciples first "scattered abroad" preached the word to "the Jews only;" but some "of Cyprus and Cyrene" coming to Antioch, conversions took place among the Greeks; and Barnabas sent from Jerusalem, brought "Saul" or Paul from Tarsus to Antioch.

"39 A. D." (Jos., and Clint.), Herod Antipas tetrarch of Galilee, deposed and banished by the emperor Caligula; who appointed Herod Agrippa ruler over Galilee.

"The same year" (Jos., and Clint.), arrival in Rome of "five ambassadors" from Alexandria; Apion the grammarian and Philon Judæus being among the number.

Linaria vulgaris of Europe and the adjoining portion of Asia. Called in Britain *toad-flax* (Prior), in France "linaire" (Nugent), in Germany "lynkraut" or "flachskraut" or "harnkraut" (Trag.), in Egypt "æisj el mælik" (Forsk.); and the "cynocephalum herbam" of Apion the grammarian, used in Egypt against all poisoning and called "osirites" — (Plin. xxx. 6), is referred here by Tragus: the "cynocephalum" is identified by Apuleius Barbarus 86 with the "antirrhinon" or "ametiston" or "pithecion" or "canis cerebrum" or "osireos taphen": *L. vulgaris* is figured in the *Ortus Sanitatis* 23 and 261, and is described by Braunsweig, Tragus i. pl. 117, Fuchsius 585, and Dodoens; is termed "linaria vulgaris lutea flore majore" by Tournefort inst. 170; and is known to occur in waste ground from Denmark throughout middle Europe (fl. Dan. pl. 982, and Pers.); was observed by Sibthorp in the Peloponnesus; by Forskal p. liii, in a single garden in Egypt. By European colonists, was carried before 1670 (Jossel.) to Northeast America; where it has become frequent in waste and cultivated ground, and in Pennsylvania is called *Ransted weed* (Shecutt, and A. Dec.). In London according to Burnett occasionally boiled in milk to destroy flies (Lindl.).

"The same year" (Alst., prior at least to the reign of Claudius, Acts xi. 26 to 28), the disciples first called "Christians" at Antioch. Eusebius places the founding "by Peter" of the Church of Antioch, in the "third" year of Caius, and the "two hundred and fourth" Olympiad.

"40 A. D." (Sueton., Dio, and Clint.), the emperor Caligula at Lugdunum (Lyons in France) on his expedition to the ocean. After his return to Rome, interview with Herod Agrippa interceding in behalf of the Jews.

"In this year" (Burm. hist., and Mason 41), Ramunsalingda succeeded by his younger brother

Bæringda as Burmese king. — Who went to Tekkatho (Taxila on the Upper Indus), where he became skilled in the knowledge of the Vedas. He reigned "twelve" years.

"41, Jan. 24th" (Sueton., Clem. Alex., and Clint.), Caius Caligula succeeded by Claudius, fourth Roman emperor. The hieroglyphic ovals of Claudius occur on temples at Dendera, Esneh, Edfu, and Philæ.

The celebrated *Series of Egyptian coins*, of so much service to history and chronology, begins with the reign of Claudius. — Nearly every year of the next two hundred and fifty-eight is accounted for; on coins inscribed with the year of the reigning emperor, often too in a variety of patterns issued.

"Before the close of the year" (Jos., and Clint.), Samaria and Judæa added to the district governed by Herod Agrippa.

42 A. D. ("in the first year of Claudius, two thousand and fifty seventh ann. Abr., and two hundred and fifth Olymp." of Euseb.), Christianity introduced into Alexandria and Egypt by the evangelist Mark, "Peter's interpreter."

"In the second year of Claudius" (according to Hieronymus sc. ecc.), Peter proceeded to Rome. As Rome and "Babylon" are considered identical by some writers, it may here be remarked: that the "Babylon" of 1 Peter v. 13 is clearly the military station — bearing the name to the present day, and situated not far from Cairo. While in Egypt, I heard of "remarkable Christian relics" discovered in the vicinity, but did not see them.

"43 A. D." (Sueton., Dio, and Clint.), expedition of Claudius into Britain, and conquest of "Vectem" (Isle of Wight); Vespasian being one of the Roman commanders. Claudius was accompanied by his physician, Scribonius Largus (Sm. b. d.).

Cerastium vulgatum of Europe and Northern Asia. Called in Britain *mouse-ear chickweed* (Prior), and the AVRICVLAE·MVRINAE prescribed against calculus by Scribonius Largus 153, — and identified in Syn. Diosc. ii. 214 with the "lavôthôlavath" of the Numidians, may be compared: the "myosoton" is described by Pliny xxvii. 8 as beginning to grow in midwinter and drying up in midsummer: C. vulgare is termed "auricula muris" by Dodoens (C. Bauhin, and Willd.), "myosotis arvensis hirsuta parvo flore" by Tournefort inst. 245; and is known to grow in North Africa and throughout middle and Northern Europe as far as Sweden and Iceland (Vaill. par. pl. 30 f. 3, Curt. lond. ii. pl. 35, Hook., and Wats.). Eastward, the "mûôs ôta" is so named according to Dioscorides from its leaves resembling a mouse's ear, is besides called "alsine" from flourishing in groves and shaded situations; and in the added Synonyms is further identified with the "muôrtôn" or "muôrtô-hôn" or "murtôsplênôn" or "anthulliôn:" C. vulgatum was observed by Sibthorp, and Chaubard, in the Peloponnesus and on mount Parnassus; is known to grow also throughout Siberia (Ledeb., and A. Dec.); and was observed by Kaempfer, and Thunberg, in Japan, frequent and called: "fan ru" or "fagu iera" or "fakobi." By European colonists, was carried to Northeast America, where it continues a weed in waste and cultivated ground and has become naturalized; also to South America (Wats.).

Cerastium viscosum, regarded as distinct, — is termed "alsine glutinosa" by Gesner (C. Bauhin, and Willd.), "myosotis hirsuta altera viscosa" by Tournefort inst. 245; is described also by Dodoens; and is known to grow in North Africa and throughout middle and Northern Europe as far as Lapland and Iceland (Vaill. par. pl. 30 f. 1, Curt. lond. ii. pl. 34, Hook., and Wats.). Eastward, was observed by Sibthorp from Constantinople to the Peloponnesus and Cyprus; is known to occur in Abyssinia (A. Rich., and A. Dec.); and was observed by Thunberg along roadsides in Japan, frequent and also called "fakobi." By European colonists, was carried to Northeast America, where it is known to occur in Greenland and Iceland (Wats.), around trading posts in the Interior (Hook.), and according to A. Gray in "grassy fields and copses" in our middle States "naturalized;" to Austral Africa (Drège and E. Mey.); and to Southwest Australia (Bartl.).

Trifolium squarrosum of the West Mediterranean countries. A species of *clover*: the TRIFOLIUM·ACVTVM or OXYTRIPHYLLON growing mostly on Sicily and seen in Italy by Scribonius Largus only at Luna harbour when on his way to Britain,* two feet high, bearing a general resemblance to "pratense trifolium" but emitting "odorem gravem," — may be compared: T. squarrosum is described by Morison ii. 2; is termed "t. dipsaceum" by Thuillier 302; and is known to grow in France and Spain, the lowest calyx-tooth very long and reflexed (Pers.).

* *Impatiens noli-tangere* of Northern Europe. Called in Britain *touch-me-not* or *balsam* (Prior): the NASTVRTII·ANIMATI·SEMINIS of Scribonius Largus 95 — may be compared; also the "melago" identified by Galfridus pr. pm. with the "balsamus" or "bawme:" the "persicariæ sili-quosæ" whose fruit on the slightest contact leaps apart, is mentioned in 1635 by Cornuti p. 5: I. noli-tangere is described by Linnæus; is termed "i. palustris" by Persoon; and is known to grow in woods and wet places in France and as far as Denmark (fl. Dan. pl. 588, and Lam. fl. fr.).

Prunus (Armeniaca) Sibirica of the mountains of Siberia. The SARKOKOLLAЕ of Scribonius Largus 22, — resembling according to Dioscorides thin frankincense, somewhat fulvous, bitterish, agglutinating wounds and the exudation of a tree growing in Persia, according to Pliny xiii. 20 and xxiv. 78 the product of a tree said by some to be spiny, mentioned also by Galen, and Paulus Aegineta, is admitted to be *sarcocol*; a drug found by Sprengel to agree in all respects with the description by Dioscorides. Among the Arabs, *sarcocol* or “anzarut” is mentioned by Rhazes, by Mesue f. 79 as the product of a spiny shrub with knotty branches, and was observed by Forskal mat. med. employed medicinally in Egypt. A figure of the tree sent by a Persian merchant to Andr. Marini has the leaves ovate-oblong serrate or dentate (Spreng.); and *A. Sibirica* observed by Ammann pl. 20, and Pallas i. pl. 8, on the mountains of Siberia, may be compared. According however to E. A. Sophocles lex., *sarcocol* is the gum of the peach tree.

Lophotaenia aurea of the East Mediterranean countries. Called in Greece “maithanōn tōu vōnōu” (Fraas): the SPONDYLION prescribed by Scribonius Largus ii. 5, — known to Pliny xii. 58 and xxiv. 16 chiefly as a drug, but according to Syn. Diosc. called “*ērvā rōutinalis*” (rotularis Spreng.) by the Romans, may be compared. Eastward, the “*sphōnthuliōn*” is described by Dioscorides as growing in wet ground, having a “*raphanō*”-like root, stems a cubit or more high, leaves between those of “*platanō*” and “*panakōs*,” seed in the umbels “*sēsēlēi*”-like but broader and strong scented, “*ōhra ē lēuka*” milky or yellowish flowers yielding a juice which is collected and preserved; is mentioned also by Asclepiades, and Galen; and is identified in Syn. Diosc. with the “*sphōnthulis*” or “*araggēn*” or “*phalaggiōn*” or “*astēriōn*” or “*nisuris*” or “*hōrōthanōn*” or “*ōinanthē*” of the Greeks, “*ōsirīs*” of the prophets, and “*apsapher*” of the Egyptians: *L. aurea* is described by Hoffmann (Steud., and Chaubard); by Sibthorp pl. 282 as having the radical leaves “*rotundatis*,” and was observed by him, and Fraas, on Parnassus and the mountains of Attica and the Peloponnesus; is known to grow also along the Taurian mountains (Bieb.).

Hyoscyamus aureus of the East Mediterranean countries. Called in Greece “*mēlōhōrtarō*” (Forsk.): the ALTERCVM identified with the YOCKYAMON of the Greeks and its seeds and root prescribed by Scribonius Largus 52 to 181, — “*altercum*” of the Arabs according to Pliny xxv. 17, including among medicinal kinds one with reddish seeds like “*irionis*,” may be compared: *H. aureus* is known to grow in Italy (Lenz), and was observed by Forskal on Malta. Farther East, the kind of “*uōskuumōs*” having according to Dioscorides its flowers “*mēlinōēithē*” yellow, and seeds “*upōxanthōn*” tawny like those of “*ērusimōn*,” is referred here by writers: *H. aureus* is termed “*h. creticus luteus major et minor*” by Tournefort inst. 118; and was observed by Forskal, and Sibthorp, frequent in Greece along walls and among rubbish as far as Tenedos.

Plantago lanceolata of Europe and Northern Asia. Called in Britain *ribwort* or *ribgrass* (Prior), in Italy “*agnoglossō*” or “*lanciola*” or “*piantaccine longa*” (Lenz), in Greece “*pēntanēurōn*” (Sibth.), in which we recognize the “*ribbe*” of the Anglo-Saxon transl. Apul. 98, and the NERVALEM identified with the ΠΟΛΥΝΕΥΡΟΝ by Scribonius Largus 12: — *P. lanceolata* is termed “*plantago minor*” in *Ortus sanitatis* pl. 333. “*p. angustifolia major*” by Tournefort inst. 127; is described also by Brunfels (Spreng. præf.); and is known to grow in Italy and throughout middle and Northern Europe as far as Sweden and Iceland (Pers., Hook., and Wats.). Eastward, the “*pōlunēurōn*” is mentioned in Syn. Diosc. ii. 152, also by Oribasius 11: *P. lanceolata* was observed by Forskal, Sibthorp, and Chaubard, abounding throughout Greece and the Greek islands as far as Smyrna and Constantinople; is known to grow also along the Taurian mountains and in the neighbouring portion of Siberia and as far as Nepal (Bieb., and Wats.). Farther South, was observed by Forskal around Cairo and among the mountains of Yemen; is known to occur also in Abyssinia (A. Rich., and A. Dec.). By European colonists, was carried to Northeast America where it continues a weed in waste ground throughout our Atlantic States (A. Gray, Chapm., and myself), and has become naturalized. The plant according to Lindley “has rather bitter astringent leaves and roots, and has been used with some other species as an expectorant and vulnerary.”

Aspidium aculeatum of Northern climates. The FILICIS-MACEDONICAE prescribed as vermifuge by Scribonius Largus 140, — and distinguished by Pliny xxvii. 55 as “*optimum*” best in quality, may be compared: *A. aculeatum* is termed “*lonchitis aculeata latioribus pinnulis*” by Tournefort inst. 538; and is known to grow throughout middle and Northern Europe (Engl. bot. pl. 1562). Eastward, was observed by Sibthorp around Constantinople and on Athos and other mountains of Greece. Westward from Europe, is known to grow in North America, in “*deep woods*” in Northern New England and New York (A. Gray).

About this time (= 29 + “nearly 15 years,” Burton in Kitt. cycl. bibl.), leaving Antioch on his First missionary tour, Paul sailed from Seleucia to Cyprus in company with Barnabas; and thence to Pamphylia on the Southern coast of Asia Minor. After visiting the neighbouring countries of Pisidia and Lycaonia, they returned by sea to Antioch; where they “*abode long time*” (Acts xiv. 11 to 28).

“41 A. D.” (Sueton., Dio, and Clint.), return of the emperor Claudius from Britain to Rome.

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Les succeeded by Za-Maseuh, now king of Abyssinia. — He reigned "six" years.

"47 A. D." (Tacit., Dio, and Clint.), the Roman general Vespasian in Britain; Corbulo having charge in Gaul and Germany.

"The same year" (= 33 + "14 years" of Galat. ii. 1 to 14, compare Acts xv. 4 and xii. 25), Third visit of Paul to Jerusalem; where "James, Cephas, and John" gave to him "and Barnabas the right hands of fellowship;" to go unto the uncircumcised. After returning to Antioch, and openly rebuking Peter for concealing the fact that "he did eat with the Gentiles," Paul set out on his Second missionary tour; and proceeded with Silas through Cilicia and Asia Minor to Macedonia, Athens, and Corinth; where "he continued a year and six months" (Acts xv. 41 to xviii. 11).

48, in "the days of unleavened bread" (Acts xii. 3), "James the brother of John" put to death, and Peter imprisoned, by Herod Agrippa. Who, before the close of "this year" (Jos., and Clint., compare Acts xii. 23), was succeeded by his nephew Agrippa the younger as governor of Judæa.

49 A. D. = "9th year of Claudius," in a Greek inscription at the Great Oasis — discovered by Hoskins.

This or another Greek inscription of the same date (see Franz) presenting the following form of the letter λ.

"The same year" (= 52 — "3 years" of Acts xx. 31), arrival of Paul in Ephesus, on his Third missionary tour.

Under Claudius, a freedman of Annius Plocamus sailing along the Arabian coast driven by a storm to the island of Taprobane; where the sun rose on the left, and the soil was carefully cultivated — (Plin. vi. 24).

Jambosa Malaccensis of the Moluccas. The *Malay apple* is called in Tamil "jambu-malacca," in Malayan "jambu-king" or "jambu-merah" (J. F. Wats.), in Burmah "tha-byu-tha-byæ" (Mason), in Tagalo "copcop" (Blanco); and the "pomis" found by the freedman abundant on Taprobane — (Plin.) may be compared: "red jambu flowers" and "jambu fruit" are mentioned in Karen dirges (Mason p. 83): *J. Malaccensis* has been long known in Hindustan; was observed by Rheede i. pl. 18 in Malabar; by Graham, "common in gardens" around Bombay; by W. Jones, Roxburgh, and Wight, under cultivation in other parts of Hindustan; by Mason v. 450, "exotic" in Burmah, thriving "luxuriantly at Mergui." Farther East, the "jambos with dark red fruit" is mentioned by Nieuhoff; *J. Malaccensis* was not seen wild on Java by Blume; was observed on Sumatra by Marsden; by myself, under cultivation only throughout the Malayan archipelago; by Blanco, on the Philippines, and termed by him "eugenia montana;" by Rumphius i. 195, spontaneously growing on the Moluccas (A. Dec.); by myself, a large tree cultivated and naturalized on the Feejeean, Samoan, Tahitian, and Hawaiian islands; by Foster, on the Hawaiian, and Marquesas islands. By Arab colonists, was carried to Zanzibar, observed by myself on the Imaum's plantation: by European colonists, was carried to the Mauritius Islands (Boj.). From transported specimens, is described in 1640 by Parkinson. (See Hawaiian Islands.)

"The same year" = beginning of the Twelfth manwantara" among the Hindus — (Graham Munjari tables, and Bentl.).

"Not earlier than the 1st century A. D." (Dallet p. xii.), commencement of Korean history. Korea at this time divided into three States or kingdoms, Kao-li in the North and Northeast, Pet-si in the West, and Sin-la in the Southeast, civil wars and contests between Kao-li and China on the one hand, and between Sin-la and Japan on the other, — continuing more than ten centuries. Sin-la in general maintaining predominance, so that the period in question is sometimes termed the "Dynasty of Sin-la."

"50 A. D. (= 9th year of the war in Britain," Tacit., and Clint.), after the defeat of the "Iceni" (Exeter?), Caractacus leader of the "Silures" (Salisbury?) defeated and taken prisoner by the Roman general Orosius.

Reseda phyteuma of the Mediterranean countries. Called in Greece "ōhēstra" or "ōhrēstra" (Fraas): the "phutēuma" with a long slender superficial root suitable according to some writers for love-charms, — further described by Dioscorides as having leaves like "strōuthiō" but smaller, and numerous perforated fruit, is referred here by Lobel adv. p. 320, and others: *R. phyteuma* was observed by Sibthorp, and Fraas, in mountain-ravines from the Peloponnesus to mount Athos, its leaves cooked and eaten. Westward, the "phyteuma" used for love-charms only, is mentioned by Pliny xxvii. 99; *R. phyteuma* is described by Columna ecphr. i. p. 270; is termed "*r. minor vulgaris*" by Tournefort inst. 423; and is known to grow in Austria and Southern France (Jacq. austr. pl. 132, Pers., and Spreng.).

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Maseuh succeeded by Za-Sutuwa, now king of Abyssinia. — He reigned "nine" years.

"In or about this year" (peripl. Eryth., and Major voy. ind.), Hippalus, commander of a vessel

in the Indian trade, proceeding from the Red Sea boldly out into the ocean discovered the regular course of the prevailing winds, and first made known the *monsoons* to the Greeks.

"In or about this year" (Samuel Aniens.), the apostle Bartholomew put to death at Arebonum in Armenia.

"In or about this year" (Meylan, and Jap. mann. 351), a "Braminical sect" "introduced into Japan, the doctrines of which were, the redemption of the world by the son of a virgin, who died to expiate the sins of men, thus insuring to them a joyful resurrection; and a trinity of immaterial persons, constituting one eternal, omnipresent, omnipotent God, the Creator of all."

"51 A. D." (Sueton. Tacit. xii. 43, and Clint., see also Acts xi. 28), severe and wide-spread famine.

"In the eleventh year of Claudius" (Euseb., appointed "before the twelfth," Jos. a. J. xx. 7. 1, J. R. Beard in Kitt. cycl. bibl.), Felix entering upon his duties as procurator of Judea.

"52 A. D." (Acts xxiv. 10, Sueton., Tacit. xii. 53, and Clint.), Paul pleading before Felix, and from this time held prisoner.

"53 A. D." (Sm. b. d.), marriage of Octavia daughter of Claudius, with Nero son of Claudius' fourth wife Agrippina.

Amanita muscaria of Europe. The "beletus medicatus" with which Claudius was poisoned by Agrippina — (Plin. xxii. 46, Mart. i. 21, Juv. v. 147, and Sueton. xlv. 33), is referred here by Fraas, and others: *A. muscaria* is described by Linnæus; and is known to grow in Italy, where it is called "tignoso" or "uovolaccio" or "uovolo rosso" or "uovolo malefico" (Lenz).

"54, Oct. 12th" (Tacit., and Clint.), Claudius succeeded by Nero, fifth Roman emperor. The hieroglyphic ovals of Nero, occur on the temple at Dendera.

Andromachus, physician to Nero and author of a theriac or compound medicine long in repute, the first person on whom the title "archiater" is known to have been conferred (Sm. b. d.).

Galium verum of Europe and the adjoining portion of Asia. Called in Anglo-Saxon "cysgerun," in current English *cheese-remnet* (Prior), in French "caille-lait," in Danish "melklobe" (Spreng.), in Germany "labkraut" (Grieb), in Italy "gallio giallo" or "gallio vero" (Lenz); in which we recognize the ΓΑΛΛΟΥ of an antidote of Andromachus — (Gal. antid. ii. 1), or "galiōn" or "gallériōn" or "galatiōn" named according to Dioscorides from coagulating milk, closely resembling "aparinē" in branch and leaves but erect with numerous slender sweet-scented yellow flowers on its summit: *G. verum* was observed by Sibthorp, Chaubard, and Fraas, from Samos and Aetolia to the Peloponnesus; is known to grow also along the Taurian mountains and in Siberia (Bieb., and Wats.). Westward, is described by Lobel pl. 804; is termed "g. luteum" by Tournefort inst. 115; and is known to grow in Italy and throughout middle and Northern Europe as far as Iceland and nearly to Lapland (Hook., Wahl., and Wats.). By European colonists, was carried to Northeast America, where it has become naturalized in a few localities around Boston.

"The same year" (= 52 + "2 years" of Acts xxiv. 27, see also Jos. a. J. xx. 8. 9), by Nero, Felix removed and Porcius Festus appointed procurator of Judæa. On the arrival of Festus, Paul brought before him and Agrippa the younger; and appealing "unto Caesar," sent to Rome.

55 A. D. (Acts xxvii. and xxviii.), arrival of Paul in Rome, after shipwreck and wintering on the island of Melita.

"56 A. D. = 1st year of the 'kian-wou-tchoung-youan' of Kouang-wou-ti" — (Chinese chron. table).

"In the reign of Kouang-wou-ti" (Topog. cant., and Pauth. 472), the barbarians brought *horses*: *walls* of stone built by Ma-yuan, to prevent the irruption of foreigners from the South and West: the Western nations about this time changed their name: and henceforward, the people of Tien-tchou or India, Thsin or Roman Empire, and other nations, came by sea and held much intercourse with Canton.

57 A. D. (= 55 + "2 whole years" of Paul's residence "in his own hired house" in Rome), end of Luke's record, called the "Acts of the apostles."

An inscription relating to Balbillus, prefect of Egypt under Nero, has been found near the Great Sphinx at Gizeh.

A *demotic papyrus* dated as late as the reign of Nero — is mentioned by De Rougé (monit. univers. Mars 1851).

"58 A. D. = 'young-ping,' 1st year of Hiao-ming-ti" or Ming-ti, of the Han or Seventh dynasty — (Chinese chron. table, and Pauth.).

"The same year" (Sen. ep. 91, and Clint.), conflagration at "Lugdunensis colonia" (Lyons), in the "one hundredth year" after its foundation. L. Seneca speaks of the rhetor Liberalis as saddened by the news.

The BLATTARIA·BALNEA mentioned by Seneca, — are clearly baths infested with the small cockroach, *Blatta Germanica*. By European colonists, the insect was unintentionally carried to Northeast America, where it has become frequent in damp places in dwellings.

"59, April 30th," in the consulship of "Vipsanius and Fonteius" (Plin. ii. 70, and Clint.), *eclipse of the sun*. Observed also in Armenia by the Roman general Corbulo. Before the close of the year, Agrippina, mother of Nero, put to death.

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Sutuwa succeeded by Za-Adgaba, now king of Abyssinia. — He reigned "ten y. six months."

As early probably as this year, Apollonius of Tyana, after "twenty months" in Persia, entering Hindustan. — He remained "four months" beyond the Indus, and returning by water — up the Persian Gulf and the river Euphrates as far as Babylon, reached Athens in the "following year" (Philostr., and Clint.). He afterwards visited Rome, Spain, and the cataracts of the Nile; everywhere accompanied by Damis, an Assyrian whose narrative is followed by Philostratus.

THE TANTAΛION: ΤΑΥΡ in which Apollonius was initiated by Brahmans, — and the water in a cave containing the statue of a human being male on one side and female on the other (described to Bardesanes by Indian envoys on their way to Antoninus) are identified by Porphyrius de styx. I remarked such a statue on the sculptured walls of the *Elephanta cave-temple*, which contains a shallow artificial basin of water, and was informed, that Guzerati bramins continue to make pilgrimages, arriving in "April and May."

Garcinia purpurea of Western Hindustan. A very elegant Calophylloid tree called in the environs of Bombay "kokum" (Graham); and from early times, its fruit eaten and oil obtained from the seeds: the tree seen by Apollonius in India bearing fruit like a large pomegranate, the apple within the husk of the colour of a fine hyacinth and the very best flavoured fruit they ever ate — (Priault in roy. asiat. soc. xvii), may be compared: *G. purpurea* is described by Rumphius iii. pl. 32: was observed by Graham in "ravines at Kandalla" and "pretty common in some parts of the Concan," also "in gardens Bombay," the acid juice of the fruit used by workers in iron as a mordant; was observed by Roxburgh, and Wight, in other parts of Hindustan, and is called "brindao" by the Portuguese at Goa, where *kokum oil* is used for adulterating ghee or butter (Graham, and Drur.).

"60 A. D." (L. Sen. nat. qu. vii. 21, Tacit., and Clint. iv. p. 45) a *comet*. Continuing in sight "six months," and differing according to L. Seneca from any seen by him during forty-six years, and from the one recorded to have made its appearance after the death of Caesar.

"61 A. D." (Sm. b. d.), at Rome, C. Petronius Turpilianus and C. Caesonius Paetus consuls. "T. Petronius consularis" — who in "A. D. 66" anticipating sentence of death broke a costly *mur-rhine vase* in order to disappoint Nero (Plin. xxxvii. 7) is termed "C. Petronius" by Tacitus xvi. 18; and the *satirical poem* attributed to him — is mentioned as the work of "Petronius" or "Arbiter" by Terentianus Maurus, and Sidonius Apollinaris xxiii. 155.

Tulipa Clusiana of the East Mediterranean countries. The SATYRION of Petronius, furnishing a potion, — and according to Dioscorides termed "triphullōn" from usually having three leaves upon the ground, its stem "psilōn" slender, a cubit high, flower "krinōēidēs" lily-like and white, root bulbous as a "mēlōn," agreeable to the taste, and infused in wine, is referred here conjecturally by Sprengel: the account of the "graeci satyrion" by Pliny xxvi. 63 seems in part taken from Dioscorides: T. Clusiana is termed "t. persica praecox" by Clusius posth. 18, "t. praecox angustifolia" by Tournefort inst. 375; was observed by Sibthorp in Italy, near Florence, flowering in March; but has not been found in Greece.

Satyrium hircinum of Western Europe. Called in Italy "satirio" or "satirione" (Targ.), and probably the "satyrion" of Petronius: — S. hircinum is known to grow in calcareous soil in France and Austria (Jacq. austr. pl. 337, and Pers.); was observed by Haller pl. 25 in Switzerland; by Scopoli, in Carniolia.

"The same year" (Tacit., Blair, and Clint.), the Romans defeated in Britain by queen Boudicea. Shortly afterwards, her army defeated in turn by the Romans under Suetonius Paulinus.

"62 A. D." (W. W. in Kitt. cycl. bibl.), "James the Lord's brother," after holding for "thirty years" (Hieronym.) the chief direction among the apostles, and therefore called "first bishop of Jerusalem," put to death by the Jews (Jos. a. J. xx. 9. 1).

"In this year" (Burm. hist., and Mason 41), Thaka succeeded by his son Thathee, now Burmese king. He had no regard for Budhism.

"62 to 63 A. D. = 8th year of Nero" (Euseb. h. c. ii. 24, Hieronym., and Clint.), Annianus or Annianah left by Mark to watch over the Christians in Egypt: in other words, ordained first bishop of Alexandria. — His successors in the office are enumerated in an uninterrupted series by Eusebius.

Clematis flammula of the Mediterranean countries. A vine called in Greece "alōgaki glukugē" or "hēlithrōnia" (Sibth.), in Egyptian "phulakōuōn" (Syn. Diosc.); and the ΕΤΕΡΑ: ΚΛΗΜΑΤΙC of Dioscorides iv. 7 (the description as repeated in iv. 179 — belonging to a different plant, according to Galen simpl. fac. vii. p. 31), may be compared: C. flammula was observed by Sibthorp, and Chaudard, in the Peloponnesus. Westward, the "ētēra klēmatis" or "ēpigētis" is identified in Syn. Diosc. with the "amvōuxōu" of the Romans: C. flammula is described by Matthaeus Platearius f.

236, Crescenzo, Matthioli 680 (Spreng.), and Dodoens pempt. pl. 404; is termed "c. sive flammula repens" by Tournefort inst. 293; was observed by Tenore pl. 48 near Naples, by Forskal near Mar-seilles; and is known to grow in hedges and thickets in Barbary and as far as Switzerland (Scop., All., Pers., Steud., and Lindl.). Is enumerated among medicinal plants by Lindley, the "leaves used as vesicatories." (See *C. vitalba*.)

Ranunculus parviflorus of the Mediterranean countries? The ΒΑΤΡΑΧΙΟΝ: ΤΡΙΤΟΝ of Dioscorides, diminutive and strong-scented with golden flowers, — may be compared: *R. parviflorus* was observed by Sibthorp, and Chaubard, in the cultivated ground of the Peloponnesus. Westward, the account of the "ranunculum tertium" by Pliny xxv. 109 seems taken from Dioscorides: but *R. parviflorus* is termed "r. arvensis annuus hirsutus flore omnium minimo luteo" by Tournefort inst. 290, is known to occur in various parts of Southern Europe, and as far even as Britain (Pers., Engl. bot. pl. 120, and Dec.). By European colonists, was carried to Northeast America, where it continues in "waste places" from Norfolk in Virginia to Georgia (Ell., Hook., A. Gray, and Chapm.).

Ranunculus lanuginosus of Europe and the adjoining portion of Asia. Called in Greece "spōur-thōkōkula" (Sibth.) or "spōurthakula" or "sphōurthakla" (Fraas): and the ΒΑΤΡΑΧΙΟΝ: ΕΤΕΡΟΝ also called ΚΕΛΙΝΟΝ. ΑΓΓΙΟΝ described by Dioscorides as taller and more woolly, with leaves more divided, and growing mostly on Sardinia — may be compared: *R. lanuginosus* was observed by Sibthorp, Chaubard, and Fraas, in wet springy soil from the Peloponnesus to Northern Greece. Westward, is termed "r. montanus lanuginosus foliis ranunculi pratensis repentis" by Tournefort inst. 291; was observed by Moris i. p. 3 abounding on Sardinia (Spreng.), by Tenore neap. pl. 147 in Italy; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 397, Thuill., and Pers.).

Aconitum lycoctonum of middle and Northern Europe. Called in Britain *wolfsbane* (Prior), in which we recognize the ΛΥΚΟΚΤΟΝΟΝ identified by Dioscorides with the ΚΥΝΟΚΤΟΝΟΝ or ΑΚΟΝΙΤΟΝ ΕΤΕΡΟΝ a cubit high, with platanus-like leaves but more divided and much smaller, growing mostly on the mountains of Italy, and the root placed in meat to destroy wolves: — in the added Synonyms, one of three kinds of "akōnitōn" is mentioned as employed in hunting, and the "akōnitōn ētērōn" or "kuamōn lēukōn" is identified with the "kōlōmēstrōm" of the Romans: *A. lycoctonum* is described by Gerarde p. 822, and Clusius hist. ii. pl. 94; and is known to grow in mountainous situations in Italy, Hungary, and throughout middle Europe as far as Sweden and Lapland (Jacq. austr. pl. 380, Pers., Lindl.). The roots according to Lindley "have been used to destroy wild beasts; this is, however, reputed less venomous than many other species."

Thalictrum flavum of Europe and the adjoining portion of Asia. Called in Britain *meadow-rue* or *fen-rue*, or by old writers "pigamon" or "peganon" (Prior), in Greece "mōulpia" (Fraas), in Italy "talittro" (Targ.); and the ΘΑΛΙΚΤΡΟΝ growing according to Dioscorides chiefly in the open country, its stem as stout as that of ΠΗΓΑΝΙΟΝ, and on it coriander-like leaves, — is referred here by Fraas: the "thaliēktrōn" is mentioned by Galen, and the "thaliētrōn" by Paulus Aegineta (Spreng): *T. flavum* was observed by Sibthorp, and Fraas, from the Peloponnesus to Constantinople. Westward, the "thalitruum" is described by Pliny xxvii. 113 as growing everywhere and having the stem "papaveris," but the remainder of his account seems chiefly taken from Dioscorides; *T. flavum* is termed "th. majus siliqua angulosa aut striata" by Tournefort inst. 270; and is known to grow in Italy and throughout middle and Northern Europe as far as Lapland (Linn. fl. lap., fl. Dan. pl. 939, Pers., and Lenz).

Thalictrum minus of Europe and Northern Asia. Possibly included in the account of Dioscorides, — observed by Sibthorp in the Peloponnesus, but according to Fraas is confined in Greece to subalpine summits. Westward, is described by Tournefort inst. 271; is known to grow in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 732, Spreng., A. Dec., and Lenz).

Delphinium tenuissimum of the East Mediterranean countries. The ΔΕΛΦΙΝΙΟΝ: ΕΤΕΡΟΝ of Dioscorides, resembling the first kind but with much more slender leaves and branches, and less potent medicinal effects, — is referred here by Sprengel, and Fraas: *D. tenuissimum* is described by Sibthorp pl. 505; and was observed by him, and Fraas, on the mountains of Attica and Southern Greece.

Leontice chrysogonum of the East Mediterranean countries. The ΧΡΥΣΟΓΟΝΟΝ having according to Dioscorides oak-like leaves, its flower like coronary ΦΛΟΜΩ, and its black ΓΟΓΓΥΛΗ-like root red within and employed against bites of ΜΥΓΑΛΗ the shrew-mouse, — is referred here by writers: *L. chrysogonum* is termed "leontopetalon foliis costæ simplicis innascentibus" by Tournefort cor. 49; was observed by Sibthorp near Abydos on the Hellespont; and by Rauwolf 119, in Syria. Westward, the "hrusōgōnōn" or "hrusōspērmōn" or "thaspin" or "ōrganōn" or "arkōphthal-mōn" is identified in the Syn. Diosc. with the "arilaria" of the Romans: *L. chrysogonum* is described by Morison iii. pl. 15; and was received by Barrelier pl. 1113 from Corvinus in Italy.

Hypecoum procumbens of the Mediterranean countries. Called in German "lappenblume"

(Grieb): the $\Upsilon\text{Π}\text{Η}\text{Κ}\text{Ο}\text{Ο}\text{Ν}$ or $\Upsilon\text{Π}\text{Ο}\Phi\epsilon\text{Ι}\omega\text{Ν}$ growing according to Dioscorides in cultivated ground, its leaves $\text{Π}\text{Η}\text{Γ}\text{Α}\text{Ν}\omega$ -like, and medicinal properties those of poppy-juice, — is referred here by writers: *H. procumbens* was observed by Sibthorp, and Chaubard, in sand along the seashore of the Peloponnesus and Greek islands. Farther South, the “afikoon” is mentioned by Edrisi, and Ebn Baitar; but “*H. patens*” observed by Forskal p. 122, and Delile, on the Mediterranean border of Egypt, is given as a distinct species. Westward, the account of the “hypecoon” by Pliny xxvii. 68, seems taken from Dioscorides; *H. procumbens* is described by Dodoens p. 449, and Lobel adv. p. 330; is termed “*h. latiore folio*” by Tournefort inst. 230; was observed by myself on Malta; and is known to occur in cultivated ground as far as France (Lam. fl. fr., and Pers.).

Corydalis claviculata of Europe and the adjoining portion of Asia. Called in Greece “*hiōnistra*” from growing on high mountains near melting snow (Fraas): the $\text{Ι}\text{C}\text{Ο}\text{Π}\text{Υ}\text{Π}\text{Ο}\text{Ν}$ called according to Dioscorides $\Phi\text{Α}\text{C}\text{Ι}\text{Ο}\Lambda\text{Ο}\text{Ν}$ from its leaves in like manner terminating in a tendril, its numerous small seeds tasting like those of $\text{Μ}\epsilon\lambda\lambda\alpha\text{Ν}\theta\iota\omega$, — is referred here by Sprengel, and Lindley: *C. claviculata* was observed by Sibthorp, Chaubard, and Fraas, in the Peloponnesus: and farther South, the “*aschkun*” of Ebn Baitar is referred here by Sontheimer. Westward, the account of the “*isopyron*” by Pliny xxvii. 70 seems taken from Dioscorides; *C. claviculata* is termed “*f. claviculis donata foliis latoribus*” by Tournefort inst. 422; and is known to grow in moist stony places throughout middle Europe as far as Denmark (fl. Dan. pl. 340, and Pers.).

Capparis? oblongifolia of Nubia and Yemen. Called in Yemen “*asal*” or “*redif*” (Forsk.); and the acrid $\text{Κ}\text{Α}\text{Π}\text{Π}\text{Α}\text{ΡΙ}\text{C}$ raising pustules in the mouth and ulcerating the gums, brought according to Dioscorides from Libya and the Red Sea, — is referred here conjecturally by Sprengel: *C. oblongifolia* was observed by Forskal p. 99 and xcvi in Yemen, and is enumerated among “*fastiditæ et nocivæ*” noxious plants.

Epimedium alpinum of middle Europe. Called in Britain *barren-wort* (Gerarde p. 389, and Prior), in Italy “*epimedio*” (Targ.), in which we recognize the $\epsilon\text{Π}\text{Ι}\text{Μ}\text{Η}\Delta\text{Ι}\text{Ο}\text{Ν}$ of Dioscorides, — and Pliny xxvii. 53: *E. alpinum* is figured in manuscript v of the Anglo-Saxon transl. Diosc. 163 (Harley and Cockayne); is described by Anguillara p. 253, Matthioli, Lobel (Spreng.); is termed “*epimedium*” by Tournefort; and is known to grow wild in shaded situations in Switzerland (Batsch, and Pers.). Eastward, was observed by Sibthorp in woods in the environs of Constantinople.

Lepidium draba of the East Mediterranean countries. Called in Greece “*vrōmōlahanōn*” or “*marōulaki*”: the $\Delta\text{Ρ}\text{Α}\text{Β}\text{Η}$ described by Dioscorides as herbaceous, a cubit high, with leaves $\Lambda\epsilon\text{Π}\text{Ι}\Delta\text{Ι}\text{ΟΥ}$ -like but softer and whiter, and a terminal elder-like corymb of white flowers, the plant cooked and eaten especially in Cappadocia, and the seed substituted for pepper in seasoning, — is referred here by writers: the “*marōulla*” is prescribed as esculent by Alexander Trallianus verm. 4, and the “*marōullōspōrōn*” is mentioned by Maximus Planudæ: *L. draba* was observed by Sibthorp, Chaubard, and Fraas, frequent in cultivated ground and along waysides from the Peloponnesus throughout Greece; is known to occur also in Roumelia and as far as Caucasus (Griseb., Bieb., and A. Dec.). Farther South, the “*hurf moscharki*” of Ebn Baitar is referred here by Sontheimer; and *L. draba* was observed by Delile along the Mediterranean border of Egypt. Westward, is termed “*L. humile incanum arvense*” by Tournefort inst. 216; is known to occur in situations more or less wild in Italy and Sardinia (Bertol., and Moris), and as a weed in cultivated ground in Spain and middle Europe as far as Britain (Boissier, Pers., and Engl. bot. 2683).

Biscutella lævigata of the Mediterranean countries. The $\Lambda\lambda\Upsilon\text{C}\text{C}\text{Ο}\text{Ν}$ growing according to Dioscorides in rough mountainous situations, single-stemmed and roughish with round leaves and fruit like a double shield, the seed within flattish, and the plant employed among other medicinal purposes against canine madness, — in the added Synonyms identified with the “*aspithiōn*” or “*aplō-phullōn*” or “*akkusētōn*” or “*athēsētōn*,” may be compared: *B. lævigata* was observed by Sibthorp on Crete; and farther South, the “*aalussun*” of Dioscorides, Galen, and Gafeki, is mentioned by Ebn Baitar. Westward, *B. lævigata* is termed “*leucoium alyssoides umbellatum montanum*” by Columna ecphr. pl. 285; and is known to grow in Italy, Portugal, and as far as Germany and France (Scop., Brot., and Pers.).

Biscutella apula of the Mediterranean countries. Possibly included with the preceding by Dioscorides: — observed by Sibthorp, and Chaubard, from the Peloponnesus to Rhodes; and farther South, received by Jussieu from Egypt (Del.). Westward, is described by Columna ecphr. pl. 234; is termed “*thlaspidium apulum spicatum*” by Tournefort inst. 215; and is known to grow in Italy (Pers.).

Bunias erucago of the Mediterranean countries. Called in Greece “*agriā gōulia*” (Fraas), in which we recognize the $\Lambda\Gamma\text{Ρ}\text{ΙΑ}\text{:}\Gamma\text{Ο}\Gamma\Upsilon\Lambda\text{Η}$ described by Dioscorides as growing in cultivated ground, a cubit high, having smooth leaves, an involucred pod with an additional inner pod, and mixed in preparations for cleansing the skin: — *B. erucago* was observed by Sibthorp, Chaubard, and Fraas, in Southern Greece, frequent in cultivated ground. Westward, is termed “*erucago segetum*” by

Tournefort inst. 232; and is known to grow in Austria and Southern France (Jacq. austr. pl. 340, and Pers.).

Aubrieta deltoidea of the East Mediterranean countries. The $\text{CHCAMOEI}\Delta\text{EC}:\text{TO}:\text{MIK}\text{PON}$ described by Dioscorides as growing in rough situations, the stems a span high, with $\text{KOPWNO}\text{ΠO}\Delta\text{I}$ -like leaves, purplish flowers white in the centre, in which the seed is $\text{CHCAM}\omega$ -like bitter and yellow, — identified in the Syn. Diosc. with the “*kōrōniōn*” or “*sēsāmōn agriōn*,” is referred here by Fraas: *A. deltoidea* is termed “*alyssum creticum foliis angulatis flore violaceo*” by Tournefort cor. 15; and was observed by Sibthorp, Bory, and Fraas, frequent on the mountains of Crete and Southern Greece.

Sinapis erucoides of the West Mediterranean countries. The $\text{APPION}:\text{EYZ}\omega\text{MON}$ described by Dioscorides ii. 169 and 187 as having leaves like $\text{E}\text{PYC}\text{I}\text{MON}$ and growing mostly in Spain, where the seeds are used for mustard, — or the “*eruca agrestis acrioris virtutis*” of Isidorus xvii. 10. 21, may be compared: *S. erucoides* is described by Barrelier pl. 132, is termed “*sisymbrium erucoides*” by Desfontaines (Steud.), and is known to grow in vineyards and along roadsides in Italy and Spain (Pers.; see *Brassica eruca*).

Hypericum quadrangulare of Europe and the adjoining portion of Asia. Called in modern English floras *St. Peter's wort*, from “flowering on his day, the 29th June” (Ainsw., and Prior): the ACKYPON according to Dioscorides a kind of $\text{Y}\text{ΠE}\text{P}\text{I}\text{KOY}$ with slender reddish leaves and yellow flowers, from its fruit of a resinous odour staining the fingers called $\text{AN}\Delta\text{POCA}\text{I}\text{MON}$, — seems referred here by Tournefort: *H. quadrangulare* was observed by Forskal, and Sibthorp, frequent in the environs of Constantinople. Westward, the account of the “*ascyron*” by Pliny xxvii. 20 seems chiefly taken from Dioscorides: *H. quadrangulare* is termed “*h. ascyron dictum caule quadrangulo*” by Tournefort inst. 255; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 640, and Pers.).

Althaea cannabina of the Mediterranean countries. Called in Italy “*canape selvatico*” or “*canape selvatica*” (Lenz), in which we recognize the $\text{KANNA}\text{BIC}:\text{A}\text{PPIA}$ of Dioscorides, a cubit high with reddish flowers like $\text{A}\text{YX}\text{N}\text{I}\Delta\text{I}$, seed and root as in $\text{A}\text{A}\text{ΘA}\text{IA}$, and its bark twisted into cordage: — *A. cannabina* was observed by Forskal, Sibthorp, and Fraas, along hedges in Greece as far as Constantinople. Farther South, the “*kunnab elbarri*” of Ebn Baitar is referred here by Sontheimer; and *A. cannabina* was observed by Forskal not far from Cairo growing in the Desert. Westward, the “*kannavis agria*” or “*uthrastina*” is identified in the Syn. Diosc. with the “*terminalis*” of the Romans: *A. cannabina* is described by C. Bauhin pin. p. 316 (Spreng.); is termed “*alcea cannabina*” by Tournefort inst. 98; and is known to grow in Hungary, Italy, and Southern France (Jacq. austr. pl. 101, and Pers.).

Malva alcea of the Mediterranean countries. The $\text{A}\text{A}\text{KEA}$ of Dioscorides, a kind of wild mallow having leaves incised after the manner of $\text{I}\text{EPAC}:\text{BOTANHC}$, stems with hemp-like bark, a small rose-like flower, and five or six roots nearly a cubit long, — mentioned also by Paulus Aegineta, is referred here by Brunfels i. f. 197, and others (Spreng): *M. alcea* was observed by Gittard in the Peloponnesus (Chaub.); and is enumerated by Clot-Bey and Figari as long known in Egypt. Westward, the account of the “*alcea*” by Pliny xxvii. 6 seems taken from Dioscorides; but *M. alcea* was observed by Tenore in Italy (Bory), and is known to grow in France and Germany (Lam. ill. pl. 582, and Pers.).

Stellaria holostea of Europe and the adjoining portion of Asia. Called in Britain *stitchwort* or *all-bone* (Prior), in Northumberland *dead-man's bones* (G. Johnst.); and the $\text{O}\text{A}\text{OCTEON}$ of Dioscorides — is referred here by Ainsworth, and others: *S. holostea* was observed by Sibthorp around Constantinople and in wooded portions on the Hæmus mountains. Westward, the “*holosteum*” according to Pliny xxvii. 65 has narrow leaves and is devoid of hardness, having been named on the principle of opposite qualities: *S. holostea* is figured in manuscript v as the “*beowyr*” of the Anglo-Saxon translation of Diosc. 154 (Harley and Cockayne): “*stich-wurt*” occurs in a manuscript of the thirteenth century as a translation of “*valeriane*,” a plant curing the sting of venomous reptiles (Mayer and Wright p. 140, and Prior): *S. holostea* is described by Gerarde; is termed “*alsine pratensis gramineo folio ampliore*” by Tournefort inst. 243; and is known to grow in shaded situations throughout middle Europe as far as Denmark (fl. Dan. pl. 698, Curt. lond. ii. pl. 30, and Pers.).

Polycarpum tetraphyllum of the Mediterranean countries. The ΠAPWNYXIA growing according to Dioscorides in stony places and resembling $\text{ΠE}\text{Π}\text{A}\omega$ but shorter, — is referred here by Anguillara and others: *P. tetraphyllum* was observed by Forskal, Sibthorp, and Chaubard, frequent along roadsides from the Peloponnesus to Constantinople and the Greek Islands; by Delile, at Alexandria on the Mediterranean border of Egypt. Westward, the “*parōnuhia*” or “*athōkētōs*” or “*nēuras*” or “*phruniōn*” is identified in the Syn. Diosc. with the “*vōuinālis*” of the Romans: *P. tetraphyllum* is described by Anguillara p. 264, and Matthioli p. 734 (Spreng.); is termed “*herniaria*

alsines folio" by Tournefort inst. 507; and is known to grow in vineyards and cultivated ground in Istria, Italy, Southern France, and Spain (Barrel. pl. 524, and Pers.). By European colonists, was carried to Northeast America, where it has become frequent in the outskirts of Charleston (Chapm.).

Polygala vulgaris of Europe and the adjoining portion of Asia. Called in Britain *milkwort*, or from flowering in time for garlands in certain religious processions, *gang-flower* or *procession-flower* or *vogation-flower* or *cross-flower*, in Anglo-Saxon "gang-dagas" (Prior), in Germany "kreuzblume" (Grieb), in which we recognize the ΠΟΛΥΓΑΛΟΝ, a span high according to Dioscorides and somewhat austere in taste, with lentil-like leaves, and drinking it believed to induce abundant milk: — *P. vulgaris* was observed by Sibthorp from the Peloponnesus to Constantinople. Westward, the account of the "polygala" by Pliny xxvii. 96 seems taken from Dioscorides: *P. vulgaris* is described by Gerard p. 450, and Tournefort inst. 174; was observed by Lenz in North Italy, by Forskal near Marseilles, and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 516, and Pers.). *P. amara*, smaller in all its parts but by some writers regarded as not distinct, is described by Tragus f. 216 (Spreng.), is known to grow from Denmark throughout middle Europe (fl. Dan. pl. 1169, and Pers.) as far as the mountains of Servia (Fraas), but has not been observed in Greece.

Polygala venulosa of the East Mediterranean countries. Bitter in taste with leaves elliptic-lanceolate, and therefore agreeing better with the account of Dioscorides—according to Fraas: described by Sibthorp pl. 669; and observed by him, and Fraas, from the Peloponnesus to Cyprus.

Alhagi pseudalhagi of the East Mediterranean countries and middle Asia. The ΕΤΕΡΑ: ΑΚΑΚΙΑ growing according to Dioscorides in Cappadocia and Pontus, resembling the Egyptian kind but much smaller and more tender, full of rigid spines, its seeds smaller than lentils and in follicles yoked in twos, threes, and fours,—may be compared: *A. pseudalhagi* was observed by Sibthorp, Chaubard, and Fraas p. 58, in maritime sand from Attica and Syra to Samos; is known to grow also in Tartary (Lerche, Bieb., and Fischer).

Poterium sanguisorba of the Mediterranean countries and middle Europe. Called in Britain *burnet* (Prior), in Germany "becherblume" (Grieb), in Italy "pimpinella minore" or "salvastrella" or "sorbastrella" (Lenz): the ΑΛΛΗ: CΙΔΗΡΙΤΙC two cubits high according to Dioscorides with leaves on long stalks and fern-like, and from the upper axils long slender shoots terminating in rough spheroidal heads,—is referred here by Columna ecphr. i. p. 124 (Spreng.), and others: *P. sanguisorba* was observed by Chaubard in the Peloponnesus. Farther South, the "sideritis achar" of Ebn Baitar is referred here by Sontheimer; and *P. sanguisorba* was observed by Delile on the Mediterranean border of Egypt near Alexandria. Westward, the account by Pliny xxv. 19 of the third "sideritin" corresponds, and seems taken from Dioscorides; *P. sanguisorba* is termed "pimpinella sanguisorba minor hirsuta vel lævis" by Tournefort inst. 157; was observed by Lenz in Italy; by Forskal, near Marseilles; and is known to grow throughout middle Europe (Curt. lond. ii. pl. 64, and Pers.). By European colonists, was carried prior to 1670 (Jossel.) to Northeast America, but has since disappeared.

Poterium polygamum of Eastern Europe. Called in Greece "poluphulla," and is the "allē sithēritis" of Dioscorides—according to Fraas: *P. polygamum* was observed by him (and perhaps by Sibthorp) frequent in Attica and on Parnassus. Farther North, is described by Waldstein and Kitaibel pl. 128 as observed in Hungary (Pers., and Steud.).

Sedum rhodiola of Subarctic climates. Called in Britain *rosewort* or *rose-root* "from the odour and rosy tint of its rootstock," in medieval Latin "rhodia radix" (Prior); in which we recognize the ΡΟΔΙΑ: ΡΙΖΑ or ΡΟΔΙΑΑ growing according to Dioscorides in Macedonia and yielding when bruised the odour of roses,—and the "herbam rhodiam ex aceto tritam" prescribed by Marcellus 1: *S. rhodiola* is known to grow throughout Siberia as far as Ochotsk and Lat. 60° on the Yenesei (Gmel., and Pall.). Westward, is described by Tragus f. 344 (Spreng.); is known to grow on the mountains of Switzerland, the Pyrenees, and throughout Northern Europe to the extremity of Lapland (Dec., and Sab.). Farther West, is known to grow from Iceland as far as Lat. 65° in Greenland, also in Labrador, Newfoundland (Hook., and Wats.), New Brunswick (A. Gray), and recently found as far as the border of Maine; was observed by E. James on the Rocky mountains (Tor.), by Richardson along the shore of the Arctic Sea, is known to grow also in Alaska (Wats.).

Sedum cepæa of Europe and the adjoining portion of Asia. Called in Greece "krömmuthi" (Fraas): the ΚΗΤΤΑΙΑ resembling ΑΝΔΡΑΧΝΗ according to Dioscorides, its roots slender and with the leaves employed medicinally cooked or taken in wine,—is referred here by writers: *S. cepæa* was observed by Sibthorp, Grisebach, Chaubard, and Fraas, frequent in Greece, in waste ground; by Thirke, along the Northern shore of Asia Minor. Westward, the "cepæa" resembling "portulacæ" is described by Pliny xxvi. 52 as bitter in taste and growing on the sandy shore; *S. cepæa* is described by Matthioli p. 666, and Clusius hist. ii. p. 68 (Spreng.): is termed "s. cepæa dictum" by Tournefort inst. 263; and is known to grow in Italy and throughout middle Europe as

far as the Northern shore of France and Maestricht in Lat. 50° 45' (Allion. pl. 65, fl. Bat. i. p. 91, and A. Dec.).

Cotyledon lutea of Europe and the adjoining portion of Asia. The ΕΤΕΡΟΝ:ΚΟΤΥΛΗΔΟΝΟC also called ΚΥΜΒΑΛΙΟΝ according to Dioscorides, having softer leaves like little tongues, astrigent, a slender stem and on the top ΥΠΕΡΙΚΩ-like flowers and fruit, its root rather large, and medicinal properties as in ΑΕΙΖΩΟΝ, — is referred here by Sprengel: *C. lutea* was observed by Sibthorp on rocks in Greece. Westward, the account by Pliny xxv. 101 of the "aliud" cotyledon seems in great part taken from Dioscorides; *C. lutea* is described by Dodart mem. pl. 73; is termed "c. radice tuberosa longa repente" by Tournefort inst. 90; is known to grow in Southern Europe as far as Portugal, and even in England (Lam., Huds., Engl. bot. pl. 1522, and Pers.).

Saxifraga media of the mountains of Southern Europe. Called in Greece "matia," and the "ἐτήρὸν κῶτὺλῆθῶν" of Dioscorides — is referred here by Fraas: *S. media* was observed by Sibthorp on the summit of the Bithynian Olympus, and by Fraas on the summit of Parnassus. Westward, is known to grow on the Pyrenees (Gouan obs. p. 27, Lapeyr. i. pl. 12, and Pers.).

Myrrhis odorata of Europe and the adjoining portion of Asia. Called in Britain *sweet cicely* (Prior), in France "cerfeuil musqué" (A. Dec.), in Italy "mirride" (Lenz); in which we recognize the ΚΕΚΕΛΙ:ΠΕΛΟΠΤΟΝΝΗCΙΑΚΟΝ of Dioscorides, growing on mount Ida as well as in the Peloponnesus, its leaves ΚΩΝΕΙΩ-like, stem larger than in the ΜΑCΑCΑΛΕΩΤΙΚΟΥ kind, with fragrant and more fleshy fruit, and the same medicinal properties: — *M. odorata* was observed by Sibthorp in shady woods in Asia Minor. Westward, is described by Anguillara, and Dodoens 701 (Spreng.); is termed "myrrhis major vel cicutaria odorata" by Tournefort inst. 315; was observed by Lenz wild in Italy; is known to grow in mountain woods as far as the Scandinavian peninsula (Jacq. austr. app. pl. 37, Pers., and Fries); is cultivated besides and has become naturalized in France and Britain; the taste according to Persoon especially of the fruit which is large "anisatus."

Rubia peregrina of Europe and the adjoining portion of Asia. Called in Greece "agriōrizari" (Sibth.), and possibly included in the ΕΡΥΘΡΟΔΑΝΟΝ: ΑΓΡΙΑ of Dioscorides: — *R. peregrina* was observed by Sibthorp from Constantinople to the border of the Peloponnesus. Westward, is described by Morison ix. pl. 21; is termed "r. sylvestris monspessulana major" by Tournefort inst. 114; and is known to grow in Russia, Central France, and as far even as Britain (Engl. bot. pl. 851, and Pers.).

Gnaphalium arvenarium of Europe and the adjoining portion of Asia. The ΑΓΗΡΑΤΟΝ named from its lasting flower according to Dioscorides, a shrub two span high and much resembling ΟΡΙΓΑΝΩ, simple, with an umbel of flowers full of golden bubbles and smaller than in ΕΛΙΧΡΥCΟΥ, — may be compared: *G. arvenarium* was observed by Sibthorp on the summit of the Bithynian Olympus. Westward, the account of the "ageraton" by Pliny xxvii. 4 seems taken from Dioscorides: *G. arvenarium* is termed "elichrysum seu stoechas citrina latifolia" by Tournefort inst. 453; is known to grow in sandy soil throughout middle Europe as far as Denmark (fl. Dan. pl. 641), and according to Persoon has occasionally crowded flowers "capitulum efformantibus subrotundis aurantiis."

Achillea ptarmica of Europe and Northern Asia. Called in Britain *sneeze-wort* from its powder causing to sneeze, in medieval Latin "sternutamentoria" (Prior), in Italy "sternutella" or "tarmica" (Lenz), and the ΠΤΑΡΜΙΚΗ of Dioscorides, having many small ΑΒΡΟΤΟΝΩ-like branches with elongate olive-like leaves around and a terminal ΑΝΘΕΜΙΔΟC-like capitulum, pungent in odour and exciting sneezing, — is referred here by Fuchsius, Sprengel, and others: *A. ptarmica* has not been observed in Greece; but is known to grow farther East in Siberia (Lindl.). Westward, is described by Tragus f. 61 (Spreng.); is termed "ptarmica vulgaris" by Clusius; and is known to grow in North Italy and from the Pyrenees throughout middle Europe as far as Denmark (fl. Dan. pl. 643, Dec. fl. 4. p. 211, Steud., and Lenz). By European colonists, was carried to Northeast America, and has become naturalized sparingly in New England. According to Lindley, "the whole plant is pungent, provoking a flow of saliva; its dried leaves produce sneezing."

Achillea magna of the Mediterranean countries. The ΑΧΙΛΛΕΙΟC of Dioscorides, with leaflets obliquely incised and white or purple flowers, — is referred here by Fraas: *A. magna* was observed by Sibthorp on Crete; and by Fraas, on continental Greece, for he speaks of finding the flowers sometimes red. Westward, is termed "millefolium maximum umbella alba" by Tournefort inst. 496; and is known to grow in various parts of Southern Europe (Pers., Poir., and Steud.).

Achillea umbellata of the East Mediterranean countries. The CΤΡΑΤΙΩΤΗC: Ο:ΧΙΛΙΟ-ΦΥΛΛΟC of Dioscorides, diminutive, a span or more high, with leaves like the wing of a young bird, and a crowded umbel of small white flowers, — may be compared: the "land stratiōtēs" is also mentioned by Galen simpl. 7 and 8: *A. umbellata* is termed "ptarmica humilis foliis laciniatis absinthii æmulis" by Tournefort inst. 496; and was observed by Sibthorp on the mountains of Greece "foliis tomentosis pectinato-pinnatifidis."

Artemisia campestris of Europe and middle Asia. The ΑΡΤΕΜΙCΙΑ with ΛΕΠΤΟΤΕΡΑ

leaves, flowering in summer according to Dioscorides, and its flowers small slender white and strong-scented, — is referred here by writers : *A. campestris* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Caria and Mysia in Asia Minor. Westward, is described by Matthioli p. 619 (Spreng.) ; is termed “*abrotanum campestre cauliculis albicantibus, etiam cauliculis rubentibus*” by Tournefort inst. 459 ; was observed by Forskal near Marseilles, and is known to grow in arid sunny situations throughout middle Europe (Engl. bot. pl. 338, Pers., and Lenz). Is enumerated by Lindley among the species that “have been used medicinally.”

Artemisia spicata of the mountains of Southern Europe. The ΑΡΤΕΜΙΣΙΑΝ:ΜΟΝΟΚΛΩΝ growing in the Interior according to Dioscorides, a small simple-stemmed herb full of wax-coloured flowers, more agreeably scented than the preceding, — is referred here by Sprengel : *A. spicata* was observed by Sibthorp on the mountains of Greece. Westward, the account by Pliny xxv. 36 of his third “*artemisia*” as far as growing “in mediterraneis” and “*simplici caule*,” seems taken from Dioscorides : but *A. spicata* is described by Jacquin austr. app. pl. 34, and is known to grow on the mountains of Switzerland and middle Europe (Allion. pl. 8, Vill., Pers., Whlbg., and Steud.). Is enumerated by Lindley among the species that “have been used medicinally.”

Stachelina chamaepeuce of the East Mediterranean countries. Called in Greece “*agriōlivanōs*” (Fraas) : the ΧΑΜΑΙΠΤΕΥΚΗ an herb entirely green according to Dioscorides, its leaves and branches incurved and flowers rose-like, — is referred here by Alpinus exot. p. 76, and others : Pliny xxiv. 86 describes the “*chamaepeuce*” as resembling in leaves “*larici*” larch ; and *S. chamaepeuce*, agreeing except in the lanate under surface of the leaves, is termed “*jacea cretica frutescens elichrysi folio flore magno purpurascens*” by Tournefort cor. 32 ; was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus to mount Athos, Crete, and Cyprus : is known to grow also in Asia Minor (Spreng.) ; and farther South, was observed by Viviani in Lybia.

Cirsium stellatum of the Mediterranean countries. The ΙΠΠΟΦΑΙΣΤΟΝ of Dioscorides, also by some called ΙΠΠΟΦΑΕΣ, a sort of ΓΝΑΦΙΚΗC:ΑΚΑΝΘΗC, stemless and flowerless with spiny leaves and tumid capitula together with the thick tender root yielding a juice, — is referred here by Columna phyt. pl. 24. and Sprengel : *C. stellatum*, depressed unless flowering, and often continuing throughout the year without flowering (Spreng.), was observed by Chaubard, in the Peloponnesus. Westward, the account by Pliny xvi. 92 and xxvii. 66 of the “*spina fullonia hippophaeston*” seems taken from Dioscorides, but he adds that the juice is expressed in summer : *C. stellatum* is described by Triumfetti pl. 96 ; is termed “*c. stellatus foliis integris flore purpureo*” by Tournefort inst. 440 ; was observed by Sibthorp on Sicily, and is known to grow as far as the border of France (Allion., and Pers.).

Silybum Marianum of the Mediterranean countries. Called in Britain *mil'k thistle* or *blessed thistle* or *lady's thistle* (Prior), in France “*chardon-marie*” (Fée), in Germany “*marien-distel*” (Fraas), in Bohemian “*ostropés*,” in Polish “*podgorzal*,” in Illyrian “*osset*” or “*osgebad*” (Moritz.), in Greece “*gaithōuragkatha*” (Fraas) or “*kōuphagkathō*” (Sibth.) : its seeds found by Forskal mat. med. employed medicinally in Egypt, in accordance with the ΑΚΑΝΘΑ:ΛΕΥΚΗ of Dioscorides, two cubits high with the stem thick as the fore-finger, leaves prickly, flowers purple, seeds and root used medicinally : — the “*akub*” of Temimi, and Ebn Baitar, is referred here by Sontheimer : *S. Marianum* was observed by Forskal, and Delile, springing up spontaneously around Cairo ; by Belon, Sibthorp, and Fraas, frequent from the Peloponnesus to Cyprus and Constantinople ; is known to occur also as far as Caucasus (C. A. Mey.). Westward, the “*akantha lēukē*” or “*agriōkinaran*” or “*thōnakitis*” or “*ērusiskēptrōn*” is identified in Syn. Diosc. with the “*karthōus ramptaria*” or “*spina alva*” or “*rēgia*” of the Romans ; a garland of “*spinae albae*” according to Pliny xxiv. 66 alleviates headache, but his account of the seeds taken against scorpions seems in part from Dioscorides : the “*herbe sancte marie*” is mentioned by Nicolaus Praepositus, Franciscus Pedemontium, and Joannes de Sancto Amando : *S. Marianum* is described by Fuchsius p. 55. Dodoens, and Lobel (Spreng.) ; was already in Britain in the days of Gerarde p. 989 ; is termed “*c. albis maculis notatus vulgaris*” by Tournefort inst. 440 ; was observed by Munby in Algeria ; is known to occur in waste places from Italy throughout middle Europe (Scop., and Pers.), is besides often cultivated (A. Dec.). By European colonists, was carried to Madeira (Lindl.) ; to Northeast America, where I have observed it springing up spontaneously in gardens ; to Austral America, where it has become naturalized from the Uruguay and La Plata to Patagonia (A. Saint-Hil.) ; to Chili, and the East Indies, the “leaves said to be sudorific and aperient” (Lindl.).

Onopordum Græcum of the East Mediterranean countries. The ΑΚΑΝΘΙΟΝ of Dioscorides, having leaves like ΛΕΥΚΗ. ΑΚΑΝΘΗ but at the extremity the spinous prominences covered with spider-web down which is collected, — may be compared : Pliny xxiv. 66 adds, that the leaves are much smaller, and that the collected down is even made into garments in the East : *O. Græcum* is termed “*carduus græcus parvus acanthi folio tomentoso flore minore*” by, Tournefort cor. 31 : is described also by Gouan obs. pl. 25 ; was observed by Sibthorp, and Chaubard, from the Peloponnesus to Cyprus ; and by Delile near Alexandria on the Mediterranean border of Egypt.

Sonchus arvensis of Europe and Northern Asia. Called in Greece "sôhōs" or "sôhōus" (Fraas), and the ΕΤΕΡΟΣ : COΓΧΟΣ described by Dioscorides as tender and ΔΕΝΔΡΩΔΕΣ with broad or wide-spread leaves and an unbranching stem,—is referred here by Fraas, and with a mark of doubt by Sibthorp ii. p. 361: *S. arvensis* was observed by Sibthorp in waste ground from Constantinople to Greece. Westward, according to Tournefort inst. 474 is by many called "hieracium majus;" is known to occur in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 606, Curt. lond. iv. pl. 53, Scop., and Pers.). By European colonists, was carried to Northeast America, where it has been observed by myself in grass-grown clearings from the Lower St. Lawrence to Salem, and is known to occur as far as Staten Island and the neighbouring portion of New Jersey (A. Gray).

Sonchus palustris of Europe and Northern Asia. The "ētērōs sôghōs" of Dioscorides—is however referred here by Sprengel: *S. palustris* was observed by Sibthorp in the marshes of the Peloponnesus. Westward, is termed "s. asper arborescens" by Tournefort inst. 474: and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 1109, Curt. lond. v. pl. 59, and Pers.).

Fasione montana of Europe and the adjoining portion of Asia. Called in Britain *sheep's-bit* or *sheep's-bit-scabious* (Prior); and the ΩΚΙΜΟΕΙΔΕΣ of Dioscorides, having ΩΚΙΜΩ-like leaves, hairy branches, and pods like ΥΟΚΥΑΜΩ,—is referred here by Lobel iii. 90: *J. montana* was observed by Forskal, and Sibthorp, from the Dardanelles to the Bithynian Olympus. Westward, the "ôkimôëithēs" or "prôvataian" or "êlaphiôn" or "antimimôn" or "porphuritha" is identified in Syn. Diosc. with the "ôkimastrôum" of the Romans: *J. montana* is described also by Dodoens (Spreng.); is termed "rapunculus scabiosæ capitulo cæruleo" by Tournefort inst. 113; and is known to grow from Denmark throughout France to the Pyrenees (fl. Dan. pl. 319, Lapeyr., and Pers.).

Campanula medium of the East Mediterranean countries. Called in Italy "medion" (Riccio, and Targ.), and the ΜΗΔΙΟΝ of Dioscorides,—and Pliny xxvii. 79, is referred here by Matthioli and others: *C. medium* is described by Dodoens pempt. 163; is termed "c. hortensis folio et flore oblongo cæruleo" by Tournefort inst. 109; is known to occur in woods in France, Italy, and Germany; and was observed by Sibthorp in shady woods on the Bithynian Olympus and around Constantinople.

Globularia alypum of the Mediterranean countries. A small-leaved shrubby plant about two feet high, called in Greece "stôurēki" or sometimes "sēnna" (Sibth.); and the ΑΛΥΠΤΟΝ of Dioscorides, growing on the seashore of Libya and other countries, and possessing purgative properties,—prescribed also by Actuarius (Ruel. iii. 132), is referred here by writers: *G. alypum* was observed by Delile on the Mediterranean border of Egypt; by Sibthorp, and Chaubard, frequent from the Peloponnesus to the Greek islands. Westward, the "alypon" is mentioned by Pliny xxvii. 7: *G. alypum* is described by Lobel adv. 158; is termed "a. monspeliensium s. frutex terribilis" by Bauhin hist. i. 598, "g. fruticosa myrti folio tridentato" by Tournefort inst. 467: was observed by Garidel pl. 42 in Southern France; and according to Sprengel, and Lindley, is not rare on the rocky shores of the Mediterranean.

Calystegia soldanella of Temperate climates, of the shore of the Mediterranean and Atlantic as far as Britain and Madeira, and the Austral and Northern shores of the Pacific. The ΘΑΛΑΚΚΙΑ : ΚΡΑΜΒΗ of Dioscorides, with leaves resembling those of CΤΡΟΓΓΥΛΗ : ΑΡΙCΤΟΛΟΧΙΑ and arising singly from red branches, its juice milky and saltish and the cooked plant purgative,—mentioned also by Rufus Ephesius, is referred here by writers: *C. soldanella* was observed by Sibthorp, Chaubard, and Fraas, in sand of the seashore from Bithynia around the Peloponnesus. Westward, the account by Pliny xx. 38 of the "marina brassica" seems taken from Dioscorides: *C. soldanella* is described by C. Bauhin pin. 295, and Morison i. pl. 3; is termed "c. maritimus nostras rotundifolius" by Tournefort inst. 83; is known to grow on the seashore from Carniola around Italy, Spain, Madeira, as far as Britain and Holland (Engl. bot. pl. 314, and Pers.); and in the Pacific, on the seashore of Chili, California, New Zealand, and Australia (R. Br., J. D. Hook., and A. Dec.). By European colonists, was carried to the Mauritius Islands, where it was observed by Bojer under cultivation and seldom flowering. The branches are described by Sprengel as reddish with bitter and saltish milky juice, and the root according to Lindley is "purgative."

Lithospermum fruticosum of the Mediterranean countries. Called in Greece "thathaki" (Sibth.); and the ΑΓΧΟΥCΑ : ΑΛΛΗ third kind of Dioscorides resembling the preceding but having smaller red fruit, the root expelling ΠΛΑΤΕΙΑΝ : ΕΛΜΙΝΘΑ *tape-worm*,—is referred here by Sprengel from the agreement in the carpels: *L. fruticosum* is described by Alpinus exot. pl. 68; and was observed by Sibthorp on the Greek islands and mountainous parts of Greece. Westward, the account of the third anchusa by Pliny xxii. 25 seems taken from Dioscorides, except that the word "karpôn" fruit is read "flore" flower: *L. fruticosum* is described by Barrelier pl. 1168, and Garidel pl. 15; is termed "buglossum fruticosum rorismarini folio" by Tournefort inst. 134; was observed

by Forskal near Marseilles; and is known to grow in various parts of Southern Europe (Pers., and Spreng.).

Frankenia hirsuta of the East Mediterranean countries and middle Asia. The ΕΤΕΡΑ: ΑΝΘΥΛΛΙC of Dioscorides, in leaves and branches resembling ΧΑΜΑΙΠΤΙΤΥΙ but more hairy shorter and rougher, flower purple, heavy-scented, and root as in ΚΙΧΩΠΙΟΥ, — is referred here by Fraas p. 114 and 171: *F. hirsuta* is termed "alsine cretica maritima supina caule hirsuto foliis quasi vermiculatis flore candido" by Tournefort cor. 45; was observed by Sibthorp, Chaubard, and Fraas, on the seashore from the Peloponnesus to Cyprus; by Hasselquist, on the Mediterranean shore of Egypt near Alexandria (Del.); and is known to grow in Siberia (Pers.). Westward, Pliny xxi. 103 adds to the account of Dioscorides, that the "altera" kind grows in stony places: *F. hirsuta* is known to grow at the Southern extreme of Italy (Pers.).

Hyoscyamus reticulatus of the East Mediterranean countries. The black-seeded ΥΟCΚΥΑ ΜΟC, having according to Dioscorides purplish flowers, CΜΙΛΑΚΙ-like leaves, and the calyx-cup hard and spinescent, — is referred here by Sprengel: the "hyoscyamus nigro semine" with flowers "paene purpureis," is said by Pliny xxv. 17 to grow in Galatia: *H. reticulatus* is described by Clusius panon. p. 502, and Camerarius hort. pl. 22; is known on Crete and in Syria (Pers., and Spreng.); and farther South on the border of Egypt, was observed by Delile near Salehyeh and Quatyeh, a vernal plant. The flowers according to Linnæus are red, beautifully reticulated with dusky veins.

Lycium Afrum of West Africa. The ΠΑΜΝΟC: ΛΕΥΚΟΤΕΡΑ one of the three kinds distinguished by Dioscorides, — is referred here by Sprengel: *L. Afrum* is described by Trew and Ehret pl. 24; is termed "jasminoides linearifolium" by Moench; is known to occur in Spain and Barbary (Pers.), on the Canaries (Reichb.), the Cape Verd Islands (Schm.), in Guinea (fl. Nigr.); and was observed by Drège and Meyer in wild situations in Austral Africa (A. Dec.). Eastward, has been met with in Egypt, Palestine, and at Medina in Arabia (Pers.). By European colonists, has recently been "introduced from the Cape of Good Hope" into the environs of Bombay (Lush, and Graham).

Linaria spuria of the Mediterranean countries. The ΕΛΑΤΙΝΗ growing according to Dioscorides in grain-fields and cultivated ground, its root giving out five or six slender shoots a span long, leaves ΕΛΞΙΝΗ-like but smaller and rounder and hairy, austere in taste, — mentioned also by Paulus Aegineta, is referred here by Lobel, and with a mark of doubt by Sibthorp: *L. spuria* was observed by Sibthorp, and Link, frequent in vineyards and cultivated ground from the Peloponnesus throughout the Greek islands; and farther South, by Delile, at Damietta on the Mediterranean border of Egypt. Westward, the account by Pliny xxvii. 50 of the "elatine" seems chiefly taken from Dioscorides: *L. spuria* is described by Lobel adv. p. 197 (Spreng.); is termed by Gerarde, and others, *male fluellin* from its soft velvety leaves (Prior), "l. segetum nummulariæ folio villosa" by Tournefort inst. 169; is known to occur in Sicily, Spain, and throughout middle Europe as far as Denmark (fl. Dan. pl. 913, Pers., Brot., and Guss.), was clearly introduced into Britain, and only in Italy found outside of cultivated ground (Seb. and Mauri fl. rom. p. 203, and A. Dec.).

Linaria Graeca of the East Mediterranean countries. The "elatine" of Dioscorides — is referred here by Fraas: *L. Graeca* is described by Chaubard, and was observed by him, and Fraas, the most frequent kind in cultivated and fallow ground in Attica and the Peloponnesus.

Linaria elatine of the Tauro-Caspian countries. The "elatine" of Dioscorides, — and Pliny, is referred here by Montigiano (Targ.) and others: *L. elatine* was observed by Sibthorp in vineyards and cultivated ground throughout Greece as far as Constantinople, the Greek islands, and Cyprus; by Delile, at Alexandria on the Mediterranean border of Egypt; and farther East, is known to occur in the Crimea, and to all appearance indigenous in the country South of Caucasus (Hohen., C. A. Mey., and A. Dec.). Westward, is described by Matthioli p. 396 (Spreng.); is termed "l. segetum nummulariæ folio aurito et villosa flore luteo et flore cæruleo" by Tournefort inst. 169; is known as a weed in cultivated ground in Algeria, Italy, and throughout middle Europe as far as Denmark, and was clearly introduced into Britain (fl. Dan. pl. 426, Pers., Lenz, and A. Dec.). By European colonists, was carried to Northeast America, where it continues in waste ground from Eastern Massachusetts to North Carolina, "scarce" (A. Gray, and Chapm.). The plant according to Lindley "is said to be bitter and purgative."

Linaria Aegyptiaca of the Egyptian Desert. Called in Egypt "asjib ed dib" or "doræjse" (Forsk.), and perhaps the "elarasch" identified with the "elathini" — by Ebn Baitar: *L. Aegyptiaca* was observed by Lippi, Forskal, and Delile, from Memphis and Cairo to the Isthmus of Suez, indigenous in the Desert. Farther North, was observed by Sibthorp frequent in vineyards and fallow ground and along hedges on the Greek islands.

Linaria cymbalaria of the East Mediterranean countries. The ΧΑΜΑΙΚΙC CΟC growing according to Dioscorides in cultivated ground, its root slender and worthless giving out five or six leafy sprigs a span long, leaves ivy-like but more elongate, and flowers resembling ΛΕΥΚΟΙΟΙC and strongly bitter, — may be compared: *L. cymbalaria* was observed by Sibthorp, and Chaubard,

on maritime rocks of the Peloponnesus and Cyprus. Westward, the "hamaikissōs" or "kissōs akarpōs" or "hamailēukē" or "gēs stēphanōs" or "sēlēnitis" is identified in the Syn. Diosc. with the "ēthēra plōuviatika" of the Romans: the account by Pliny xxiv. 84 of the "chamaecissos" having the flower of "alba viola" seems chiefly taken from Dioscorides: *L. cymbalaria* is known to grow wild in Dalmatia and Italy (Vis., Chav., and A. Dec.); is termed "*cymbalaria italica*" in the Second edition of Gerarde in 1636, "*L. hederaceo folio glabro*" by Tournefort inst. 169, *ivy-leaved snapdragon* by Lindley; and escaping from cultivation made its appearance on old walls and in humid situations around Bale after the days of Bauhin (Hagenb.), around Iena in the Seventeenth century (Linn.), in Holland where it was previously unknown (Miq.), in Britain a little before 1640 (Park. theatr. p. 682), and in Ireland (Mackay). The plant according to Lindley "has a warm cress-like flavour, and has been recommended as an antiscorbutic."

Antirrhinum asarina of the Mediterranean countries. The "hamaikissōs" of Dioscorides — is referred here by Sprengel, and Fraas, and seems to agree better in the colour of its flowers, "*albis leviter purpurascens*:" *A. asarina* was observed by Fraas among ruins near Lamia in Greece. Westward, is described by Lobel obs. p. 329; is termed "*asarina procumbens*" by Miller; and is known to grow in Southern France and as far as Geneva (Pers., and Spreng.).

Mentha tomentella of the Mediterranean countries. The ΚΑΛΑΜΙΝΘΗ: ΟΡΕΙΝΟΤΕΡΑ described by Dioscorides as whitish, with "ōkimō"-like leaves and the flower purple, — is referred here by Fraas: *M. tomentella* was observed in Greece by Link, and Fraas, not rare in dry situations. Westward, was observed by Brotero in Portugal (Steud.).

Polygonum hydropiper of Europe and the adjoining portion of Asia. Called in Britain *water pepper* or *cyderack* or *ciderage* or *culrage*, in France "*curage*" or "*cidrage*" (Prior), in Italy "*erba pepe*" or "*idropepe*" (Lenz), in Greece "*agria pipōuria*" (Fraas) or by the Turks "*su biberi*" (Sibth.), in which we recognize the ΥΔΡΟΠΙΠΕΡΙ growing according to Dioscorides along slow-moving or stagnant water, its stem geniculate, leaves larger than in ΗΔΥΟCΜΩ and acrid like pepper but not aromatic, and fruit in dense racemes arising in proximity to the leaves, — mentioned also by Galen simpl. 8: *P. hydropiper* was observed by Sibthorp, and Fraas, frequent in Greece in the situations described by Dioscorides; is known to grow also about Caucasus (Bieb.). Westward, is described by Fuchs p. 842, Anguillara iv. 115 (Spreng.), and Gerarde p. 361; is termed "*persicaria urens seu hydropiper*" by Tournefort inst. 509; and is known to grow in Italy and throughout middle and Northern Europe as far as Sweden and Iceland (Pers., Hook., and Wats.). By European colonists, was carried prior to 1670 (Joss.) to Northeast America, where it continues in moist situations along roadsides and near dwellings, fairly naturalized. The plant according to Lindley "will dye wool yellow," and the leaves are "so acrid as to act as vesicants."

Passerina hirsuta of the Mediterranean countries. Called in Greece "*agria gērōklatha*" (Fraas) or "*agriō thērōkallō*" (Sibth.), in Egypt "*metnan*" (Forsk.); and the ΕΜΠΙΕΤΡΟΝ of Dioscorides, purgative, near the sea saline to the taste but farther inland more bitter, — identified in the added Synonyms with the "*phakōēithēs*," is referred here by Dalechamp: the "*phakōēithēs*" is mentioned also by Rufus Ephesius, and Oribasius vii. 25: *P. hirsuta* was observed by Sibthorp, Chaubard, and Fraas, frequent on the seashore, barren hills and plains from Crete and the Peloponnesus to Cyprus, flowering in November; by Forskal p. 81, and Delile, on the Mediterranean border of Egypt, brought in the dried state in great quantities into Alexandria to be used in cooking. Westward, is described by Dalechamp 1070, and Bauhin i. 595 (Spreng.); is termed "*thymelæa tomentosa foliis sedi minoris*" by Tournefort inst. 595; is known to grow in Italy, Barbary, and Southern France (Pers.), and was observed by Lapeyrouse as far as the Pyrenees (Steud.).

Statice sinuata of the shores of the Mediterranean. Called in Greece "*prōphasis*," and the ΤΡΙΠΟΛΙΟΝ growing according to Dioscorides not on dry ground but in places inundated by the sea, a span high, its stem dividing above, and flower said to change colour thrice a day, white in the morning, purplish at noon, and in the evening red, — is referred here by Sibthorp, and Fraas: *S. sinuata* was observed by them, and Chaubard, one of the most frequent and elegant seaside plants of the Peloponnesus and Greek islands; according to Fraas, presenting a white summit before flowering, the flowers when expanded are blue, and in fading change to violet. Farther South, is known to grow on the seashore of Palestine (Pers.). Westward, the "*tripoliōn*" or "*psuhēn*" or "*mēris*" or "*pōtamōgēitōn*" or "*stahuitēs*" is identified in the Syn. Diosc. with the "*kōliōumarēs*" of the Romans; the "*tripolium*" growing by the seaside, and by some called "*polium*," changing colour thrice a day, is mentioned by Pliny xxi. 21 and xxvi. 22: *S. sinuata* is described by Clusius cur. pl. 33; is termed "*limodorum peregrinum foliis asplenii*" by Tournefort inst. 342; and is known to grow on the seashore of Sicily, and Barbary (Desf. atl. i. p. 276, and Pers.).

Statice limonium of the seashore in Northern climates. Called in Britain *sea-lavender* (Prior), in Greece "*thalassōgamvros*" (Sibth., and Fraas), in Egypt "*e'rq angibar*" (Del.): the "*isatis*"-like leaves but juiceless and broader, and fragrant root heating to the taste, in the description of the

"tripōliōn" by Dioscorides. — are referred here by Fraas: *S. limonium* was observed by him, Sibthorp, and Chaubard, everywhere frequent in the salt marshes of Greece; by Delile, along the Mediterranean shore of Egypt; and farther East, by Thunberg, on the seashore of Japan. Westward, is described by Matthioli p. 696 (Spreng.); is termed "*limonium maritimum majus*" by C. Bauhin pin. 192, and Tournefort inst. 341; and is known to grow on the seashore of Barbary, Portugal, and along the Atlantic as far as Sweden (Desf., Brot., fl. Dan. pl. 315, and Wats.). Farther West, was observed by Lappalaie in Newfoundland; by myself, in salt marshes along the Atlantic from Lat. 43° to 39°; by Elliot, near Charleston; and by N. A. Ware, in Florida (Nutt.).

Euphorbia cyparissias of Europe and the adjoining portion of Asia. Called in Italy "titimalo cipressino" (Lenz), and the ΤΙΘΥΜΑΛΟC:ΚΥΠΤΑΡΙCЦИAC named according to Dioscorides from resembling a young shoot of pine ΠΙΤΥΛ, a span or more high but the leaves on its reddish stem more tender and delicate, and the whole plant full of white juice, — is referred here by most writers: *E. cyparissias* was observed by Sibthorp, and Fraas, in Greece though rare; by Grisebach fl. rum., in Albania and Macedonia. Westward, the "cyparissian" or fifth kind of "herbam lactariam" is described by Pliny xxvi. 43 as growing in the open country "campestribus," and having a double or triple stem: *E. cyparissias* is described by Gerarde pl.; is termed "tithymalus cyparissias" by Tournefort inst. 86; was observed by Forskal near Marseilles; and is known to grow in barren situations throughout Italy and middle Europe as far as the Northern border of France (Jacq. austr. pl. 435, Pers., Spreng., and Lenz), but is regarded by Watson, and Bromfield, as introduced into Britain (A. Dec.). By European colonists, was carried to Northeast America, where it continues under cultivation around dwellings, and according to A. Gray has escaped "to road-sides in a few places in New England." The plant according to Lindley is "a virulent poison," but the "powder of the root" is given in small doses.

Euphorbia Aleppica of the East Mediterranean countries. Called in Greece "galatzithōhōrtōn" (Fraas): the ΠΙΤΥΟΥCΑ differing according to Dioscorides from the ΚΥΠΤΑΡΙCЦИΟΥ:ΤΙΘΥΜΑΛΟΥ, more than a cubit high with leaves like those of pine ΠΙΤΥΟC slender and pointed, and small almost purple flowers, — identified in the added Synonyms with the "klēma" or "kramviōn" or "paraliōn" or "kanōpikōn," may be compared: *E. Aleppica* is described by Alpinus exot. pl. 64; is termed "t. orientalis cyparissias patulus foliis superioribus hastatis flore minimo" by Tournefort cor. 2; and was observed by Sibthorp, Chaubard, and Fraas, frequent in cultivated ground from the Peloponnesus to the Bithynian Olympus and Smyrna. Westward, the "pityusa" seems known to Pliny xxiv. 21 only from its medicinal uses and the account of Dioscorides.

Euphorbia dendroides of the East Mediterranean countries. Called in Greece "phlōmō" or "phlōmōs" (Sibth., and Fraas): the ΤΙΘΥΜΑΛΟC:ΔΕΝΔΡΟΕΙΔΕC growing in stony places according to Dioscorides, full of juice and at its summit leafy with many crowns, the leaves around the reddish branches resembling the more tender ones of the myrtle, — is referred here by writers: *E. dendroides* was observed by Sibthorp, Chaubard, and Fraas, in stony mountainous situations exposed to the sea in Crete and the Peloponnesus, a tree with a trunk six or eight inches in diameter though only three to five feet high. Westward, the account by Pliny xxvi. 45 of the seventh "herbam lactariam" called "dendroides" or "cobion" or "leptophyllon," seems chiefly taken from Dioscorides: *E. dendroides* is described by Barrelier pl. 910; is termed "tithymalus arboreus" by Tournefort inst. 85; and is known to grow as far as Italy and Sicily (Lam. fl. fr., Pers., and Spreng.).

Euphorbia platyphylla of the Crimea and middle Asia. Called in Greece "galatzitha" (Fraas): the ΤΙΘΥΜΑΛΟC:ΠΛΑΤΥΦΥΛΛΟC resembling the ΦΛΟΜΩ according to Dioscorides, and if bruised and mingled in water destroying fish like the other kinds, — is referred here by writers: *E. platyphylla* was observed by Chaubard, and Fraas, in waste and cultivated ground in the Peloponnesus and Greek islands; farther East, by Bieberstein, in barren stony situations wild in the Crimea (A. Dec.). Westward, the sixth "herbam lactariam" called "platyphyllon" or "corymbiten" or from resemblance "amygdaliten," its leaves broader than in other kinds, is mentioned by Pliny xxvi. 44: *E. platyphylla* is described by Linnæus; is known to occur in cultivated and fallow ground in Italy and middle Europe as far as Paris (Thuil., Jacq. austr. pl. 376, Scop., and Lenz), and from the silence of writers, appears to have been only recently introduced into Britain (Bromf.). According to A. Decandolle p. 753, has also been introduced into Northeast America.

Alisma plantago of Temperate climates. Called in Britain *water-plantain* (Prior), in Italy "piantaggine aquatica" or "barba silvana" or "erba alisma" (Lenz), in Greece "plēmōnōhōrtōn" or "lappa" (Sibth.), in which we recognize the ΑΛΙCΜΑ growing according to Dioscorides in watery places, its leaves resembling those of the plantain, stem simple more than a cubit high bearing capitula thyrus-like, the flowers pale-yellowish and white, — identified in the added Synonyms with the "alkēan" or "thamasōniōn" or "akurōn" or "lurōn": *A. plantago* was observed by Forskal, Sibthorp, and Chaubard, frequent along river-margins from the Peloponnesus to Constantinople, but is regarded by Fraas as belonging properly to the salt water; is known to grow also in the Tauro-

Caspian countries and throughout Siberia to Kamtschatka (Gmel., and Bieb.). Farther South, the "mizmar elrai" of Ebn Baitar, is referred here by Sontheimer: *A. plantago* was observed by Delile on the Mediterranean border of Egypt near Rosetta; was received by Fresenius from Abyssinia (A. Dec.). Westward, the account by Pliny xxv. 77 of the "alisma" or "damasonion" or "lyron," seems chiefly taken from Dioscorides: *A. plantago* is described by Valerius Cordus f. 60 (Spreng.), and Fuchsius 42; is termed "*ranunculus palustris plantaginis folio ampliore et angustiore*" by Tournefort inst. 292; and is known to grow in Italy, Barbary, Portugal, and middle and Northern Europe as far as Lapland (fl. Dan. pl. 561, Desf., Brot., Wats., and Lenz). Farther West, was observed by Drummond in Lat. 54° in central North America at Cumberland House; by Nuttall, on the Arkansas; by E. James, at the sources of the Platte; by Short, in Kentucky; and is known to grow as far South as Newbern and upper Georgia (Croom, and Chapm.), but so far as observed by myself along the Atlantic from Lat. 43° to 38°, chiefly near inhabited places. In the Southern Hemisphere, was observed by R. Brown gen. rem. p. 60 in Australia.

Serapias grandiflora of Europe and the adjoining portion of Asia. The ΑΓΡΩΚΤΙC: ΕΝ: ΤΩ: ΠΑΡΝΑCΩ growing according to Dioscorides on Parnassus, and having ΚΙCΩ-like leaves, a white fragrant flower, and five or six white roots thick as the finger and very sweet, — mentioned also by Pliny xxiv. 118, is referred here by Fraas: *S. grandiflora* was observed by Sibthorp in shady situations on mount Hymettus, and by Fraas frequent on Parnassus. Westward, is termed "*helleborine flore albo vel damasonium montanum latifolium*" by Tournefort inst. 436; and is known to grow in Switzerland and throughout middle Europe as far as Sweden (Hall. helv. pl. 41, Engl. bot. pl. 271, Pers., and Wahl.).

Helleborus lingua of the Mediterranean countries. Called in Greece "glössari" (Fraas), in which we recognize the ΛΟΓΧΙΤΙC of Dioscorides, having leek-like but broader leaves, and on the stem yellow flowers like caps or comic masks with a tongue hanging downwards, — referred here by writers: *H. lingua* was observed by Sibthorp, Chaubard, and Fraas, in grassy mountainous situations in the Peloponnesus and as far as Parnassus. Westward, the "lōghitis" or "kēstrōn" or "mēthōusa" is identified in the Syn. Diosc. with the "vēnērēa" or "lagkēōla" of the Romans; but the account by Pliny xxv. 88 of the "lonchitis" seems taken from Dioscorides: *H. lingua* is described by Matthioli pl. 636, and Columna ecphr. pl. 322 (Spreng.); is termed "*orchis montana italica lingua oblonga altera*" by Tournefort inst. 434; and is known to grow in Italy, and Southern France (Allion., Lapeyr., Pers., and Dec. fl. fr.).

Anthericum ramosum of middle Europe. The ΦΑΛΑΓΓΙΟΝ growing on hills according to Dioscorides, and giving out two three or more branches distant from each other, its flowers white and ΚΡΙΝΩ-like, seeds black and like half a lentil, its small slender root greenish while fresh, and the leaves seeds and flowers employed against scorpion and phalangium bites, — identified in the added Synonyms with the "phalaggitiōn" or "lēukakanthan," and termed "phalaggitēs" by Galen fac. simpl. viii. p. 150, is referred here by writers: but *A. ramosum* has not at the present day been observed in Greece. Westward, the account by Pliny xxvii. 98 of the "phalangites" by some called "phalangion" or "leucanthemon" or in some copies "leucacantha," seems chiefly taken from Dioscorides: *A. ramosum* is described by Dodoens p. 106 (Spreng.); and is known to grow in limestone districts in Austria and France (Jacq. austr. pl. 16, Lam. fl. fr., Pers., and Steud.).

Narcissus odoratus of the Mediterranean countries. The ΒΟΛΒΟC called ΕΜΕΤΙΚΟC, having according to Dioscorides longer and more thong-like leaves than the ΕΔΩΔΙΜΟΥ kind, and a black-skinned bulbous root that if eaten excites vomiting, — is referred to this tribe by Dodoens, Camerarius, and Sprengel: *N. odoratus* was observed by Gittard in the Peloponnesus (Chaub.). Westward, the account by Pliny xx. 41 of the "bulbus vomitorius" with black and longer leaves than the other kinds, is perhaps taken from Dioscorides: *N. odoratus* is described by Rudbeck elys. ii. pl. 50; and is known to grow in various parts of Southern Europe (Hall. helv. 1251, and Pers.). Is according to Lindley one of the species having emetic properties.

Muscari spicatum of the East Mediterranean countries. Called in Greece "vōrvōi" (Sibth.), and agreeing better with the "vōlvōs ēmētikōs" of Dioscorides: — *M. spicatum* was observed by Sibthorp, and Chaubard, in the Peloponnesus, its leaves narrow, linear-lanceolate, a span long; but nothing is said of the properties of its root.

Scilla pancratium of the Mediterranean countries. The ΠΑΓΚΡΑΤΙΟΝ by some called ΚΚΙΛΛΑΜ, having according to Dioscorides leaves like ΚΡΙΝΩ but longer, a great reddish bulb, and properties like ΚΚΙΛΛΗ but milder, — mentioned also by Galen simpl. viii. 16. 1, is referred by Anguillara sempl. p. 120 to the red-bulbed variety of *S. maritima*, but by Steinheil to *S. pancratium*, recognized by him as a distinct species. Westward, the "pancratium" by some called "*scillam pusillam*" is described by Pliny xxvii. 92 as having the leaves of "albi lilii" but longer and "crassioribus" thicker, the large bulbous root "rufo" reddish: *S. pancratium* the "bulb about half the size" and "pale green or whitish green or occasionally red, leaves much shorter more acute erect and nar-

rower, stem more glaucous, flowers smaller more compactly arranged with shorter bracts, flower-stalks shorter, flower-bud more blunt, petals and sepals spread fully out white oval obtuse mucronulate marked with a pale pink line along the middle of the back" has been found in the environs of Cadiz and on Malta (Lindl.).

Polygonatum multiflorum of Europe and Northern Asia. Called in Italy "sigillo di Salomone" or "sigillo di S. Maria" (Lenz), in Greece "pölugônâtôn" (Sibth.), in which we recognize the ΠΟΛΥΓΩΝΑΤΟΝ growing according to Dioscorides on mountains and more than two cubits high, its leaves laurel-like but smoother and broader, with white flowers at the base of each, the long white root hairy and geniculate, and as thick as the finger: — *P. multiflorum* was observed by Sibthorp, and Chaubard, in the Peloponnesus; by Gmelin, as far as East Siberia: and by Thunberg, on mount Fakon in Japan. Westward, is described by Matthioli p. 678 (Spreng.); is termed "p. latifolium vulgare" by Tournefort inst. 78; and is known to grow on the Appenines and throughout middle Europe as far as Sweden (fl. Dan. pl. 152, Engl. bot. pl. 279, Wats., Savi, and Lenz).

Polygonatum vulgare of Europe and the adjoining portion of Asia. Called in Britain *Solomon's seal* or *seal-wort* (Prior), and perhaps included in the "pölugônâtôn of Dioscorides, — referred here by Clusius pannon. p. 264, and Sibthorp: *P. vulgare* was observed by Sibthorp in woods on mount Parnassus. Westward, is termed "p. latifolium flore majore odore" by Tournefort inst. 78; and is known to grow in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 337, Pers., Spreng., and Lenz).

Streptopus amplexifolius of Subarctic climates. The ΙΔΑΙΑ ΠΙΖΑ having according to Dioscorides ΟΞΥΜΥΡCΙΝΗ-like leaves, and next them little tendrils bearing the flower, — is referred here by Anguillara p. 259, and Sprengel. Westward, the account of the "idaeae herbae" by Pliny xxvii. 69 seems taken from Dioscorides; but *S. amplexifolius* was observed by Anguillara frequent in the forests of Italy; is described by Matthioli 841, and Columna phyt. pl. 15; and is known to grow on the Pyrenees, Jura, and other mountains of middle Europe (Pers., and Dec.). Farther West, was observed by Wormskiold in Greenland (Meyer); by Colmeister, and Herzberg, in Labrador from Lat. 57°; by Lapylaie, in Newfoundland; is known to grow throughout Canada and our Northern States as far as Lat. 43° (near Utica, A. Gray), and farther South on the mountains of Pennsylvania (Pursh); also in Northwest America at Unalascha, and across the Pacific in Kamtschatka (Cham.).

Sparganium ramosum of Northern climates. Called in Britain *bur reed* (Prior): the CΙΤΑΡ ΓΑΝΙΟΝ having according to Dioscorides ΞΙΦΙΩ-like leaves, balls at the summit of the stem, and its root and fruit taken in wine against poisonous animals, — identified in the added Synonyms with the "xiphithiôn" or "völôn," and mentioned by Galen simpl. viii. 18. 34, may be compared: *S. ramosum* was observed by Sibthorp, and Gittard, growing in water from the Peloponnesus to Constantinople; is known to grow also in the Tauro-Caucasian countries and Siberia (Bieb., and Wats.). Westward, the "sparganium" is mentioned by Pliny xxv. 63 as taken in wine against snake-bites: *S. ramosum* is described by Matthioli pl. 702 (Spreng.), and Tournefort inst. 531; is known to grow in Barbary and throughout Europe as far as Sweden (Curt. lond. v. pl. 66, Pers., and Wats.). Farther West, was observed by Lapylaie in Newfoundland; by Drummond, in Lat. 54° near Cumberland House in central North America; by Short, in Kentucky; by myself, along the Atlantic from Lat. 43° near Portsmouth to 40°; and apparently the same species by Elliott in Georgia, and by Chapman in Florida.

Sparganium simplex of Northern climates. Agreeing better with the description of the leaves, — according to Sprengel: *S. simplex* has not been observed in Greece; but is known to grow in Siberia (Wats.). Westward, is known to grow in Barbary and Switzerland, and throughout middle and Northern Europe as far as Russia and Sweden (Engl. bot. pl. 748, Pers., and Wats.). Farther West, was observed by Drummond in Lat. 54° near Cumberland House in central North America; by myself, along the Atlantic from Lat. 44° to 42°, subaquatic and the terminal peduncle sometimes branching, but a more humble plant than the preceding.

Calamagrostis epigeios of Northern climates. The ΚΑΛΑΜΑΓΡΩCΤΙC larger in every way than the ΑΓΡΩCΤΕWC according to Dioscorides, and if eaten by cattle killing them, especially along roadsides in Babylonia, — is referred here by Lobel, and others: *C. epigeios* was observed by Chaubard frequent in humid situations in the Peloponnesus; is known to grow also in Siberia (Wats., and Kunth). Westward, is described by Lobel adv. pl. 6 (Spreng.); and is known to grow in Barbary and throughout Europe as far as Russia and Lapland (Poll., Lightf. fl. Scot., Steud., and Wats.). Farther West, was observed by Hooker on Iceland (but compare *C. stricta* of the Alpine portion of the White Mountains in New England and the mountains of Europe). This grass according to Sprengel is in general avoided by cattle, and if eaten through necessity, is known to induce internal inflammation and occasionally death.

Molinia cærulea of Europe and the adjoining portion of Asia. The ΚΙΝΝΑΜ so called in Cilicia where it grows, and further according to Dioscorides iv. 32 if eaten moist by cattle often

inducing inflammation, — may be compared with this reedy grass: *M. cœrulea* was observed by Sibthorp growing among heath near Constantinople. Westward, is termed “gramen paniculatum autumnale panicula angustiore e viridi nigricante” by Tournefort inst. 521; is known to grow throughout middle Europe as far as Britain (Curt. lond. v. pl. 11, Thuil., Gaud., and Pers.); and according to Sprengel, has been observed to injure cattle.

Gastridium lendigerum of the Mediterranean countries and middle Europe. Called in Britain *nit-grass* (Prior): the ΦΑΛΑΠΙC of Dioscorides, two palms high with slender useless roots giving out several geniculate stems reedy and like those of ΖΕΑC, its seeds oblong white as large as millet and with the bruised plant relieving pain in the bladder, — mentioned also by Galen, and Paulus Aegineta, may be compared: *G. lendigerum* was observed by Sibthorp in the sand of the seashore of Asia Minor; by Gittard, in the Peloponnesus (Chaub.); by Delile, on the Mediterranean border of Egypt near Alexandria. Westward, the “phalaris” is described by Pliny xxvii. 102 as having a long slender “thyrsus” and seeds like “sesamæ:” *G. lendigerum* is described by Plukenet alm. pl. 33; is termed “panicum serotinum arvense spica pyramidata” by Tournefort inst. 515, “agrostis australis” by Linnaeus; and is known to grow in Southern France and as far even as Britain (Gouan hort. 39 pl. 1, Huds., and Pers.).

Equisetum limosum of Northern climates. The ΙΠΠΟΥΡΙC: ΕΤΕΡΑ described by Dioscorides as more than a cubit high with whiter shorter and softer foliage, — is referred here by Sprengel, and Fraas: *E. limosum* was observed by Fraas in Greece, more frequent than other kinds and called “polutribia.” Westward, the account of the “aliam hippurin” by Pliny xxvi. 83 is taken from Dioscorides; *E. limosum* is described by Tragus f. 264; and is known to grow in Italy (Lenz) and throughout middle and Northern Europe. Farther West, has been observed by myself in North America, from Lat. 48° on the Lower St. Lawrence to Salem in New England and 39° beyond Philadelphia.

Aspidium lonchitis of Europe and the adjoining portion of Asia. Called in Britain *holly-fern*, “from its prickly fronds” (Prior): the ΛΟΓΧΙΤΙC: ΕΤΕΡΑ having according to Dioscorides ΚΟΛΟΠΙΕΝΔΡΙΩ like fronds but larger rougher and more deeply incised, — is referred here by writers: *A. lonchitis* was observed by Sibthorp, and Fraas, from the mountains of Crete to the Bithynian Olympus. Westward, the “lōghitis ētēra” or “loghitin trahēian” is identified in the Syn. Diosc. with the “lōggina” or “kalavrina” of the Romans: *A. lonchitis* is described by Matthioli p. 666 (Spreng.); is termed “lonchitis aspera” by Tournefort inst. 538; and is known to grow in Italy and throughout middle Europe as far as Britain (Engl. bot. pl. 797, and Lenz).

Agaricus dryinus of middle Europe. The ΑΓΑΡΙΚΟΝ: ΘΗΛΥ distinguished by Dioscorides by having within straight lamellæ, — is referred here by Sprengel: the agaricon “femina” is mentioned also by Pliny xxv. 57: *A. dryinus* is described by Persoon; and is known to grow on oaks and beeches in middle Europe (Spreng.).

Agaricus ostreatus of middle Europe. Regarded by Sprengel as perhaps included in the “agarikōn thēlu” of Dioscorides: *A. ostreatus* is described by Jacquin; is known to grow in middle Europe, and like the preceding on oaks and beeches (Spreng.).

Zonaria pavonia of the coasts of the Mediterranean and North Atlantic. The ΦΥΚΟC: ΘΑΛΑC CΙΟΝ: ΠΛΑΤΥ of Dioscorides — is referred here by Sprengel, and Fraas: *Z. pavonia* was observed by Forskal, Sibthorp, and Bory, from the Peloponnesus throughout the Greek islands as far as Imros; and by Delile, near Alexandria in Egypt. Westward, is termed “f. maritimus gallo-pavonis pennas referens” by Tournefort inst. 568; was observed by Forskal near Marseilles; is known to grow throughout the Mediterranean (Bory), and as far North in the Atlantic as Britain (Engl. bot. pl. 1276).

Wormskieldia granatea of the coasts of the Mediterranean. The ΦΥΚΟC: ΘΑΛΑC CΙΟΝ distinguished by Dioscorides as oblong and ΦΟΙΝΙC CΟΝ red, — is referred here by Sprengel: *W. granatea* is described by Lamouroux, and Turner; and according to Sprengel, is not rare in the Mediterranean.

Valeriana Hardwickii of the Himalayan mountains. The ΝΑΡΔΟΥ: ΙΝΔΙΚΗ: ΟΡΕΙΝΗ of Dioscorides — is referred here by Sprengel. *V. Hardwickii* is described by Wallich (in Roxb. fl. ind. i. 166, as. research. vi. 350); and its thick “fleshy strong-scented root is used in medicine in Nepal and the North of India” (Royle lect. 82, and Lindl.).

Gardenia lucida of Tropical Hindustan. Its resin called by the Arabs at Bombay “kunkham” (Birdwood 44. 269, and J. F. Wats. index); in which we recognize the ΚΑΓΚΑΜΟΝ described by Dioscorides as the exudation of an Arabian tree, in some measure resembling myrrh; — and mentioned by Pliny xii. 44 as brought by the Nabathean Arabs to the Mediterranean countries. *G. lucida* was observed in Hindustan by Roxburgh, and Wight; and is described by Graham as “a large shrub or small tree, in gardens Bombay, grows wild on Elephanta, Kennery jungles, S. M. country (Law),” and “furnishes the gum called ‘decamalee.’” Farther East, enumerated by Mason as “exotic” in Burmah. As transported to Europe, described by Plukenet pl. 367.

Mesua ferrea of Tropical Hindustan. An elegant Clusioid tree called in Sanscrit "canchana" or "champeya" or "cesara" or "nagacesara" (W. Jones), in Bengalee "nagkushur," in Malabar "belutta-champagam" (Drur.), in the environs of Bombay "nag chumpa" (Graham); and the $\text{NAC KA}\Phi\Theta\text{ON}$ or $\text{NAPKA}\Phi\Theta\text{ON}$ of Dioscorides, imported from India on account of its fragrance, mixed in perfumes, and employed medicinally, — may be compared. Eastward, *M. ferrea* is sacred in Hindu mythology (Mason v. 401), and in the Naishadha poem, Cama is whetting his arrows on an alabaster wheel compared to a "nagacesara" flower (W. Jones as. res. iv. 295); the "kesara" is mentioned by Dhanvantari (Susrut. sutr. 37), and Kalidasa kum. iii. 55; and flowers of the "mesua," by Valmiki ramayan. vi. 96 (transl. Gorr.): *M. ferrea* was observed by Rheede iii. pl. 53 in Malabar; by Nimmo, and Graham, in the environs of Bombay, the flowers "regularly picked as they expand for sale in the bazar, and preserve their fragrance even when dried;" by Burmann, Roxburgh, and Wight, in other parts of Hindustan, the dried flowers "used for perfuming ointment," employed also "medicinally" (Drur.). Farther East, was observed by Wallich in Burmah, by Mason "exotic" there, the dried anthers according to Drury stuffed in pillows; is described also by Rumphius vii. pl. 2; and is known to be much cultivated on Java (Drur.).

"64 A. D. = 7th year of the 'young-ping' of Ming-ti" (Chinese chron. table), beginning of the Forty-sixth cycle.

"The same year" (the Tching-tseu-thong, Khang-pi, and Pauth. 256 and 490), by the emperor Ming-ti, *Budhism* or the "religion of Fo" introduced from Hindustan into China. — The new religion "was not fully established till A. D. 310" (De Guignes, and Elphinst. ii. 4); but at the present day, includes "at least half of the population of China."

Ptychotis involucrata of Northern Hindustan. An Umbelliferous plant called there "aneeson," in Bengal "chanoo" or "raahooni" (Lindl.), and known from early times: — observed by Royle, used as a substitute for parsley by resident Europeans.

Ferula hooshee of Eastern Persia. The gum called in Beloochistan "hooshee," long known though not collected,* — according to Mrs. Macneill resembles opoponax and is produced by a plant in size and appearance like *F. asafetida*; is also described as resembling opoponax by Royle ill. p. 231. The plant according to Lindley "has a distinct smell of asafœtida."

* *Polygala crotalarioides* of Nepal. Shrubby, decumbent, the stems branching from the base; and from early times, the root employed by the hill-people to cure snake-bites: — sent by Colvin to Royle him.; but according to Buchanan, Wallich pl. as. rar., and Drury, the plant is "common on the Himalaya." From transported specimens, described by Decandolle prodr. i. 327 (Lindl.).

Brucea (Nima) quassioides of Nepal and the Himalayas. A woody Simaruboid plant, its bark exported from early times — and sold in Bengal under the name of "bharangi;" its root also according to Royle ill. p. 158 bitter as quassia: described by Buchanan, and Don prodr. 248 (Lindl., and Drur.).

Xanthoxylum alatum of the mountainous district North of Bengal as far as Nepal. A low tree called in Hindustanee "durmur" (Lindl.), and from early times an aromatic essential oil procured from it by the natives: — observed by Roxburgh, and known to grow "in Rohilcund and Oude" (Drur.).

Cerasus capricida of Nepal. A species of *wild cherry* known there from early times from being so poisonous as to kill goats: — described by Don prodr. 239, and Wallich cat. 718 (Lindl.).

Cucumis Hardwickii of the lower portion of the Himalayas. Climbing, called there "puharee indrayun" hill colocynth (Lindl.), and from early times: — observed by Royle, its fruit two to three inches long and about half as broad, very bitter and in quality similar to colocynth. (See *Citrullus pseudo-colocynthis*.)

Luffa? bindaal of Northern Hindustan. A climbing Cucurbitaceous plant, from early times regarded there as a powerful drastic in cases of dropsy: — observed by Roxburgh iii. 717, and Royle, its "fruit round, echinate with long firm straight ciliate bristles" (Lindl.: see *Cucumis? prophetarum*).

Ptychotis sylvestris of Northern Hindustan. Called there "arub ajwain" (Lindl.), and long known as an Indian carminative: — observed by Royle.

Carum nigrum of Central Asia. A species of *wild caraway*, from early times imported into Hindustan as a carminative — and called "zeera seeah:" found by Royle brought "from Kunawur" (Lindl.).

Gentiana kurroo of the Himalaya mountains. Its root from early times in Northern Hindustan used like *gentian*: — observed by Royle ill. pl. 68 at Mussooree, Simla, and in other parts of the Himalayas (Lindl.).

Picrorhiza kurroo of the Himalaya mountains. A low Rhinanthaceous perennial, its intensely bitter root from early times used medicinally: — observed by Royle ill. pl. 71, and Wallich cat. 404, at

Plantago ispaghula of Central Asia. A low annual called in Persian and Hindustanee "ispagool" (Lindl.) ; carried to Hindustan, and from early times cultivated there for medicinal use : — observed by Fleming as. res. xi. 174, Ainslie, Roxburgh, and Royle, its seeds of a very cooling nature sold in the bazaars and used to prepare a mucilaginous drink often prescribed as emollient (Drur.).

"The same year" (Sueton. 16, Tacit. xv. 44, Tertull. apol. v., and Clint.), conflagration at Rome, destroying a large portion of the city : followed by the "First persecution" of Christians. Josephus at the age of "twenty-six" visiting Rome and introduced to Poppaea wife of Nero.

"65 A. D." (Dionys. of Corinth, Tertull., Euseb., and Clint.), war commencing in Judæa, with the defeat of the Romans under Cestius Gallus. In Rome, Paul put to death. The charge of the Christians there devolving on Linus (2 Tim. iv. 21, Iren., and Euseb.).

Peter "about the same time" put to death (Dionys. of Corinth) : was crucified with his head downwards, at his own request — (according to Origen, Euseb. h. e. ii. 25 and iii. 1). The gospel of John xxi, 18 was written subsequently to this event.

Greek manuscripts written as early as this year and found at Herculaneum (Sylvestre) presenting the following form of the letter θ .

The same year (= 326 B. C. — "140 — 130 — 120" = 56 B. C. "—120 yrs." of Masudi, Wilford as. res. ix. 181), a date possibly marking the accession of the Andra dynasty. The capital of the kings of Andra or inland Telingana was Varangul (Elph. iv. 2).

"66 A. D." (Clint.), arrival of Nero in Greece. — Where, in the following year ("two years after the true period") he celebrated the Olympic games.

"67 A. D." (Jos., and Clint.), Josephus taken prisoner at the capture of Jotapata in Galilee by the Romans under Vespasian.

One hundred and thirty-first generation. A. D. 67, Sept. 1st, mostly beyond youth : the Chinese historian P'an-kou, and his sister Pan-hoei-pan. Justus of Tiberias : the Greek philosophers, Musonius Rufus, Ammonius of Lampræ, and Euphrates ; the rhetors, Isæus, and Ardys : the Christian writers, Glaucias, Menander the Simonian ; the Latin writers, Quintilianus, Silius Italicus, Statius, and Frontinus ; the Roman painters, Cornelius Pinus, and Accius Priscus (Bryan).

"68, June 9th" (Sueton., and Clint.), Nero succeeded by Galba, sixth Roman emperor. The hieroglyphic ovals of Galba occur on Egyptian monuments. His name occurs besides on coins issued in Egypt ; and in a Greek inscription at the Great Oasis. dated in his brief reign.

Cachrys Sicula of the Mediterranean countries. Called in Greece "pétrōanarthēkōs" (Sibth.) : the ΚΡΑΤΙΠΠΟΥ : ΝΑΡΘΗΚΟC prescribed by Andromachus the younger — (Gal. comp. med. vi. 6) may be compared : C. Sicula was observed by Sibthorp in stony situations in Boeotia and on Cyprus. Westward, is described by Morison ix. pl. 1, and Boccone pl. 18 ; is termed "c. semine fungoso sulcato aspero foliis peucedani latiusculis" by Tournefort inst. 325 ; and is known to grow in Sicily, Barbary, and Spain (Pers.).

As early perhaps as this date, arrival of Pliny in Spain, having been appointed procurator "towards the close of the reign of Nero." — He continued in Spain in "71," and returned to Rome shortly before "73" (Sm. b. d.).

Gossain Than, Kamaon, and Kedarkonta, its root "fleshy," and flowers "deep blue, in dense spikes" (Benth., and Lindl.) ; by Irvine mat. med. patn. 38, used as a tonic, and called in Hindustanee "kootki" (Drur., 162).

Dioscorea deltoidea of Subtropical Hindustan. A species of *yam* ; from early times in Cashmere, its roots used for washing woollen cloths and silk for shawls — (Powel punj., and Drur.) : D. deltoidea was observed by Rumphius v. 482 and pl. 180 "circa castellum Victoriam," and by Wallich 5110 in Nepal (Grisebach and A. Dec.) ; the "mu-kelengue" observed by Rheede viii. pl. 51 in Malabar, and the "common yam, cultivated" according to Graham around Bombay, may also be compared.

Xyris Indica of Hindustan and Burmah. Annual, a foot high, and called in Bengalee "cheena ghauza" or "dabi dooba" (Lindl.) or "dali dooh," in Malabar "kotsjelleti-pullu" (Drur.) ; from early times, its leaves and root used to cure ringworm, itch, and leprosy : — observed by Rheede ix. pl. 71 in Malabar ; by Nimmo, in the "S. Concan" (Graham), nearly as far as Bombay ; by Roxburgh, as far as Coromandel and Bengal ; by Mason, in Burmah, enumerated as indigenous. Transported to Europe, is described by L'lukenet alm. pl. 416.

Andropogon iwarancusa of the skirts of the mountains of Northern Hindustan. A fragrant grass three to six feet high and called in Bengalee "kurankusha" or "ibharankusha" or "iwarankusha" (Lindl.) or "iwaran-kussa" (Drur.) ; and from early times in Northern Hindustan, its aromatic roots used in intermittent fevers : — observed by Ainslie, Roxburgh, and Royle, as far as Hurdwar. A grass regarded by Graham as probably identical, was observed by him as far as Bombay, in the "Concans, rare."

Rosa canina of Europe and Northern Asia. Called in Britain *brier-rose* or *dog-rose* (Prior), in Italy "rosa di macchia" or "rosa canina" or "rosa selvatica" (Lenz), in Greece "agria triantaphullêa," in which we recognize the "cynorrhodon" or "silvestris rosae" whose root sent out to a Roman soldier in Lacetania in Spain was found to cure hydrophobia — (Plin. viii. 63 and xxv. 6): *R. canina* is termed "r. sylvestris vulgaris flore odorato incarnato" by Tournefort inst. 638; was observed by Forskal near Marseilles; and is known to grow also in Italy and throughout middle Europe as far as Denmark (Curt. lond. v. pl. 34. and Pers.). Eastward, was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent from Constantinople to the Peloponnesus; by Kaempfer, and Thunberg, in Japan, and called "foosen" or usually "ibara." *Conserve of roses* according to Lindley is prepared "from the pulpy fruit of this and probably other allied species."

Arum crinitum of the West Mediterranean countries. The "dracunculum" with a variegated stem an inch in diameter, recently found in the same province of Spain — (Plin. xxv. 6), may be compared: *A. crinitum* is described by Aiton, and the younger Linnæus; and is known to grow on Minorca (Pers.).

"69, Jan. 15th" (Sueton., Tacit., and Clint.), Galba succeeded by Otho, seventh Roman emperor. The hieroglyphic ovals of Otho occur on a propylon at Thebes; and his name, on coins issued in Egypt.

"April 19th" (Tacit., and Clint.), news received at Rome of the death of Otho. He was succeeded by Vitellius: whose name also occurs on coins issued in Egypt.

"Dec. 21st" (Jos., Dio, and Clint.), Vitellius succeeded by Vespasian, now ninth Roman Emperor. The hieroglyphic ovals of Vespasian occur on the temple at Esneh, on a building at Thebes, and on an obelisk (now in Rome).

"70 A. D." (Jos., Sueton., Clint., and Kitt. cycl. bibl. lit.), after a siege of "nearly five months," Jerusalem captured by the Romans under Titus; bringing the Jewish war to a close. With the temple, the city was now destroyed, "three towers and a part of the Western wall" being alone left standing.

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Adgaba succeeded by Za-Agba, now king of Abyssinia. — He reigned "six months," and was succeeded by Za-Malis, who reigned "six years."

"In the reign of Kei-ko" (San-kokf transl. Klapr.), the barbarians of the East (Ainos) making an irruption inflicted much damage on the Japanese; a thing that never before happened.*

"71 A. D." (Jos., and Clint.), at Antioch, persecution of the Jews repressed by Titus. At Rome (Oros. vii. 9), "Sixth" closing of the temple of Janus; the Romans being at peace with all nations.

"In this year" (Jap. centen. comm. 88), accession of . . . the son of Keiko, as dairo of Japan.

* *Agaricus eburico* of Yeso and the neighbouring countries. A fungus growing on the trunks of *Larix leptostachys* and called "eburico" by the Ainos; one of the two medicines known to them, employed internally against cholic, affections of the heart, vomiting, and worms — (San-kokf transl. Klapr., and Sieb.).

Larix leptostachys of Yeso and the neighbouring countries. Called by the Japanese "fuzi mats," and on account of the wood, — enumerated by Siebold among the useful plants of the Ainos. Observed by Schrenk on Krafu (Sachalin) as far North as Lat. 50° (Sieb. p. 90).

Urostelma ikema of Yeso and the neighbouring countries. An Asclepiaceous plant called "ikema" or "penpu" by the Ainos, being the other medicine known to them; employed both internally and externally in tumours, wounds, "rhumès très forts," and fevers, — further described in the San-kokf transl. Klapr. as creeping, growing also in the districts of Sendai and Simotske in Japan. Known to Siebold only as growing on Yeso.

Andropogon sp. of Yeso and the neighbouring countries. Called "nino," or by the Japanese "kaze gusa?" (Sieb.); apparently the "koutsi gousa" or mouth herb of the Japanese, so named from being employed by the Aino women to paint their lips green; *tattooing* around with black material figures of flowers or other objects, and the same on the back of the hands and feet — (San-kokf transl. Klapr.).

Urtica mosl of Yeso and the neighbouring countries. Called "utarpe," or by the Ainos "mosl," and the fibres used by them for weaving coarse cloth — (San-kokf transl. Klapr., and Sieb. p. 169).

Broussonetia? ats'ni of Yeso and the neighbouring countries. A tree called "ats'ni" by the Ainos, the fibrous bark used by them for weaving coarse cloth — (San-kokf, and Sieb. p. 116 and 170).

He removed the *sword** of Amaterasu "to the temple of Atsuta, Owari, — where it still remains, but is never shown" (Jap. c. c.).

"Other almost equally ancient swords — are preserved in various places, but sword making in Japan is of comparatively much more recent origin" (Jap. c. c.).

"74 A. D." (Sm. b. d.), at Rome, censors appointed for the last time.

Fumaria officinalis of middle and Eastern Asia? Called in Britain *earth-smoke* or *fumitory*, by Treveris gr. herb. 171 "fume or smoke of the earth," in the *Ortus sanitatis* 176 "fumus terrae," in France "fume-terre" (Prior), in Italy "fumosterno" or "fumaria" (Lenz), in Greece "kapnia" (Sibth.), in which we recognize the ΦΟΥΜΑΡΙΑ of the Romans identified in Syn. Diosc. with the ΚΑΠΝΙΘΗC or ΚΑΠΝΟC among barley: — the "capnos" growing in gardens and barley fields of Pliny xxv. 99, may also be compared: *F. officinalis* is described by Brunfels i. 99; is termed "f. officinarum" by Tournefort inst. 422; was observed by Lenz frequent in Italy; and is known to occur in cultivated ground throughout middle Europe (Curt. lond. ii. pl. 52, and Pers.). Eastward, was observed by Sibthorp, Chaubard, and Fraas, in vineyards and waste ground throughout Greece and the Greek islands: by Forskal, and Delile, in Egypt and called "sjætaredj," in which we recognize the "shahtarraj" of Ebn Masawia, Ebn Amran, Elisraeli, Rhazes, Elgafaki, and Ebn Baitar; "aqua" and "syrupus fumarie" are besides enumerated by Forskal mat. med. as employed medicinally in Egypt; and *F. officinalis* was observed by him in the higher mountain-region of Yemen and called "summina." Farther East, was observed by Thunberg frequent everywhere in Japan and called "karas no ninsin" or "fingosakf." By European colonists, was carried to Northeast America, where it has become a weed in waste and cultivated ground. The juice according to Lindley "was formerly administered in cutaneous diseases and obstructions of the liver." (See *F. parviflora* and *F. capreolata*.)

Geranium pratense of Europe and the adjoining portion of Asia. Called in Britain *crowfoot* or *cranesbill* (Prior), and the ΓΕΡΑΝΟΠΟΔΙΟΝ of Syn. Diosc. iii. 104 — (mistaken for *Agrostemma coronaria*?), may be compared: *G. pratense* was observed by Sibthorp around Constantinople; and is known to grow as far as Northern Japan (Sieb.). Westward, is termed "g. batrachioides gratia Dei Germanorum" by Tournefort inst. 266; and is known to grow throughout middle Europe as far as Britain (Cav. iv. pl. 87, Curt. lond. iv. pl. 49, and Pers.).

Erodium moschatum of Europe and the adjoining portion of Asia. Called in Greece "mōskō-lahanōn," and the ΜΥΡΡΙC or ΜΕΡΤΥΞ of Syn. Diosc. iii. 121, — identified by Pliny xxvi. 68 with the "geranion" resembling "cicutae" but having a shorter stem, finer leaves, and agreeable in taste and odour, is referred here by Fraas: the "herbæ moschatae" is mentioned by Nicolaus Myrepsus iii. 46: *E. moschatum* was observed by Sibthorp, Bory, and Fraas, frequent in the Peloponnesus; is known to grow also in Siberia (Pers.). Westward, is termed "acus moschata" by Euricius Cordus (Spreng.), "g. cicutæ folio moschatum" by Tournefort inst. 268; and is known to grow in Barbary and throughout middle Europe as far as Britain (Jacq. hort. i. pl. 55, and Engl. bot. pl. 902). By European colonists, was carried to Austral Africa, Brazil, and Peru (Pers.).

Berberis vulgaris of Europe and the adjoining portion of Asia. Called in Britain *barberry* or *berberry* (Prior), in France "epine-vinette" (Nugent), in Italy "berberi" or "crespino" or "trespino" (Lenz), in Greece "ōxuakantha" (Sibth.); in which we recognize the ΟΞΥΑΚΑΝΘΑ of Syn. Diosc. i. 123, — identified by Serapion with the "amir beris" or "berbaris" or "atsrar;" the "amyrberis" is mentioned by Avicenna (Prior), and the "azrur" by Ebn Baitar: *B. vulgaris* was observed by Sibthorp, and Chaubard, in the Peloponnesus; is known to grow on Lebanon (Pers.); and its fruit, imported "from Greece," is enumerated by Rhazes, Alpinus, and Forskal mat. med. as employed medicinally in Egypt. Westward, the "spina appendix" having according to Pliny xxiv. 70 scarlet berries called "appendices," is referred here by writers: *B. vulgaris* is described by Matthæus Sylvaticus 38, Valerius Cordus, and Gerarde; is identified with the "amyrberis" of the Arabs in the *Ortus sanitatis* 55 (Prior); is termed "b. dumetorum" by Tournefort inst. 614; is known to grow in Italy and throughout middle Europe as far as Norway (A. Dec.), but is regarded by Watson as perhaps exotic in Britain. By European colonists, was carried to Northeast America, where it has become naturalized from Newfoundland to the environs of Boston. The bark according to Lindley

* *Magnolia hypoleuca* of Japan, as far as Yesso. Called by the Ainos "ikajubni" (Sieb.), in Japan "honoki," and possibly as early as this date used for scabbards by the Japanese — (see Jap. centen. comm. 31 and 88); by the Ainos, for quivers (Sieb.).

Isolepis sp. of Japan. A rush from early times used for "mattings of better quality" in the province of Bingo — (Jap. centen. comm. 74).

Hydropyrum latifolium of Japan. From early times used in Japan "for commoner mattings" — (Jap. centen. comm. 74). The plant, from transported specimens, described by Grisebach.

is "astringent," and "a refreshing drink prepared by crushing the fruit in water is considered serviceable in fevers." (See *Crategus pyracantha*).

Hippuris vulgaris of Northern climates. Called in Italy "coda di cavallo" (Lenz), in Britain in old herbals "female horsetail," and by modern botanists *mare's-tail* (Prior), the ΓΥΝΟΝ or ΕΚΥΤΙΟΝ identified in Syn. Diosc. iv. 47 with the ΚΑΛΙΞ : ΕΚΥΝΑ of the Romans, — may be compared: *H. vulgaris* has not been observed in Greece, but is known to grow from "Lat. 44°" in Italy throughout middle and Northern Europe as far as Lapland, the Shetland Islands, and Iceland (Hook., Dec., Fries, Bertol., and A. Dec.), is figured in manuscripts T and G of the latin Apuleius 40, and is described by Matthioli p. 676, and Dodoens p. 113 (Spreng.). Eastward, is known to grow in the river Terek, and from Affganistan throughout Siberia to the mouths of the Obi and Lena and to Kamtschatka. Farther East, is known to grow from Bering's Straits and "Lat. 60°" to Norfolk Sound, the Saskatchewan, Newfoundland (Mert., Drumm., and Hook.), Labrador (Mey.), and Greenland (Wats.); was observed by myself at the Southern extreme of Nova Scotia, by Eaton in "Lat. 43°" in the Hudson river, and by Short in Kentucky. In the Southern Hemisphere, was observed by J. D. Hooker fl. ant. ii. p. 73 at the abandoned settlement at Port Famine in the Straits of Magellan.

Linum Gallicum of the Mediterranean countries. Called in Greece "linōn" (Sibth.), in Italy "lino silvestre" (Riccio, and Targ.), and possibly the ΛΙΝΟΝ : ΑΓΡΙΟΝ identified in Syn. Diosc. ii. 125 with the ΛΙΝΟΥΜ : ΑΓΡΕΚΤΕΜ or ΛΙΝΟΜΥΡΟΥΜ of the Romans: — *L. Gallicum* is termed "lino salvatico" by Matthioli (Targ.), "l. sylvestre minus luteum annuum folio latiore" by Tournefort inst. 340, "l. maritimum" by Lamarck fl. fr., and is known to grow from Montpellier to the hills near Genoa (Ger. prov. pl. 15, Viviani, and Pers.); was observed by Sibthorp, and Chaubard, from the Peloponnesus to the Greek islands.

Iberis amara of the Mediterranean countries. Called in Germany "bitterer bauernsenf" (Fraas), and the ΚΙΝΗΤΗ : ΑΓΡΙΟΝ or ΚΙΝΗΤΗ : ΠΕΡΣΙΚΟΝ of Syn. Diosc. ii. 185 — may be compared: *I. amara* is described by Linnæus; was observed by Fraas not rare in Greece; by Lenz, to all appearance wild in Italy; is known to grow as far as Switzerland and Germany (Crantz, and Pers.); but in Britain occurs only in cultivated ground (engl. bot. pl. 52. and A. Dec.).

Picridium perenne of the East Mediterranean countries. Called in Greece "agria pikralitha" (Fraas), and the ΑΓΡΙΑ : ΠΙΚΡΙΚ of Syn. Diosc. ii. 159 — may be compared: *P. perenne* is described by Sprengel; and was observed by Fraas frequent in rocky situations in and around the Peloponnesus.

Rhinanthus minor of Northern and Subarctic climates. Called in Britain *rattle-box* or *yellow rattle* (Prior), in Italy "cresta di gallo" (Lenz), in which we recognize the ΚΡΙΣΤΑ : ΓΑΛΛΙΝΑ ΚΕΑ of the Romans in Syn. Diosc. iv. 60, — or the "crista" described by Pliny xxvii. 23 as having leaves that resemble a cock's comb, a slender stem, and pods containing black seeds which when placed under the eyelids traverse around and finally come out: *R. minor*, distinguished by C. Ch. Gmelin (Steud.), is known to grow on the Appenines and in Spain, and throughout middle and Northern Europe as far as Lapland and Iceland (Ehrh. 46, Fries, Hook., and A. Dec.). Eastward, has not been observed in Greece, but is known to grow on the Taurian mountains and in Persia and throughout Siberia as far as Lake Baikal (Gmel., Pall., and Bieb.). Farther East, was observed by Chamisso on Unalascha; by Scouler on the Lower Columbia, by Drummond on the Rocky mountains; is known to grow also from Slave Lake and Fort Franklin throughout Canada to Newfoundland and Greenland (Hook., and Wats.); has been observed by myself in grass-grown clearings from the Lower St. Lawrence to Salem in New England, and is known to occur as far as Lat. 42° at Plymouth (A. Gray).

Rhinanthus alpinus of Eastern Europe. The "alectorolophos" supposed by Pliny to be identical with the Italian plant, — mentioned also by Aelian (Ainsw. dict.), is referred here by Fraas: *R. alpinus* is described by Baumgarten, and was observed by Fraas on mount Pindus at the elevation of "four thousand" feet.

Veronica anagallis of Northern climates. Called in Britain by Lyte *water-pimpernell* (Prior), in accordance with the ΑΝΑΓΑΛΛΙΣ : ΕΝΥΔΡΟΚ of Syn. Diosc. ii. 153 — indirectly referred here by Fuchsius (Spreng.): *V. anagallis* was observed by Forskal, Sibthorp, and Chaubard, frequent in rills and ditches from the Peloponnesus to the Greek islands and Smyrna; is known to grow also from Northern Hindustan throughout middle Asia to China and Kamtschatka (Gmel., Ledeb., and Benth.), and was observed by Thunberg in Japan, called there "kalen so." Southward from Greece, the "karrat elain" of Gafeki, and Ebn Baitar, is referred here by Sontheimer: *V. anagallis* was observed by Delile around Rosetta, is known to grow on mount Sinai (Benth.), was observed by Forskal among the mountains of Yemen, and is known to grow in Abyssinia (Rich.). Westward, is termed "*v. aquatica major et minor folio oblongo*" by Tournefort inst. 145; and is known to grow in Italy, Algeria, Portugal, the Canary Islands, Madeira, the Azores, and throughout middle and North-

ern Europe as far as Sweden and Iceland (Brot., Savi, Wats., Hook., and A. Dec.). Farther West the "blew-flowered pimpernel" was observed by Josselyn in New England prior to 1670; *V. anagallis* is known to grow throughout Canada and our Atlantic States as far as South Carolina and Texas (Beck, Berland., and Hook.), also on the Platte, the Rocky mountains (E. James, and Drumm.), and along the Pacific coast to Sitka and Norfolk Sound (Cham., Mert., and Bong.). Probably by European colonists, as suggested by Bentham, carried to Austral Africa, where it continues rare (A. Dec.).

Veronica beccabunga of Northern climates. Called in Britain *brooklime*, in Old English "brok-lempe" or "brok-lympe" (Prior), in Icelandic "lemiki" (Cockayne), by the Turks "becabunga," and possibly included in the "anagallis ênuthrôs" of Syn. Diosc.:—*V. beccabunga* was observed by Sibthorp, and Chaubard, in the outflowing water of springs from Constantinople to the Peloponnesus; is known to grow also on Caucasus, and from Cabul and the Himalayas throughout Siberia to Behring's Island (Gmel., Bieb., and Ledeb.). Southward from Greece, is enumerated by Clot-Bey and Figari as observed in Egypt; and is known to grow on the mountains of Abyssinia (A. Dec.). Westward, the "hleomoce" growing in brooks of the Anglo-Saxon Leechbook i. 38. 4 is referred here by Cockayne: *V. beccabunga* is described by Fuchsius 725; is termed "*v. aquatica major folio subrotundo*" by Tournefort inst. 145; and is known to grow in Italy, Algeria, Spain, Portugal, and throughout middle and Northern Europe as far as Finland and Sweden in "Lat. 63°" and Iceland (Savi, Brot., Hook., and Wahl.). Farther West, is known to grow from Norway House throughout Canada and as far South as Lat. 40° in our Atlantic States (Hook., and Conrad).

Cyclamen Europæum of the West Mediterranean countries. Called in Spain "pan de puerco," in France "pain de pourceau" (Spreng.), in Italy "pamporcino" or "artanita" or "ciclamino" (Lenz), in which we recognize the "cyclaminos" identified by Pliny xxv. 67 with the "tuber terrae;" the ΠΑΠΟΥΜ:ΤΕΡΡΑΙ or ΟΥΜΒΙΛΙΚΟΥΜ:ΤΕΡΡΑΙ or ΑΡΚΑΡΑ of the Romans in Syn. Diosc. ii. 193 — may therefore be compared: the "cyclaminos" is described by Pliny as growing in Italy in shaded situations and sometimes cultivated, but his account seems in part taken from Dioscorides: *C. Europæum* is termed "*c. orbiculato folio inferne purpurascens*" by Tournefort inst. 151, and is known to grow in Italy and as far as middle Europe (Jacq. austr. pl. 401, Pers., and Lenz). Farther South, the "kuklaminôs" is identified by Apuleius with the "palalia;" *C. Europæum* is called in Arabic "arthanitsa" (Spreng., the origin of one Italian name), and the "bachur mariam" of Ebn Baitar is referred here by writers.

Juniperus excelsa of the East Mediterranean and Tauro-Caspian countries. The ΑΡΚΕΥΘΟC: ΜΕΓΑΛΗ of Syn. Diosc. i. 103, resembling the ΚΥΠΑΡΙCΣΩ and generally known, growing in rough broken situations and along the sea, — may be compared: *J. excelsa* is termed "*j. sabina var. taurica*" by Pallas; was observed by Fraas in Greece, often "twenty feet high;" by Grisebach, on the Greek islands and in Asia Minor (Daub.); is known to grow in Tauria and towards the Caspian (Willd., Pers., and Bieb.), also in Syria and Arabia (Lenz. See *J. drupacea*).

Orchis morio of Europe and the adjoining portion of Asia. Called in Britain *gandergoose* (Ainsw.), in Germany "knabwurz" (Fraas), in Greece "ôura tōu lagōu" (Sibth.); and the ΚΥΝΟC: ΟΡΧΙΝ of Syn. Diosc. iii. 131, — and Galen (Orib. xiv. 23), written "cynosorchin" by Pliny xxvii. 42, is referred here by writers: the "chusa elkab" is mentioned also by Ebn Baitar: *O. morio* was observed by Sibthorp, and Fraas, frequent from Attica to Cyprus and Constantinople, its dried root cooked and eaten. Westward, the "*altera satyrios orchis*" considered "femina" and its root worn as an amulet according to Pliny xxvi. 62, may be compared: *O. morio* is described by Fuchsius p. 554 (Spreng.); is termed "*O. morio fœmina*" by Tournefort inst. 433; and is known to grow throughout middle Europe as far as Britain (Vaill. pl. 31, Curt. lond. iii. pl. 59, and Pers.).

Orchis mascula of Europe and the adjoining portion of Asia. Included at least in the old English *ragwort*, and German "ragwurz" (see Prior, and Lenz); and associated with the preceding as early perhaps as this date:—*O. mascula* was observed by Sibthorp, Chaubard, and Fraas, in the Peloponnesus and on Parnassus, its dried root cooked and eaten. Westward, a double root is attributed to the "satyrior" by Pliny xxvi. 62: *O. mascula* is described by Brunfels p. 104, and Fuchsius p. 554; is termed "*o. morio mas foliis maculatis*" by Tournefort inst. 432; was observed by Haller pl. 33 in Switzerland; and is known to grow throughout middle Europe as far as Scotland and Denmark (fl. Dan. pl. 457, Pers., and A. Dec.).

Orchis coriophora of Europe and the adjoining portion of Asia. Possibly included: — observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Constantinople, its dried root cooked and eaten. Westward, is termed "*o. odore hirci minor*" by Tournefort inst. 443, "*o. cimicina*" by Crantz; was observed by Haller pl. 34 in Switzerland; is known to grow in various parts of Southern Europe, and as far as the environs of Paris (Vaill. par. pl. 31, Jacq. austr. ii. pl. 122, and Pers.).

"75 A. D." (Sueton., Dio, Euseb., and Clint.), the temple of Peace near the Roman Forum completed; together with a colossal statue "one hundred and twenty-eight cubits" high.

Asperugo procumbens of Europe and the adjoining portion of Asia. Called in Britain *madwort* (Prior), in Greece "köllētitha," and the ΑΛΥC C O C of Antonius of Cos, — described by Galen antid. ii. p. 168 as resembling horehound, more rough and prickly about the balls and the flower blue, may be compared: *A. procumbens* was observed by Sibthorp, Chaubard, and Fraas, in waste places in the Peloponnesus, Attica, and Cyprus. Westward, the "alysson" named from preventing madness from a dog's bite is further described by Pliny xxiv. 57 as differing from "rubiam" madder "foliis tantum et ramis minoribus:" *A. procumbens* is described by Gerarde; is termed "a. vulgaris" by Tournefort inst. 135; is known to occur in waste places in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 552, and Pers.); but has not been observed in Ireland (Mackay, and Power), was known to Ray in only one locality in Britain, and is regarded by A. Decandolle as a naturalized exotic.

"76 A. D. = 'kian-tsou,' 1st year of Hiao-tchang-ti" or Tchang-ti, of the Han or Seventh dynasty — (Chinese chron. table).

"The same year" (Abyss. chron., C. Mull. geogr. min. p. xcvi, and M. Russel p. 109), Za-Malis succeeded by Za-Hakale, now king of Abyssinia. — He is called Zoskales in the Erythræan periplus.

The ΠΕΡΚΗ of the Rhine of Xenocrates aquat., — is referred by writers to the *perch*, *P. fluviatilis*, inhabiting the rivers and lakes of middle and Northern Europe.

"77 A. D." (Hieronym., and Clint), the celebrated rhetor Gabinianus teaching in Gaul.

"In this year" (Plin. i. 1, Sm. b. d., and C. Mull.), Pliny dedicating his "Naturalis Historia" to Titus, now for the sixth time consul.

In the days of Pliny . . . , commerce with India in no year drained the Roman Empire of less than "five hundred and fifty millions of sesterces" (estimated by Major "at about £1,400,000"), the return being wares sold at fully one hundred times their prime cost.

The "jamben" of Pliny vi. 33 is identified by C. Muller (geogr. min. i. p. 169) with Yambo on the Red Sea. At Zanzibar the Soahili salutation is "yambo," and the word has appeared to me to belong to the Negro class of languages. The Arabs on the Red Sea and outer coast of Arabia doubtless held commercial intercourse with Zanzibar as early as the time of Pliny. (See *Amomum zingiber*.)

The city of "Omanæ" is mentioned by Pliny vi. 149 as one of the "oppidi Omanorum." The name may have been derived from the Persian deity "Omanōs," mentioned by Strabo xi. 8. 4 and xv. 3. 15. — In conversing with inhabitants of Mocha, I found the term "Oman" extended to the whole Eastern extremity of Arabia.

The ASTROBOLVS of Pliny, described as "a gem like a fish's eye," may be compared with the lens or hardened portion of the eye of *cuttle-fish*, *Sepiadæ*. Hemispheroidal pearl-like granules that seemed to have this origin, were observed by myself among gems exhumed in Egypt.

The earliest notice of SAPO *soap* is by Pliny; who terms it an "invention of the Gauls" (F. Adams): — "sapōn" is also mentioned by Galen, Aretæus, and Paulus Aegineta; and "sabun," by Serapion, Avicenna, and Ebn Baitar.

Ranunculus polyanthemus of Western Europe. The POLYANTHEMV M, ulcerating according to Pliny xxvii. 90 and by some called BATRACHION, — is referred here by Linnæus, and Sprengel: *R. polyanthemus* is known to grow in France and middle Europe (Crantz, Pers., Gilib., Neck., and Steud.).

Actæa spicata of Europe and Northern Asia. Called in Britain *baneberry* (Prior), in Italy "barba di capro" (Lenz): the ACTÆA growing according to Pliny xxvii. 26 in deep-shaded rough watery places, its stems geniculate and ASPERIS, berries soft SEMINE · NIGRO, — is referred here by writers: *A. spicata* is termed "christophoriana vulgaris nostras racemosa et ramosa" by Tournefort inst. 299; is known to grow in Italy, Switzerland and throughout middle and Northern Europe (Hill herb. p. 320, Hall. helv. 1076, fl. Dan. pl. 589, and Pers.). Eastward, was observed by Sibthorp in wooded situations on the mountains of the Peloponnesus; is known to grow also on Caucasus and in Siberia (Lindl). The roots according to Lindley are "antispasmodic, expectorant, astringent."

Fumaria capreolata of the Mediterranean countries. Called in Greece "staktēri" ashes, or "kapnōhōrtōn" (Sibth.), in which we recognize the CAPNOS PRIMA or PEDES GALLINACEOS growing according to Pliny xxv. 98 on walls and along hedges, its branches extremely slender, flower PVRPVREO · VIRIDIS, and juice removing dimness from the eyes: — the "kapnōs hēlithōniōn" of the collyrium of Martianus is mentioned by Aetius ii. 3. 109 and iii. 2 (Dod.): *F. capreolata* is termed "f. viticulis et capreolis plantis vicinis adhærens" by Tournefort inst. 422; is known to grow in Italy and Southern France, and even in England (Curt. lond. vi. pl. 47, Pers., and Lenz). Eastward, was observed by Sibthorp, and Chaubard, on walls and in cultivated ground in Greece and on the Greek islands: and by Forskal, and Delile, around Alexandria and Cairo. (See *F. parviflora*).

Elatine hydropiper of Western Europe. Called in Britain *water-wort* or *water-pepper* (Prior), and the CALLITRICHE hot to the taste according to Pliny xxv. 86, growing in wet shaded situations, its leaves lentil-like, stems resembling a slender rush, and root diminutive, — may be compared: “waeter-wyrt” is mentioned in the Anglo-Saxon transl. Apul. 48; “piper aqua.” is enumerated among potherbs by Franciscus Pedemontium; and *E. hydropiper* is known to grow throughout middle Europe (Vaill. par. pl. 2, Hoffm. germ., Schuhr pl. 109, and Pers.).

Sinapis juncea of Eastern Asia. The *Indian mustard* is called in Egypt “kabar” and the seeds “khardel” (Forsk., and Del.), in Sanscrit “sarshapa” (J. F. Wats.), in Hindustanee “sarsaf,” in Bengalee “sarshapa” or “sarshya” (D’roz.) or “rai,” in Tamil “kudaghoo” (Drur.); and the third or GRACILE kind of SINAPI, mentioned by Pliny xix. 54 to xx. 87, as well as the mustard seed brought from Egypt. — may be compared: *S. juncea* was observed by Delile in the cultivated fields of Egypt. Eastward, the protecting flour on a boy’s forehead mentioned by Bhavabhuti 9 — is referred by H. H. Wilson to white mustard; and the “sarshapa” as an external application is prescribed in the stanzas of the Ayurvedas (Susrut. chik 5): *S. juncea*, according to Wight i. 20, and Drury, is cultivated all over India; is known to occur also in China (Pers.).

Dentaria enneaphylla of the mountains of Austria as far as Italy. The ENNEAPHYLLON having according to Pliny xxvii. 54 nine long leaves and exciting pustules if applied externally, — is referred here by writers: *D. enneaphylla* is described by Linnæus; was observed by Scopoli in Carniolia; and is known to grow in calcareous soil on the mountains of Austria as far as Silesia (Jacq. austr. pl. 316, Pers., Grabowsk., and A. Dec.).

Reseda alba of the Mediterranean countries. Called in France with other species “reseda” (Nugent), in Germany “resede” or “resedenkraut” (Grieb), in Greece “aggēiōtra” or “ōhētra” (Sibth.), and the RESEDAM herb of Pliny xxvii. 106 — is referred here by Sprengel: *R. alba* is termed “*r. foliis calcitrapæ flore albo*” by Tournefort inst. 423?; was observed by Forskal among rubbish on Malta; and is known to grow in Barbary, Spain, and as far as Montpellier in France (Pers., Dec. fl. fr., and Steud.). Eastward, was observed by Sibthorp in the Peloponnesus.

Lychnis vespertina of Europe and the adjoining portion of Asia. The MALVNDROM herb, growing according to Pliny xxvi. 24 in meads and grain-fields, its flower white and fragrant, — is referred here by Clusius, Sprengel, and others: *L. vespertina* is termed “*l. sylvestris alba*” by Tournefort inst. 334; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 792, and Engl. bot. pl. 1580), its flowers becoming fragrant at night (Pers.). Eastward, was observed by Sibthorp in shaded situations around Constantinople.

Lychnis dioica, having purple flowers — but usually regarded as not distinct: termed “*l. sylvestris*” by Dodoens pempt. 171, “*l. s. seu aquatica purpurea simplex*” by C. Bauhin pin. 204. “*l. diurna*” by Sibthorp oxon., and known to grow throughout middle Europe (Pers.): observed by Roehling in Germany (Steud.): by Linnæus, in the mountain-valleys of Lapland, but the flower more frequently white “*quæ naturaliter purpurea est.*” Westward, “*L. dioica*” was observed by Sabine in Greenland (Hook.).

Lychnis flos-cuculi of Europe and the adjoining portion of Asia. Called in Britain *cuckoo flower* or *cuckoo gilliflower* or *rugged robin*, in France “*robinet déchiré*” (Prior), in Italy “*oculus Christi*” (Riccio, and Targ.), and the ASYLA or FERVS·OCVLVS of Pliny xxv. 92, sought by cattle that have eaten the blue ANAGALLIDA, — may be compared: *L. flos-cuculi* is described by Tragus 403 (Spreng.); is termed “*l. pratensis flore laciniato*” by Tournefort inst. 336; is known to grow from Denmark throughout middle Europe (fl. Dan. pl. 500. Curt. lond. i. pl. 33, and Lam. fl. fr.); was observed by Sibthorp, and Chaubard, in moist grassy meads in the Peloponnesus.

Cucubalus bacciferus of Western Europe. The CVCVLVS of Pliny xxvii. 44, by some called STRVMVM, by others STRYCHNON, having black berries and its leaves used against the stings of serpents and scorpions, — may be compared: *C. bacciferus* was observed by Lucas Ghini (Dalech. 1429, and Spreng. comm. Diosc. ii. 194); by Scopoli, in Carniolia; termed “*lychnanthus volubilis*” by S. G. Gmelin (Steud.); known to grow in woods as far as Paris and Maestricht (Mill. pl. 112, Pers., and fl. Bat.), and formerly on an islet in Thames (A. Dec.).

Gypsophila struthium of Spain. The imported root called in Italy “*strutio*” or “*struzio*” (Targ.), and possibly the RADICVLA mentioned by Pliny xix. 18 as preserved or stored for washing woolen garments: — *G. struthium* was sent by Ferrandus Imperatus to C. Bauhin, its root used by the Neapolitans as a substitute for soap, and believed to be the “*khondus*” of the Arabs (C. B. pin. 206, and Spreng.): *G. struthium* is termed “*radicetta*” by Matthioli (Targ.), is described also by Boccone mus. ii. pl. 122, and Barrelier rar. pl. 119, is known to grow in Spain (Pers.), and its root is imported from Spain into Italy (Targ.).

Silene spinescens of the East Mediterranean countries. The STRUTHION described by Pliny xix. 18 as SPINOSA·ET·CAVLE·LANVGINOSO spinous and with a woolly stem, — may be compared: *S. spinosa*, described by Sibthorp as having opposite spinescent branches and leaves pubescent on all sides, was observed by him in Asia Minor.

Saponaria vaccaria of Europe and the adjoining portion of Asia. The CONDVRDVM herb, belonging according to Pliny xxvi. 14 to the time of the Solstice and bearing a red flower,—is referred here by Sprengel: *S. vaccaria* was observed by Sibthorp frequent in Greece and on the Greek islands; is known to occur in the Ukraine and about Caucasus and along the Altaian mountains as far as Semipalatinsk (Kar. and Kir. in Ledeb.). Westward, is described by Lobel adv. p. 148; is termed “*lychnis segetum rubra foliis perfoliatæ*” by Tournefort inst. 335; and is known to occur in waste and cultivated ground throughout middle Europe as far as the Baltic and “Lat. 54° 30’,” occasionally making its appearance in Britain (Wats., and A. Dec.). By European colonists, was carried to Northeast America, where it has been observed by A. Gray “escaped from gardens and becoming spontaneous in some places” in our Middle States.

Vicia cracca of Europe and the adjoining portion of Asia. A *vetch* called in Denmark “*fuglevikker*” (Cockayne), in Germany “*vogelwicke*,” in Italy “*vezzon*” (Lenz), in Greece “*agriōs vikōs*” (Fraas): the CRACCA according to Pliny degenerating from legumes and grateful to pigeons—is referred here by writers: and the “*fugeles bean*” of gloss. Laud. 567, is referred here by Cockayne: *V. cracca* is described by Clusius ii. 235; is termed “*v. multiflora*” by Tournefort inst. 397; and is known to grow in Italy, Barbary, and throughout middle and Northern Europe as far as Lapland (Lam. fl. fr., fl. Dan. pl. 804, Pers., and Wats.). Eastward, was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus to Caria and Cyprus; and is known to occur in cultivated ground in the Tauro-Caspian countries (Bieb.). By European colonists, was carried to Iceland (Hook.), Greenland (Wats.), Newfoundland (Hook.), and thence perhaps to Canada and our Atlantic States, where it has been observed by myself, sometimes in wild situations, from the Lower St. Lawrence throughout New England; is known to occur also as far inland as Kentucky (A. Gray).

Anthyllis barba-jovis of the Mediterranean countries. The BARBA-IOVIS enumerated by Pliny xvi. 31 among woody plants avoiding water, and further mentioned as clipped in ornamental gardens into roundness, the leaves silvery,—is referred here by writers: *A. barba jovis* is termed “*barba jovis pulchre lucens*” by Tournefort inst. 651; was observed by Sibthorp on the isle of Capri, and is known to grow on rocks in other parts of Italy and as far as Spain (Mill. pl. 41, Lam. fl. fr., Pers., and Lenz). Eastward, was observed by Gittard on the mountains around Philiatra in the Peloponnesus (Bory).

Ononis natrix of Europe and the adjoining portion of Asia. Called in Italy “*erba bacaja*” (Lenz): the NATRIX herb of Pliny xxvii. 83,—is referred here by writers: *O. natrix* is termed “*natrix*” by Rivinus tetr. pl. 69, “*anonis viscosa spinis carens lutea major*” by Tournefort inst. 409; and is known to grow from Italy throughout France and middle Europe (Mill. pl. 37, Pers., and Lenz). Eastward, was observed by Sibthorp in the Peloponnesus, and along roadsides near Smyrna.

Cotoneaster vulgaris of Europe and the adjoining portion of Asia. The GALLICVM mentioned among the three kinds of MESPILIS by Pliny xv. 22—may be compared: *C. vulgaris* is described by Linnæus; and is known to grow in Switzerland and on the Pyrenees and throughout middle and Northern Europe as far as “Lat. 58°” in Norway (fl. Dan. pl. 112, Pers., Fries, and A. Dec.). Eastward, was observed by Veit in Asia Minor (Fraas); and is known to grow on the mountains of the Crimea, Caucasus, and in Siberia (Ledeb.).

Pyrus (Aria) torminalis of Europe and the adjoining portion of Asia. Called in Italy “*ciavardello*” or “*sorbo torminale*” (Lenz), in which we recognize the TORMINALE described by Pliny xv. 23 as a fourth kind of SORBA, having the smallest fruit and leaves almost those of PLATANUS,—referred here by writers: *A. torminalis* is termed “*c. folio laciniato*” by Tournefort inst. 633; is known to grow in Italy and Austria (Jacq. austr. pl. 443, Crantz, Pers., and Lenz); and was observed by Sibthorp on mount Athos and around Constantinople.

Sorbus aucuparia of Northern Europe and Asia. Called in Britain *mountain ash* or *wild service tree* or *rowan* or *roan tree*, in the Northern counties *ran* or *royne*, in Danish and Swedish “*rönn*” or “*runn*” (Prior); and the SORBIS-TRITIS with which CINNABARI was adulterated in the days of Pliny xxxiii. 39—may be compared: *S. aucuparia* has long been held sacred in the North, “supposed to have power to avert the evil eye,” and its wood used for carving runes or charms upon (Jamieson, and Prior); is known to grow in Labrador (Meyer), Greenland (Wats.), Iceland, and from Cape North in Lat. 71° to 47° 30’ in Bretagne, and on mountains as far as Switzerland and the Pyrenees (Martins, and A. Dec.). Eastward, was observed by Sibthorp on mount Athos; is known to grow also on the mountains of the Crimea and Caucasus, and as far as Obdorsk and beyond in Siberia (A. Dec.) By European colonists, was carried to Northeast America, where it continues to be planted for ornament.

Rosa villosa of Europe and the adjoining portion of Asia. The ALABANDICAM-VILIOREM ALBICANTIBVS-FOLIIS of Pliny xxi. 10—is referred here by Sprengel: *R. villosa* is termed

"*r. sylvestris pomifera major*" by Bauhin, and Tournefort inst. 638, and is known to grow in the woods of middle Europe (Pers., and engl. bot. pl. 583); was observed by Sibthorp on mount Athos.

Rosa montana of Western Europe. A white-flowered species called in Italy "*rosa di macchia*" or "*spine bianche*" (Targ.), and the SPINA ALBA of Pliny xv. 34, its POMVM being the stem itself, — may be compared: *R. montana* is termed "*r. myrtifolia*" by the younger Haller, "*r. olei-carpa*" and "*r. sepium*" by Thuillier, "*r. biserrata*" by Merat, was observed by Villars in Dauphiny, by C. Ch. Gmelin near Baden and termed "*r. agrestis*" (Steud.); by O. Targioni-Tozzetti, in open uncultivated places and along hedges in Italy.

Rosa pimpinellifolia of the Mediterranean countries. A small species called in Italy "*rosa pimpinella*" (Targ.), and the SPINEA or SPINEOLA of Pliny xxi. 10, a kind of rose with small leaves — (Ainsw.), may be compared: *R. pimpinellifolia* is described by Linnæus, and is known to grow in Southern Europe (Pers.).

Rosa alba of Western Europe. The PRAECOX CAMPANA rose of Pliny xxi. 10, one of the two CELEBERRIMA species, — is referred here by Sprengel: *R. alba* is described by Duhamel, Linnæus, and in fl. dan. pl. 1215; is termed "*r. usitatissima*" by Gatereau (Steud.); is well known in the gardens of Europe (Pers.); and was observed by Delile in gardens at Cairo.

Rosa Provincialis of Western Europe. Called in Britain *Province rose* from the village of Provins near Paris where it used to be cultivated (Prior), in France "*roses pompones*" (Pers.): the PRAENESTINA rose of Pliny xxi. 10, one of the two CELEBERRIMA kinds, — is referred here by Clusius (Spreng.): *R. Provincialis* is described by Ehrhart, Poiret, Dumont de Courset, and Roesig (Steud.); was observed by C. Ch. Gmelin near Baden; is known to grow also in Bohemia, Italy, France, and Spain (Pers.).

Rosa rubiginosa of Europe and the adjoining portion of Asia. Called in Britain *sweetbriar* (Prior), and the RVBORVM ROSA growing according to Pliny xxi. 10 and xxiv. 74 on the RVBO and even there having a pleasant odour, — may be compared: the "*bramble flour that bereth the red hepe*" of Chaucer 13676, may also be compared: the "*swete lreere*" is mentioned by Turner pl.: *R. rubiginosa* is termed "*r. sylvestris foliis odoratis*" by Tournefort inst. 638, "*r. fol. subtus rubiginosis*" by Haller; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 870, Lightf., Jacq. austr. pl. 50, and Pers.). Eastward, was observed by Sibthorp in the Peloponnesus. By European colonists, was carried prior to 1670 (Josselyn) to Northeast America, where it has become naturalized; was also carried to Hindustan, where it continues "in gardens, a delicate plant" (Graham); and to Burmah (Mason).

Geum urbanum of Europe and the adjoining portion of Asia. Called in Britain *avens* or *herb bennet*, by Topsell and Askham "*avance*," by Galfridus pr. pm. "*avence*," in medieval Latin "*avencia*" or "*avantia*" (Prior), in Germany "*nelkenwurz*," in Italy "*cariofillata*" (Lenz), and the GEVM having according to Pliny xxvi. 21 slender black fragrant roots of an agreeable flavour, — is referred here by writers: the "*herba benedicta*" is mentioned by Platearius, and the "*anancia*" in the *Ortus sanitatis* (Prior): *G. urbanum* is termed "*caryophyllata vulgaris*" by Tournefort inst. 294, and is known to grow in Italy and throughout middle Europe as far as Denmark (Pet. h. brit. pl. 40, fl. Dan. pl. 672, and Pers.). Eastward, was observed by Forskal, Sibthorp, and Fraas, in shaded situations from Constantinople to mount Athos and Corax. The root according to Lindley is "*astrigent*, and in some degree aromatic, said to give an agreeable clove-like flavour to beer and even to wine."

Mesembryanthemum Copticum of the Egyptian Desert. — The ACINOS EPIPETRON-VOCANT that never flowers, enumerated by Pliny xxi. 52 among the esculent plants of Egypt, — may be compared: capsules of "*M. geniculiflorum*" were found by Forskal p. 98 soaked and dried by the Bedouins and the seeds separated for making bread, which however is not eaten by other Arabs; the plant was observed by him, growing in the Desert around the Pyramids, and called "*ghasul*" or "*samhh*;" and by Delile, not far from Cairo in the Desert. (See *M. nodiflorum*.)

Myrrhis temula of Western Europe. The ANTHRISCVS having medicinal properties according to Pliny xxii. 38, — is referred here by Dalechamp 791 (Linn.): *M. temula* is described by Morison 9 pl. 10, is termed "*scandix nutans*" by Moench, and is known to occur along waysides and in cultivated ground throughout Western Europe, the young umbels nodding (Curt. lond. pl., Jacq. austr. pl. 65, and Pers.); was observed by Linnæus in Sweden; by Roth, in Germany; by Pallas, as far as Russia (Steud.).

Oenanthe phellandrium of Northern Europe and Asia. Called in Britain *water-fennel* (Prior), in Germany "*weierfenchel*" or "*wilden fenchel*" (Trag.); and the PHELLANDRION of Pliny xxvii. 101, growing in marshes, its leaf like APII, and its seed used against calculus and other affections of the bladder, — is referred here by writers: *Oe. phellandrium* is described by Tragus 427, and Matthioli 812 (Spreng.): is termed "*phellandrium aquaticum*" by Linnæus; is known to grow in Siberia and the Crimea (Lindl.), and throughout middle and Northern Europe (Engl. bot. pl. 684, fl. Dan. pl. 1154, Crantz, and Pers.). The plant according to Lindley is "*poisonous like*" *Oe. crocata* "but in a less degree."

Eryngium maritimum of the seashore along the Mediterranean and Atlantic as far as Denmark. Called in Britain *sea-holm* or *sea-holly* (Ainsw.), and the ERYNGE or ERYNGION distinguished by Pliny xxii. 8 as growing by the seaside, APII-leaved and more rigid, — may be compared: also the “hiringiu” identified with the “cardus marinus vel benedictus” by Symon Januensis sinon.: *E. maritimum* is described by Parkinson theatr. p. 988, Morison vii. pl. 36, and Tournefort inst. 327; and is known to grow on the seashore of Western Europe (fl. Dan. pl. 875, Engl. bot. pl. 718, and Pers.). Eastward, was observed by Forskal, Sibthorp, and Chaubard, in maritime sand from Constantinople to the Peloponnesus and Greek islands. Having according to Lindley “similar properties” with *E. campestre* “but in a less degree,” *E. maritimum* may furnish a portion of the “eryngium” root found by Forskal mat. med. employed medicinally in Egypt.

Cnidium silaus of middle Europe. Called in Britain *meadow saxifrage* or *pepper saxifrage* (Prior), in Germany “seselkraut” (Grieb), and the SILAVS growing according to Pliny xxvi. 56 in gravelly places along streams, a cubit high and resembling APII, cooked as an acid potherb and besides used medicinally, is referred here by writers: *C. silaus* is described by Tabernaemontanus, and Rivinus pl. 59; and is known to grow in moist situations from Switzerland and Southern France throughout middle Europe as far as Britain (Jacq. austr. pl. 15, Pers., and Spreng.).

Filago Germanica of Europe and the adjoining portion of Asia. Called in Britain *herb impious* (Prior), and the HERBA-IMPIA hoary with the aspect of RORISMARINI according to Pliny xxiv. 113, capitate and giving out branchlets that are capitate, like children rising above their parent, — is referred here by writers: *F. Germanica* is termed “f. seu impia” by Tournefort inst. 454; and is known to occur in pastures and cultivated ground throughout middle Europe as far as Denmark (fl. Dan. pl. 997, Lam. fl. fr., and Pers.). Eastward, was observed by Sibthorp, and Chaubard, frequent from the Peloponnesus to the Greek islands; and by Delile, around Alexandria and Cairo. By European colonists, was carried to Northeast America, where I have occasionally met with it in waste ground in our Northern and middle States.

Bellis perennis of Europe and the adjoining portion of Asia. Called in Britain *daisy*, in Old English and by Chaucer “da'eseyshe,” in Anglo-Saxon “dæges-eage” (Prior), in Germany “ganseblume” or “ganseblumchen” (Grieb), in France “marguerite” (Nugent), in Italy “margheritina” or “primo fiore” or “pratolina” or “bellide” (Lenz), in Greece “asprōlōulōutha,” in which we recognize the *BELLIS* growing IN-PRATIS among grass according to Pliny xxvi. 13, its flower white ALIQVATENVS-RVBENTE to some extent blushing, and when mixed and smeared rendering ARTEMISIA more efficacious: — *B. perennis* is termed “masslieben premula veris” in the Ortus sanitatis pl. 333, “primula veris” by Brunschwygk ii. 8, and Fuchsius pl. 145, “fior di primavera” in French “marguerites” by Matthioli p. 653 (Prior), and is known to grow in grassy situations from Italy throughout middle Europe as far as Denmark (fl. Dan. pl. 503, and Pers.), extensively multiplied in consequence of the removal of the forest. Eastward, was observed by Sibthorp, and Chaubard, throughout Greece and the Greek islands. By European colonists, was carried to Northeast America, where it continues under cultivation only as a favourite greenhouse plant.

Hyoseris minima of Western Europe. A small annual called in Britain *swine succory* (Prior), a translation of the HYOSERIS of Pliny xvii. 64: — *H. minima* is termed “arnoseris pusilla” by Gaertner pl. 157; was observed by Allioni in Northern Italy (Steud.); and is known to grow in sandy soil throughout middle Europe as far as Denmark (fl. Dan. pl. 201, Lam. fl. fr., and Pers.).

Hyoseris scabra of the Mediterranean countries. Possibly the plant in question, the name being of Greek origin, and the HYOSERIS described by Pliny as INTVBO-SIMILIS-SED-MINORET-TACTV-ASPERIOR bruised and applied to wounds: — *H. scabra* is termed “hieracium minimum supinum tragopogoni capitulis” by Boccone pl. 106 as observed in Sicily; was observed by Allioni in Northern Italy (Steud.); is known to grow also in France and Barbary (Pers.); and was observed by Sibthorp in Caria and on Cyprus.

Bellium bellidioides of the Mediterranean countries. The *BELLIO* described by Pliny xxi. 25 as crowned with flowers in the form of little balls, — mentioned also by Apuleius Barbarus 57, is referred here by Billerbeck, and others: *B. bellidioides* is termed “bellis maritima minima roris solis folio Cynæa” by Boccone pl. 107; is described also by Tournefort inst. 491; and is known to grow in Italy, Corsica, and on the Balearic Islands (Pers.). Eastward, was observed by Sibthorp on the islands of Eubœa and Rhodes.

Doronicum scorpioides of the mountains of Western Europe. The *SCORPION* described by Pliny xxv. 75 as GENICVLATA and growing in the shade, — may be compared: *D. scorpioides*, distinguished by its geniculate root, is described by Matthioli p. 762, and Columna (Spreng.); and is known to grow on the mountains of Corsica and France (Pers., Mohl, and A. Dec.).

Callistephus Chinensis of Eastern Asia. Called in Britain *China aster*, in France “reine marguerite” (queen daisy, see Prior, and Graham), in Italy “adoni” or “adonide” (Targ.), in which we recognize the ADONIVM sown in the summer of Pliny xxi. 34: — *C. Chinensis* continues a

favourite garden flower; is described by Dillenius elth. pl. 34. and Knorr del. i. 3; was observed by Forskal in gardens at Constantinople; by Lush, at Dapoorree near Bombay (Graham); by Thunberg, in vases in Japan, but no native name given. By European colonists, was carried to Northeast America, where it continues frequent in gardens.

Artemisia maritima of the North shore of the Mediterranean, and along the Atlantic as far as Norway. The second ARTEMISIA, described by Pliny as tender with more slender leaves and growing only in maritime situations, — may be compared: *A. maritima* was observed by Sibthorp on the shore of the Bosphorus, near Constantinople. Westward, is termed “absinthium seriphium belgicum” by Tournefort inst. 458; and is known to grow on the seashore of Italy and from Belgium to Norway (Engl. bot. pl. 1706, Pers. and Lenz).

Echinops ritro of Europe and the adjoining portion of Asia. Called in English *globe thistle*: the ECHINOPODE according to Pliny xi. 8 one of the two plants from which bees do not procure wax, — mentioned also by Plutarch frat. am. 13, is referred to this tribe by Tournefort: *E. ritro* is termed “ritro flor. caeruleis” by Lobel ic. ii. 8, is described also by Miller pl. 130, and is known to grow on barren hills in France (Lam. fl. fr., and Pers.). Eastward, was observed by Forskal at the Dardanelles; and by Gmelin ii. pl. 46, in Siberia. (See *E. Graecus*)

Inula bubonium of the Uralian plains. The ASTER-AB-ALIQVIBVS-BVBONION of Pliny xxvii. 19 — is referred here by Scopoli and others: *I. bubonium* is described by Tabernæmontanus 543; was observed by Scopoli pl. 58 in Carniola; by Jacquin app. pl. 19, in Austria; is termed “i. salicina” by Pallas (Steud.); and is known to grow as far as the river Donez and Tauria (Pers.).

Carduus erisithales of the mountains of Eastern Europe. The ERISITHALES of Pliny xxvi. 85, — is referred here by Sprengel, and others: *C. erisithales* is described by Linnæus; was observed by Scopoli in Carniola; and is known to grow in subalpine meads on the mountains of Austria (Jacq. austr. pl. 312, Pers., and Steud.).

Carduus leucographus of the Mediterranean countries. The LEVCOGRAPHIS known to Pliny xxvii. 88 only as reported useful against spitting blood, — is referred here by Sprengel: *C. leucographus* is termed “cirsium maculis argenteis notatum” by Tournefort inst. 448; and is known to grow in Italy and Southern France (All. pedem. 529, and Pers.). Eastward, was observed by Sibthorp, and Chaubard, in places somewhat moist in the Peloponnesus.

Cerintho maculata of Europe and the adjoining portion of Asia. The “leucographis” of Pliny — is referred here conjecturally by Dodoens pempt. v. i. pl. 13: *C. maculata* is termed “c. quinquemaculata” by Wahlenberg; was observed by Allioni in Piedmont; by Pallas, and Bieberstein, in the Tauro-Caspian countries (Steud.).

Oxycoenus palustris of Northern climates. Called in Britain *cranberry* or *fen-berry* or *marsh-whorts*, by Lyte vi. 11 “marrish whorts” (Prior): the SAMOLVM-HERBAM growing according to Pliny xxiv. 63 in HUMIDIS wet situations, — is referred here by Ainsworth, and Billerbeck: *O. palustris* is described by Bauhin i. pl. 525; and is known to grow from Switzerland throughout middle and Northern Europe as far as Lapland and Iceland (Hook., Pers., Dec., and Wats.): and Eastward, throughout Siberia to Kamschatka (Gmel.). Farther East, was observed by Chamisso on Unalaska, by Mertens at Norfolk Sound, by Drummond in Lat. 54° on the Saskatchewan; and is known to grow from Baffin’s Bay and Greenland to Newfoundland (Lapylæ, and Wats.) and Lat. 43° in our Atlantic States.

Samolus Valerandi of Temperate Climates. Called in Britain *brook-weed* or *water pimpernell* (Prior), in Italy “samolo” (Targ.), and probably the “samolum” in question: — *S. Valerandi* is termed “s. valerandi” by Bauhin hist. iii. 791, “anagallis aquatica rotundo folio non crenato” by C. Bauhin pin. 252, and known to grow throughout Europe and Northern Asia (Tourn. inst. 103, fl. dan. pl. 198, Curt. lond. iv. pl. 20, Pers., and Wats.): observed by Linnæus, and Wahlenberg, on the seashore of Sweden; by A. Decandolle, inland as far as Switzerland; by Lemann, on Madeira; by Braun, on the Cape Verd Islands; was received by R. Brown from Bornou in Central Africa; by Decandolle, from North Africa; was observed by Forskal on Malta; by Sibthorp, and Chaubard, from Crete to mount Athos and the Bithynian Olympus; by Aucher 2597, in Persia; was received by Bieberstein from Tauria; by Ledebour from Lithuania and Siberia from the Southwest to the Southeast; by Duby from Coromandel in Tropical Hindustan. Westward, by Watson from the Azores; by Hooker from Canada and the Northwest coast of America; was observed by myself along the Atlantic from 43° to 38°; by Pursh, from Canada to Carolina; by Elliot, in South Carolina; by Chapman, in “brackish marshes, Florida to Mississippi, and northward;” by H. Little, near New Orleans; by Short, in Kentucky; by E. James, on the Canadian branch of the Arkansas. In the Southern Hemisphere, by R. Brown in Australia; by Drège, and Burchell, in Austral Africa; by Gay, near Coquimbo in Chili; and was received by Duby from Montevideo. Probably distributed through its seeds enduring transport by ocean currents.

Gentiana asclepiadea of the mountains of Southern Europe and the adjoining portion of Asia. Called in Switzerland "grosse bitterwurz," and the CALATHIANA of Pliny, a flower springing up in autumn without smell — (Ainsw.), is referred to this or an allied species by Gesner ii. fig. 82: *G. asclepiadea* was observed by Gesner in Switzerland, flowering in the autumn; is termed "*G. asclepiadis folio*" by C. Bauhin phyt. 343, and Tournefort inst. 80; is known to grow in the mountainous portion of Spain, Italy, and Austria (Pers.); and was observed by Sibthorp in woods on the Bithynian Olympus.

Vinca major of Western Europe. With *V. minor* called in Britain *periwinkle*, by Chaucer and other old poets "pervenke" or "pervinke" (Prior), in which we recognize the VINCAPERVINCA identified with the CHAMAEDAPHNE of the Greeks by Pliny xxi. 39 and 99, evergreen and employed for TOPIARIA ornamental garden-work, supplying the want of flowers, and having besides medicinal properties: the Latin name — is derived by Prior from "vincire" to bind, and "a garland of pervenke" is mentioned in the Ballad against the Scots (Rits. i. p. 33): *V. major* is known to grow wild in Italy and Southwestern France (A. Dec., and Lenz), is cultivated for ornament throughout Europe, and had become naturalized in Britain before the days of Ray. (See *V. minor*.)

Cynanchum (Sarcostemma) pyrotechnicum of the Egyptian and Arabian Desert. The SCORPIONEM · VEPREM · SINE · FOLIIS growing in Asia, further described by Pliny xiii. 37 and xxii. 17 as having the stem of asparagus and a single terminal spine, — may be compared: *S. pyrotechnicum* was observed by Forskal p. 53 everywhere in Tropical Arabia, and the pith used to receive the fire procured by rubbing together pieces of wood; was observed by Delile near Suez on the Red Sea, and called "mareh;" by myself, along the border of the Desert in Upper Egypt. (See *Ephedra distachya*.)

Anchusa officinalis of Western Europe. Called in Britain *bugloss* (Prior), in Italy "Luglossa" or "buglossa volgare" (Lenz), in which we recognize the BVGLOSSO of Pliny xxvi. 71 said to arrest intermittent fever if gathered and applied in a specified manner, — also the medicinal "vöuglösson" of Galen, and the "buglossa" of Macer Floridus 34 referred here by Baudet: *A. officinalis* is described by Lobel nov. stirp.; is known to occur in waste ground throughout middle Europe as far as Denmark (fl. Dan. pl. 572, Pers., and A. Dec.), but is regarded by Watson and others as not indigenous in Britain. Farther South, "anchusa" root procured by way of Alexandria is enumerated by Forskal mat. med. as employed medicinally in Egypt; and the living *A. officinalis* according to Clot-Bey has been recently introduced. The "buglossum" of European shops is referred here by Lenz.

Echinosperrum spinocarpos of Egypt. The LAPPAGO of Pliny xxvi. 65, distinguished as MOLLVGO and resembling the ANAGALLIDI but more branching, — may be compared: *E. spinocarpos* was observed by Forskal p. 41 at Alexandria, its leaves "mollia;" by Delile in the Desert on reaching Sâlehhyeh; but is not known to yield a medicinal fetid juice, nor to grow North of Egypt.

Echinosperrum lappula of Siberia. The LAPPAGO distinguished as ASPERVGO, resembling according to Pliny xxvi. 65 the preceding but with rougher leaves, — may be compared: *E. lappula* is described by Tragus 196, and Columna ecphr. pl. 179, is termed "buglossum angustifolium semine echinato" by Tournefort inst. 134; occurs along walls and in waste places from Northern Sweden throughout middle Europe, but only recently has been introduced into Britain (Haller helv. 589, Pers., and Bab.). Eastward, was observed by Sibthorp, and Chaubard, in the Peloponnesus; and is known to grow around Caucasus, and throughout Siberia (C. A. Mey., and A. Dec.). Probably by European colonists, was carried to Northeast America, observed by A. Gray in "waste places, common" in Central New York, by myself around Montreal, and according to A. Decandolle occurs in Oregon.

Convolvulus Cantabrica of the Mediterranean countries. The CANTABRICA of Pliny xxv. 55 — is referred here by writers: *C. Cantabrica* is termed "cantabrica quorundam" by Clusius hist. ii. 224, "c. linariæ folio assurgens" by Tournefort inst. 83-4; is known to grow in Southern Europe and the neighbouring portion of Africa as far as Tauria (Pers.); was observed by Sibthorp, and Chaubard, from the Peloponnesus to the Greek islands.

Lamium maculatum of Europe and the adjoining portion of Asia. Called in Italy "ortica morta" or "lamio macchiato" (Lenz), in which we recognize the LAMIVM included among nettles by Pliny xxii. 16, and having ALBVM · IN · MEDIO · FOLIO that cures erysipelas: the LEVCE of Pliny xxvii. 77, resembling MERCVRIALI and called MESOLEVCON from a white line along the middle of the leaf, employed against fistula and cancer, — mentioned by Caelius Aurelianus as sometimes called "polium," is referred here by F. Columna i. p. 192, and Sprengel: *L. maculatum* is termed "l. alba linea notatum" by Tournefort inst. 183; is known to grow in Algeria, Italy, and throughout middle Europe as far as Sweden (Pers., and Benth.); was once introduced and cultivated in Britain, and within the present century has made its appearance springing up spontaneously in a few localities (Wats., and A. Dec.). Eastward, was observed by Sibthorp, and Chaubard, from the Peloponnesus to mount Athos; and is known to grow as far as the Altaian mountains (Benth.)

Lamium purpureum of Europe and Northern Asia. With other species called in Britain *dead-nettle* or *dead-nettle* (Prior), in Germany "taubnessel" (Grieb), in Italy "lamio" (Lenz), and possibly one of the kinds mentioned by Pliny xxii. 16 as distinguished by the Romans: — the "urtica mortua" is mentioned in *Ortus sanitatis*; *L. purpureum* is described by Brunfels i. p. 153, and Tragus f. 2 (Spreng.); is termed "*L. purpureum foetidum folio subrotundo*" by Tournefort inst. 183; and is known to occur in waste and cultivated ground from Italy throughout middle and Northern Europe as far as Lapland in Lat. 69° and Iceland (fl. Dan. pl. 532, Hook., and A. Dec.). Eastward, was observed by Sibthorp, and Chaubard, frequent from Constantinople to the Peloponnesus and Greek islands; by Bieberstein, in waste places along the Taurian mountains; and by Thunberg, frequent along roadsides in Japan and called "fiofuki" or "kakidosi." By European colonists, was carried to Northeast America, where it continues a weed in gardens in our Middle States, as yet rare (Darl.).

Salvia calycina of the East Mediterranean countries. A species of wild *sage* called in Greece "agria alisphakia" (Fraas), and the SILVESTRIUS kind of ELELISPHACOS mentioned by Pliny xxii. 71 — may be compared: *S. calycina* is termed "*s. orientalis frutescens foliis circinatis acetabulis moluccæ*" by Tournefort cor. 10; and was observed by Sibthorp, Chaubard, and Fraas, frequent in Attica and the Peloponnesus.

Stachys arvensis of Europe and the adjoining portion of Asia. Called in Italy "stache" (Sod., and Targ.), and possibly included in the STACHYS of Pliny xxiv. 86: — *S. arvensis* is termed "*marubiastrum vulgare*" by Tournefort inst. 190; is known to occur in cultivated ground from Denmark to the Mediterranean (fl. dan. pl. 587, Curt. lond. iv. pl. 41, Villars delph., and Pers.); was observed by Sibthorp, and Chaubard, from the Peloponnesus to Caria. By European colonists, has been carried to Northeast America, found in "waste places E. Massachusetts, scarce" (A. Gray).

Scutellaria hirta of the mountains of Crete. The scordotin ALTERIVS · GENERIS of Pliny xxv. 27 — is referred here by Honorius Bellus (Pona bald. pl. 93, and Sibth.): *S. hirta* is termed "*cassida cretica minor catariae folio flore subcæreulo*" by Tournefort cor. 11; and was observed in shady places on the mountains of Crete by Sibthorp.

Tenarium spinosum of the West Mediterranean countries. The CVNILAGO · MOLLIS having according to Pliny xx. 64 more hairy leaves and pricking branches, and emitting if bruised the odour of honey, — is referred here by Cornuti pl. 124: *T. spinosum* is mentioned by him in 1634 as recently brought from Spain, and is termed "*scordium spinosum odoratum*;" is termed by Tournefort inst. 205 "*chamædrys multifida spinosa odorata*;" and is known to grow on hills as well as in cultivated ground in Portugal and Spain (Barr. rar. pl. 202, Cav., and Pers.). Eastward, was observed by Sibthorp in cultivated ground around Smyrna.

Euphrasia odontitis of Europe and the adjoining portion of Asia. Called in Britain *eye'right* *cow-wheat* (Prior), in Germany "zahntrost" (Grieb): the ODONTITIS growing according to Pliny xxvii. 84 in meads CAVLICVLIS DENSIS AB EADEM RADICE, and having a diminutive purple flower, — is referred here by writers: *E. odontitis* is described by Gerarde p. 91; is termed "*pedicularis serotina purpurascens flore*" by Tournefort inst. 172; and is known to grow in Northern Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 625, Huds., Curt. lond. i. pl. 44, Pers., and Lenz). Eastward, was observed by Sibthorp, and Gittard, in the Peloponnesus and around Constantinople.

Scrophularia canina of Europe and the adjoining portion of Asia. The CANARIAM eaten by dogs according to Pliny xxv. 51, — may be compared: *S. canina* is termed "*s. ruta canina dicta vulgaris*" by Tournefort inst. 167; and is known to grow in Switzerland, Germany, and France (Schleich., Lam. fl. fr., and Pers.). Eastward, was observed by Sibthorp, and Chaubard, frequent from the Peloponnesus to Crete, and Cyprus, and called "skröphithöhörtön."

Armeria vulgaris of Northern climates. Called in Britain *thrift* or *sea-gillflower* (Prior), in Sweden "strandblömster" (Linn.), in Greece "hölavröhörtön" (Sibth.); and the STATICE · SEPTEM CAVLIBVS of Pliny xxvi. 33, — "*statika kölluria*" of Aetius, and "*statikē pōa*" of euporist. i. 116 and ii. 82, are referred here by Sprengel: *A. vulgaris* is mentioned by Anguillara 247 (Spreng.); is termed "*gramen polyanthemum majus*" by Dodoens pempt. 564, "*armerius montanus tenuifolius major*" by Clusius hist. i. 287, and is known to grow on the seashore and in exposed situations on mountains from the Arctic Ocean throughout Europe and Northern Asia (C. Bauh. pin. 211, Tourn. inst. 341, engl. bot. pl. 206, and Hook.): observed by Linnæus on the seashore of Sweden; by Brotero, in Portugal, both on the seashore and on mountains; by Decandolle, on the mountains of Switzerland; by Sibthorp, on the mountains of the Peloponnesus; by Pallas, at 67° on the Oby. Westward, by Sabine in Greenland; by Colmaster, in Labrador (herb. Collins); is known to grow along the Arctic American seashore (Hook.), and as far as Alaska (Wats.). Is besides cultivated for ornament in gardens, both in Europe (Linn. fl. suec.) and the United States.

Salicornia herbacea of the seashore of the Mediterranean and North Atlantic, and Interior salines throughout Northern America and Asia. Called in Greece "krithmōs" (Sibth.), and the CRETHMOS.

AGRIOS of Pliny xxv. 96 and xxvi. 61, applied externally in affections of the eyes and having other medicinal properties, — may be compared: *S. herbacea* is termed "*s. geniculata annua*" by Tournefort cor. 51; is known to grow along the seashore from Sweden to the Mediterranean (fl. Dan. pl. 303, Engl. bot. pl. 415, and Wats.); was observed by Brotero in Portugal; by Desfontaines, in Barbary; by Sibthorp, frequent on the seashore of Crete and other Greek islands; and by Delile, on the Mediterranean shore of Egypt. Farther East, was observed by Bieberstein in salines along Taurus; by Pallas, on the shores of the Caspian; and by Gmelin, around salt lakes throughout Siberia. Westward from Europe, was observed by Lapylaie in Newfoundland; and is known to grow on our Atlantic seashore as far as Florida (Ell., Nutt., Chapm., and myself); as well as around Interior salines, at Onondaga towards Lake Ontario, and in Lat. 49° on Red river of Lake Winnipeg (Long's exp., Schw., and Nutt.). The plant according to Prior is called in Britain *glasswort* "from furnishing the kali for glass-making" called according to Guibourt "*soda of Narbonne*," and containing fourteen or fifteen per cent of the carbonate of soda (Lindl.).

Kochia scoparia of Central and Eastern Asia. Called in the gardens of Europe "*belvedere*" (Forsk.), by the Greeks "*axuris*" (Anguill.): the **SCOPIA REGIA** of Pliny xxi. 15 and xxv. 19 having strong-scented leaves, — is referred here by Sprengel: *K. scoparia* is described by Anguillara p. 290, and Dodoens pempt. pl. 101; is termed "*ch. lini folio villosa*" by Tournefort inst. 506; is known to occur in Carniola (Pers.), and around Constantinople (Sibth.), was observed in gardens there by Forskal; and by Bieberstein, in the Tauro-Caucasian countries. Farther East, is known to grow in Songarian Tartary (Sievers, and Pall.); and in China (Pers.); was observed by Kaempfer, and Thunberg, in Japan, employed medicinally and called "*tsisu*" or usually "*fawa kingi*" or "*niwa gusa*" or "*fooki gusa*."

Atriplex hastata of maritime and subsaline situations in Northern climates. The **ALIMON-SILVESTRI** of Pliny xxii. 33 having **TENVIORA** thinner leaves and more powerful medicinal properties, — may be compared: *A. hastata* is described by Morison v. pl. 32; was observed by Delile on the Mediterranean shore of Egypt near Danielta; by Sibthorp, on the shore of the Greek islands; by Gmelin, and Pallas, from the Caspian to the salt lakes of the Yenisei; and is known to grow from the Mediterranean along the Atlantic as far as Britain and Iceland (Sm. in Engl. bot., Pers., Hook., Dec., and Wats.). Farther West, is known to grow along the Atlantic shore of North America from at least 44° to 34°, extending inland sometimes to situations hardly saline (Walt., Pursh, A. Gray, and myself). "*A. rosea*," termed "*a. sylvestris fructu roseo compresso*" by C. Bauhin pin. 119, and known to grow in Southern Europe (Pers.), was observed by Bory frequent in the Peloponnesus.

Amaranthus tricolor of Tropical Eastern Asia. Called in Britain *florimer* or *floramor*, in France "*fleur d'amour*" (Prior): the **GROMPHAENA** having leaves according to Pliny xxvi. 23 **ALTERNIS VIRIDIBVS ROSEISQVE**, and used against spitting blood, — may be compared: the "*gelisia*" of Hildegarde ii. 153 is referred here by Sprengel: *A. tricolor* is described by Lobel pl.; was observed by Forskal in gardens at Constantinople; and the "*bustan abruz*" of Elmadhusi, and Soliman Ben Hassan, identified by Ebn Baitar with the "*dadschdsch elemir*" of the Persians, is also referred here by Sontheimer. Eastward, *A. tricolor* was observed by Graham "in gardens" at Bombay; by Roxburgh iii. 608, in Bengal; by Thunberg, in Japan; by myself, on the Feejee Islands, aboriginally introduced. "*A. melancholicus*," received by Linnæus from "*India orientali*" (Willd. pl. 9. f. 18, and Pers.), and cultivated in the gardens of Europe (Moench) and Northeast America (A. Gray), is regarded as a variety only (A. Dec.).

Polygonum bistorta of Europe and the adjoining portion of Asia. Called in Britain *bistort* (Prior); and the **DRACVNCVLVVS** having according to Pliny xxiv. 91 a root after the manner of a convoluted dragon, — may be compared: the "*serpentaria viperina*" of Apuleius Barbarus 5, is referred here conjecturally by Fraas: *P. bistorta* is described by Brunfels, Gesner hort. germ. 265, and Matthioli (Spreng.); is termed "*twice-writhen*" by Turner, "*bistorta major*" by Tournefort inst. 511; is known to grow throughout middle and Northern Europe as far as Denmark (fl. Dan. pl. 421, and Curt. lond. i. pl. 22). Eastward, was observed by Sibthorp on the Bithynian Olympus and in the Peloponnesus; "*bistorta*" root is enumerated by Forskal as used medicinally in Egypt; and the living plant according to Clot-Bey has been recently introduced there. According to Lindley, the plant is "*a powerful astringent*."

Rumex (Acetosa) tuberosus of the East Mediterranean countries. A species of *sorrel* called in Greece "*xinitra*" (Sibth.); and the **ALIVD HIPPOLAPATHVM** of Pliny xx. 85, larger than the **SATIVO** kind **CANDIDIVSQVE AC SPISSIVS** and having **RADICES**, — may be compared: *R. tuberosus* is described by Dodoens 649; is termed "*acetosa tuberosa radice*" by Tournefort inst. 503; is known to grow in Italy (Pers., and Pollini); and was observed by Sibthorp, and Chaubard, from the Peloponnesus to Cyprus and Asia Minor.

Urtica dioica of Northern Asia or America. Called in Britain *nettle*, in Anglo-Saxon and Dutch "*netel*," in Denmark "*naelde*," in Sweden "*naetla*," in Germany "*nessel*," from supplying "the

thread used in former times by the Germanic and Scandinavian nations" and till a late period in Scotland and Friesland (Prior), in France "ortie" (A. Dec.), in Italy "ortica" (Lenz), in Greece "tziouknitha" (Forsk.) or "tziknitha" (Sibth.); in which we recognize the *VERTICA-SILVESTRI* called *CANIA* described by Pliny xxi. 55 as more virulent with fringed leaves and even the stem stinging: — *U. dioica* is described by Brunfels, Fuchsius pl. 107, Tragus, Gesner, Turner, Matthioli, Lobel, Thalius, and Bauhin; is termed "*u. urens maxima*" by Tournefort inst. 534; was observed by Lenz frequent in Italy; and is known to occur about dwellings throughout middle and Northern Europe as far as Lapland and Iceland (fl. Dan. pl. 746, Pers., Hook., and Wats.). Eastward, was observed by Forskal, Sibthorp, and Chaubard, about dwellings and along roadsides from the Peloponnesus to Constantinople and Smyrna; by Hasselquist, and Clot-Bey. in Lower Egypt; is known to occur also along the Taurian mountains (Bieb.); was observed by Thunberg here and there in Japan, called "hatji kusa," and sought by bees; by Gmelin, throughout Siberia; but in Kamtschatka is regarded by Chamisso as exotic and introduced. Farther East, was known to Gmelin before 1743 as occurring on the neighbouring continent of America; but at Norfolk Sound was observed by Mertens only around trading establishments, has however an American aspect. By European colonists, was carried to Northeast America, where it continues in waste places in our Atlantic States and as far South as Kentucky (Short); to Brazil, observed by A. Saint-Hilaire in the outskirts of towns in the Interior (A. Dec.).

Aristolochia sempervirens of the East Mediterranean countries. The *PLISTOLOCHIA* or fourth kind of *ARISTOLOCHIAE* known to the Romans, having according to Pliny xxv. 54 numerous radical fibrils, and by some termed *POLYRRHIZON* (known therefore to the Greeks), — may be compared: *A. sempervirens* is termed "*pistolochia altera*" by Clusius hist. ii. 260, "*a. pistolochia altera*" by Tournefort inst. 162; and was observed by Sibthorp, and Chaubard, from the Peloponnesus to Crete and the Greek islands. Westward, is described by Sabbati hort. ii. pl. 82 (Pers.); and is enumerated among the officinal species by Lindley.

Pinus pinaster of the West Mediterranean countries. The *PINASTER* or *PINVS-SYLVESTRIS* growing according to Pliny xvi. 17 *IN-PLANIS*, and *MIRA-ALTITVDINE* exceedingly lofty, branching from the middle upwards, is referred here by writers: *P. pinaster* is termed "*p. maritima major*" by Duhamel (Steud.); is described also in Lam. encycl. v. p. 337, and by Santi, and Lambert ix. pl. 4 and 5; is known to grow in Italy as far South as Genoa also in Southern France and in Spain and Portugal (Tenore, Lenz, and Daub.). The tree according to Lindley yields "*Bordeaux turpentine*," which has the property of solidifying with magnesia."

Luzula maxima of Western Europe. The *COMBRETVM* described by Pliny xxi. 16 to 77 as resembling the *BACCHAR* and employed medicinally, its leaves attenuated into threads, — is referred here by Anguillara 179. *L. maxima* is termed "*j. nemorosus latifolius major*" by Tournefort inst. 246, "*j. sylvaticus*" by Hudson, Curtis, and Smith brit. p. 385; and is known to grow throughout middle Europe as far as Denmark (Retz fl. dan. 441, Roth germ. i. 157, Wulfen, Villars, and Pers.).

Crocus odoratus of Italy and Sicily. The *CROCVM-SILVESTRE* of Pliny xxi. 17, the best kind but its cultivation hardly succeeding in Italy, — may be compared. *C. odoratus* was observed by Bivona iii. pl. 2 in Sicily, is known to grow wild there, and according to Gussone i. pl. 11 yields *saffron* (Lindl.).

Orchis (Habenaria) bifolia of Europe and the adjoining portion of Asia. Called in Britain *butterfly orchis* (Prior), and the *OPHRYS* herb, according to Pliny xxvi. 93 like *DENTICVLATOLERI* and having two leaves, — may be compared: *H. bifolia* is termed "*o. bifolia minor calcari oblongo*" by Tournefort inst. 433; and is known to grow from Denmark throughout middle Europe (fl. Dan. pl. 235, Vaill. pl. 30, Hall. helv., and Pers.); was observed by Sibthorp in the environs of Constantinople.

Allium ursinum of middle and Western Europe. The *allium SILVESTRE-QVOD-VRSI-NVM-VOCANT-ODORE-MOLLI-CAPITE-PRAETENVI-FOLIIS-GRANDIBVS* of Pliny xix. 34, — is referred here by Linnæus; and the "*greata crauleac*" of an Anglo-Saxon leechdom, is referred here by Cockayne i. p. 377: *A. ursinum* is described also by Bernhardt; is a vernal species known to grow in woods and moist grassy situations in Britain, France, and Denmark (fl. Dan. pl. 757, Lam., and Pers.)

Dactyloctenium mucronatum of Equatorial Africa. Called in Egypt "*na'ym el-salyb*" or "*rigl el herbayeh*" (Del.): the *DACTYLON-ALTERO* of Pliny xxiv. 119, a prickly grass resembling *AIZOO* and employed to cure whitlow and maladies around the nails, — may be compared: *D. mucronatum* is termed "*gramen dactylon ægyptiacum*" by Tournefort inst. 521; is known to grow in Barbary (Pers.); was observed by Sibthorp not rare in Greece: by Alpinus, Forskal, and Delile, in Egypt; by Forskal, further South in Tropical Arabia; and is known to grow along the Atlantic in Equatorial Africa (Benth. fl. nigr. p. 566). Eastward, in the absence of Sanscrit names, one in Hindustanee is given by Roxburgh (A. Dec.); *D. mucronatum* is described by Rumphius vi. pl. 4;

was observed in Hindustan by Rheede xii. pl. 69; by Graham, "a very common grass on pasture grounds;" by myself, frequent in waste ground around Bombay: farther East, was observed by Mason in Burmah, but no native name is given. By European colonists, was carried to Northeast America, where it continues around dwellings and in cultivated ground in our Southern States as far as Virginia and Illinois (Walt., Mx., A. Gray, and Chapm.).

Eriophorum polystachium of Northern climates. The wool or Orchomenian flax procured according to Pliny xix. 2 from the panicle DVNTAXAT-PANICVLA of a reed-like plant growing in marshes — is referred here by Sprengel: *E. polystachium* is described by Tragus, and C. Bauhin (Spreng.); is known to grow from Lapland to Switzerland (engl. bot. pl. 563, and Wats.); was observed by Brotero in Portugal, by Bieberstein on Caucasus, and by Gmelin throughout Siberia. Westward, by Hooker on Iceland; by myself, along the Atlantic as far South as 42°; by A. Gray, in Central New York; by Muhlenberg, in Pennsylvania; by Chapman, "in the upper districts, Georgia."

Secale cereale of Northeastern Europe and the adjoining portion of Asia. Called in Anglo-Saxon "ryge" and in current English *rye*, in Welsh "rhyg," in Ancient Danish "rugr," in Lithuanian "ruggei," in Esthonian "rukki," in Russian "rosh," in Polish "rez," in old high German "roggo" (Prior) and in current German "roggen" (Grieb), in Celtic "secal" (Reynier) or "segal" (Theis) and in current French "seigle" (Nugent), in Italy "segala" or "segale" (Lenz), in Greece "sikali" or "vriza" (Fraas), in which we recognize the SECALE of Pliny xviii. 39, at TAVRINI Turin under the Alps called ASIAM — (a seeming indication of its origin): *S. cereale* is a Northern grain, cultivated as far as "Lat. 67°" (A. Dec.). Eastward, occurs along roadsides and in waste ground in Hungary and Transylvania (Sadler, and Baumg.); the "vriza" is mentioned by Galen alim. fac. i. 13 as a kind of grain known in Thrace; and *S. cereale* was observed by Chaubard, and Fraas, under cultivation in Greece. Farther South, is known to occur in Syria; and was observed by Alpinus in Egypt. Farther East, is called in Hindustanee "deogandum" in Bengalee "shasya bishesh" (Droz.), but has not been met with in Hindustan by European observers. By European colonists, was carried to Northeast America, where it continues extensively cultivated in our Northern States; and to the Mauritius Islands, where it was observed under cultivation by Bojer.

Setaria glauca of Tropical and Subtropical Asia. A millet-like species called in Egypt "safia" or "sar afar" mouse-tail (Forsk.), and the MILIARIA-HERBA according to Pliny xxii. 78 destroying millet, — may be compared (see Spreng.): *S. glauca* is described by Plukenet alm. pl. 190; was observed by Forskal on Malta; and is known to occur throughout middle Europe as far as Sweden, in cultivated ground and especially after harvest (Schreb. pl. 25, Pers., Beauv., and A. Dec.). Eastward, was observed by Forskal, and Sibthorp, from Zante to Smyrna; by Forskal, and Delile, from Damietta to Cairo; by Roxburgh, and Graham, in Hindustan; is known to occur also on Ceylon (Linn fl. zeyl.). By European colonists, was carried to Northeast America, where it continues in waste and cultivated ground extending along roadsides as far as Kentucky (Short), Arkansas (Nutt), and the Saskatchewan (Hook.).

Setaria viridis of Tropical and Subtropical Asia? Also closely allied, and possibly included with the preceding: — described in Johnson's Gerarde 17, observed also by Parkinson, and Ray, in waste ground in Britain (A. Dec.); termed "p. vulgare spica simplici et molliori" by Tournefort inst. 515; observed by Forskal near Marseilles; and known to occur with the preceding species throughout middle Europe as far as Denmark (fl. Dan. pl. 852, Curt. lond. iv. pl. 5, and Pers.). Eastward, was observed by Sibthorp in pastures and cultivated ground around Constantinople; and by Delile, at Rosetta in Egypt. By European colonists, was carried to Northeast America, where it continues "common in cultivated grounds" (A. Gray).

Ophioglossum Lusitanicum of the Mediterranean countries. The CERATIA of Pliny xxvi. 34 having a single leaf, a large nodose root, and used medicinally, — is referred to this genus by Billerbeck: *O. Lusitanicum* is described by Linnæus; is known to grow near Rome, also in Corsica, Tripoli, Algeria, Spain, and as far North as Brest and the outlying Glenan islets (Bory); was observed by Link near Lisbon; by Webb, on the Canaries and Madeira; and by Bory, in the Peloponnesus.

Ophioglossum vulgatum of Northern climates. Called in Britain *adder's tongue*, in Old manuscripts "nedderis-tonge" or "nedderis gres," in medieval Latin "serpentaria," in Holland "adders-tong" (Prior), in Germany "natter zünglin" (Trag.), in Italy "herba senza costa" (Dod.), and the LINGVA-HERBA or LINGVLACA of Pliny xxiv. 108 and xxv. 84, growing about springs and its root used against baldness, — is referred here by some writers: *O. vulgatum* from early times employed medicinally, was observed by Tragus i. pl. 106 in Germany; is described also by Baptista Sardus, and Dodoens pempt. i. 5. 21; and is known to grow throughout Northern Europe. Westward, was seen in New England 1669 by Josselyn, who doubted its being indigenous; by J. H. Emerton in 1872, in one locality near Salem (J. Robinson); by Conrad, in the environs of Philadel-

phia: by A. Gray in Central New York, in "bogs and meadows, not common;" by Chapman, "Tennessee, and northward;" and by Nuttall, on the Arkansas. *O. bulbosum*, seen by Walter in South Carolina, by Michaux, and Chapman, from Georgia and Florida to Louisiana, may prove distinct.

Marchantia polymorpha of Northern climates. Called in Britain *liverwort* (Prior): the LICHEN of Pliny xxvi. 10, an herb growing in stony places and having a single broad leaf at the root, one small stem with long pendent leaves, and used against the cutaneous disease bearing the same name, — is referred here by Sprengel and others: *M. polymorpha* is described by Brunschwygk ii. 11 (Prior); is termed "lichen fontanus major stellatus æque ac umbellatus et cyathophorus" by Dillenius 523 pl. 76; was observed by Sibthorp from the Peloponnesus to Cyprus and Constantinople; and is known to grow throughout Europe. Westward, is also frequent in North America (Sullivant, and myself).

Ramalina fastigiata of Europe and Northern Asia. The BRYON-HERBA-CORALLINAE-ET-MVSCVS-IN-ARBORIBVS of Pliny xxvii. 8 — (Billerb.), may be compared: *R. fastigiata* is termed "lichen cinereus latifolius ramosus" by Tournefort inst. 550, "lichenoides coralliforme rostratum et canaliculatum" by Dillenius pl. 23. f. 62; was observed by Sibthorp, and Bory, on rocks and trees in Greece and on the Greek islands; and is known to grow throughout Europe (Engl. bot. pl. 890).

Sticta pulmonacea of Northern climates. Called in Britain *tree lungwort* (Prior), and the PVLMONARIA-HERBA-LICHEN of Pliny xxvi. 4, — is referred here by Billerbeck, and others: *S. pulmonacea* is described by Matthioli p. 733 (Spreng.); is termed "l. arboreus sive pulmonaria arborea" by Tournefort inst. 549; is known to grow throughout middle and Northern Europe (Dill. pl. 29. Engl. bot. pl. 572, and Achar.). Eastward, was observed by Sibthorp, and Bory, from the Peloponnesus to Constantinople; and is known to grow in Siberia. According to Lindley, besides being employed in pulmonary affections, its nutritious properties resemble those of *Cetraria islandica*; in Siberia it is used for giving a bitter to beer."

Evernia prunastri of Northern Europe and Asia. The LIMVS-ARBORVM called LICHENA by the Greeks growing according to Pliny xxiii. 69 on the garden plum tree and employed medicinally against RHAGADIS and CONDYLOMATIS, — may be compared: *E. prunastri* is termed "l. cinereus cornua damæ referens" by Tournefort inst. 549; was observed by Sibthorp, and Bory, on the branches of plums and other trees throughout Greece and around Constantinople; and is known to be frequent also on trees throughout Europe (Ach. syn. 245, and Engl. bot. pl. 859). According to Forskal p. 193, is imported in ship-loads from Greece into Egypt, and mixed in bread: and according to Lindley, "has a peculiar power of imbibing and retaining odours."

Agaricus integer of Europe and the adjoining portion of Asia. Called in Italy "rossola," and the poisonous mushroom described by Pliny xxii. 46 as DILVTO-RVBORE, — is referred here by Lenz: *A. integer* was observed by him in Italy; is termed "a. emeticus" by Schaeffer i. pl. 15 and 16; and is known to grow in middle Europe (Sowerb. pl. 201). Eastward, was observed by Sibthorp on mount Parnassus and in the environs of Constantinople.

Agaricus alutaceus of Europe. The kind of FVNGORVM commended as safest by Pliny xxii. 47, M. NVS-DILVTO-RVBORE, — is referred here by Lenz: *A. alutaceus* was observed by him in Italy, where it is called "rossola buona di gambo lungo" or "rossola mezzara" or at Verona "fungo rossetto."

Conferva rivularis of Northern climates. Called in North Italy "lino acquatico" or "conferva" (Lenz), in which we recognize the CONFERVA according to Pliny xxvii. 45 mostly peculiar to the rivers of the Alps, and in an instance under his own observation employed successfully, wound around the body and kept moist, to cure fractured bones: — *C. rivularis* is termed "c. fluviatilis sericea vulgaris et fluitans" by Dillenius xii. pl. 2; was observed in Greece by Sibthorp; and is known to grow throughout middle Europe as far as Britain (Dillw. pl. 39, and Engl. bot. pl. 1654).

Amyris heptaphylla of Eastern Hindustan. A shrub called in the environs of Bombay "karun-phul" (Graham); in which we recognize the GARYOPHYLLON of Pliny xii. 15, produced in India and resembling grains of pepper, but larger and more fragile and imported for the sake of their odour: — *A. heptaphylla* was observed in Hindustan by Roxburgh, and Colebrooke (linn. trans. xv. p. 365); by Graham, in a garden at Bombay, "probably introduced from Bengal," the "leaves when bruised have the fragrance of fresh anise seed."

Calanus draco of the Malayan archipelago. Ascertained by Royle to yield the best "d'jurnang" or *dragon's blood*: the SANIEM-DRACONIS used according to Pliny xxxiii. 38 as a pigment, and also medicinally, but sometimes confounded with and called CINNABARI a decided poison, — is referred here by writers: "kinnabari inthikōn" is mentioned in the Erythraean periplus, and as the product of trees on Socotra; and the resinous astringent substance called dragon's blood is men-

tioned also by Paulus Aegineta, Constantinus, and Arab medical writers (Royle fibr. ind.). *C. draco* was observed by Rumphius v. pl. 58 in the Malayan archipelago; and the *red ratan* of Burmah called "kyeing-nee," producing according to Mason v. 485 "a red exudation like dragon's blood," is regarded by him as probably identical. (See *Dracæna draco*).

Borassus flabelliformis of Tropical Eastern Asia. The *fan palm* is called in Hindustan "tarh" or "tar" (Graham, and Royle fibr.), and the *TARVM* brought according to Pliny xii. 44 by the Nabathean Arabs, — may be compared with the sweet and edible juice of its fruit; inspissated into solid plates after the manner of bdellium, at least on the Moluccas (Herbertus de Jager, Rumph. i. pl. 10, and Spreng.): the "taur" is mentioned in the Mahabharat conclud. sect. (D. Price in Orient. transl. lond.): *B. flabelliformis* was observed in Hindustan by Rheede i. pl. 9, and Roxburgh cor. i. pl. 71; by Graham, overshadowing cottages "in elevated and lilly situations;" by myself, under cultivation; and according to Royle fibr., yields toddy, its young seeds are eaten, its leaves are made into fans called "vissaries," and are almost universally used for writing on with an iron style. Farther East, was observed by Mason v. p. 425 and 522 "exotic" in Burmah and called "htan," more "generally diffused than any other" palm, and by an exception "the orders that are issued from the Burmese courts are written on" its leaves; was observed by myself aboriginally introduced and cultivated and made into fans on the Feejean, Tongan, and Samoan Islands.

"78, midsummer" (Tacit., and Clint.), Julius Frontinus succeeded by Agricola, as Roman governor in Britain.

"The same year" (Elphinst. iii. 3 and iv. 2), the *Salivahana era*; named after the Hindu king reigning at Paitan on the Godaveri, — and continuing in use in the surrounding district "the Deccan" (compare also the *Prome era*).

"The division of India into four empires happened in the first century A. D." — (Wilford as. res. ix. p. 182).

Dowlutabad (not far from Paitan) may have been the real attraction: that the rocky sides of this mountain were already cut away to a perpendicular wall all around, — may be inferred from the name "Tagara" in the periplus of the Erythræan Sea, corresponding as remarked by writers with Deogiri or Dowlutabad (see Elphinstone). Dowlutabad was visited by Ebn Batuta.

Of the neighbouring cave-temples at Ellora, some may have been already constructed. The series is Braminical, distinguished by many-handed and many-headed personages and other evidence of Polytheism: including as if by an attempt at union a few cave-temples of the Buddhist pattern,* devoid however of signs of acknowledgment by Buddhists and of inscriptions in the "cave character." — The Kailas temple hewn there out of the solid rock, the "splendid masterpiece of Brahminism" (according to Lübke and Lütrow) "is said to have been excavated and built during the earliest half of the ninth century."

"79 A. D." (Mason iii. 38), the *Prome era*: — used by the Burmese "about seven hundred years" (compare *Salivahana era*).

"June 23d" (Sueton., and Clint.), Vespasian succeeded by his son Titus, tenth Roman emperor. The hieroglyphic ovals of Titus occur on temples at Esneh and in the Oasis of Dakkeh; and his name, on coins issued in Egypt during each year of his reign.

"In the summer" (Tacit., and Clint.), Second campaign of Agricola in Britain.

"Aug. 24th" (Plin. Secund. vi. 16, Sueton., Dio, and Clint.), eruption of Vesuvius, overwhelming the cities of Herculaneum and Pompeii. (A striking chronological landmark; the brief reign of Titus, leaving slight room for error in date; the attendant death of Pliny, limiting his Encyclopedic summary of the state of human knowledge; while coeval illustration of the whole condition of society is accessible in the vast variety of objects disinterred. Seeds and fruits are included, which have been deposited in the museum of Naples, but I have not met with any published account of them).

Among the surgical instruments: the *catheter* — is figured by Vulpes pl. 3; relief afforded by using the catheter, is expressly mentioned by Aretæus acut. ii. 9 (Cockayne):

An instrument for *tying arteries*, — very similar to the forceps used by the French surgeon who towards the end of the Sixteenth century revived the art (Vulp.): the practice of tying arteries during surgical operations, is mentioned by Archigenes (Cockayne).

* *Ficus tsiela* of Hindustan. A species differing from the Banian tree in the fruit having no involucre, figured in the cave-temples at Ellora, — as observed by myself; also seen near Ahmednugger, growing around and overshadowing a temple of Krishna, evidently planted and regarded as sacred. *F. tsiela* was observed in Hindustan by Rheede iii. pl. 63, and Roxburgh; is described by Graham as "a large tree" called "datira," growing "on the Ghauts," and one "near Kennery caves;" and was observed by Rumphius iii. pl. 89.

VIII. THE EARLY CHRISTIAN PERIOD.

Two Heathen cities thus by extraordinary means have been preserved, and from about the latest moment possible: there are no traces of Christian relics, but perhaps at this very time Josephus was announcing the continued existence of the new religion.

Anastatica Hierochuntica of the North African and Syrian Desert. The BAAPAC herb described by Josephus bell. jud. vii. 23 as running away from him who tries to gather it, — may be compared: *A. Hierochuntica* being easily uprooted, and contracting in the form of a ball, is said to be sometimes driven by the wind over the sands of the Desert; in this state also, is imported as a curiosity under the name *rose of Jericho*. In Egypt, *A. Hierochuntica* is called “kaf maryam” (Mary’s hand); in which we recognize the “kaff marjam” identified by Ebn Baitar with the “schadscharat elkaff” of S. E. Hasan (Ebn Joljol): the plant was seen by Forskal, Delile, and myself, in the Desert of Lower and Middle Egypt; and according to Forskal p. 117, in the dry contracted state is used superstitiously in parturition, facility being prognosticated according to quickness in unfolding when moistened. Farther West, *A. Hierochuntica* is known to grow in Barbary (Pers.). As transported to Europe, is described by Euricius Cordus, Valerius Cordus (Spreng.), Jacquin hort. pl. 58, and Lamarck ill. pl. 555; and by European colonists was carried to the Mauritius Islands, where it was seen under cultivation by Bojer.

“80 A. D.” (Sueton., Dio, and Clint.), at Rome, the Great amphitheatre or the “colosseum” completed and dedicated by Titus. Baths also built by him.

“The same year” (Tacit., and Clint.), in Britain, Third campaign of Agricola; making known “new” tribes and nations.—Solinus’ account of Britain, not earlier therefore than this date.

“81, Sept. 13th” (Sueton., Dio, and Clint.), Titus succeeded by his brother Domitian, eleventh Roman emperor. The hieroglyphic ovals of Domitian occur on temples at Philæ, Esneh, and Dendera, on a propylon at Thebes, and on obelisks (now in Rome and at Benevento in Italy): and his name, on coins issued in Egypt during each year of his reign.

Tamarindus Indicus of Tropical Africa and Arabia. The *tamarind* tree is called in Tagalo Pampango and Camarines “sampiloc” or “macasampiloc,” in Bisaya “sampiloc” or “sambac” or “sumalagui” or “sampilagui” or “camalagui” (Blanco), in Burmah “mag-gee” (Mason), in Bengalee “tentool” or “tintil” or “tintiree,” in Sanscrit “tintree” or “tintri,” in Hindustanee “amli” or “umli,” in Telinga “chinta-chitto” (Lindl.), in Tamil “poolie,” in Malabar “balam poolie,” in Canara “hoonise” (Drur.), in the environs of Bombay “umlee” (Graham), in Yemen “homar” (Forsk.), on Madagascar “monte” (Flac.) or “voua-matouri” (Boj.), in Equatorial Africa “loo-quajoo” (Grant); a hieroglyphic character  (Leps. ausw. 14. Buns. and Birch) resembling a three-jointed pod, may be compared with the Egyptian “phōiniankō,” — translated “dactyli Indici” by Edwards: the “ōxuphōinikōn” is mentioned by Porphyrius, Oribasius, Nicolaus Myreps. i. 24, Actuarius, and Maximus Planudes; tamarinds by Mohammed kor. xxxiv. 15; the “tamr Hindi” by Abu Hanifa, A. Hassam, and Ebn Baitar; and “tamarendi” were seen by Marco Polo 184 in “Gozurat.” *T. Indicus* was seen by Belon, Alpinus, Forskal, Delile, and Clot-Bey, under cultivation in Egypt; by Forskal, everywhere wild among the mountains of Yemen; by Bruce, and Salt, on the Taranta Mountains of Abyssinia (Grev.); by Cailliaud iv. 323, quantities of the pods brought by the Darfour caravans; by Grant, growing in Equatorial Africa from “6° 46’ S. Rumuma to 4° N.” on the Nile; by Flacourt, and Bojer, long known on Madagascar. Eastward, by Rheede i. pl. 23 in Malabar; by Graham, “common about villages” in the Bombay district; by myself to the end of my journey in the Deccan, frequent, but only planted and naturalized; by Ainslie, Roxburgh, Wight, and Drury, as far as Ceylon and Bengal; by Mason v. 457, in Tenasserim and Pegu, “exotic” and cultivated extensively by the natives for its leaves and fruit; by Blanco, well known on the Philippines; is described also by Rumphius ii. pl. 23. By European colonists, was carried to the Mauritius Islands (Boj.); and to Tropical America (Jacq. am. pl. 13).

Anthemis nobilis of Western Europe. Called in Britain *chamomile*, in France “camomille” (Nugent), at Smyrna “hamōmilla” (Forsk.); and its flower seems to form a hieroglyphic character : powdered “hamomilla” flowers mixed with oil were applied as a medicinal ointment by Nechepson the Egyptian — (Aet., and Ruel iii. 68): the “hamaimelōn” called by Archigenes “anthemitha” is mentioned as good for the headache by Galen comp. med. ii. 2: the “anthēmisiōn” of Alexander Trallianus viii. 2. 20, may also be compared: “*A. chamomilla*” having a paleaceous receptacle was observed by Forskal at Smyrna; the “babunaj” is mentioned by Ebn Baitar; dried flowers of *A. nobilis* were found by Alpinus employed medicinally in Egypt; and the living plant according to Clot-Bey has recently been introduced. Westward, the “anthemin” is identified by Macer Floridus 14 with our “chamaemelum” or “chamomillam:” *A. nobilis* is described by Lobel obs. 455 (Spreng.), and Blackwell pl. 526; and is known to grow wild in France and middle

Europe as far as Britain (All. ped. 673, Lam. fl. fr., Engl. bot. pl. 980, and Pers.). Chamomile flowers according to Lindley "contain a volatile oil, resin, and bitter extractive," and are stimulant and tonic.

"82 A. D." (Sueton., Plut., and Clint.), at Rome, the capitol which had been destroyed by fire, restored with increased splendour by Domitian.

"In the reign of Domitian" (Sm. b. d.), Plutarch lecturing on philosophy in Rome.

Lunaria rediviva of the Mediterranean countries. Called in Britain *satin-flower* or *honesty* (Prior): the $\text{C}\epsilon\lambda\text{H}\text{N}\text{H}$ plant with which shepherds in the days of Plutarch inach. anointed their feet for protection against reptiles, — may be compared: *L. rediviva* is termed "*l. graeca perennis*" by Besler hort. Eyst. pl. 21, and was observed in the Peloponnesus by Sibthorp, and Chaubard. Westward, is described by Clusius hist. pl. 297; is termed "*l. major siliqua longiore*" by Tournefort inst. 218; is known to grow as far as the border of Germany, central France, and the Pyrenees (Pers., and A. Dec.), and is besides cultivated throughout Europe. By European colonists, was carried prior to 1670 (Jossel.) to Northeast America, where it continues under cultivation in gardens (A. Gray).

"83 A. D." (Sueton., and Clint.), Domitian's expedition into Germany and Dacia, against the Catti and Sarmati.

"The same year" (Tacit., and Clint.), Sixth campaign of Agricola in Britain; among the towns beyond "Bodotria" with an accompanying fleet examining the harbors; and a victory gained by him over the Caledonians.

"The same year" (Philostrat., Euseb., and Clint.), three delinquent Vestal virgins put to death. The making of *eunuchs*, also prohibited by Domitian.

"The same year" (Mason iii. 41), Adetya succeeded by Nagarisingna as king at Prome. Nagarisingna was the first conqueror; he carried on wars; and in his reign "Burmah" is first mentioned.

The first balhara or king of Guzerat may have been at this time reigning: — he is called Di-Saca or Deva-Saca in the Vansavali, and Dabshelim by the Muslims. His capital on the Narmada is called Minnagara in the Erythraean periplus as well as by Ptolemy, Mankir by Masudi, and at the present day Manhawer.

By his direction, Pilpai his prime minister wrote the Javidan-khird or the "will of Hushenk:" a work — that continues extant in Persian (Wilf. l. c.).

"86 A. D." (Euseb., and Clint.), beginning of the Dacian war. — In the course of four years, the Romans were worsted; Domitian at length consenting to pay an annual tribute to the Dacian king Decebalus (Sm. b. d.).

Hardly later than this year ("80 to 89 A. D.," C. Mull. geogr. min. p. xcvi), the Erythraean periplus written. Axum and its king Zoskales are mentioned; also a Hindu king Pandion.

The $\text{Π}\epsilon\text{T}\rho\text{C}$ of the Erythraean periplus, regarded by writers as the nut of *Areca catechu*, implies the use of *betel*: a *Malayan* invention, — to the present day chiefly confined to men of the Malayan Race, well known however throughout Hindustan even among Muslims, but farther West making no progress among the Arabs and African tribes.

"87 A. D." (Alst. p. 142), the evangelist John writing his Third epistle; as shown by his naming Diotrephes.

"89 A. D. = 'young-youan,' 1st year of Hiao-ho-ti" or Ho-ti, of the Han or Seventh dynasty (Chinese chron. table).

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Hakale succeeded by Za-Demahé, now king of Abyssinia. — He reigned "ten" years.

"90 A. D." (Gell., Euseb., and Clint.), the mathematicians and philosophers, including Dion Chrysostomus, expelled from Rome and Italy by Domitian. The exiles assisted by Plinius Secundus iii. 11, in this year praetor.

"91 A. D." (Plin. Secund. iv. 11, Sueton., Euseb., and Clint.), the principal Vestal virgin Cornelia after having once received pardon, found delinquent a second time, and now buried alive.

"92, Nov. 29th, five hours before midnight" (Blair), occultation of the Pleiades by the moon, observed in Bithynia by Agrippa.

Clematis erecta of the Mediterranean countries. The $\lambda\epsilon\gamma\kappa\omicron\upsilon\gamma\text{:}\ \chi\epsilon\lambda\iota\delta\omicron\nu\iota\omicron\iota\omicron\text{:}\ \pi\epsilon\tau\eta\lambda\lambda\alpha$ of Pancrates, — and Athenaeus xv. 6. p. 469, may be compared: *C. erecta* is identified with the "flammula" of Platearius by Matthioli comm. iv. pl. 7, observed in Italy; is termed "*c. sive flammula surrecta alba*" by Tournefort inst. 294; is known to grow from Spain to Austria (All. 1078, Jacq. austr. pl. 291, Mill., and Pers.); was observed by Sibthorp, and Chaubard, from the Peloponnesus to mount Haemus: and its "powdered leaves" according to Lindley have been "used as an escharotic" (see *C. flammea*).

"93 A. D." (Euseb., and Clint.), edict of Domitian prohibiting the planting of *grape-vines* in

cities. A revocation of the edict was procured soon afterwards by Scopelianus of Clazomenae, ambassador from the Greek cities of Asia.

"May" (Martial, and Clint.), the Sarmatian war, and departure of Domitian from Rome.

"94, January" (Martial, and Clint.), after "eight months" absence, return of Domitian to Rome.

Ferula glauca of the West Mediterranean countries. The FERVLAEQVE · TRISTES · SCEP TRA PAEDAGOGORVM of Martial x. — is referred here by Tournefort voy. vi. p. 292: *F. glauca* was observed by Tournefort in Italy and Southern France; is termed "*f. communis*" by Gouan (Steud.); is known to grow also in Sicily (Pers.).

Bartsia alpina of the mountains of middle and Western Europe. An herb called in Britain *poly-mountain*, in medieval Latin "*polium montanum*" (Prior), and the "*Martialis polium*" — of Apuleius Barbarus 57, may be compared. *B. alpina* is known to grow on mountains from Switzerland and mount Baldo to Lapland (Crantz, Engl. bot. pl. 361, fl. Dan. pl. 43, and Pers.).

"95 A. D." (Iren., Euseb., and Clint.), the evangelist John living on the island of Patmos, not far from Ephesus.

Erodium ciconium of the Mediterranean countries. The name *stork's-bill* having extended to allied species in Britain (Prior), the ΠΕΛΑΓΙΤΙΚ herb prescribed by Asclepiades the younger — (Gal. comp. med. ix. 2) may be compared: *E. ciconium* was observed by Forskal, and Sibthorp, from Constantinople to the Peloponnesus; and by Forskal near Cairo in Egypt. Westward, is described by Boccone mus. ii. pl. 83; is termed "*g. cicutæ folio acu longissima*" by Tournefort inst. 268; was observed by Desfontaines in Barbary (Steud.); and is known to grow also in Italy, Spain, and Southern France (Cav. iv. pl. 95, and Pers.). "*E. gruinum*" regarded as perhaps not distinct, is termed "*g. latifolium longissima acu*" by Tournefort inst. 269, was observed by Sibthorp, and Bory, from Constantinople to the Peloponnesus, by Delile near Alexandria in Egypt, is known to grow also in Crete, Italy, North Africa, and Spain (Cav. iv. pl. 88, and Pers.).

"The same year" (Sueton., Dio, Euseb., and Clint.), by Domitian, T. Flavius Clemens consul for this year compelled to abdicate and put to death; and his niece Flavia Domitilla exiled for being a Christian. T. Flavius Clemens is regarded as the author of the "First epistle of Clemens Romanus," and as the bishop of Rome who succeeded Anegkletus and was succeeded by Euarestus. — In the continuation of the series by Irenaeus (Clint. iv. p. 177), Alexander is named as the fifth bishop of Rome, Xystus as "sixth," and Telesphorus as seventh.

"96 A. D." (Sueton., Dio, and Clint.), Domitian succeeded by Nerva, twelfth Roman emperor. The hieroglyphic ovals of Nerva have been found only on a small temple at Assuan or Syene.

"97 A. D." (Philostrat., and Clint.), the rhetor Nicetes of Smyrna sent into Gaul. At Rome, Frontinus (aquaed. 102) appointed "curator aquarum."

"98, Jan. 11th, five hours after midnight" (Blair), occultation of the star Spica Virginis by the moon, observed at Rome by Menelaus.

"Jan. 25th" (Chron. Pasch., and Clint.), Nerva succeeded by Trajan, absent at Agrippina (Cologne), as thirteenth Roman emperor. The hieroglyphic ovals of Trajan occur on temples at Dendera, Ombos, and Philæ.

"In the reign of Trajan" (Sm. b. d.), the Greek physician Archigenes practising in Rome. He is mentioned by Juvenal vi. 236 to xiv. 252.

Valeriana officinalis of middle Europe. Called in Britain *valerian*, in France "*valeriane*" (Nugent), in Germany "*baldrian*" (Grieb): the ΟΠΩ: ΚΑΡΠΙΑCΟΥ prescribed for curling the hair by Archigenes — (Gal. comp. med. i. 3), inducing sleep and strangulation according to the treatise Pharm. delet. 13, or "*karpēsîou*" of Quintus, and Galen fac. simpl. vii. 14 and antid. i. p. 71, growing on the mountains of Pamphylia and brought from Pontus and in great quantities from Syria, resembling "*phōu*" in taste and effects but the odour more powerful, or the "*karpēsian*" of Paulus Aegineta, may be compared: valerian root is enumerated by Alpinus as employed medicinally in Egypt. Westward, *V. officinalis* is described by Brunsfels append., and Columna (Spreng.); and is known to grow in situations more or less moist throughout middle Europe as far as Denmark (fl. Dan. 570, Pers., and A. Dec.). The "*fetid roots*" according to Lindley bring on "as is well known a kind of intoxication in cats, and in large doses occasioning in man scintillations, agitation, and even convulsions."

Salicornia Indica of the seashore of Western Hindustan. Called in the environs of Bombay "*muchoor*" (Graham); and the ΑΛΑ: ΙΝΔΙΚΟΝ of Archigenes — (Barton, and Spreng. comm. Diosc. p. 453) may be compared with the *barilla* or Carbonate of soda effloresced on the soil of Northwestern Hindustan (Royle) as well as procured from the ashes of this and other Salsolaceous plants: *S. Indica* was received by Willdenow act. herol. ii. pl. 4 from Tranquebar (Pers.); was observed by Graham "common on salt marshes" in the environs of Bombay, pickled by the natives, and furnishing "alkali used in the manufacture of soap and glass."

Salicornia brachiata of the seashore of Eastern Hindustan. Called in Telinga "quoiloo" (Drur.); and its ashes possibly included in the "ala inthikōn" of Archigenes: — *S. brachiata* was observed by Roxburgh, and Wight pl. 738, abounding in ground overflowed by the spring-tides from Coromandel to the mouths of the Ganges, and according to Drury "yields a barilla for soap and glass."

Salsola Indica of the seashore of Hindustan. A species of *saltwort* called in Telinga "yella-kura" (Drur.); and its ashes possibly included in the "ala inthikōn" of Archigenes: — *S. Indica* was observed by Graham "in salt marshes" in the environs of Bombay, its leaves eaten by the natives; by Roxburgh, and Wight pl. 1797, along the coast as far as Coromandel and the mouths of the Ganges; and according to Irvine, and Drury, yields the impure soda called "kharsuji," imported from Scinde and employed in the manufacture of soap and glass; the name "k'har" or "k'hari," in Bengalee "khyar," in Hindustanee "khar," is regarded by Royle antiq. 41 as the probable origin of the term "alkali."

Salsola nudiflora of the seashore of Hindustan. Called in Telinga "rawa-kada" (Drur.); and its ashes possibly included in the "ala inthikōn" of Archigenes: — *S. nudiflora* was observed by Graham in salt marshes in the environs of Bombay; by Roxburgh, and Drury, from Travancore to Coromandel and the mouths of the Ganges, yielding "a kind of barilla used for making soap and glass."

"99 A. D." (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Demahé succeeded by Za-Awtet, now king of Abyssinia. — He reigned "two" years.

One hundred and thirty-second generation. A. D. 101, Jan. 1st, mostly beyond youth: the philosophers, Valerius Pollio, Epictetus, Favorinus, and Oenomaus; the astronomer Theon of Smyrna (Blair); the historians Philon Byblius, and Cephallion; the grammarians, Hermippus of Berytus, and Nicanor; the rhetors, Dionysius of Miletus, and Lollianus; other Greek writers, Aelianus Tacticus; the editors, Dioscorides the younger, and Artemidorus Capito; the musician Dionysius: the Latin writers, the satirist Juvenalis; the historians Suetonius, and Tacitus; and the grammarian Terentius Scaurus.

"In this year" (Abyss. chron., and C. Mull. p. xcvi); Za-Awtet succeeded by Za-Elawda, now king of Abyssinia. — He reigned "thirty" years.

"The same year" (Dio, and Clint.), expedition of Trajan into Dacia.

"103 A. D." (Dio, Vict., and Clint.), after subduing many nations beyond the Danube, peace granted by Trajan to Decebalus and the Dacians.

"104 A. D." (Clint.), letter of Plinius Secundus x. 97 respecting the Christians of his Province in Asia Minor. The reply of Trajan is also extant, and is much celebrated.

The Andra mentioned by Pliny "in the second century" as a powerful dynasty; — and "the name of Andre Indi, on the Ganges, in the Peutengerian tables" (Ælphinst. iii. 3).

"The same year" (Mason iii. p. 42), in Burmah, destruction of the city of Prome.

"105 A. D." (Dio, and Clint.), by Trajan, a stone bridge built over the Danube, under the supervision of the architect Apollodorus of Damascus.

"October" (Dio. Chron. Pasch., and Clint.), the *Era of Petra and Bosra*. The Roman governor of Syria Cornelius Palma extending his conquests over Petra the chief city of Arabia Petræa.

Posidonius the younger about this time writing. He quotes Archigenes, and describes the glandular or true *plague*; a disease mentioned also about this time — or a little later by Rufus Ephesius (Greenhill in Sm. biog. dict.).

Curcuma zerumbet of Tropical Hindustan and Java. The imported product is called in European drug-shops *zedoaria longa*, in Persian "zerumbad" (Lindl.), in Arabic "zarnab;" and the APNABW of Posidonius the younger, — Aetius, and Paulus Aegineta, is referred here by Haller: the "zarnab" is mentioned by Avicenna, and Ebn Baitar. Farther East, *C. zerumbet* is called in Sanscrit "pulasha" or "gundha-moollee" or "shudgrunthika" or "shutee" or "kurvoora" or "kurchoora," in Bengalee "shuthee" or "kuchoora," in Telinga and Hindustanee "kuchoora" (Lindl.), in the environs of Bombay "sotee" or "satee" or "kutchoora" (Graham); is described by Rumphius v. pl. 68; was observed in Hindustan by Rheede xi. pl. 7; by Roxburgh cor. iii. pl. 206, "the powdered root" composing in part "the red stuff called 'abeer,' thrown about during the license of the Hooly;" by Graham, "distinguished by the purple mark down the centre of the leaves," and producing "the real *zedoaria* of the" shops; is known to grow also in Chittagong, and in the nearest portion of Java (Blume, and Lindl.).

"106 A. D. = 'yen-ping,' 1st year of Hiao-chang-ti" or Chang-ti, of the Han or Seventh dynasty (Chinese chron. table).

"107 A. D. = 'young-tsou,' 1st year of Hiao-ngan-ti" or Ngan-ti, of the Han or Seventh dynasty (Chinese chron. table).

"The same year" (Mason ii. 20, and iii. 42), establishment of the Burman empire at Pūgan: and the city founded or rebuilt by king Thamugdareet.

"109 A. D." (= 114 — "6th year of reign" in the Mahavamsa xxxv.), in Ceylon, death of queen Seehewallie, and escape from bondage of her successor king Ellowena.

"112 A. D." (= 109 + "3 years" in the Mahavamsa xxxv.), Ellowena, returning "with great forces" from "the coast Malaya," recovered his kingdom of Ceylon.

"113 A. D." (Dio, and Clint.), in Rome, Trajan's column erected. — To the present day, remaining almost entirely uninjured.

"In the reign of Trajan" (Suid.), Rufus Ephesius writing. He quotes Zeuxis, Dioscorides, and Posidonius the physician, divides the nerves into two classes, those of sensibility and those of motion, — and is himself quoted by Galen (Greenhill in Sm. b. d.).

Spergularia rubra of Northern climates. Called in Greece "mēlēgōnōn" (Sibth.): the "mouron rouge" first mentioned by Rufus Ephesius as a remedy in hydrophobia — (Spreng. hist. med. ii. p. 48): *S. rubra* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Cyprus and Constantinople; is known to grow also around Caucasus and throughout Siberia as far as lake Baikal (Ledeb.) Farther South, was observed by Delile in Lower Egypt as far as Cairo; by myself, in Upper Egypt; is known to occur also in Abyssinia (A. Rich.). Westward, is termed "alsine spergulæ facie minor" by Tournefort inst. 244; was observed by Desfontaines, and Munby, in Barbary; and is known to grow in middle and Northern Europe as far as Archangel (Engl. bot. pl. 852, Wahl., and A. Dec.). Farther West, is known to grow on the Azores (Wats.); in Northeast America, seems most abundant within a few miles of the sea, in roadways and waste ground often by human means transported from place to place, and I have met with it more than forty miles inland; is known to occur also on the Western coast of America at Sitcha (Ledeb.).

Spergularia media, erect and larger in all its parts, but regarded as probably not distinct. Clearly indigenous in salt marshes along our Atlantic coast as observed by myself from Lat. 43° to 38°; observed by Elliot in "brackish marshes" in South Carolina; and by Chapman, in Florida. Eastward, is termed "alsine spergulæ facie media" by Tournefort inst. 244. "ar. maritima" by Linnæus lap. (Steud.); is known to grow on the European seashore from Sweden to Portugal and Italy (fl. Dan. pl. 740, Wats., Brot., and Savi); was observed by Sibthorp, and Chaubard, on the shore of the Peloponnesus; by Granger, and Olivier, on the Mediterranean shore of Egypt (Del.); and by Bieberstein, in Tauria. In the Southern Hemisphere, is known to occur at Valparaiso in Chili, and on the island of Juan Fernandez (C. Gay, and Hook.).

Erum monanthos of the Mediterranean countries. An annual weed: the ΦΑΚΟΕΙΔΕC prescribed by Rufus Ephesius — may be compared: *E. monanthos* was observed by Sibthorp in cultivated ground from the Peloponnesus to Cyprus. Westward, is termed "vicia sylvestris cum lentis siliqua" by Bauhin hist. ii. 316, "lens monanthos" by Tournefort inst. 390; is known to grow in various parts of Southern Europe (Pers.); was observed by Desfontaines ii. 165 in Barbary; but is not known to be employed medicinally.

114 A. D. (= 116 — "3d year of his reign" of the Mahavamsa xxxv.), Ellowena succeeded by his son Sandigamonal, now king of Ceylon.

"In this year" (Dio, and Clint.), departure of Trajan on his Eastern expedition.

The practice of *sheathing ships* well known. Trajan's galley being covered with a sheet of *lead* fastened on with little *copper* nails: — as ascertained after "more than thirteen hundred years" when it was raised from the bottom of the Lake of Riccia (Alberti arch. v. 12. in Churchill coll.).

"115 A. D." (Act. martyr., and Clint.), Ignatius a disciple of the evangelist John, brought before Trajan at Antioch at the time of a severe *earthquake* there; and in accordance with his own request, sent to Rome to perish by wild beasts in the amphitheatre.

"The same year" (Euseb., and Clint.), sedition of the Jews in Egypt and Cyrene. — After continuing two years, suppressed by Trajan.

Fresh *oysters*, "ōstrēa," preserved by Apicius after a method of his own, sent by him to Trajan in Parthia, many days distant from the sea (Athen. i. p. 7, and Suid.).

Puccinellium palustre of Northern and middle Europe. Called in Britain *milky parsley* (Prior), in Germany "olsenich" (Dod.); and the SIL-MONTANVM of Apicius — may be compared: remnants of *P. palustre* have been found in the lake-villages of Switzerland (Heer): the plant is described by Dodoens, and Bauhin hist.; is termed "selinum palustre" by Linnæus, "s. lactescens" by Lamarck fl. fr.; and is known to grow from Denmark throughout middle Europe (fl. Dan. pl. 257, and Crantz austr. 170), its root used for ginger by the Russians, and "a famous remedy in Courland in epilepsy" (Rust, and Lindl.).

Calamintha nepeta of Europe and the adjoining portion of Asia. The NEPETA-MONTANA used in cookery by Apicius — is referred here by Dierbach, and others: *C. nepeta* is described by Matthioli (Spreng.); is termed "c. pulegii odore sive nepeta" by Tournefort inst. 194; was observed by Forskal near Marseilles; and is known to grow from Italy throughout middle Europe as far as Britain (Scop., Lam. fl. fr., Pers., Curt. lond. vi. pl. 40, and Wats.). Eastward, was observed by

Sibthorp, and Chaubard, frequent from the Peloponnesus throughout Greece and the Greek islands. By European colonists, was carried to Northeast America, where it has become naturalized, recurring in "waste places and road-sides" (Chapm.) from Virginia to Georgia, and found by Nuttall already in Arkansas.

Cantharellus cibarius of Europe. The FVNGI-FAGINEI of Apicius, — are referred by Dierbach to this *edible mushroom*.

116 A. D. (= 137 — "22d year of reign" in the Mahavamsa xxxv.), Sandigamonal succeeded by his son Gayabahoo, now king of Ceylon.*

* *Cocculus (Tiliacora) acuminatus* of Tropical Hindustan and Burmah. Woody and twining to a great extent, called in Bengalee "tiliakora," in Telinga "tiga-mushadee," in Hindustanee "baga-mushada" (Lindl.) or "baga-luta" (Drur.); and from early times rubbed between two stones and mixed with water as an antidote to snake-bites; — observed by Rheede vii pl. 3 in Malabar; by Nimmo, in "the Concans" as far as Bombay (Graham); by Colebrooke, and Roxburgh, among hedges and bushes from Coromandel to Bengal; by Mason, indigenous in Burmah.

Menispermum (Coccinium) fenestratum of Ceylon and Southern Hindustan. A stout woody climber called in Cingalese "womivol" or "venivel" or "bangwelgetta" (Lindl.), in Tamil "mara munjel," in Telinga "mani-pussupoo" (Drur.); and from early times in Ceylon, the water in which the sliced root has been steeped drank as a stomachic: — observed by Ainslie, and Roxburgh, as far as the Aurungole Pass and Courtallum, its root brought from the mountains and sold in the bazaars, and according to Drury its bitter deep yellow wood has given rise to the name of *tree turmeric*. From transported specimens, described by Gaertner i pl. 46.

Menispermum (Clypea) Burmanni of Tropical Hindustan. A climbing herbaceous plant called in the environs of Bombay "pakur" (Graham); and from early times its extremely bitter root employed medicinally in dysentery, intermittent fevers, and liver complaints: — observed by Rheede vii. pl. 49 in Malabar; by Graham, on "the Ghauts" and "hilly parts of the Concan, not very common;" by Roxburgh, and Wight, in Coromandel (Lindl.); and by Burmann pl. 101, on Ceylon. From transported specimens, is described by Lamarck, and Gaertner ii. pl. 180.

Kydia calycina of Tropical Hindustan and Burmah. A Sterculioid tree called in Telinga "pan-dikee," in Hindustanee "choupultea" (Lindl.), in the environs of Bombay "warung" or "warungud" (Graham); and its mucilaginous bark used from early times as sudorific and in cutaneous diseases: — observed by Graham in the "Kennery forests" and "along the Ghauts, pretty common;" by Roxburgh, and Wight, from Mysore and the slopes of the Neilgherries to the Circar mountains and Nepal (Lindl., and Drur.), the bark in the Northern provinces according to Royle used to clarify sugar. Farther East according to Mason v. 537 growing in Burmah and called "boke-may-za," the saplings found by McClelland "used for their great strength and elasticity for making banghy sticks."

Bergera Koenigii of Tropical Hindustan. A small Aurantiaceous tree called in Bengalee "bursunga," in Telinga "kari-vepa," in Tamil "kamwepila" (Lindl.) or "carroova-pillay," in Hindustanee "karay-paak" (Drur.), in the environs of Bombay "koodia neem" (Graham); and from early times, its hard and durable wood used for implements of husbandry, *limbole* oil procured from its seeds, and its dried aromatic leaves sold in the bazaars to be put in curries: — observed by Rheede iv. pl. 53 in Malabar; by Roxburgh, on the Circar mountains; by Ainslie, and Wight, in other parts of Hindustan; by Graham, in "gardens Bombay," but "B. integerrima" common "on the Ghauts" and also called "koodia neem," perhaps the same species "in its wild state."

Calophyllum calaba of Western Hindustan. A handsome tree with cuneate obovate leaves called in Tamil "cheroo-pinnay," in Malabar "tsirou-panna" (Drur.); and from early times its fruit eaten, and *pootunjee* oil for lamps expressed from it: — observed by Rheede iv. pl. 39 in Malabar; by Nimmo, in "S. Concan" (Graham), nearly as far as Bombay; by Wight, and Drury, as far as Travancore; and by Burmann pl. 60 (Pers.), on Ceylon.

Schmidelia serrata of Tropical Hindustan. A large straggling Sapindaceous shrub called in Telinga "taualikæ," in Hindustanee "rakhal-phul" (Drur.), in the environs of Bombay "teepin" or "mendrie" (Graham); and from early times, its ripe berries eaten and its astringent root employed medicinally in diarrhœa: — observed by Rheede v. pl. 25 in Malabar; by Graham, "on the Ghauts" as far as Bombay, and found by Murray "very common at Mahabeshwur;" by Roxburgh, and Wight, as far as Coromandel and Bengal (Lindl., and Drur.); and is termed "rhus cobbe" by Linnæus as received from Ceylon (Pers.).

Schleichera trijuga of Tropical Hindustan and Burmah. A pinnate-leaved Sapindaceous tree fifty feet high and called in Telinga "may" or "koatangha," in Tamil "zolim-buriki" (Lindl.) or "poo-marum," in Malabar "poovum" (Drur.), in the environs of Bombay "koosimb" or "koosum"

Cissus setosa of Tropical Hindustan. A climbing herbaceous vine called in Telinga "barubut-sali" (Lindl.); and from early times its leaves toasted and oiled to bring indolent tumours to suppuration: — observed by Roxburgh, and Wight, from Mysore to Rajahmundry and Bengal, in forests

(Graham); and from early times, its bark used to cure itch, its fruit eaten, and lamp oil expressed from the seeds: — is termed "cussambium spinosum" by Rumphius i. pl. 57; was observed by Graham in the "Kennery forests" near Bombay, and "on the Ghauts pretty common;" by Buchanan, Roxburgh, Wight, and Drury, from Malabar and Travancore to Coromandel. Farther East, by Berdmore, and Mason v. 35, in Burmah, called "kyo" and abounding "in Shwaygyen," used "for pestles of mortars and axles of wheels," and considered by McClelland "a most valuable timber."

Xanthoxylon rhetsa of Southern Hindustan. A large tree armed with prickles and called in the environs of Bombay "teesul" or "cochlee" (Graham), in Malabar "moolleela," in Telinga "rhetsa maun" (Drur.) from the hill people being accustomed to assemble in the shade in "rhetsa" committee to examine and determine public affairs: — *X. rhetsa* was observed by Rheede v. pl. 34 under cultivation in Malabar and the seeds used as a condiment; by Graham, as far as Bombay, "Parr village" and other localities near dwellings enumerated; by Roxburgh, and Wight, on the Coromandel mountains, its aromatic bark put in food as a condiment, and its seeds used as a substitute for pepper (Drur.).

Gomphia angustifolia of Tropical Hindustan. An Ochnaceous shrub, its bitter root and leaves from early times in Malabar employed as tonic stomachic and anti-emetic: — observed in Malabar by Rheede v. pl. 48 and 52; by Nimmo, in "S. Concan" (Graham), nearly as far as Bombay; by Wight, in other parts of the peninsula.

Elaeodendron Roxburghii of Tropical Hindustan. A Celastroid shrub or small tree called in Telinga "neerija" (Lindl.); and from early times its fresh astringent bark applied by the natives to almost every sort of swelling: — observed by Gibson, and Graham, in the Bombay district, on the "Sattara and Kamatkee ghauts" and "about Hurrychunderjee;" by Roxburgh, and Wight, from the mountains of Coromandel to Courtallum (Drur.).

Bridelia spinosa of Tropical Hindustan. A Euphorbiaceous tree of thirty to forty feet high, called in Telinga "kora man" (Lindl.), in Tamil "moolloo-vengay," in Malabar "mooloo-vangay" (Drur.), in the environs of Bombay "asanna" (Graham); and known from early times, cattle being fond of the leaves, said to free them from intestinal worms: — was observed by Nimmo, and Graham, "common on Elephanta and the Ghauts," the "trunk and larger branches armed with strong thorns;" by Roxburgh, Wight, and Drury, as far as Travancore, the Circar mountains, Bengal, and Assam, its dark-coloured wood hard and durable, and the bark strongly astringent. "*B. montana*," growing "on the Ghauts" and also called "asanna," a "tree exactly like the last but without thorns," having "red coloured and very hard wood," is regarded by Graham as probably "a mere variety."

Cluytia (Lebidieropsis) collina of Tropical Hindustan. A Euphorbiaceous tree called in Telinga "kadishen" (Lindl.) or "wodisha," in Tamil "wodagu marum" (Drur.); and from early times the rind of its capsules reputed to be exceedingly poisonous: — observed by Roxburgh, Wallich, and Drury, from the Concans to the Circar mountains and Orissa, its wood "very hard and durable, much used in Rajahmandry and the Northern Circars."

Croton (Baliospermum) polyandrum of Tropical Hindustan. A bushy undershrub called in Telinga "konda-amadam," in Hindustanee "hakoon" (Lindl.); and its seeds taken from early times as a good purgative: — observed by Roxburgh, Wight, Stewart, and Drury, from the Punjaub to Malabar, the Circar mountains and Bengal, its seeds probably furnishing "the greater part of the *jumalgota* of the drug-sellers." "East of the Sutlej its leaves are in high repute for wounds, and its sap is believed to corrode iron." Farther East, was observed by Mason v. 402 "exotic" in Burmah and called "tha-dee-wa," cultivated by the natives, its seeds "a strong purgative."

Holigarna longifolia of Tropical Hindustan and Burmah. A large Terebinthoid tree called in Malabar "cattu tsjeru" (Drur.), in the environs of Bombay "biboo" (Graham); and from early times a varnish extracted from the trunk, and small boats made of the timber: — observed by Rheede iv. pl. 9 on the mountains of Malabar; by Graham, on "the hilly wooded parts of the Concan as far as Bombay; by Roxburgh cor., and Wight, from Travancore to Chittagong, the juice of the fruit according to Don used by painters, also for fixing indelible colours figured on linen cloths (Drur.). Farther East, was observed by Mason v. 514 in Burmah, "another black varnish tree in the forests," and "on the other coast, where the tree grows, its exudation is used by the natives to varnish shields, and for other purposes."

Semecarpus cuneifolium of Tropical Hindustan. An allied tree also called "biboo" in the

and hedges, "every part of the plant exceedingly acrid" (Lindl., and Drur.). Westward, fragments of a caustic herbaceous *Cissus* were observed by myself in a hedge on Zanzibar.

Toddalia aculeata of Tropical Hindustan. A thorny Xanthoxyloid shrub called in Telinga

environs of Bombay, being indistinguishable from the last except by the fruit, — observed by Graham at "Kandalla" and in "jungles about Parr;" by Roxburgh fl. ii. 86, in other parts of Hindustan.

Ormocarpum sennoides of Tropical Hindustan. A Leguminous plant called in Telinga "nall kashina" (Lindl.); and from early times its tonic and stimulant root employed medicinally: — observed by Roxburgh, and Wight, in peninsular Hindustan, in forests hedges and uncultivated lands.

Acacia leucophloea of Southern Hindustan. A thorny tree called in Telinga "tella-tooma" (Lindl.), in Tamil "vel-vel" or "vel-veylam," in Malabar "vel-veylam," in Bengalee "suphaid-babul," in Hindustanee "sufed-kikar" (Drur.); and from early times, the tough and strong fibres of its bark made into large fishing-nets and coarse cordage: — observed by Law, and Graham, "common in some parts of the Southern Mahratta country, and in the Sholapore districts between the Bheema and Krishna, a spirituous liquor is distilled from the bark, and in some places the trees are farmed on account of government;" by Roxburgh, and Wight, in woods and on hills on the Coromandel coast, its timber "hard and dark-coloured," the natives mixing the bark "with palm-wine and sugar" to obtain the ardent spirit (Drur.).

Ammania vesicatoria of Hindustan and Burmah. An erect annual having a strong muriatic smell and called in Telinga "aghun drapakoo," in Bengalee "daud-maree" (Lindl.), in Hindustanee "dad-mari," in Tamil "mumel-neruppa" or "kallurivi," in Malabar "kallar-vanchi" (Drur.); and from early times, its exceedingly acrid leaves used by the natives for raising blisters: — observed by Graham "common in moist places" around Bombay "towards the close of the rains;" by Ainslie, Roxburgh, Fleming, and Wight, as far as Bengal, common in cultivated ground (Lindl.). Farther East, by Mason in Burmah, enumerated as indigenous. Transported to Europe, is described by Plukenet alm. pl. 136.

Luffa amara of Tropical Hindustan. A climbing Cucurbitaceous vine called in Telinga "sheti beera" (Lindl.) or "sendu-beer-kai," in Hindustanee "kerula," in Bengalee "tito-dhoondhool" (Drur.); and from early times, juice of the roasted young fruit applied to the temples to cure headache, and the seeds taken as emeto-cathartic: — observed by Nimmo, and Graham, "wild about Bombay in the rains, and throughout the Concans;" by Roxburgh, and Wight, as far as Bengal, in dry uncultivated places (Lindl.). Transported to Europe, is termed "cucumis indicus" by Plukenet pl. 172.

Bryonia rostrata of Southern Hindustan. A slender climbing Cucurbitaceous vine called in Tamil "appakovay" (Drur.); and from early times, its leaves eaten as greens, and its sweet mucilaginous root employed medicinally: — observed by Rottler act. berol. iv. 212 in Tranquebar; by Nimmo, in "S. Concan" (Graham suppl.), nearly as far as Bombay; by Ainslie, Roxburgh, and Wight, in other parts of Southern Hindustan.

Trichosanthes palmata of Tropical Hindustan and Burmah. A Cucurbitaceous vine running over the highest trees and called in Bengalee "mukhal," in Telinga "kadi-danda" (Lindl.) or "abuvu," in Tamil "ancoruthay" (Drur.), in the environs of Bombay "mukal" (Graham); and from early times, its fruit regarded as poisonous but employed medicinally to cleanse offensive sores inside the ears, and the stem and root much esteemed in diseases of cattle: — observed by Gibson, and Graham, "in jungles in the Concans and on the Ghauts pretty common," and by Murray "at Mahableshwur;" by Ainslie, Roxburgh, and Wight, as far as Bengal; by Mason, in Burmah. By European colonists, was carried to Austral Africa, where its fruit by pickling is rendered edible; and to the West Indies, used there for killing rats (Drur.). From transported specimens, is termed "modicca bracteata" by Lamarck enc. meth.

Bassia longifolia of Southern Hindustan and Burmah. A Sapotaceous tree called in Burmah "kan-zau" (Mason), in Tamil "elloopa," in Malabar "elloopie," in Telinga "ippa," in Hindustanee "mohe" (Drur.); and from early times, its flowers roasted and eaten, oil from its ripe fruit substituted for butter, used also for lamps and for making country soap, and the gummy juice of its bark employed medicinally by the Vytians: — observed by Ainslie, Roxburgh, Hunter, and Drury, from Malabar to the Circars and Coromandel, its timber "nearly as durable as teak;" by Mason, "indigenous" in Southern Burmah, its oil mixed by the natives "with their food," employed besides for various purposes, and its timber valued. From transported specimens, described by Linnæus, and Lamarck pl. 398. *Illupie oil* according to Drury is now imported into England for the manufacture of candles.

Hoya viridiflora of Tropical Hindustan. A woody Asclepioid climber called in Bengalee "tita-

"conda cashinda" (Lindl.), in Tamil "moolacarnay-marum," in Malabar "kaka-toddali" (Drur.), pungent in all its parts and from early times employed as febrifugal:—observed by Rheede v. pl. 41 in Malabar; by Nimmo, in "S. Concan" (Graham), nearly as far as Bombay; by Roxburgh,

kunga," in Telinga "doodee-palla" (Lindl.), at Mahableshwur "dooree" (Graham); and from early times employed medicinally by the natives, and the brown mealy substance on the follicles given by cow keepers as medicine to their cattle:—observed by Rheede ix. pl. 15 in Malabar; by Graham, "common" around Bombay and on "the Ghauts, on the table land Mahableshwur" and its flexile stems "used as ropes;" by Rumphius, Ainslie, Roxburgh, Sonnerat, and Wight, from the Neilgherry hills to Coromandel and Sylhet (Lindl., and Drur.).

Secamone emetica of Southern Hindustan. An Asclepioid plant, its acrid and emetic root known from early times:—observed by Retz obs. ii. 14, and Wight, common in thickets at the foot of mountains in the Southern part of the peninsula (Lindl.).

Tylophora asthmatica of Tropical Hindustan and Burmah. A twining Asclepioid plant called in Bengalee "unta-mool," in Telinga "kaka-palla" (Lindl.), in Tamil "codegam" or "coorinja" (Drur.); and from early times its root employed as an emetic:—observed by Roxburgh, J. Anderson, Wight, and Drury, from Mysore to Coromandel and Bengal, "very abundant," to "be met with in nearly all situations and in flower at all seasons;" is known to grow on Ceylon (Pers.); and was observed by Mason indigenous in Burmah. By European colonists, was carried to the Mauritius Islands, and cultivated there (Pers., and Boj.).

Convolvulus (Argyria) bracteatus of Southern Hindustan. A branching woody twiner, filled with milky juice; and from early times, its boiled leaves applied to scrofulous enlargements of the joints, using the water as fomentations:—observed by Wallich cat. 1419, and Wight, common "near Madras" (Lindl.), and known to grow as far as Coromandel (Drur.).

Anisomeles Malabarica of Tropical Hindustan. A Labiate shrub, two to five feet high with white woolly branches, and called in Tamil "retti pameretti" (Lindl.) or "peyameratti," in Telinga "moga-bira," in Malabar "karintoomba" (Drur.); from early times, employed medicinally:—observed by Rheede x. pl. 93 in Malabar; by Graham, on "the Katruj and Kamatkee ghauts," and by Law "at Nalutwar;" by Ainslie, Roxburgh, and Wight, in other parts of the peninsula as far as Travancore (Drur.); by Mason, indigenous in Burmah. By European colonists, was carried to the Mauritius Islands (Drur.).

Aristolochia bracteata of Hindustan. Trailing, and called in Telinga "gardi gavapoo" (Lindl.) or "gadida-guda-pa," in Tamil "addatinapalay" (Drur.), on the Deccan "gundatee" or "keeramar" worm-killer (Graham), its juice from early times squeezed into wounds to kill worms, all parts of the bitter and nauseous plant used also medicinally:—observed by Buchanan on the banks of the Jumna in Northern Hindustan (Wall. rar. ii. 3); by Newton, its dried root used in Scinde "to increase uterine contractions;" by Gibson, and Graham, growing abundantly in "dark red or black soil" on the Deccan; by Retz obs. v. 29, Ainslie, Roxburgh, and Drury, in cultivated ground on the Coromandel coast and as far as Travancore, its fresh bruised leaves applied in "that kind of psora called in Tamil *carpang*."

Ficus demonum of Southern Hindustan and Burmah. Its fruit on the trunk and branches, but usually in long radical racemes at the apex penetrating the earth, or often entirely under ground (Lindl.); from early times, the juice known as extremely poisonous:—growing on the seacoast of Tanjore (Vahl., and Roxb.). Farther East, observed by Mason in Burmah, called there "yae-kha-ung."

Arum (Typhonium) trilobatum of Tropical Eastern Asia and the Malayan archipelago. Stemless, and called in Telinga "surei-kund," in Bengalee "ghekool" (Lindl.); and from early times, its fresh tubers employed medicinally in scirrhus tumours and the bites of venomous snakes:—observed by Nimmo in "the Concans" as far as Bombay (Graham); by Roxburgh fl. iii. 505, in other parts of Hindustan; and is known to grow on Ceylon (Pers.). Farther East, was observed by Loureiro ii. 534 in Anam; by Blume rumph. i. 132, as far as Java; and is termed "arisarum amboinicum" by Rumphius v. pl. 110. "T. Orixense," termed in Bengalee "ghet-kuchoo" (Drur.), and observed by Roxburgh iii. 503, and Wight pl. 801, in the peninsula and Bengal, by Mason in Burmah, may be compared.

Gracilaria lichenoides of the coast of Ceylon and the opposing portion of the Malayan archipelago. A fucus or seaweed, in colour between olive and purple (Mason), and from early times highly valued for food on Ceylon and other islands of the East—(Lindl.): by O'Shaughnessy first brought into notice: observed by Mason v. 507 in Burmah, abounding and of superior quality on the Tenasserim coast, and called "kyouk-pwen." From transported specimens, described by Turner pl. 113.

and Wight, very common on the Coromandel coast, used for various medicinal purposes and its ripe berries making excellent pickles (Drur.); by Burmann pl. 24, on Ceylon. Imported into Europe under the name of *Lopez root*, attained formerly some celebrity; and according to Bidie, is remarkable for a happy combination of three qualities, being stimulant, carminative, and tonic.

"In this year" (Dio, and Clint.), voyage of Trajan from Ctesiphon down the Euphrates to the Persian Gulf.

Before the close of the reign of Trajan (Suid., Ermerins, and Sor. Eph. 38), Soranus Ephesius leaving Alexandria and arriving in Rome, where he practised medicine. He quotes Archigenes, Moschion, and Rufus, and — with his pupil Attalus is mentioned by Galen. Some of the writings of Soranus Ephesius were translated into Latin by Caelius Aurelianus.

Ruta linifolia of the Mediterranean countries. A species of *rutæ* called in Greece "pēgani" (Sibth.); and the ΠΗΓΑΝΟΝ: ΛΕΙΟΝ prescribed as an application by Soranus Ephesius mul. aff., 48 — may be compared: *R. linifolia* was observed by Forskal, and Sibthorp, from Greece to Cyprus and Constantinople. Westward, is described by Barrelier pl. 1186; is termed "*r. sylvestris linifolia hispanica*" by Tournefort inst. 257; and is known to grow in waste places from Tunis to Spain, the leaves smooth (Pers.).

Erigeron acre of Europe and the adjoining portion of Asia. Called in Britain *blue flea-bane* (Prior); and the ΚΟΝΥΖΑ: ΛΕΠΤΟΦΥΛΛΟC prescribed as an application by Soranus Ephesius m. a. 48, — may be compared: *E. acre* was observed by Sibthorp on mount Athos and the Bithynian Olympus. Westward, is termed "*aster arvensis cæruleus acris*" by Tournefort inst. 481; was observed by Linnæus in Lapland; and is known to grow throughout middle Europe (Curt. lond. i. pl. 60, and Pers.).

Asparagus verticillatus of the East Mediterranean countries. The ΑCΠΑΡΑΓΟΝ: ΑΓΡΙΟΝ enumerated among potherbs by Soranus Ephesius mul. aff. 15 — may be compared: *A. verticillatus* is termed "*a. orientalis foliis galii*" by Tournefort cor. 21; was also observed in the East by Buxbaum v. pl. 37; by Sibthorp, from the Peloponnesus to Smyrna; and young shoots of all the species were found by Chaubard eaten in the Peloponnesus. (Compare also *A. officinalis* of the West).

"117, August" (Dio, and Clint.), Trajan succeeded by Hadrian, fourteenth Roman emperor. The hieroglyphic ovals of Hadrian occur at the "Oasis of Khargeh, on a ruin near Esneh, at Ermend" or Hermonthis, "on the little temple of Isis above Medinet-abu, on the Typhonium at Dendera, and on an obelisk" (now in Rome, Glid. analect.).

All pretension to territory beyond the Euphrates and Tigris, at once relinquished by Hadrian. Who in private life was fond of the society of "philosophers, grammarians, rhetors, musicians, painters, geometers, and astronomers" (Spartian. 5 to 16, and Eutrop. viii. 6).

"118 A. D." (Spartian., and Clint.), in consequence of difficulties with the Sarmatas and Roxolani, Hadrian visiting Moesia; where peace was concluded with the king of the Roxolani.

"120 A. D." (Spartian. 10, and Clint.), visit of Hadrian to Gaul, and afterwards to Germany, and Britain. Across this island he built a wall, "separating the Romans from the barbarians: " — the remains traceable to the present day "from Carlisle to Newcastle" (Blair).

"In this year" (Perceval i. 85), bursting of a reservoir at Mareb near San'aa, causing destruction among the descendants of Saba: — an event alluded to in the Surat-Saba chapter of the Koran, and giving rise to an Arab proverb.

"In or about this year" (Percev. ii. 411), birth of Temin, founder of "one of the most considerable tribes of Arabia."

"122 A. D." (Euseb., Spartian. 10, and Clint.), after spending a winter at Tarragon in Spain, Hadrian by the way of Asia visiting Athens. — He next sailed for Sicily, and ascended mount Etna.

"123 A. D." (Yuan kian loui han, and Klapr. mem. ii. 343), Pan young sent Westward established the military post of Lieou tchlin in Lat. 42° 45' Long. 25° 18' (W. of Peking), attacked and defeated the Kiu suz or Ouigour, and took possession of their country. — Under the Thang, peace having been concluded with the Ouigour, a city of the third order was built here, called at present Louktchak.

"124 A. D. = 3d year of the 'yen-kouang' of Ngan-ti" (Chinese chron. table), beginning of the Forty-seventh cycle.

"125 A. D." (Euseb., Hieronym., and Clint.), at Athens, Hadrian addressed on behalf of the Christians by the philosopher Aristides, and Quadratus a disciple of the apostles: and a decree obtained, That no one should be put to death without trial in due form.

About this time, "110 to 134 A. D." (Clint. iv. p. 123), the Gnostic Sect founded by Saturninus. Who continued preaching in Antioch and Syria, while his colleague Basilides proceeded to Alexandria.

"126 A. D. = 'young-kien,' 1st year of Hiao-chun-ti" or Chun-ti, of the Han or Seventh dynasty — (Chinese chron. table).

128 A. D. (Ptol. obs. on equinox), end of the third *Great Year* of the Egyptians.

"129, Jupiter being in the sign Leo" (Aristid. i. p. 519, Masson, and Clint.), birth of the rhetor Aelius Aristides.

"In the reign of Hadrianus" (Lubke and Lutrow), the temple to the Olympian Jupiter at Athens completed under the Roman architect Cossutius.

"130, autumn" (coins, inscript. on Vocal Memnon, and Clint.), after passing the winter at Athens, arrival of Hadrian in Egypt: where he found Christians numerous, as appears from one of his letters; and in the course of his voyage on the Nile, founded the new city of Antinoë: — to the present day marked by ruins in the Roman style of art.

The *Second era of Gaza* begins from this visit of Hadrian.

"131 A. D." (Dio, Clint., and Kitt. cycl. bibl.), on reaching Jerusalem, Hadrian changed the name of the city to Aelia Capitolina; and on the site of Solomon's temple, founded a temple to Jupiter. The building operations were shortly afterwards interrupted by the Jews; who, led by Cochebas, commenced war against the Romans, and were at first successful.

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Elawda succeeded by Za-Zigen and Rema as kings of Abyssinia. — They ruled "forty" years.

"In this year" (Jap. centen. comm. 88), in Japan, end of the reign of . . . the son of Keiko.

Cloth made of *hemp* "is very old" in Japan, and "was the only textile fabric" in the country "prior — to the introduction of silk weaving" (Jap. centen. comm. 77).

Among dye stuffs used in Japan, "*gall-nuts, turmeric*" (*Curcuma longa*), "*madder*" (*Rubia cordifolia*), "*safflower*" (*Carthamus tinctorius*), and "*brazil wood*" (*Caesalpinia sappan*),* — are enumerated in Jap. centen. comm. 75.

"132 A. D." (Hieron., Eutrop., Blair, and Clint.), the "Perpetual Edict," a body of laws for praetors, compiled by Salvius Julianus.

"133, May 6th, 11 hours 15 minutes P. M." (Blair), *eclipse of the moon*. Observed at Alexandria by Claudius Ptolemy.

Coronilla emerus of the Mediterranean countries and as far as middle Europe. A small shrub called in France "*faux baguenaudier*" (A. Dec.), in Greece "*agriopēganōs*" (Sibth.), in which we recognize the ΑΓΡΙΟΝ ΠΗΓΑΝΟΝ placed under the wing protecting birds from cats according to Sotion, — and Florentinus (geopon. xii. 25 and xiii): C. emerus was observed by Sibthorp, and Chaudard, frequent on the mountains of the Peloponnesus and Crete; is known to grow also in Asia Minor and the Crimea (Tchih., and Bieb.). Westward, is termed "*emerus*" by Tournefort inst. pl. 418; and is known to grow in Italy, and as far as "Lat. 47° 45'" from Vienna to the Jura (Pers., and A. Dec.). The leaves called *scorpion senna* are according to Lindley "cathartic like those of senna, but less active."

One hundred and thirty-third generation. May 1st, 134. mostly beyond youth: Iamblichus of Babylon: the Greek poet Mesomedes of Crete; the philosophers, Sextus the stoic, Crescens, Valerius Diodorus, Taurus of Berytus, Maximus of Tyre, and Apollonius of Chalcis; the historians, Appianus, and Phlegon of Tralles; the grammarians, Telephus, Alexander of Cotiaeum, and Hephaestion; the rhetors, Antonius Polemo, Marcus of Byzantium, Aristocles of Pergamus, Nicostratus, Varus of Perga, and Philager; other Greek writers, Polyaeus of Macedonia: the Christian Greek writers, Papias, Justinus Martyr, and Hegesippus.

"The same year" (Just. Mart., Euseb., and Clint.), by Cochebas leader of the Jewish revolt, many Christians persecuted for not taking part in the war against the Romans. Basilides the Gnostic at this time in Alexandria, and his doctrines opposed in writing by Agrippa Castor.

* *Gardenia florida* of Subtropical China and Japan. An ornamental shrub called in Anam "*cay deanh tau*," in China "*chy tsu*" (Lour.), in Japan "*si*" or "*kutsjinas*" (Thunb.); and from early times planted for hedges in Japan, and its flowers used for dyeing yellow — (Jap. c. c. 75): observed in Japan by Cleyer ii. 7. f. 21, and Kaempfer, by Thunberg, everywhere. Southward and Westward, was observed by Loureiro in China and Anam; by Rumphius vii. pl. 14, on Amboyna; by Mason v. 414 to 785, "*exotic*" in Burmah and called "*thung-hsen-pan*," cultivated by the natives for ornament and its fragrant flowers; by Roxburgh, and Graham, in gardens in Hindustan, called "*gundha raja*," and "*probably introduced from China*." By European colonists, was carried to Austral Africa (Pers.); to the Hawaiian Islands, verified by myself; and to North America, where it has become a favourite in greenhouses.

Evodia glauca of Japan. Called there "*kiwada*," and from early times its bast used in the process of dyeing — (see Jap. c. c. 31 and 80): E. glauca is described by Miq.

Lithospermum erythrorhizon of Japan as far as Yesso. Called in Japan "*murasaki*" (Sieb.), and from early times used for dyeing purple — (see Jap. c. c. 80): known to grow as far as Yesso (Sieb.).

"135 A. D." (Euseb., Clint., and Kitt. cycl. bibl.), the Jewish war brought to a close; and all obstacles to the original design of Hadrian removed. Jerusalem was now made the site of an exclusive Roman colony, the Jews being prohibited from residing there or in the vicinity. From this edict, the "final dispersion of the Jews" is often dated; it having exerted a powerful influence on their destiny.

Until the siege of Jerusalem by Hadrian, its bishops had all been circumcised; Judas being the "fifteenth."

"The same year" (Dio, and Clint.), the historian Arrianus governor of Cappadocia.

Cape Comori in Hindustan named according to Arrianus from a temple dedicated to a goddess — ("Kumari, a name of Parvati or Uma, the virgin bride of Siva," H. H. Wils. note to the Mrich. vi.).

136 A. D. ("in the twentieth year of Hadrian and two thousand one hundred and fifty third ann. Abr.," Euseb.), the first Gentile bishop at Jerusalem, Marcus.

"The same year" (Franz 126), a Greek inscription relating to Sabina wife of Hadrian, presenting the following form of the letter Δ.

"In the reign of Hadrianus" (Sm. b. d.), Claudius Aelianus, Italian by birth, teaching rhetoric at Rome. He wrote in the Greek language, especially admired Herodes Atticus, and mentions visiting Alexandria in Egypt (anim. xi. 11 and 40).

The . . . of Aelianus — is referred by Cuvier to the *yak* or mountain bullock of Thibet, Bos grunniens: the Indian "agriavōus" furnishing the "tōupha" ornament on the banner of military prefects, is mentioned by Cosmas Indicopleustes xi. p. 335; the yak is also mentioned by Rubruquis (Voyag. Belg.), and Marco Polo 72; and Nicolo Conti in Ava heard of "long-haired cattle" in the country beyond "towards Cathay."

Conferva? rupestris of the European and Mediterranean coasts. The ΤΡΙΧΕC seaweed of Aelianus xiii — (Dod. pempt. iii. 5. 19), may be compared: *C. rupestris* is termed "*c. marina trichodes ramosior*" by Dillenius musc. xxviii. pl. 5. f. 29; was observed by Sibthorp in the Propontis and among the Greek islands; and is known to grow in the Atlantic as far as Britain (Dillwyn pl. 23, and Engl. bot. pl. 1699).

137 A. D. (= 143 — "6 years reign" in the Mahavamsa xxxv.), Gayabahoo succeeded by Mahalomanā, now king of Ceylon.

"138, before July 20th" (Ptol. can., and Clint.), Hadrian succeeded by Antoninus Pius, fifteenth Roman emperor. The hieroglyphic ovals of Antoninus Pius occur in the Oasis El-Kargeh, and at Medamot, Dakleh, Philæ, Esneh, Medinet-Abu, and Dendera (Glid. analect.). His name occurs also in Greek inscriptions in Egypt.

"139, Sept. 26th" = "ninth of Athyr" (Ptol. meg. synt., and Clint.), the *Autumnal equinox* observed at Alexandria by Claudius Ptolemy.

"140 A. D." (Euseb., Hieronym., and Clint.), Hyginus being bishop in Rome, arrival there of Cerdo preceptor of Marcion, and of Valentinus the Gnostic. Valentinus had known and conversed with one of Paul's disciples.

"March 22d" = "seventh of Pachon" (Ptol. meg. synt., and Clint.), the *Vernal equinox* observed at Alexandria by Claudius Ptolemy.

Deflection or *refraction* of the rays of light, giving a false position to the stars, mentioned by Claudius Ptolemy opt. v. (The treatise is extant in an Arabic version by Sahl et Thaberi; see also Roger Bacon spec. math. p. 37, and Steinschneid. ii. 21). — The phenomenon of refraction, is also mentioned by Alhazen.

The "krup̄tōn limēna" on the Arabian shore of the Persian Gulf, mentioned by Claudius Ptolemy, — is referred by C. Muller (geogr. min. p. lxxii) to the port of Muscat. To the appropriateness of the name "concealed harbour," in approaching from the sea, I can myself bear witness.

The ΖΙΓΓΙC promontory of East Africa, described by Claudius Ptolemy i. 17 and iv. 7 as conspicuous from its forked head and its elevation above a level shore of nearly four hundred miles, — may be compared with mount Kilmungaro, situated some four degrees South of the Equator, and visible from the sea, as witnessed by myself. Cosmas Indicopleustes i. p. 132 on his voyage to the Persian Gulf went nearly as far as "Varvarian" (Berbera), "beyond which Ziggion is situated, this name being given to the mouth of the ocean."

The country South of the Equator, known to Claudius Ptolemy i. 7 to 12, iv. 8 and vii. 5, as ΑΓΑCYΜΒΑ, — may be compared with Kissimbany on the island of Zanzibar.

"Baithana" on the Godaveri (Ptol. geogr., and Wilford as. res. ix. p. 199), or Paitan, the metropolis of king "Siri-Polemaios" or Sri-Pulimana.

143 A. D. (= 127 — "24 years reign" of the Mahavamsa xxxvi), Mahalo-manā succeeded by his son Bhatia-tissa, now king of Ceylon.

"In this year" (Clint.), after governing for some years the cities of Asia, the rhetor Herodes Atticus consul at Rome: Fronto being "consul suffectus" during two months.

"144 A. D." (Wathen soc. calcutt. iv. 480, Tod, and Elph. iv. 1), accession of Kanak Sena as king at Ballabi in Guzerat. He came from Oud, and founded a new dynasty.

Phyllanthus niruri of Tropical Asia. An erect branching small-leaved annual having a Sanscrit name (Pidd.), and called in Malabar "kirganelli" (Rheede) or "kirjaneilie," in Tamil "kilanelly," in Telinga "neela-ooshireker" (Drur.) or "nella userekee," in Bengalee and Hindustanee "sada-hazur mune" (Lindl.); and from early times used as diuretic, and for other medicinal purposes: *—observed by Rheede x. pl. 15 in Malabar; by Graham, "a common weed in gardens and cultivated lands" around Bombay; by Burmann pl. 93. on Ceylon; by Ainslie, and Roxburgh, as far as Bengal; by Loureiro, in Anam (Steud.); and is described by Rumphius vi. pl. 17. Westward, was observed by Grant "by dwellings 2° N." on the Upper Nile; and is known to occur in Equatorial Africa as far as the Atlantic (Benth. fl. nigr.). By European colonists, was carried to the Mauritius Islands (Boj. i. 280); to Brazil, regarded there as a specific against diabetes (Mart.); to the West Indies, not mentioned by the older writers (A. Dec.), but at present occurring as far as the Pacific (Maycock, Schlecht., and Benth. bot. Sulph.); to the environs of Marseilles, where it has been found growing spontaneously (Castagne).

"145 A. D. = 'young-kia,' 1st year of Hiao-tchoung-ti" or Tchoung-ti, of the Han or Seventh dynasty — (Chinese chron. table).

"146 A. D. = 'pen-tsou,' 1st year of Hiao-tchi-ti" or Tchi-ti, of the Han or Seventh dynasty — (Chinese chron. table).

"The same year" (inscript., Blair, and Clint.), introduction by Antoninus Pius of the worship of Serapis into Rome; and on "May 6th," the mysteries celebrated. The great sun-temple at Balbeck in Syria was also built by Antoninus Pius (Lubke and Lutrow).

In the "sandstone" quarry at Gertasse in Nubia, where stone was cut for the temple on Philæ, "about fifty-one" *Greek inscriptions*, "exvotos" in honour of Isis; belonging to the reigns of Antoninus Pius, — Marcus Aurelius, Severus, and Philippus (Wilk. theb. and eg. 478).

About this time, "136 to 150 A. D." (Clint.), the Christian treatise termed "Pastor" written in Rome, by Hermas brother of Pius the bishop.

"147 A. D. = 'kien-ho,' 1st year of Hiao-hiouan-ti," or Hiouan-ti, of the Han or Seventh dynasty (Chinese chron. table). "In his reign" (Pauth. 267), beginning of *commercial intercourse* with foreigners, through the port of Canton.

"The same year" (Vict., and Clint.), celebration of the Nine hundredth anniversary of the building of Rome.

"150 A. D." (Iren., and Clint.), Pius succeeded by Anicetus, tenth bishop of Rome.

"The same year" (Tertull., and Clint.), the teaching of Marcion, founder of the Marcionite sect.

"152 A. D." (Blair), persecution of Christians stopped by Antoninus Pius.

"The same year" (Alst. p. 381, and Nicol.), the earliest ecclesiastical Council on record. Held at Pergamus in Asia Minor, and the opinions of Colarbas condemned.

* *Phyllanthus urinaria* of Tropical Hindustan. Distinguished from the last by its sessile flowers and rough capsules, and called in Bengalee and Hindustanee "hazar mune," in Telinga "yerra userekee" (Lindl.); from early times, known as a powerful diuretic:—observed by Rheede x. pl. 16 in Malabar; by Graham, "common in Bombay during the rains;" by Ainslie, and Roxburgh, in other parts of Hindustan; and is termed "herba mæroris rubra" by Rumphius vi. pl. 17. Transported to Europe, is described by Plukenet alm. pl. 183.

Phyllanthus simplex of Southern Hindustan. Called in Telinga "uchi userekee" (Lindl.), and from early times its fresh leaves bruised with buttermilk as a wash to the itch in children:—observed by Retz v. 29 in Tranquebar; described also by Roxburgh; and according to Lindley, growing in "dry cultivated ground in the East Indies."

Oxystelma esculenta of Tropical Hindustan. The most beautiful of the Asclepias tribe, twining, and called in Sanscrit "dooghdkā," in Bengalee "doodhee" or "doodh-luta" or "kirui," in Telinga "doodee-palla" (Lindl.); and from early times, used in decoction as a gargle in apthous affections:—known to grow in Malabar and on Ceylon (Pers.); by Graham, as far as Bombay, generally on certain "almost leafless shrubs, where it shows" its "elegant blossoms to the best advantage," its own "leaves deciduous in the cold season;" by W. Jones, and Roxburgh, as far as Bengal; by Wight, in other parts of Hindustan, but he could not find that the natives eat it. Transported to Europe, is described by Plukenet alm. pl. 359.

"156 A. D." (Blair), Attilius Titianus for aspiring to the empire, put to death by the Senate; the only instance of proscription in the reign of Antoninus Pius.

"About this time" (Lucian, and Clint.), in Paphlagonia, an oracle of Aesculapius and Apollo founded by Alexander, a native of the country.

Arbutus uva-ursi of Subarctic climates. Called in Britain *bearberry* or *bear's bilberry* (Prior): the Pontic medicine ΑΡΚΟΥ: ΣΤΑΦΥΛΗC employed by Arrhabinus, — growing according to Galen comp. med. vii. 4 in Pontus, a depressed shrub with leaves like those of "mēmaikulō" and round red fruit, is referred here by writers: *A. uva-ursi* has not been observed in Greece, but is known to grow throughout Siberia to Kamtchatka. Westward, is known to grow on the Appenines, Alps, and Pyrenees (Savi, and Dec.), and from Britain and Ireland throughout Northern Europe as far as Lapland and Iceland (fl. Dan. pl. 33, fl. Lapp. pl. 6, Pers., and Hook.). Farther West, is known to grow from Arctic America throughout New England to Lat. 40° along the Atlantic (Pursh, and Conrad), on the Saskatchewan in Lat. 54° (Drumm.), the Rocky mountains (James), and Unalascha in the Pacific (Cham.). The leaves "in the form of decoction and powder," according to Pereira, and Lindley, are "used in nephritic" complaints.

"161, March 7th" (Dio, and Clint.), Antoninus Pius succeeded by Marcus Aurelius Antoninus, sixteenth Roman emperor. Who at once associated Lucius Verus in the government. Separate hieroglyphic ovals of the associate emperors, occur at Philæ — (Glid. analect.).

"The same year" (coins, and Clint.), in Rome, dedication of the column of Antoninus Pius. — This column continues almost uninjured to the present day.

"162 A. D." (Capitolin., and Clint.), the Roman territories in Asia invaded by the Parthians under Vologesus, and Verus sent against him. — The war continued four years.

"The same year" (Iren., and Clint. iv. p. 177), Anicetus succeeded by Soter, eleventh bishop of Rome.

"165 A. D." (Amm. Marc., Hieronym., and Clint.) at the Olympic Games, self-immolation by burning of the philosopher Peregrinus. The satirist Lucian being among the spectators.

"166 A. D." (Euseb., and Clint.), persécution of Christians; and Polycarp, who had seen John and others of the apostles, put to death.

Celtis Tournefortii of Asia Minor. A tree, said to have been raised from the staff of Polycarp, — and planted before his tomb at Smyrna, appeared to Tournefort trav. iii. 292 to 380 the same seen by himself farther East on the route to Tocat, little larger than a plum, and having yellow styptic drupes. *C. Tournefortii*, transferred to the gardens of Europe, is described by Miller (Pers.).

"167 A. D." (Galen xix. p. 15, Euseb., and Clint.), *pestilence* at Rome; said to have originated in Babylonia, and to have accompanied Verus and his companions throughout their return home.

Trees in Hyrcania whose leaves are sprinkled with honey, which unless collected at sunrise disappears, are mentioned by Quintus Curtius, — obviously *honey-dew*: Galen also speaks of a substance like dew, foreign to but occasionally found on the leaves of plants (Ruel iii. 21).

One hundred and thirty-fourth generation. Sept. 1st, 167, onward mostly beyond youth: Phrynichus of Arabia (compare Hippocratic sentences): the Greek poet Oppianus of Cilicia; the philosophers, Alexander of Damascus, and Atticus; the geographer Dionysius Periegetes; the historians, Amyntianus, Chryseros, and Pausanias; the rhetors, Proclus of Naucratis, Demostratus, Theodotus, Alexander of Cilicia, Hermogenes, Chrestus, Athenodorus, Heracleides, Ptolemaeus of Naucratis, Apollonius of Athens, and Onomarchus; the Christian Greek writers, Athenagoras, Apollinaris of Hierapolis, Meliton of Sardis, Musanus, Modestus, Miltiades, Heraclitus, Candidus, Dionysius of Corinth, and Pinytus of Crete.

In this year (= 185 — "18 years reign" in the Mahavamsa xxxvi.), Bhatia-tissa succeeded by his brother Mula-tissa, now king of Ceylon.

"168 A. D. = 'kan-ning,' 1st year of Hiao-ling-ti" or Ling-ti, of the Han or Seventh dynasty (Chinese chron. table). He caused the five "king" or canonical books to be engraved on marble. Which transcript remained at the entrance to the Academy building "seven hundred years" (Pauth. p. 267).

"169, December" (Capitolin., Clint., and Sm. biog. dict.), death of the associate emperor Verus. Galen, who had just joined the two emperors at Aquileia, accompanied M. Aurelius to Rome, and was appointed physician to Commodus now "nine" years old.

Drosera rotundifolia of Northern climates. With other species called in Britain *sundew*, by Lyte "sonnedewe," in Germany "sindau" (Prior), and the "epatica" growing according to Galen "in moist stony places and dew or a drop of water falling upon it" — (Serapion, and Ort. san. 159), mentioned also by Platearius, may be compared: *D. rotundifolia* is known to grow from the Alps and Pyrenees throughout middle and Northern Europe as far as Lapland and Iceland (fl. Dan. pl. 1028, Pers., Brot., Hook., and Wats.). Eastward, species of *Drosera* have not been observed in

Greece nor on Caucasus (Bieb., C. A. Mey., Ledeb., and A. Dec.), but *D. rotundifolia* is known to grow on Lebanon (Schlecht), on the Altaian mountains and throughout Siberia (Gmel., and Ledeb.). Farther East, is known to grow on Unalascha and at Norfolk Sound on the Pacific coast of America (Cham., and Mert.), also on the Rocky mountains in Lat. 54° (Drumm.) and from the Arctic Circle to Newfoundland (Hook.), Kentucky (Short), and throughout our Atlantic States to Lat. 31° in Florida (Baldw., and Chapm.).

Thlaspi saxatile of the East Mediterranean countries. The ΘΛΑCΠΙ:ΚΡΗΤΙΚΟΝ of Galen — is identified by Caesalpinus viii. 77 with a species growing in scraggy places on mount St Julian, and having "subrubentes" flowers: *T. saxatile* is termed "t. parvum saxatile flore rubente" by Tournefort inst. 212; was observed by Sibthorp, and Chaubard, in the Peloponnesus and on mount Hymettus; and is known to grow as far as middle Europe (Jacq. austr. pl. 236, and Pers.).

Ligusticum levisticum of the Apennines. Called in Britain *lovage*, by Galfridus pr. pm. "love-ache," in Germany "liebstockel," in France "levesche" (Prior), in Italy "ligustico" or "levistico" (Lenz), in which we recognize the ΛΙΒΥCΤΙΚΟΝ of Galen top. vii. 6, — "levisticum" of the capitularia of Charlemagne, and "lybisticum" hurtful to the eyes according to Walafridus Strabus: *L. levisticum* is described by Brunfels, Tragus, and Morison ix. pl. 3; is known to grow on the Apennines (Pers., and Lenz), and is well known in gardens throughout Europe. Eastward, seems known in Greece, being translated "ligustikōn" in Koromelas lex. Farther South, the "kaschim rumi" of Tiaduk, Ebn Masawia, Eljuz, I. E. Amran, Ebn Masah, and Rhazes, identified by Ebn Baitar with the "ligustikōn," is referred here by Sontheimer; and *L. levisticum* was observed by Pococke in Palestine. By European colonists, was carried to Northeast America, where it continues under cultivation in gardens. (See *L. nodiflorum*).

Centaurea (Rhaponticum) rhapontica of Switzerland. The ΡΗΟΥΥ of Galen fac. simpl. viii. 106, — is referred here by Dodoens p. 389: *C. rhapontica* is described by Manardus v. 5, Lobel pl. 288, Pona p. 65, and Bellardi; and is known to grow on the Alps (Pers., and Spreng.).

Centaurea armoracifolia of the Mediterranean countries. The ΚΡΟΚΟΔΕΙΛΙΑΔΟC:ΤΗC: ΜΕΡΙCΤΗC growing near water, and its root prescribed by Galen comp. med. ii. 2 against headache, — may be compared: *C. armoracifolia* was observed by Sibthorp, and Chaubard, on the mountains of the Peloponnesus. Westward, is described by Clusius hist. ii. pl. 11; is termed "centaurium majus folio non dissecto" by Tournefort inst. 449; and "*C. Tagana*" found by Brotero pl. 3 in Portugal (Pers.) is regarded by Bory as not distinct.

Stachys palustris of Northern climates. Termed by Gerard p. 852 *clown's allheal* or *clown's woundwort* from being successfully employed by a rustic to heal a wound (Prior): the CΤΑΧΥΟC: CΚΥΘΙΚΟΥ of Galen ther. 19 — may be compared: *S. palustris* was observed by Sibthorp in moist shady places around Smyrna and Constantinople; is known to grow also around Caucasus and in Northern China (Bieb., and Benth.). Westward, is termed "galeopsis palustris betonica folio flore variegato" by Tournefort inst. 185; and is known to grow throughout middle and Northern Europe as far as Petersburg and Sweden (Fries, and Benth.), occurring sometimes in cultivated ground (Pers.). Farther West, was observed by Drummond throughout Canada, and by Douglas along the Columbia river. "*S. aspera*" regarded by A. Gray as identical, was observed by Reeves at Token in China (Benth.), by Pitcher in Arkansas, and is known to grow from Canada to the Yadkin river and South Carolina (Frazer, Schweinitz, Muhl, Benth., and myself).

Solanum coagulans of Nubia and Tropical Arabia. Called in Yemen "beikaman" (Forsk.), at Syene "kaderanbes" (Del.); and the ΛΥΚΟΠΕΡCΙΟΝ fruit received from Egypt by Galen fac. simpl. iv, — may be compared: *S. coagulans* was observed by Delile on the border of cultivated ground at Elephantine and Syene, its fruit nearly an inch and a half in diameter; by Forskal. p. 47, frequent in Yemen, and its seeds with the adhering pulp used to coagulate milk.

"171 A. D." (Iren., and Clint. iv. p. 177), Soter succeeded by Eleutherus, "twelfth" bishop of Rome.

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Zigen and Rema succeeded by Za-Gafale, now king of Abyssinia. — He reigned "one" year.

"In this year (or 173" of Euseb., and Syncell., and in the reign of "Marcus Antoninus," Suid.), Oppianus of Cilicia writing. He mentions Antoninus and his son (Commodus).

Solanum dulcamara of Europe and the adjoining portion of Asia. Called in Britain *bitter-sweet*, in medieval Latin "amara-dulcis," in Germany "je lenger je lieber" (Prior) or "bittersuss" (Grieb): the ΔΕΛΦΙΝΙΟΥ plant used according to Oppianus for stupifying fish — (geopon. xx. 2), "agriomeltzana" of Scarlatus, may be compared: *S. dulcamara* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus throughout the Greek islands and along roadsides near Smyrna; by Forskal, in gardens at Constantinople; and by Gmelin, throughout Siberia. Westward, is figured in manuscript v of the Anglo-Saxon herb. Apul. 76 (Harl., and Cockayne), and under the name of "cardamomum" in Ortus Sanitatis pl. 92; is described by Tragus pl. . . , Turner iii. 2, Matthioli, and

Lobel adv. p. 102; is termed "s. scandens seu dulcamara" by Tournefort inst. 149; and is known to grow in moist situations in Barbary and throughout middle Europe as far as Sweden (fl. Dan. pl. 365, Pers., and Wats.). By European colonists, was carried to Northeast America (later perhaps than 1670, for it is not mentioned by Josselyn), has become completely naturalized, occurring not only along roadsides but in wild marshy situations, and as far inland as Kentucky where it was observed by Short. The root and young branches according to Smith, and Lindley, "have been recommended in scrophulous or glandular obstructions."

"172 A. D." (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Gafale succeeded by Za-Bæsiserk, now king of Abyssinia. — He reigned "four" years.

"173 A. D." (Euseb., and Clint.), the "pseudo-prophecy termed Cataphrygas" originated by Montanus, Priscilla, and Maximilla, the beginning of the Montanist sect. Also about this time, the Encratite sect founded by Tatianus; another heretical sect, by Bardesanes the Syrian; and splendid buildings erected in Greece by Herodes Atticus.

174 A. D. = "14th year of Aurelius Antoninus," in an inscription at Shekh Abadeh in Egypt (Glid. analect.).

"The same year" (Clint.), in Germany, during the battle of the Romans with the Quadi, remarkable rain, regarded as miraculous (mentioned by Dio, Capitolinus, Claudian, Themistius, and by the Christian writers Apollinaris of Hierapolis, Tertullian, Eusebius, Orosius, Gregorius of Nyssa, and Xiphilinus).

This defeat of the Quadi seems the latest historical event mentioned by Pausanias (Sm. biogr. dict.).

The Celtic name for *horse* is given by Pausanias as ΜΑΡΚΑΝ: — hence the Welsh or British "march," Danish "mår," Low German "märe," Anglo-Saxon "myre" or "mere" or "mære," and current English *mare* (Prior).

Ranunculus aquatilis of Northern climates. Called in Britain *water crowfoot* (Prior), and the ΒΑΤΡΑΧΙΑ: ΤΑ: ΕΝ: ΤΑΙ: ΑΙΜΝΑΙ: of Pausanias ix. 21. 1, — may be compared: *R. aquatilis* was observed in Greece by Silbthorp, Chaubard, and Fraas: and farther South, is known to grow in Abyssinia (Rich.). Westward, occurs in relics in the debris of lake-villages in Switzerland (Heer); is termed "*r. aquaticus folio rotundo et capillaceo*" by Tournefort inst. 291; and is known to grow in Sicily, Sardinia, Algeria, the Canary Islands (Guss., Moris, Desf., Munby, and Webb), and throughout middle and Northern Europe as far as Lapland and Iceland (Hook., and A. Dec.), Eastward from Greece, is known to grow about Caucasus and throughout Siberia (Bieb., and Gmel.), also on Unalaschka (Chem.), in Oregon and California (Torr. and Gr., and Beechey voy.), from near the Arctic Sea throughout Canada to Lat. 38° on the Mississippi and along the Atlantic (Hook., Beck, and Conr.), and farther South among the Alleghanies (Chapm.).

"175 A. D." (Dio, and Clint.), in Syria, revolt of Avidius Cassius; who, after "three months and six days," was put to death. Aurelius Antoninus and his son Commodus now proceeded to Egypt, as far at least as Alexandria; — and in the following spring, to Antioch and Smyrna.

The Peschito *Syriac translation* of the New Testament in the "second century," does not contain the "Second Epistle of Peter, the Second and Third of John, that of Jude," nor "the Apocalypse. Nor are these books received to this day by either Jacobite or Nestorian Christians." — John the Elder (according to Eusebius Pamphilus eccles. hist.) had a separate monument at Ephesus from John the Evangelist. — The Vatican and Medicean manuscripts of the above translation were "written in the years 548 and 586;" the beautiful one in the Estrangelo character, now in the British museum, was finished in 768 at the monastery of Bethkoki (W. Wright in Kitt. bibl. cycl.).

"176 A. D." (Clint.), the "Onomastikon" Greek lexicon of Julius Pollux published and dedicated to the youthful Commodus.

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Bæsiserk succeeded by Za-Elasguaga, now king of Abyssinia. — He reigned "seventy-six" years.

"177 A. D." (Sulpic. Sev., and Clint.), "beyond the Alps," Christians for the first time persecuted, and Pothinus bishop of Lugdunum (Lyons) and a disciple of Polycarp, put to death. He was succeeded by Irenæus, a disciple of Papias. At this time, there was also a church not far from Lugdunum at "Vienne" (epist. eccl. Lugd. et Vienn., in Euseb.).

"178 A. D." (Beda, and Clint.), Eleutherus in Rome having received the application of Lucius king of South Britain to be made a Christian, missionaries sent there. The fact has been ascertained, that the missionaries taught in Britain the Oriental or original mode of observing Easter.

"In this year (= 1st of the kouang-ho," hist. Sian-pi, and San-kokf transl. Klapr.), Thsieou-thsiuan (in the Chinese province of Kan-sou) invaded by the Ainos under their first king Than-chy-houai, following in winter the river Thsin-choui.

"180, March" (Dio, and Clint.), Marcus Aurelius Antoninus succeeded by his son Commodus, seventeenth Roman emperor. The hieroglyphic ovals of Commodus occur at Philæ, Esneh, and on a small temple at Contra-Latopolis.

"181 A. D." (Euseb., and Clint.), at Alexandria, the temple of Serapis injured by fire.

"183 A. D. About this time" (Niceph., and Clint. iv. p. 181), Theophilus succeeded by Maximus or Maximinus, "seventh" bishop of Antioch.

"184 A. D. = 1st year of the 'tchoung-ping' of Ling-ti" (Chinese chron. table), beginning of the Forty-eighth cycle.

"The same year" (Dio, and Clint.), in Britain, an outbreak of the tribes beyond the Wall suppressed by the Romans under Ulpius Marcellus.

"185 A. D." (Clint. iv. p. 177), death of Eleutherus, unlike all his predecessors, not through violence (Alst.). He was succeeded by Victor of North Africa, "thirteenth" bishop of Rome.

"In this year" (append. agni-purana, and Wilf. as. res. ix. 183, = 326 B. C. — "140 — 130 — 120 — 120" = 56 B. C. — "120 — 120 yrs" of Masudi), accession at Ujayin of Aditya or Sudraka of the Pomara tribe.* — After a long reign, Sudraka immolated himself by burning, leaving his kingdom to his son (prol. Mrichchh. transl. Wils.). Sudraka is mentioned also by Kalidasa sakont.

In this year (= 187 — "2 years reign" of the Mahavamsa xxxvi.), Mula-tissa succeeded by his son Rohunna, now king of Ceylon.

"186 A. D." (Lamprid., and Clint.), by Commodus, a fleet prepared to bring corn from Mauritania, should the supply from Egypt fail.

"187 A. D." (Lamprid., Chron. Pasch., and Clint. iv. p. 182), at Rome, the "baths of Commodus" built by Cleander.

In this year (= 188 — "1 year reign" of the Mahavamsa xxxvi.), Rohunna succeeded by his brother Cudananga, now king of Ceylon.

"188 A. D." (Hieronym., and Clint.), at Rome, the *Library* contained in the capitol burned by lightning.

In this year (= 210 — "21 years reign" of the Mahavamsa xxxvi.), Cudananga succeeded by Sirinaga, now king of Ceylon.

"189 A. D." (Euseb., and Clint.), at Rome, the head of the colossus removed by Commodus, and one in his own likeness substituted. Victor at this time bishop.

"190 A. D. = 'tsou-ping,' 1st year of Hiao-hien-ti" or Hien-ti, of the Han or Seventh dynasty (Chinese chron. table). During the ensuing civil wars, he was sustained by the Chinese general Thsao-thsao.

"The same year" (Euseb., and Clint.), Maximus succeeded by Serapion, "eighth" bishop of Antioch. Julianus succeeded by Demetrius, "eleventh" bishop of Alexandria. On application through legates to Demetrius, the stoic philosopher Pantaenus sent as a missionary into India. Pantaenus had conversed with persons who had seen the apostles.

"191 A. D." (Galen, Dio, Euseb., and Clint.), at Rome, the temple of the Vestals, regarded as the finest building in the city, destroyed by fire; together with the *Libraries* in the palace, the store-houses of the Egyptians and Arabians, and many private dwellings.

About this time (Steinschneid. i. 4), death of Rabbi Jehuda, the redactor or compiler of the Mishna; a body of collective Hebrew literature. — The work was retouched by his pupils, one of whom, Abba Aricha distinguished by the name of Rab, at the end of thirty-five years transplanted to Babylon the "last amended recension." The "External Mishna," a separate collection, was compiled "about a generation later" by R. Oschaja.

Indigofera argentea of Tropical Arabia and Abyssinia. Called in Yemen and Egypt "nile" or "nyleh" (Forsk., and Del.); and clearly the species of *indigo* cultivated "under the Roman dominion" by the Jews, as appears from the Mishna, — and in instances on record as far North as Malta (Niederstedt, Reynier 431, and A. Dec.); its cultivation in Egypt not antedating the middle ages (Reyn. 354), but mentioned by Abd-allatif, and Abulfeda: *I. argentea* was observed by Forskal, and Delile, in gardens at Cairo; by Forskal, under cultivation in Yemen, and everywhere wild; is known to grow wild also in Abyssinia (Rich.).

Mexico inhabited as early as this date; and the art of making *indigo* carried there, possibly by newly-arrived colonists.† — This art is among those attributed to the Toltecs (Humb. atl. pict.).

* *Agaricus sp.* of Hindustan. Called in Hindustan "bhauma" or "ch'hatraca," in Sanscrit "caraca;" and W. Jones further states, That mushrooms were held in detestation by the ancient Hindus, the legislator Yama declaring the eating them, "whether springing from the ground or growing on a tree, fully equal in guilt to the slayers of Brahmens." — The above *Agaricus* and a species of *Phallus*, the only fungi seen by W. Jones as. res. iv. p. 311 in Hindustan.

† *Indigofera*, three species of Tropical America. In the absence of the accustomed Asiatic species, plants equally suitable for making indigo were discovered in the new country. It is true the Asiatic process differs from the Mexican — described by Hernandez 108, and the plant figured by

"192 A. D." (. . . . Clint.), exhibition in Rome of the marvels of different countries, including animals previously unknown from India, Ethiopia, the South, and the extreme North, witnessed by the historian Herodian. The rhetor Adrianus of Tyre appointed in this year secretary to Commodus.

Cucumis utilissimus of Tropical Hindustan and Burmah. The *winter melon* is called in the Taleef Shereef "kukrie," in Hindustanee "kukree" or "kakrie" (J. F. Wats.), in Telinga "doskai," in Bengalee "kankoor kurktee" (Drur.), in the environs of Bombay "kunkarai" or "kakri" (Graham), by Muslims "kissa" and regarded by Royle as possibly the "kshaym" of Num. xi. 5 (Kitt. bibl. cycl.): the ΤΕΤΡΑΓΚΟΥΡΑ of Herodian epim. 124, — or "tétraggôurôn" of Suidas, Constantinus Porphyrogenitus, Moscopulus, and the Greek translation of Rhazes, may be compared: the "tétraggôura" or "laggôura" is described by Symeon Sethus as a large edible kind (Turn.); the "cucumis turcicus" is described by Fuchsius pl. 698; the "himônîkō" was seen by Forskal "in gardens at Constantinople;" and fruit of the winter melon, by myself on Malta, regarded there as a variety only of *C. melo*. Eastward, the "ervaru" of Susrutas sutr. 46 to chik. 18 is referred by Hessler to *C. utilissimus*, observed by Graham extensively cultivated in the environs of Bombay; by Roxburgh, and Wight, under cultivation as far as Bengal and by far the most useful species, its fruit having "much the flavour of the melon, and will keep for several months," the seeds are ground into a meal eaten by the natives, yield besides a bland oil used in food and in lamps, and in the Guntoor Circar form a considerable branch of commerce (Drur.); was observed by Mason indigenous in Burmah, and one of the cucumbers "consumed in immense quantities" by the natives.

"Dec. 31st" (Dio, and Clint.), Commodus succeeded by Pertinax, eighteenth Roman emperor. The name of Pertinax occurs on coins issued in Egypt during his three months' reign.

"193, March 28th" (Dio, and Clint.), Didius Julianus by purchase, now nineteenth Roman emperor. His name has not been found in Egypt.

The historian Dion Cassius one of the Roman senators who voted the death of Didius Julianus.

"June 1st" (Dio, Herodian, and Clint.), accession of Septimius Severus, twentieth Roman emperor. His hieroglyphic ovals occur at Esneh (Glid. analect.).

"194 A. D." (Dio, and Clint.), civil war; Byzantium besieged by Severus; Aemilianus defeated and slain; and shortly afterwards, Pescennius Niger himself defeated at Issus, and put to death at Antioch. The hieroglyphic ovals, once supposed to be those of Pescennius Niger, are referred by Lepsius k. pl. 67 to an "undetermined Caesar."

The archæologist Athenæus at this time writing. Also Clemens of Alexandria, a Christian presbyter (Clint.).

Clemens of Alexandria mentions a pyramid in India erected over relics of a god (Budha), and worshipped by "sēmnoî" venerable persons — (arhats according to Burnouf introd. 295. Compare "samanaiōi").

"195, summer" (Dio, Eutrop., and Clint.), crossing the Euphrates, Severus carried on war and partially subdued the Parthians and Arabs.

"196, A. D." (Dio, and Clint.), after three years siege, Byzantium captured: and Severus, at the time in Mesopotamia, returned to Rome.

"197, Feb. 19th" (Spartian., and Clint.), another aspirant Clodius Albinus defeated and slain near Lugdunum (Lyons), and the civil war brought to a close. Soon afterwards, Severus again proceeded into Asia.

"The same year" (Euseb., Hieronym., and Clint.), the question in regard to Easter. And the churches of Asia, persisting in celebrating the day after the Jewish Passover, "as taught by the apostles and their immediate successors," put out of communion by Victor bishop of Rome. To this measure, the other churches refused their assent; as appears by letters from Narcissus "thirtieth" bishop of Jerusalem, Polycrates bishop of Ephesus, Irenæus bishop of Lugdunum, Bacchylus bishop of Corinth, Palmas bishop of Pontus, Theophilus bishop of Cæsarea, Cassius bishop of Tyre, and Clarus bishop of Ptolemais: — the original mode of observing Easter continued among the so-called "Quartadecimans" until the meeting of the Council of Nice.

This interference by Victor is regarded as the beginning of Catholicism, of deciding theological

him is not an *Indigofera* (A. Dec.). *Indigo* is one of the pigments employed in ancient Mexican paintings (Humb. nouv. Esp. iv. 10); is enumerated by F. Columbus among the productions of Aiti or Hayti (Humb.); was found by J. Acosta 175 largely exported from Mexico; and farther South, among specimens of ancient Peruvian cloth exhumed at Pachacamac, I remarked some that appeared to be dyed with indigo. *Indigofera* *sp.*, found by Sloane ii. pl. 176 growing spontaneously in the West Indies, is regarded as an ancient plant by Hughes 203, and Maycock 304; and two or even three apparently indigenous species are according to A. Decandolle cultivated in America.

questions by authority. A further innovation by Victor, was the first issuing of Christian writings in the *Latin* language (according to Hieronymus).

"198 A. D." (Spartian., and Clint.), arrival at Ctesiphon of Severus, warring against the Parthians.

One hundred and thirty-fifth generation. Jan. 1st, 201, onward mostly beyond youth: the Greek poets, Oppianus of Apamea, and Peisander of Laranda; the philosopher Ammonius Saccas; the biographer Diogenes Laertius (Blair); the rhetors, Hippodromus, Antipater of Hierapolis, Hermocrates, Philiscus, Heliodorus, Antiochus of Aegae, Aspasius of Ravenna, Apsines of Gadara, and Damianus of Ephesus; the commentator Alexander of Aphrodisias; the Christian Greek writers, Apion, Sextus, Arabianus, Rhodon, Judas, Musianus, Caius, and Carpocrates the Gnostic (Alst. p. 379).

"The same year" (Euseb., and Clint.), Victor succeeded by Zephyrinus, "fourteenth" bishop of Rome; and (according to Alsted) a Montanist.

"The same year" (Cassiodor., and Clint.), at Rome, building of the "baths of Severus and the Septizonium."

"202 A. D." (Spartian., and Clint.), from Syria by the way of Palestine, Severus and his son Caracalla arriving in Egypt. Proceeding up the Nile, they "carefully inspected the Pyramids, Memphis, the Labyrinth, and Memnon," maintaining throughout the worship of Serapis and prohibiting conversions to Judaism and Christianity; and before the close of the year, returned to Rome.

The *Vocal Memnon*, as already stated (see Strabo's visit), was repaired by order of Severus; and ceased uttering sounds.

From about this reign also (according to Letronne, Leps. eg. and sin. p. 443), the *porphyry* quarries at Gebel Dochan . . . appear to have been neglected. — This porphyry is further described by Lepsius p. 370 as "bluish-red."

"Not before the Third century" (according to Zoega), Greek letters employed in writing the *Egyptian language*: additional ones being invented for the additional sounds. — The *inscriptions* and manuscripts in this so-called "Coptic alphabet," have with a single exception proved to be Christian; and few are older than the "Seventh" century (Champ-Fig. p. 228): the series continuing thence downward to the extinction of the Literature and Language in the "Sixteenth."

Hyoscyamus muticus of the Egyptian and Arabian Desert. Called in Egypt "datora" or "tatourah" or "sem el-far" or "sekarán" inebriating, and possibly the seed ΝΑΦΙ of the Coptic translation of Matthew xiii. 31: — *H. muticus* was observed by Forskal p. 45, and Delile, growing in the Desert from Cairo to Upper Egypt, the powder maliciously thrown rendering persons insane for several days: is known to grow also in the Arabian Desert (Linn. mant. 45, Lam., and Persoon. See *Datura metel*).

"203 A. D." (Clint.), Serapion succeeded by Asclepiades, "ninth" bishop of Antioch.

"The same year" (inscript., and Clint.), the "arch of Severus," commemorating his victories, erected in Rome. The latest *Phoenician inscription* known, is on this arch (Gesén.).

"204 A. D." (Censorin., and Clint.), at Rome, the games of Severus. Witnessed by the historian Herodian.

"207 A. D." (Clint.), the Treatise "adv. Marcion" by Tertullianus of Carthage, "the first after Victor of Latin" Christian writers (Hieronym. catal. 53). Apollonius, however, hardly more recent than Tertullian.

Greek inscriptions in the reign of Severus (Franz 107 to 138), presenting the following forms of the letters, ε, θ, υ. Also in this reign (Franz 137 to 152), the earliest Greek inscriptions with the words spaced; intervening dots being omitted.

"208 A. D." (Dio, and Clint.), war in Britain, and arrival there of Severus.

"209 A. D." (Dio, and Clint.), invasion of Caledonia (Scotland) by Severus.

"210 A. D." (coins, Spartian., Vict., Oros., and Clint.), North of Hadrian's Wall, another wall across Britain built by Severus. — Traces are extant, extending from "the Frith of Forth" Westward (Blair).

In this year (= B. C. 543 — "752 y. 4 m. 10 d. of the Mahavamsa xxxvi.), Sirinaga succeeded by his son Tissa, called Vyewahara-tissa and now king of Ceylon. — He burned the heretical books of Vytullya, a Leathin brahmin.

"211, Feb. 4th" (Dio, and Clint.), death of Severus in Britain, at Eboracum (York). He was succeeded by his son Caracalla, twenty-first Roman emperor. The separate hieroglyphic ovals of Caracalla and his brother Geta, occur at Esneh. The name also of Caracalla, occurs in a Greek inscription in the quarries at Philæ.

"In or about this year" (vit. Opp. and Sm. b. d., see also Sozom.), the *Cynegetica* brought by Oppianus to Rome and dedicated to Caracalla. In this poem, Oppianus i. 490 speaks of the inhabi-

tants of Britain as painting their bodies, and possessing a peculiar breed of dogs "agaseos." He had also seen a living *giraffe*, as appears from the details of his description.

"212, February" (Dio, and Clint.), Geta put to death by his brother Caracalla. Also many others, including the jurist Papinianus who had been prefect of Britain, and Serenus Sammonicus (Sm. biog. dict.).

"The same year" = "40th after the rise of the Montanists" (Euseb., and Clint.), Apollonius writing against Montanus and his Sect.

"214 A. D." (Spartian., and Clint.), from Gaul, invasion of the Alamanni by Caracalla; who next proceeded to Dacia, and Thrace, and wintered in Nicomedia.

"The same year" (Euseb., and Clint.) Narcissus succeeded by the bishop of Cappadocia Alexander, now thirty-first bishop of Jerusalem.

Jasminum officinale of the mountains of Yemen. Called in Britain *jasmine* (Cowper) or *jessamine* or *jessamy* or *jesse*, in Spain and France "jasmin," in Italy "gesmino," in Armenia "jasamun," in Persia "jasemin" (Prior), in Yemen "sæs" or "kæjan," in Egypt "kajan" or "jasmin" (Forsk.), in which we recognize the Egyptian or Coptic ACMI—(referred here by Kircher p. 179), and the "iasmē" of the Persians, according to Aetius i. a fragrant ointment made of flowers: the "yasmin" is mentioned by Ishak ben Amran, I. ben Masah, Rhazes, Mosih ben Elhakam, S. E. Hasan, and Ebn Baitar: *J. officinale* was observed by Forskal, and Delile, in the gardens of Egypt; and by Forskal, wild among the mountains of Yemen. Farther North, was observed by Forskal much cultivated at Constantinople for its flowers and the ointment prepared from them; is described by Blackwell pl. 13; is well known in the gardens of Western Europe as far as Britain, and escaping from cultivation has been sometimes found growing spontaneously (Pers., and A. Dec.). Eastward from Arabia, is called in Hindustanee "yasmin," in Bengalee "mallika" or "beli pushpa" (D'roz); and was observed by Graham "in gardens" at Bombay.

Jasminum grandiflorum, regarded by Graham as perhaps not distinct, and in the environs of Bombay called "chumbelly" and "jatee jai:" the fragrant "djatika" or "djatyā" is mentioned in the Saddharma pundarika (Burn. ii. 218 to 415), and the "jati" or "sumana" or "sukumara" of Susrutas i. 25 to iv. 20, is referred here by Hessler: *J. grandiflorum* was observed in Hindustan by Rheede vi. pl. 52, and Roxburgh; by Graham, "in gardens everywhere," its flowers "peculiarly sweet-scented," and distinguished by residents as the *Catalonian* or *Spanish jasmine*. Farther East, is enumerated by Mason as "exotic" in Burmah and called "myat-læ." Westward, was observed by Delile in the gardens of Egypt; is described by Miller dict. 4, and Aiton kew. i. p. 10. By European colonists, was carried to Tropical America, where it was observed in Surinam by Merian pl. 46 (Pers.).

"215 A. D." (coins, Dio, and Clint.), leaving Nicomedia, Caracalla proceeded to Antioch, and for the second time to Alexandria in Egypt. At Rome, building of the "baths of Caracalla."

As early possibly as this date, cutting through the air-tube of the throat, *tracheotomy*, in extreme cases of difficult respiration practised by Asclepiades:—directions for even a timid operator, are given by Antyllus (Paul. Aegin. vi. 33, and Cockayne).

"217, April 8th" (Dio, and Clint.), Caracalla slain near Edessa. And "on the fourth day" afterwards, accession of Macrinus, twenty-second Roman emperor. The name of Macrinus occurs on coins issued in Egypt.

"The same year" (Dio, and Clint.), invasion of Mesopotamia by the Parthians under Artabanus, and peace purchased by Macrinus. Who concealed some of the facts from the Senate.

"In the third century and under the Han" (Humb. cosm. ii), the Chinese writer Hiu-chin composing his dictionary.

"218, June 8th" (Dio, and Clint.), Macrinus succeeded by Elagabalus, twenty-third Roman emperor. The name of Elagabalus occurs on coins issued in Egypt.

Ranunculus muricatus of the Mediterranean countries. Called in Greece "sphourthōkōkula" (Sibth.) or "sphourthakla" (Fraas); and the ἈΙΜΝΗCΤΗΝ or ΑΙΜΝΗCΙΟΝ enumerated by Anthyllus among acrid plants mixed in acrid liniments—(Oribas. vi. 6 and x. 13) may be compared: *R. muricatus* is described by Alpinus exot. pl. 262; was observed by Sibthorp, Chaubard, and Fraas, frequent about gardens and in moist and watery places from the Peloponnesus throughout Greece. Westward, is termed "*r. palustris echinatus*" by Tournefort inst. 286; was observed by Desfontaines in Barbary; and is known to grow in various parts of Southern Europe (Pers.). By European colonists, was carried to Madeira (herb. A. N. S.); to Northeast America, where it continues in cultivated ground from Virginia to Charleston (Mx., Pursh, and Ell.) and New Orleans (H. Little, and Drum.) ; also to Buenos Ayres, Tucuman, and Valparaiso (Dec., and Hook.).

"219 A. D." (Lamprid., and Clint.), arrival of Elagabalus from Nicomedia; and a temple with an image erected by him in Rome, where he wished to be worshipped as the principal deity.

"220 A. D. = epoch of the San-kouë," or of the Three kingdoms, Han of Chou, Wei, and Ou, having its seat of government at Khian-khang:—the city afterwards called Nan-king (Pauth).

"221 A. D. = 'tchang-wou,' 1st year of Tchao-lie-ti, of the Heou han" or Eighth dynasty—(Chinese chron. table).

"The same year" (Clint.), end of the chronicle of Julius Africanus. Through whose care and intercession—(Euseb.) Emmaus in the following year was rebuilt under the new name of Nicopolis.

"222, March 11th" (Dio, and Clint.), Elagabalus succeeded by Alexander Severus, twenty-fourth Roman emperor. The name of Alexander Severus occurs in a Greek inscription at Antinoë in Egypt.

"The same year" (Euseb., and Clint.), end of the chronicle of Hippolytus: and beginning of "his Paschal Cycle of sixteen years."

At this time (Blair), annual tribute received by the Goths, not to invade the Roman Empire.

"223 A. D. = 'kian-king,' 1st year of Heou-tchou" or Heou-ti, of the Heou han or Eighth dynasty—(Chinese chron. table).

"The same year" (Lamprid., and Clint.), the jurists Ulpianus and Florentinus among the counsellors of Alexander Severus.

"226 A. D." (Hieronym., and Clint.), at Rome, building of the "baths of Alexander Severus."

"The same year" (Clint., and Plate in Sm. b. d.), the Parthian king Artabanus defeated in the plain of Hormuz by Artaxerxes or Ardishir; who thus became the head of a new dynasty, the Sasanidæ. Greek inscriptions now disappear from the Persian *coins*, and are replaced by a different alphabet.

The capture of Jericho by Artaxerxes or Ardishir is the latest historical event mentioned by Solinus 35:—supposed to be the senator Julius Solinus or Solonis, who was put to death by Alexander Severus (J. Masson, H. Valesius, and J. A. Fabric. edit. Ernest).

According to Solinus 22, "*Finis erat orbis ora Gallici litoris, nisi Britannia insula non qualibet amplitudine nomen paene orbis alterius mereretur*" the seashore of France would be the end of the world but for the isle of Britain, expanding so widely in all directions as almost to deserve the name of another world: among other islands around, "*Siluram*" (Scilly Islands, or Isle of Man) inhabited by people who "*custodiunt morem vetustum, nummum refutant, dant res et accipiunt, mutationibus necessaria potius quam pretiis parant*" retain their ancient customs, disapprove of money, give articles and receive, procure what is needful by exchanges rather than by a fixed price. The strait between Britain and another large island Hibernia navigated in boats of wicker-work covered with ox-hide, and during the voyage no food is eaten.

In Hibernia "*nullus anguis, avis rara, gens inhospita et bellicosa*" there are no snakes, birds are rare, and the people inhospitable and warlike: "*sanguine interemtorum hausto prius victores vultus suos oblinunt*" smearing their faces with and drinking the blood of slain enemies: "*fas et nefas eodem loco ducunt*" they make no distinction between right and wrong: when a male child is born, the mother offers vows, hoping that it may be killed in battle: "*qui student cultui dentibus mari nantium belluarum insigunt ensium capulos, candicant enim ad elurnam claritatem, nam præcipua viris gloria est in armorum nitela*" those who affect gentility ornament the hilt of their swords with the teeth of great sea-beasts (Physeter or sperm-whale), shining like ivory, for the principal glory of the man is in the brightness of his armour.

Among the productions of Britain, Solinus enumerates great abundance of various metals, "*gagates*" *agate*s abundant and of the best quality, and "*nigro gemmeus*" *jet*.

"About this time" (Clint.), return of Origen from Antioch to Alexandria, where he commenced his "*hexapla*" of the Scriptures.

"227 A. D." (Chinese chron. table), Wen-ti king of Wei succeeded by Ming-ti; who named the years of his reign "*tai-hao*."

"The same year" (Hieronym., and Clint.), Beryllus bishop of Bostra in Arabia, and Geminianus a presbyter of Antioch, prominent as Christian writers.

"228 A. D." (Euseb., and Clint.), Urbanus after "eight years" service succeeded by Pontianus, sixteenth bishop of Rome. In this year also, Philetus succeeded by Zebinus, "eleventh" bishop of Antioch.

"230 A. D." (Alst. p. 367), the growing pretensions and arrogance of the bishops of Rome, denounced by Tertullianus de pudicit.

"231 A. D." (Clint.), removal of Origen from Alexandria to Caesarea in Palestine; on invitation of Firmilianus bishop of Cappadocia.

232 A. D. (= 210 + "22 years reign" in the Mahavamsa xxxvi), Tissa succeeded by his brother Abha-tissa, now king of Ceylon.

"233 A. D." (Euseb., and Clint.), Demetrius succeeded by Heraclas, "twelfth" bishop of Alexandria.

"In or about this year" (Percev. i. 230), commencement of the Coraysh tribe of Arabs, Fihir-Coraysh, eleventh progenitor of Mohammed, having numerous children.—One of his sons, Ghalib, married a daughter of Cab, son of Amr the Khozaite.

Hardly later than this date (Graha Munjari tables, Puranas, and Bentr.), Devaban reigning in Hindustan.

The Saddharma pundarika, lotos of the law of good men, written as early perhaps as this date. Siva is mentioned, and king Virudhaka — (Burn. ii. 240 and 258). It was first translated into Chinese "in 280 A. D.:" a second translation was made between "397 and 402," and a third between "601 and 605" (Stan-Jul., and Burn. i. 9).

Jasminum (Mogorium) sambac of Tropical Hindustan. The *Arabian jasmine* is called in Egypt "fell" (Del.), in Yemen "full" or "fyll" (Forsk.), in Sanscrit "malli" or "mallica" (W. Jones), in Bengalee "but-moogra" or the double variety "bela," in Tamil "kody-mulli," in Telinga "boondoo-mallie" (Drur.), in the environs of Bombay "bhutt mogra" (Graham), in Burmah "ma-lee" or "sa-bay" (Mason), in Malay "kambang malatti" malatti flower (Thunb.), in Bisaya "manul" or "capopot bisaya," in Pampango "campopot" or "culatai" or "sampangang pongso," in Tagalo "sompaga" (Blanco); in which we recognize the "mallika" of the Saddharma pundarika* — (Burn. ii. 218 to 415), forming bowers according to Valmiki ram. i. 25, cultivated in gardens according to the Mrich-chhakati iv., having fragrant flowers and growing in the woods according to Kalidasa rhag. xvi. 47, and prescribed medicinally by Susrutas (Hessl.): *M. sambac* is described by Rumphius v. pl. 30; was observed by Rheede vi. pl. 50 to 55 in Malabar, its flowers sacred to Vishnu; by Graham, "common in every garden" around Bombay; by Drury, "common in every forest in the peninsula" and "generally cultivated in gardens," its leaves root and flowers employed medicinally; by Burmann pl. 58, on Ceylon; by W. Jones as. res. iv. 245. "wild in the forests" of Bengal; by Mason, "exotic" in Burmah; by Loureiro, in Anam; by Blanco, known to all the natives of the Philippines; by Thunberg, in the Malayan archipelago, and from the warmer portion of India introduced into the gardens of Southern Japan. Westward, the "full" is mentioned by Ishak ben Amran, Rhazes, Avicenna, Serapion, and as an Indian medicine by Ebn Baitar: *M. sambac* was observed by Forskal under cultivation in Yemen; by him, and Delile, in the gardens of Egypt; is described by Parkinson pl. . . , and from having been brought from Goa to Pisa is sometimes called *Tuscan jasmine* (Graham). By European colonists, was carried to Northeast America, where it continues in greenhouses.

One hundred and thirty-sixth generation. May 1st, 234, onward mostly beyond youth: Scythianus: the Greek historians, Asinius Quadratus, and Callinicus; the grammarian Lupercus of Berytus; the rhetors, Nicagoras, Minucianus, Paulus, . . . Andromachus of Syria, Diophanes, and Philostratus the younger; the Christian Greek writers, Tryphon, and Gregorius Thaumaturgus: the Latin writer Censorinus; the Christian Latin writer Pontius.

"235, Feb. 10th" (Clint.), Alexander Severus succeeded by Maximinus, twenty-fifth Roman emperor. The name of Maximinus occurs on coins issued in Egypt.

"236 A. D." (lib. pontif. Damas., and Clint.), after serving "one month and ten days," Anteros succeeded by Fabianus, eighteenth bishop of Rome.

"237 A. D., probably in or about" (Sm. b. d.), Philostratus writing his *Lives of the sophists*. — The work however is continued until the reign of Philippus A. D. 244-9.

Sedum eriocarpum of the Mediterranean countries. Called in Greece "amarantō" (Sibth.), and the *AMAPANTOC* of Philostratus — may be compared: *S. eriocarpum* was observed by Sibthorp pl. 449, and Bory, in arid situations in the Peloponnesus. "*S. pallidum*" received from the Tauro-Caspian countries by Pallas, and Bieberstein (Steud.), is regarded by Bory as not distinct: "*Crasula rubens*," observed by Sibthorp in the Peloponnesus, by Magnol pl. 237 at Montpellier, and known to grow as far as Germany (Hoffm. fl. Germ. and Pers.), is also considered identical by Bory.

Sedum confertum of middle Asia? — Called in Egypt "hay a'lem" (Del.); and possibly the "amarantōn" recommended in Geopon. iii. 6 to be placed in gardens: *S. confertum* was observed by Forskal, and Delile, in the gardens of Egypt, and is not known to occur elsewhere.

* *Jasminum revolutum* of Subtropical Hindustan. From early times, an essential oil distilled from it and used as a perfume, and its root employed medicinally in ringworm: the fragrant oil of the "navamalika" or "vanamalika" mentioned in the Saddharma pundarika — (Burn. ii. 250 to 424) may be compared: *J. revolutum* was observed by Powell in the Punjaub (Drur.). Transported to Europe, is described by Sims (Steud.).

Phrynium capitatum of Tropical Eastern Asia. A Scitamineous plant called in the environs of Bombay "kudali" (Graham); and the "kadali" having an unsubstantial stem according to the Saddharma pundarika — (Burn. ii. 241 and 420), may be compared: *P. capitatum* was observed by Rheede xi. pl. 34 in Malabar; by Graham, in the environs of Bombay. Farther East, by Loureiro in moist shady places in Anam and Tropical China, its leaves wrapped around articles of food previous to boiling to impart colour and grateful flavour (Pers., and Graham).

"238 A. D. = 1st year of the 'yen-hi' of Heou-tcheou" — (Chinese chron. table).

"In the spring" (Clint.), Maximinus succeeded by Pupienus Maximus, twenty-sixth Roman emperor. He reigned only about three months; but his name occurs on coins issued in Egypt.

"June" (Clint.), Pupienus Maximus and his colleague Balbinus put to death; and succeeded by Gordianus Pius, at the age of "thirteen" the twenty-seventh Roman emperor. The name of Gordianus Pius occurs on coins issued in Egypt: and (according to Champollion-Figeac), in inscriptions addressed to the ancient deities, acts of adoration by Egyptian families.

His preceptor, Serenus Sammonicus, presented the extensive library of his own father bearing the same name.

"239 A. D." (Chinese chron. table), Ming-ti king of Wei succeeded by Tsao-fang; and the years of his reign named "tcheng-chi."

"In this year" (= 1209 — "970 years" of Tchao yuan phing, Klapr. mem. ii. 335), Boukakhane made chief of the Ougours, a Turkish tribe on the Selenga.

"240 A. D." (J. R. Hind, and Humb. cosm. i. 1), the Chinese from beyond "B. C. 500" having recorded the apparent paths of comets through the constellations, the first comet whose orbit is known; calculated from these observations.

In this year (= 232 + "8 years reign" in the Mahavamsa xxxvi.), Abha-tissa succeeded by his brother Sirinaga II. now king of Ceylon.

"241 A. D." (Eutrop., Zosim., and Clint.), marriage of Gordianus Pius; the temple of Janus opened by him, and his departure for the seat of war in Persia.

"The same year" (Agath., and Clint.), Artaxerxes succeeded by Sapor (Shahpoor), second Sasanid king of Persia.

242 A. D. (= 240 + "2 years reign" in the Mahavamsa xxxvi.), Sirinaga II. succeeded by his son Wijaya, now king of Ceylon.

243 A. D. (= 242 + "1 year reign" in the Mahavamsa xxxvi.), Wijaya succeeded by Saughatissa, now king of Ceylon.

"After the Korean invasion in the earlier part of the third century, certain Koreans were brought" by the empress Jingo-Kogu "to introduce the cultivation of mulberry and of the silk-worm" into Japan — (Jap. centen. comm. 77).

"244 A. D. = 7th year of the 'yen-hi' of Heou-tcheou" (Chinese chron. table), beginning of the Forty-ninth cycle.

"In the spring" (Clint.), Gordianus Pius succeeded by Philippus, twenty-eighth Roman emperor; an Arab by birth, and nominally a Christian. The name of Philippus occurs on coins issued in Egypt: and (according to Champollion-Figeac), in the above mentioned series of inscriptions dedicated to ancient deities of Egypt.

In the quarry at Gertassee in Nubia, some of the Greek inscriptions, "exvotos" in honour of Isis, are in the reign of Philippus. A "considerable number of Greek exvotos, inscribed to Hermes Trismegistos," occur at Pselcis (Wilk. theb. and eg. p. 478). But in ascending the Nile, the "last harvest of Greek inscriptions" occurs at Hierasykaminos (Leps. eg. and sin. p. 125).

"245 A. D." (Nicol.), a synod at Ephesus. Against Noetus, who denied distinction of persons in the Trinity.

247 A. D. (= 243 + "4 years reign" in the Mahavamsa xxxvi.), Saughatissa succeeded by Sirisanghabo, now king of Ceylon. — He reigned "two years."

"247 or 248 A. D." (Nicol., see Alst.), a synod in Arabia, Origen presiding. Against those who asserted the death and resurrection of the soul with the body.

"248 A. D." = "third consulship of Philippus" (coins, Eutrop., Capitolin., Vict., Clint., and Ramsay in Sm. b. d.), celebration of the Thousandth anniversary of the founding of Rome. (The exact month not ascertained, but the computation of Varro is evidently the one followed).

"The same year" (Clint.), the rhetor Cyprianus, who after conversion had given up his property to the poor, appointed bishop of Carthage. His writings are in Latin.

"249, after Aug. 29th" (coins, and Clint.), Philippus succeeded by Decius, twenty-ninth Roman emperor. The hieroglyphic ovals of Decius conclude the series on the Egyptian monuments.

"The same year" (Vict., Syncell., and Clint.), the Goths, a "Scythian" tribe, crossing the Danube ravage Thrace, and capture the city of Philippopolis.

"The same year" (Euseb., and Clint.), Heraclas succeeded by Dionysius, "thirteenth" bishop of Alexandria.

About this time, Democritus the Platonic philosopher writing. He was seen by Longinus, — and is mentioned by Porphyrius vit. Plot. 20, and Syrianus (Ruhnken, and Sm. b. d.).

Cnicens benedictus of the Mediterranean countries. Called in Germany "cardo benedict" (Trag.), in Greece "kalaggathō" (Sibth.); in which we recognize the ΚΑΛΑΚΑΝΘΟΥ of Democritus, — Anatolius Berytius, and Paxamus: C. benedictus was observed by Forskal, Sibthorp, and Fraas,

from the Peloponnesus and Crete to Cyprus and the Dardanelles; by Hasselquist, at Damietta in Egypt; and is known to grow in Persia (Lindl.). Westward, said to have been sent from "India" to the German emperor Frederick (Trag.): is described by Fuchsius p. 121, Gesner hort. f. 249, and Dalechamp 1450 (Spreng.); is termed "*cnicus sylvestris hirsutior sive carduus benedictus*" by Tournefort inst. 450; was observed by Forskal near Marseilles; and is known to grow in other parts of Southern Europe (Lam. fl. fr., and Pers.). By European colonists, was carried to Northeast America, where it has been found along "roadsides, scarcely naturalized" (A. Gray); and to Chili (Lindl.). The plant according to Lindley was "once much used as a febrifuge."

"250 A. D." (Dionys. Alex., Greg. Tur., and Clint.), severe persecution against Christians. Fabianus bishop of Rome put to death, and succeeded by Cornelius; Babylas twelfth bishop of Antioch put to death, and succeeded by Fabius (Euseb., and Clint. iv. p. 269 to 287); and Alexander bishop of Jerusalem also put to death. Seven "ordained bishops" sent as missionaries into Gaul: Gatianus to "Turonis" (Tours), Trophimus to "Aretensis" (. . .), Paulus bishop of "Narbonæ," Saturninus bishop of "Tolosæ," Dionysius to "Parisiacis," Stremonius to "Arvernus," and Martial to "Lemovicinis" (Limoux?).

"The same year" (Alst. p. 399), retirement into the Egyptian Desert of Paulus of Thebes; regarded as the first hermit. — His example was followed some forty years later by Antonius, afterwards by others, and eventually led to *monachism*.

"251 A. D." (Pont., and Clint.), the schism of Novatian; his ordination at Rome outside of the church, by Novatus a presbyter of Cyprianus.

"Before the close of the year" (Clint.), Decius succeeded by Trebonianus Gallus, thirtieth Roman emperor. The name of Trebonianus Gallus occurs on coins issued in Egypt.

"252, Sept. 14th" (Hieronym., and Clint.), Cornelius nineteenth bishop of Rome put to death. Lucius is next in order (on the Lists of Alsted and Nicolas).

"The same year" (Hieronym., and Clint.), a great *pestilence* throughout the Roman empire; especially severe in Egypt and Alexandria. — The pestilence continued "fifteen years."

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcvi), Za-Elasguaga succeeded by El-Herka, now king of Abyssinia. — He reigned "twenty-one" years.

"253 A. D." (Porphyr., and Clint.), Plotinus founder of the Neo-Platonist school of philosophy, beginning to write. Amelius of Tuscany, and Origen the younger, among his disciples.

"The same year" (Nicol.), a synod at Carthage, under Cyprianus. On the baptism of heretics, and declaring that infants may be baptized.

In this year (= 543 B. C. — "795 yrs" of the Mahavamsa xxxvi), the revived Vytulya-wada books burned by king Ghota-abaya, and the brahminical priests, sixty in number banished from Ceylon.

"254, about February" (Clint.), Trebonianus Gallus and his son and colleague Volusianus, put to death; and the accession of Aemilianus, thirty-first Roman emperor. Who reigned "three months" only; but his name occurs on coins issued in Egypt.

"The same year = 1st year of Koung-tcheng, a descendant of Tsao-tsao" or Thao-thsao — (Chinese chron. table).

"May" (Clint.), Aemilianus succeeded by Valerianus, thirty-second Roman emperor. The name of Valerianus occurs on coins issued in Egypt.

About this time (Vopisc. 7), the Franci from Germany wandering over Gaul; and a body of them defeated at Moguntiacum (Mayence on the Rhine) by Aurelianus, "tribune of the sixth Gallic legion."

Hardly later than this date (Graha Munjari tables, Puranas, and Bentr.), Upadeva reigning in Hindustan.

"256 A. D." (Eutrop., Oros., and Clint.), irruption of the "Franci" or "Germani ultiores" through Gaul into Spain. Dacia beyond the Danube, lost to the Romans. And Pannonia ravaged by the Sarmati and Quadi.

"257 A. D." (Vopisc., Eutrop., and Clint.), the Goths after ravaging Pontus in Asia, Macedonia, and Greece, repelled by the Roman general Aurelianus.

"The same year" (Euseb., Hieronym., and Clint.), letter from Dionysius to Xystus "successor to Stephanus" and now twenty-second bishop of Rome.

"258 A. D." (Clint.), Xystus bishop of Rome, and Cyprianus, put to death.

"The same year" (Vict., Eutrop., and Clint.), Postumus, of obscure origin, having established himself over the Gauls as king, claiming the Empire and issuing coins. — He governed Gaul with great firmness and moderation "ten" years.

"The same year" (Zosim., and Clint.), after the arrival of Valerianus at Antioch, the populous city of Trapezus (Trebizond) captured by the Scythian Borani, a Gothic tribe. — In the following year, Bithynia ravaged by them.

"259, July 22d" (Pont., and Clint.), Dionysius ordained twenty-third bishop of Rome.

"260 A. D." (coins, Zosim., and Clint.), in the East, Valerianus defeated by the Persian king Sapor, and taken prisoner. His son and colleague Gallienus remaining at home, thus became sole Roman emperor. The name of Gallienus occurs on coins issued in Egypt.

The physician Philumenus possibly at this time writing: — he is mentioned by Oribasius, Aetius, and Alexander Trallianus (Sm. b. d.).

Lepidium spinosum of the East Mediterranean countries. The ΜΙΛΗCΙΑC herb of Philumenus, whose chopped or bruised leaves applied fresh reddened tumours, to be restored by emollient cataplasms — (Orib. xlv. 29), is referred to some species of *pepper-wort* by Cornarius (Daremb.): *L. spinosum*, its stem and branches somewhat rigid, was received from the East by Arduini ii. pl. 16 (Pers.); was observed by Sibthorp in Greece, by Chaubard in the Peloponnesus.

"The same year" (Hieronym., Vict., Oros., and Clint.), irruption across the Alps and Rhaetia of Alamanni and Germani into Italy, "as far as Ravenna."

"261 A. D." (Hieronym., Vict., and Clint.), in Spain, the city of Tarraco captured by invading Franci. — Who after a while obtaining ships, sailed along the coast, and even passed into Africa.

"262 A. D." (Clint. iv. p. 285), Demetrianus succeeded by Paulus of Samosata, "fifteenth" bishop of Antioch. Hymenaeus at this time "thirty-seventh" bishop of Jerusalem.

"The same year" (Ammian., and Clint.), Antioch captured unexpectedly and plundered by the Persians. At Ephesus, the temple of Diana plundered and burned by the Scythians or Goths. And on account of the *pestilence, earthquake*, the claiming of the empire by Odenatus at Palmyra, occupying of Illyricum by Aureolus, and of Egypt by Aemilianus, the Sibylline books at Rome consulted and a sacrifice offered to Jupiter (Trebell.).

Formosa,* forming part of what was anciently called Houang fou, was included under the Han dynasty among the Man ty countries of Southern barbarians, — and under the Youan the inhabitants were called Toug fan Eastern foreigners. Under the Ming the island received the name of Ky Ioung, from a mountain at its Northern extreme, the neighbouring harbour being anciently called Pe kiang North Bay (Ming szu 323 p. 16, and Klapp. mem. i. 323).

"263 A. D. = 1st year of the 'yen-hing' and 41st of Heou-tchou," the entire extinction of the Han dynasty — (Chinese chron. table).

"264 A. D. = 'hien-hi,' 1st year of Youan-ti II., of the Wei" and a descendant of Thsao-thsao — (Chinese chron. table).

"265 A. D. = 'tai-chi,' 1st year of Wou-ti II.," head of the new dynasty of the Tsin — (Chinese chron. table).

Thea bohea of China. The use of *tea* traced in Chinese writings as far back as this year — (geogr. plant. lond. tract soc. p. 123); is mentioned also in Chinese history in the "Fourth" century, again in the "Sixth" (Schouw 21); was first taxed "in 763;" and from China, the living shrub was introduced into Japan "prior to the Tenth century," as appears from Japanese accounts. "Sah" or tea is mentioned by the early Arab travellers in China, Wahab and Abuzeid; also by Mehemet Arabs (as quoted by Ramusio). The beverage has never been much used among the Arab tribes: which may in part account for its having so long remained unknown to Europeans. *T. bohea* was observed by Kaempfer, and Thunberg, everywhere in Japan, both cultivated and springing up spontaneously.

"The same year" (Euseb., and Clint.), Dionysius succeeded by Maximus, fourteenth bishop of Alexandria.

"The same year" (Clint.), letter of Longinus naming several living philosophers; and among them, Eubulus of Athens, and his own pupil Porphyrius.

Porphyrius at this time thirty-two years old by his own account (= 2 + "30 in tenth Gallien.," vit. Plot. iv. p. 99), and for the last two years a pupil of Plotinus. — In the same treatise, Porphyrius mentions the "sixty-eighth year" of his own age.

Britain is mentioned by Porphyrius, and termed "fertilis provincia tyrannorum" having many kings, — as translated by Gildas hist. 4.

* *Olea fragrans* of Tropical and Subtropical Eastern Asia. Called in Japan "mokusei" (Jap. c. c. 35); and the "san yeou houa" flowers of "jasmin sauvage" exported from Formosa to China for scenting tea — (Klapp. mem. i. 327) may be compared: *O. fragrans* was observed by Loureiro in Anam and Tropical China: by Thunberg pl. 2, in Japan, where it is cultivated in gardens (Jap. c. c.).

Colocasia? maxima of Formosa and the Philippines. Called in Tagalo, Pampango, and Bisaya "biga" (Blanco); and the "arum majus" growing in the Southern portion of Formosa and having leaves as large as a house, — much used by the natives (Klapp. mem. i. 331), may be compared: *C. maxima* was observed by Blanco in shallow water on the Philippines, the leaves five feet long, and the decaying petioles triturated and applied externally in toothache.

The Hindus are described by Porphyrius abst. iv. 17 as divided into two factions: the Brahmans, hereditary throughout; and the ΚΑΜΑΝΑΙΟΙ (Buddhists), indiscriminately selected and who practise celibacy, have no possessions, and pray at the sound of bells.

266 A. D. (= 276 — “10 years reign” in the Mahavamsa xxxvi.), Ghoti-abaya succeeded by his son Dette-tissa, now king of Ceylon.

“267 A. D.” (Trebell., Zosim., and Clint.), at Palmyra, Odenatus put to death, and succeeded by Zenobia. In Greece, the Heruli (a Gothic tribe) after pillaging Athens, repulsed by a band of “two thousand” men under the historian Dexippus.

“The same year” in Gaul (Vict., Hieronym., and Clint.), Postumus succeeded by Victorinus as king; next by Marius; and at the close of the year, by Tetricus. Coins of all these princes are extant.

One hundred and thirty-seventh generation. Sept. 1st, 267, onward mostly beyond youth: Rabbi Jochanan: the Greek poet Aurelius Apollinaris; the historian Callicrates of Tyre; the Christian Greek writers, Malchion of Antioch, Pierius of Alexandria, and Theognostus: the Latin writer, the poet Nemesianus; the Latin Christian writer Arnobius.

About this time (Gesens., and others), the modern *Hebrew letters* make their appearance for the first time; in inscriptions at Palmyra. — The “vowel-points,” were introduced more than two centuries later, and after the time of Hieronymus.

Ceasing of the *Great pestilence*, after continuing its ravages “fifteen years” (Hieronym., and Clint.). The pestilence (according to Sharp) is described by the physician Aretaeus: — who is mentioned by Aetius xi. i.

Menispermum (Anamirta) cocculus of Tropical Hindustan and the neighbouring portion of the Malayan archipelago. The imported seeds are called in commerce *cocculus indicus* (Lindl.): the ΚΟΚΑΛΟΥ seeds prescribed by Aretaeus, — may be compared; and the “mahizehrah” of Hobaisch, Elmansuri, and the Persians, identified by Ebn Baitar with the “samm elsamak,” is referred here by Sontheimer. Farther East, *A. cocculus* was observed in Hindustan by Rheede vii. pl. i and xi. pl. 62, Colebrooke, and Wight; by Graham, “a twining shrub” growing “throughout the Concans” and called “kakmari-ka-beenje;” by Helfer, “indigenous” in Tenasserim (Mason v. p. 490); and by Rumphius v. pl. 22, on Java. The seeds according to Lindley “are a well-known poisonous drug, used occasionally in the form of powder or ointment for destroying pediculi, and in some skin diseases,” but chiefly “to render malt liquor intoxicating;” a practice “said to be persevered in, although prohibited by severe enactments.”

Menispermum (Cocculus) laëba of middle and upper Egypt. — Called in Egypt “lebakh el-gebel;” and the account of the drug “lehibach” by Rhazes, and Avicenna, may be compared with this and the preceding plant: *C. laëba* was observed by Forskal not far from Cairo growing in the Desert, and by Delile in upper Egypt.

Listera ovata of Europe and the adjoining portion of Asia. A small orchid called in Britain *tway-blade* or *bifol*, in medieval Latin “bifolium” (Prior); and the ΔΙΠΛΩΝ of Aretaeus, — and Aetius (Ruel ii. 147), may be compared: *L. ovata* is termed “o. bifolia” by Tournefort inst. 437; and is known to grow from Denmark throughout middle Europe (fl. Dan. pl. 137, Lam. fl. fr., and Pers.); was observed by Sibthorp in woods in the Peloponnesus.

“268, March” (coins, Vict., and Clint.), Gallienus succeeded by Aurelius Claudius, thirty-fourth Roman emperor. The name of Aurelius Claudius occurs on coins issued in Egypt.

“In autumn, in the seventh lunation” (Pauth. 270). display of *meteorites* witnessed in China: a multitude of shooting stars, like a shower, falling or following each other Westward.

The sun-temple and principal structures at Tadmor or Palmyra, erected under the government of queen Zenobia (Lubke and Lutrow).

“269 A. D.” (Clint.), invasion of Egypt by queen Zenobia of Palmyra; and with partial success. Her name, with that of her colleague Vabalathus, occurs on coins issued at Alexandria.

“Dec. 26th” (Clint.), death of Dionysius; and after a few days, Felix ordained twenty-fourth bishop of Rome.

“270 A. D.” (Trebell., and Clint.), the Goths overwhelmingly defeated, and quieted by Aurelius Claudius. For which service, his “statue in gold” was placed in the capitol at Rome.

Genista candicans of the Mediterranean countries. The HIRSVTA-GENISTA under which cows are reposing in Titus Calphurnius ecl. ii. — (Dod. pempt. vi. 2. 2), may be compared: *G. candicans* was observed by Dodoens in Spain; is termed “*cytissus monspessulanus medicæ folio siliquis dense congestis et villosis*” by Tournefort inst. 648, “*c. pubescens*” by Moench; is known to grow in Italy and Southern France (Pers.); was observed by Sibthorp, and Chaubard, in the Peloponnesus and on the mountains of Euboea. “*G. Canariensis*,” known to grow in Spain and on the Canary Islands, the flowers fragrant (Pers.), is regarded by Chaubard as not distinct.

“Before summer” (coins, and Clint.), Aurelius Claudius succeeded by Aurelianus, now thirty-

fifth Roman emperor. The name of Aurelianus occurs on coins issued in Egypt, as also the name of an unsuccessful aspirant Domitianus. — From this time (Zoega, Tochon, and Sharpe), the *precious metals* disappear from the Egyptian coinage: except that in one or more instances, the Roman Legion in Egypt coined silver into money for their own pay.

"The same year" (Euseb., and Clint., see also Nicolas), Paulus of Samosata deposed by a synod, for denying the divinity of Christ; and after an order for his removal procured from Aurelianus, the ordination of Domnus as "sixteenth" bishop of Antioch.

"The same year" (Alst.), compilation of the "Codex Gregorianus." Containing laws enacted from "117 to 261," under the reign of Hadrian to that of Gallienus.

"271, January" (Vopisc., and Clint.), the Marcomanni entering Italy and laying waste the country around Mediolanum (Milan), letter from Aurelianus directing the consultation of the Sibylline books. Soon afterwards, the Marcomanni defeated in three battles, and expelled by Aurelianus. Peace was also granted by him to the Vandals (Dexipp. p. 17); and returning to Rome, he commenced rebuilding the city wall.

"272 A. D." (Japanese chron. transl. Nicholai, and Bickmore), the Ainos bringing presents for the first time acknowledge the Japanese authorities as their rulers.

"The same year" (Vopisc., and Clint.), Aurelianus leading an army, by the way of the Danube and Byzantium, against Palmyra and queen Zenobia. A letter from Zenobia "in the Syrian language, translated into Greek" by the historian Nicomachus (Vopisc., and Clint.).

"The same year" (Agath., and Clint.), Sapor succeeded by Hormisdas (Hoormuz), third Sasanid king of Persia.

"In the reign of Aurelianus" (Sharpe), the church of St. Mary built at Alexandria; and the first *public service of Christianity* in Egypt probably held within its walls.

"273 A. D." (Agath., and Clint.), Hormisdas succeeded by Vararam, fourth Sasanid king of Persia.

"The same year" (Hieronym., and Clint.), Domnus succeeded by Timaeus, "seventeenth" bishop of Antioch.

"The same year" (Vopisc., and Clint.), Zenobia defeated, and while fleeing from Palmyra on "dromadas" (*camels*) taken prisoner by Aurelianus.

"In or about this year" (Percev. i. 107), Abdhaa succeeded by Abd-Kelal, now tobba of Yemen. — He was converted to Christianity by a Syrian stranger, but kept his change of religion secret; until at length his subjects discovering the fact put both him and the Syrian to death "about 297." He was the first Christian convert known in Yemen, according to the concurrent testimony of Oriental writers.

"In this year" (Abyss. chron., and C. Mull. geogr. min. p. xcvi), El-Herka succeeded by Zæsi Tsawesa, now king of Abyssinia. — He reigned "one" year.

"274 A. D." (Vopisc., and Clint.), Tetricus of Gaul vanquished by Aurelianus; and afterwards led at Rome in a *triumphal procession* in company with Zenobia and "Axomitæ" (Sm. geogr. dict.), captive "Gotthi, Alani, Roxolani, Sarmati, Franci, Suevi, Vandali," and "Germani." Dacia however was abandoned as part of the Roman Empire by Aurelianus: who next commenced a temple to the sun.

About this time, "273 to 275 A. D." (Sharistan. and Clint. iv. p. 307), Manes, a Persian teacher of religious dogmas and the founder of the Manichaean sect, put to death by king Vararam. Manes denied the death on the cross: — an opinion afterwards adopted by Mohammed, and maintained by his followers to the present day.

"275, Jan. 5th" (Pont., and Clint.), next after Felix, Eutychianus ordained twenty-fifth bishop of Rome.

"Before March 25th" (Clint.), Aurelianus succeeded by Tacitus, thirty-sixth Roman emperor. The name of Tacitus occurs on coins issued in Egypt.

"276, April 11th" (Clint.), Tacitus succeeded by Florianus, thirty-seventh Roman emperor. In the East, Florianus was not acknowledged; and his name has not been found in Egypt.

"Beginning of July" (Euseb., Zosim., and Clint.), Florianus succeeded by Probus, thirty-eighth Roman emperor. The name of Probus occurs on coins issued in Egypt.

"The same year" (Agath., and Clint.), Vararam succeeded by Vararam II., fifth Sasanid king of Persia.

In this year (= 513 B. C. — "818 y. 9 m. 20 days" in the Mahavamsa xxxvii.), Dette-tissa succeeded by Mahasana, now king of Ceylon.

"277 A. D." (Vopisc., Zosim., and Clint.), in Gaul, campaign of Probus against the "Logiones, Franci, Burgundi, Vandili," and other tribes to the number of "nine:" as many vanquished kings being enumerated by Probus in his letter to the Senate.

Campanula hybrida of Europe and the adjoining portion of Asia. Called in Britain *Venus*'

looking-glass (Prior) ; and the "specularis" cooked and finely powdered in the "emplastri" attributed to king Ptolemy — by Marcellus of Bordeaux 36, may be compared: *C. hybrida* is described by Morison v. pl. 2; is termed "*c. arvensis minor siliqua ampliori*" by Tournefort inst. 112; and is known to occur in fallow ground in limestone districts in France and Britain (Pers., and Engl. bot. pl. 375). Eastward, was observed by Sibthorp in cultivated ground in the Peloponnesus.

"278 A. D." (Hieronym., and Clint., see also Nicolas), in Mesopotamia, Archelaus bishop of "Caschar" writing in Syriac against the Manichaeans. A translation in Greek, is mentioned by Hieronymus.

"279 A. D." (Hieronym., and Clint.), Anatolius, successor to Eusebius bishop of Laodicea, at this time writing.

"The same year" (Vopisc., and Clint.), campaign of Probus in the East, and against the "Blemyas" in Upper Egypt: where he added the cities of Ptolemais and Coptos to the Roman dominions.

"280 A. D." (Hieronym., and Clint.), Timaeus succeeded by Cyrillus, "eighteenth" bishop of Antioch.

Hardly later than this date (Graham Munjari tables, Puranas, and Bentl.), Devashreshtha reigning in Hindustan.

"281 A. D. About this time" (Eutrop., and Clint.), by Probus, permission granted to the Gauls and Pannonians to plant vineyards.

"282, October" (coins, Euseb., and Clint.), Probus succeeded by Carus, thirty-ninth Roman emperor. The name of Carus occurs on coins issued in Egypt.

"283 A. D." (Euseb., and Clint.), Maximus succeeded by Theonas, "fifteenth" bishop of Alexandria.

"End of November" (Cod. Justin., Vopisc., and Clint.), death of Carus near Ctesiphon, warring against the Persians. He was succeeded by Carinus, fortieth Roman emperor. The name of Carinus occurs on coins issued in Egypt; as also the name of his brother and colleague, the poet Numerianus.

"Dec. 7th" (Clint.), death of Eutychianus; and "before the close of the year," Caius ordained twenty-sixth bishop of Rome.

"284, Sept. 17th" (Clint.), notwithstanding that Carinus outlived his brother, the accession of Diocletian always computed from this date (see p. xvi).

"6th day of eighth lunat." (ann. Jap., and Klaproth), by O-zin, an embassy sent to Corea to procure men capable of teaching Chinese literature and civilization.

"285 A. D." (ann. Jap., and Klapr.), returning from Corea, Wo-nin (Wang-jin) brought the Lunyu of Confucius and other books, and introduced the art of reading and writing into Japan.

The art of spinning and weaving was at the same time introduced (ann. Jap. and Klapr.): or (according to the Nihon-gi, the most ancient book on Japanese history, centen. comm. 77), four girls were brought back to teach the art of weaving plain and figured silk-goods. In other words, the *Silk manufacture*.

"In this year" (Idat., and Clint.), Carinus defeated and slain, and his name erased from the Fasti by Diocletian; who substituted his own.

The great syenite column so conspicuous at Alexandria, erected (according to a Greek inscription on its base) in the reign of Diocletian.

"286 A. D." (Vict., and Clint.), campaign of Maximian colleague of Diocletian, against the Bagaudic faction in Gaul. In successive skirmishes, the insurgents were subdued and quieted.

Hardly earlier than this date, a colony from Kling (Southeastern Hindustan) led by Tritresta or Aji Saka to Java; where he found the inhabitants rude and subsisting principally on "the grain called 'java-wut' (*Setaria Italica*). After several combats, he formed a settlement at Giling Wesi and introduced the religion and arts of Hindustan. — On his return to Guj'rat, he delivered to his sovereign Prabu Jaya Baya "a written account of all he had seen and done" (Nata Kasuma, Adi Mang'gala, and Raffles x.).

The Javan alphabet formed perhaps shortly after the arrival of Aji Saka, — to whom it is attributed.*

"287 A. D." (Vict., Eutrop., and Clint.), death-sentence against Carausius, a Menapien from the mouths of the Rhine employed by the Romans to keep order on the sea, infested at the time by Franci and Saxones. Hearing of the sentence, Carausius escaped with the fleet to Britain, and established himself there as king.

* *Pandanus* sp. of Burmah and the neighbouring countries. An upland *screw-pine*; and the "godong'i pandan" Pandanus leaf or mystical meaning of the letter "rang kang," — may be compared: observed by Mason v. 521 in Burmah, growing "above tide-waters," the leaves furnishing the "smaller and finer mats in common use." Farther East, the Pandanus found by Loureiro ii. p. 603 employed in Anam for hedges and for feeding tame elephants, may also be compared.

"289, April 21st" (Clint.), oration of Mamertinus, to Maximian on the point of sailing with a new fleet against Carausius. By whom he was defeated in *naval warfare*.

"290 A. D. = 'tai-hi and young-hi,' death of Wou-ti II. and accession of Hiao-hoei-ti" (Chinese chron. table). The year however is referred to the reign of Wou-ti II.*

"The same year" (coins, Eutrop., and Clint.), peace granted to Carausius. Coins issued by him in this. — and the following year, are extant.

"The same year" (Alst., and Blair), compilation of the "Codex Hermogenianus." Containing laws enacted under the reign of Aurelius Claudius to that of Diocletian.

Manuscripts of the "Third" century (Sylvestre), presenting the following forms of the letters, u, m, q, ò, b.

"291 A. D. Not later than this date" (see Clint. iv. p. 437), retirement of Antonius at the age of "thirty-five" into the Egyptian Desert; the earliest example of the life of a hermit. In his writings, pilgrimages and the superstitious veneration of relics are denounced (Alst. p. 368).

"293 A. D. (Vict., Eumen., and Clint.), the "archipirata" Carausius, succeeded by Allectus, as king in Britain.

"The same year" (Agath., Abulpharag., and Clint.), Vararam II. succeeded by Vararam III.; and after "four months," by Narses, seventh Sasanid king of Persia.

"At this time" (Vopisc., and Clint.). Claudius Eusthenius writing the lives of Diocletian and his three colleagues, Maximian, Galerius, and Constantius; all of whom were living.

"296, April 22d" (Pont., and Clint.), death of Caius, twenty-sixth bishop of Rome. Marcellinus is next in order (on the Lists of Alsted, and Nicolas): — and after him, Marcellus, and Eusebius.

"The same year" (Eumen., Vict., and Clint.), near London, Allectus defeated by Constantius, and Britain recovered by the Romans. Maximian at the time, stationed on the Rhine.

"297 A. D." (Eutrop., Hieronym., and Clint.), in Egypt, Achilleus defeated and Alexandria captured by Diocletian. The event is noticed in the oration of Eumenius, addressed in this year to Constantius.

As early probably as this date. *Hermetic writings* translated from Egyptian into Greek — (Iambl. myst. viii. 1 to 7). One of them is quoted by Lactantius div. inst. vii. 18.

Daphne sericea of Crete. The ΚΟΚΚΟC ΝΗCΙΩΤΙΚΟC of the Hermetic iatromathem. — may be compared: *D. sericea* is termed "thymelæa cretica oleæ folio subtus villosa" by Tournefort cor. 41; and was observed by Sibthorp, and Fraas, on the subalpine portion of the mountains of Crete and Southern Greece. "*D. buxifolia*" observed by Sibthorp on the mountains of Crete, is regarded by Fraas as identical, and notwithstanding the pubescent leaves hardly distinct from *D. jasminea*. (See *D. alpina* and *D. tartonraira*). .

"298 A. D." (Ammian., and Clint.), in Armenia, the Persians under Narses defeated by Galerius: and after the cession of five provinces beyond the Tigris to the Romans, peace concluded.

"The same year" (Euseb., and Clint.), Hymeneus succeeded by Zabdas, "thirty-eighth" bishop of Jerusalem.

"299 A. D." (Clint.), end of the independent Egyptian *coinage*: — the coins issued at Alexandria, instead of Greek, bearing Latin inscriptions, and are similar in every respect to those of the rest of the Empire.

"300 A. D." (Euseb., and Clint.), Zabdas succeeded by Hermon, "thirty-ninth" bishop of Jerusalem.

One hundred and thirty-eighth generation. Jan. 1st, 301, onward mostly beyond youth: Metrodorus of Persia: the Greek philosophers, the Neo-Platonists Iamblichus of Chalcis in Syria, and Sopater of Apamea; the grammarian Helladius Besantinus; the rhetors, Julianus, and Onasimus; the Christian Greek writers, Eustathius of Antioch, Meletius of Lycopolis, and Pamphilus: the Latin writers, the poet Optatianus Porphyrius; the historians Vopiscus, and Trebellius Pollio; the rhetor Nazarius; the Christian Latin writers Lactantius, Rheticius, and the poet Juvenecus of Spain.

"In the beginning of the year" (Hieronym., and Clint.). Theonas succeeded by Petrus, "sixteenth" bishop of Alexandria.

"The same year" (Agath., and Clint.), Narses succeeded by Hormisdas II., eighth Sasanid king of Persia.

* *Paeonia moutan* of China. The *arborescent piony* or "mou-tan," according to Chinese authorities, has been known and cultivated only about "fourteen hundred years" — (mem. Chin. iii. 461), is further described by Cibot as woody-stemmed, eight to ten and it is said even twenty-five feet high: the "meu-tan" or "queen of flowers" was also seen in China by Navarrete i. 16; *P. moutan*, by Thunberg in Japan; and by Loureiro in Anam. Transported to Europe, is described by Sims, is termed "*p. arborea*" by Donn (Steud.); was also carried to Northeast America, where it continues in greenhouses.

"302 A. D." (Hieronym., and Clint.), at Rome, *triumphal procession* of Diocletian and Maximian; their car preceded by statues of the wife and sisters of Narses.

"The same year" (Hieronym., and Clint.), Cyrillus succeeded by Tyrannus, "nineteenth" bishop of Antioch.

"In this year" (Max Mull. p. xi), death of Mahasena king of Ceylon. The last reign mentioned in the Dipavansa, a historical work manuscripts of which are said to be extant.

Azadirachta Indica of Tropical Hindustan. A large tree called in Tamil "vaypum," in Telinga "vepa," in Malabar "aria-bepou," in Bengalee and Hindustanee "nim" (Drur.), in the environs of Bombay "neem" (Graham); and the "nimba" fruit of a Hindu proverb—quoted in the Ramayana ii. 29, and of Harivansa 96, is referred here by Carey and Marshman: the "malaka" or "pichumanda" of Susruta . . . , is referred here by Hessler: A. Indica was observed by Rheede iv. pl. 52 in Malabar; by Burmann pl. 15, on Ceylon; by Graham, "common about villages" in the environs of Bombay; by myself, around villages on the Deccan; by Roxburgh, Wight, and Drury, as far as Bengal, its bitter bark used as a febrifuge, and with the leaves seeds and oil for various medicinal purposes, and its beautifully mottled mahogany-like wood used for ship-building and made into chests that will exclude insects; was observed by Mason v. 493 "exotic" in Burmah, cultivated by the natives "for its medicinal properties for which it is famous all over India." Westward, the "azadiracht" of E. Masah, Maserjawia, Rhazes, Ebn Samhun, Avicenna, A. B. A. Chaled, Madschul, Ebn Baitar, mentioned as an Indian tree by Caboudi, and Ebn Joljol, is referred here by writers. According to A. Richard, this and the olive are the only known instances of the pericarp around the nut yielding oil.

"303, February" (Clint.), the celebrated edict of Diocletian against Christians. Supposed to have been in part extorted from him through the intrigues of Galerius. Even in Britain, Alban, Aaron, Julius, and many persons of both sexes, were put to death (Gildas hist. 10).

In this year (= 276 + "27 yrs. reign" in the Mahavamsa xxxvii), Mahasana succeeded by his son Kiertissry-magawarna, now king of Ceylon.

Hardly later than this date (Graham Munjari tables, Puranas, and Bentl.), Tapaswi reigning in Hindustan.

"304 A. D. = 1st year of the 'young-hing' of Hiao-hoei-ti" (Chinese chron. table), beginning of the Fiftieth cycle.

"In the reign of Hiao-hoei-ti" (Pauth.), the new religious Sect of the Wou-wei-kiao, a stoical offshoot from the doctrines of Lao-tseu.

"305 A. D." (inscript., and Clint.), at Rome, dedication of the "thermae" or "baths" of Diocletian.

"The same year" (Lactant., Vict., and Clint.), abdication of Diocletian: who retired to Salone or Spalatro in Dalmatia, where ruins of his palace or castle are extant. He was succeeded by Constantius, forty-second Roman emperor.

"The same year" (Nicol.), by a synod at Cirtes in Numidia, "the bishops who during the persecution had read the Scriptures to the Pagans" absolved.

Cocculus bakis of Senegambia. Twining; and from early times, its root used in decoction by the Negroes in intermittents, and to stop urethral discharges:—observed by Perrotet fl. i. pl. 4 in hedges and on the sides of woods in Senegal. The root according to Lindley diuretic and very bitter.

Swietenia (Khaya) Senegalensis of Senegambia. A mahogany-like tree eighty to a hundred feet high, called "karson khayi" and its bark "cail-cedra" (Lindl.); the latter very bitter, and from early times used in infusion and decoction against fevers by the Blacks:—observed by Leprieur common in the forests along the borders of the Gambia (Forsten p. 12, and Lindl.).

Heudelotia Africana of Senegambia. A spiny Amyroid bush eight to ten feet high, called "niouttout" (Lindl.), and known from early times:—observed by Adanson, and Perrotet, in the sandy wastes of Interior Senegal, and tears of *bdellium* collected. These proving hardly bigger than peas, the "African bdellium" of commerce is regarded by Guibourt ii. 498 as possibly the product of a different species (see Balsamodendron Africanum).

Ocimum viride of Western Equatorial Africa. A Labiate plant from early times employed as a febrifuge,—as to the present day in Sierra Leone (Lindl.): received and described by Willdenow.

"306, July 24th" (Eumen., and Clint.), after his victory in Caledonia over the Picts, death of Constantius at York in Britain. He was succeeded by Constantine, forty-third Roman emperor.

"307 A. D. = 'young-kia,' 1st year of Hiao-hoi-ti, of the Tcin" or ninth dynasty (Chinese chron. table).

"309 A. D." (Agath., and Clint.), birth and accession of Sapor II., ninth Sasanid king of Persia.

"About this time" (T. Wright mediæv. engl. vii), by a few missionaries, Christianity introduced among the Teutonic tribes on the Rhine.

"311, April 30th" (Lactant., and Clint.), in Nicomedia, an edict issued by Galerius to stay the persecution against Christians. Dying soon afterwards, Asia was seized by Maximinus, who withdrew the protection granted to Christians.

"312, Sept. 1st" (Clint.), beginning of the *Indictions*. A cycle of "fifteen years," substituted by Constantine for the Olympiads.

"The same year, at the close of the persecution against Christians" (Clint.), Methodius bishop of Tyre put to death. Also "in this year" (Hieronym., and Clint.), Petrus succeeded by Achillas, "seventeenth" bishop of Alexandria.

"313 A. D. = 'kien-hing,' 1st year of Ming-ti II., of the Tcin" or Ninth dynasty — (Chinese chron. table).

"The same year" (Lactant., and Clint.), edict by Constantine and Licinius in favour of the Christians. Death of Diocletian. Maximinus defeated by Licinius near Byzantium, and, fleeing Southward, died near Tarsus. From this time, persecutions against Christians ceased.

"The same year" (Augustin., and Clint.), Caecilianus bishop of Carthage accused before Constantine by Donatus; tried and acquitted by an ecclesiastical court, Melciades thirtieth bishop of Rome presiding.

"315 A. D." (cod. Justin. i. 9. 3, and Clint.), edict of Constantine against the Jews. Prohibiting the persecution of persons leaving the Sect; and prohibiting joining the Sect.

In this year (= "240 an. jav." of Nata Kasuma, Raffles x.), death of Watu Gunung from Kling (Southeastern Hindustan), successor of Agi Saka as chief of the Hindu colony at Giling Wesi on Java. Gutaka was sent from Kling to be the third governor.*

"317 A. D. = 'kien-wou,' 1st year of Youan-ti III., of the Tcin" or Ninth dynasty (Chinese chron. table). The seat of government now removed from Ho-nan-fou to Nan-king; and hence the name "Eastern Tcin" for the remainder of the dynasty.

"318 A. D. = 1st year of the 'tai-hing' of Youan-ti III." — (Chinese chron. table).

"319 A. D." (= 56 B. C. — "375th" year of Tod, Prinsep i. p. 86), era of Valabhi Samvat, or of the Balhara dynasty of Hindu kings of Guzerat. — Ruling in the time of the early Arabian travellers whose narrative is translated by Renaudot p. 15.

"320 A. D." (Nazar., and Clint.), in Gaul, the Franci defeated by Crispus son of Constantine.

"321 A. D." (Hieronym., Prosp., and Clint.), Alexander ordained "eighteenth" bishop of Alexandria: and the expulsion by him of Arius a presbyter, from communion with the church. Silvester at this time thirty-first bishop of Rome; Philogonus, bishop of Antioch; Macarius, bishop of Jerusalem; and Alexander, bishop of Byzantium.

"322 A. D." (Zosim., and Clint.), the Sarmatae defeated and pursued beyond the Danube by Constantine.

Apsyrthus, the veterinary physician, rendering important services in this war — (Spreng. comm. D. iv. 8).

"323 A. D. = 'tai-ning,' 1st year of Ming-ti III., of the Tcin" or Ninth dynasty — (Chinese chron. table).

"September" (Vict., and Clint.), surrender of Licinius, defeated near Byzantium by sea and land.

"In this year" (palm-leaf ann. Jagan., and W. W. Hunter), invasion and conquest of Orissa by Yavanas under Rakta Bahu (Red-arm); king Sobhan Deva taking with him in his flight a wooden image of Vishnu entitled "jagannath" (Lord of the World). — Chandra-deva was placed on the throne by the Yavanas; who in 328 put him to death, and held the country "one hundred and forty-six years."

"324 A. D." (cod. Theodos., and Clint.), Licinius put to death, and on "May 16th" his laws abrogated: Constantine being now sole emperor.

Christianity appears to have made more rapid progress in Egypt than in any other country: and after the general conversion, temples were no longer reared by princes. Architectural taste however continued, as shown by *remains of churches* in the Thebaid: where also is abundant evidence, that the early Christians did not destroy antiquities; while their deserted villages present more refinement, — than prevails in that district at the present day.

* *Spinifex squarrosus* of the Tropical seashore from Hindustan throughout the Malayan archipelago. A singular sand-binding gramineous plant called in Malabar "illy mulu" (Rheede); and the superstitious belief that its light globular heads driven along the sands by the wind "are propelled by the devil" (Rumph.), as early probably as this date: — *S. squarrosus* was observed by Rheede xii. pl. 75 in Malabar; by Graham, "common in the beach near Bandora," in the vicinity of Bombay; by Tennent, and Drury, on sandy shores of the peninsula and Ceylon; by Mason 478, "on all the sandy beaches" of Burmah; by Blanco, on the Philippines, but having no native name; by myself, on the beaches of islands around the Sulu Sea, its globular heads floating away from the land.

"325, June 19th" (Clint.), the first general Council among Christians, convened at Nice in Asia Minor. Attended by an Indian bishop, Ioannes (Coqueb.-Montbret in rec. voy. et mem. iv. p. 27), and by "nearly one hundred" Egyptian and Lybian bishops, the total number being "three hundred and eighteen." Hosius of Spain taking the lead: the Western mode of celebrating Easter was established. The celibacy of the clergy was strenuously and successfully opposed by Paphnutius. Metropolitan bishoprics were constituted (Alst. p. 368 and 392). The Arian question was discussed, the Greek word "ὁμολοσιῶν" adopted; and the "Nicene creed" formed. Towards the close of the session, Constantine entered and pronounced an address in Latin; which was replied to by Eusebius; and on the "25th of August," the session terminated.—The authority of this Council continues to be recognized by the Greek Church (E. A. Soph.).

"The same year" (Clint.), end of the chronicle of Eusebius. Who on other subjects continued writing.

"The same year" (cod. Theodos., and Clint.), law of Constantine prohibiting *gladiators*.—Exhibitions continued notwithstanding at Rome, and at Antioch.

The Roman lexicographer Sext. Pompeius Festus may have been at this time writing, his remarks on the word "supparus" implying familiarity on the part of readers generally with the ceremonies of the Christian religion.—He is mentioned by Macrobius (Sm. b. d.).

Polygonum (Helxine) convolvulus of Eastern Europe and Siberia. Called in Britain *black bind-weed* (Prior): the ΣCΑΝΘΟΥΛΑCΑ herb of Pompeius Festus, killing growing grain—by twining around (Migne edit. Paul. Diac.), may be compared: *P. convolvulus* is described by Bauhin hist. ii. p. 158; is termed "fagopyrum vulgare scandens" by Tournefort inst. 511; and is known to occur as a weed in cultivated ground in Italy and Sicily (Bertol., and Guss.) and throughout middle Europe as far as Denmark (Ray, fl. Dan. pl. 744, and Pers.); was observed by Sibthorp, and Fraas, in cultivated ground in Greece; by Bieberstein, and Ledebour, in the Tauro-Caspian countries. In its wild state, was observed by Pallas trav. i. 58 in wooded tracts on the Upper Volga; by Gmelin, frequent throughout Siberia (A. Dec.). By European colonists, was carried to Northeast America, where it continues a weed in cultivated ground, and was observed in Carolina as early as 1793 by Michaux.

"326, January" (Clint.), Alexander succeeded by Athanasius, "nineteenth" bishop of Alexandria.

"The same year" = 'hien-ho,' 1st year of Tching-ti II. of the Tcin "or Ninth dynasty"—(Chinese chron. table).

"The same year" (cod. Theodos., and Clint.), law of Constantine respecting heretical and schismatic Christians.

"The same year" (Kitt. cycl. bibl.), arrival in Palestine of Helena mother of Constantine, now in her "80th" year. She "built churches on the alleged site of the Nativity at Bethlehem, and of the Resurrection on the Mount of Olives."—Of extant churches and monasteries in Egypt, the earliest are by the Coptic inmates attributed to donations from Helena.

"327 A. D." (Hieronym., and Clint.), in Bithynia, the city of Drepanum rebuilt by Constantine, and the name changed to Helenopolis; in honour of his mother Helena.

Hardly later than this date (Graha Munjari tables, Puranas, and Bentl.), Sutapa reigning in Hindustan.

"330, May 11th" (Idat., Clint., and Plate in Sm. b. d.), dedication of a new city on the site of Byzantium, and the removal there by Constantine of the Roman seat of government. He also transported an obelisk from Egypt to the new city; which received the name of "Constantinopolis," city of Constantine.

"As early as this date" (M. Russel p. 110 and 250, and Sm. geogr. dict.), Christianity preached in Abyssinia by the Abba Salama or Frumentius.

331 A. D. (= 303 + "38 years reign" in Mahavamsa xxxvii), Kiertissry-magawarna succeeded by his brother Dattatissa, now king of Ceylon.

333 A. D. = "Dalmatio et Dalmatice Zenophilo cons." (T. Wright early trav. in Palest.), arrival in Jerusalem of the author of the "Itinerarium a Burdigala" (Bordeaux): after journeying by land, across France to Turin, Pavia, Milan, Brescia, Verona, Aquileia; and thence across Noricum, Pannonia, Illyria, Dacia, Thrace to Constantinople, and across Asia Minor.

Greek inscriptions of about this time (Franz), presenting the following forms of the letters, Η, Ω.

One hundred and thirty-ninth generation. May 1st, 334, onward mostly beyond youth: Ephraem of Edessa: the Greek philosophers, Maximus of Ephesus, and the Neo-Platonist Aedesius; the medical writer Philagrius; the historian Eustochius; the rhetors, Proaeresius, Epiphanius of Petra, Tuscianus, and Diophantus; the Christian Greek writers, the elder Gregorius of Nazianzus, Asterius, Audaeus of Syria, Theodorus of Heraclea, Triphyllus of Cyprus, Eusebius of Emisa, Serapion of Thmuis, Didymus of Alexandria, and Hilarion: the Latin writers, the orator Gennadius; the historians Eutropius, and Festus Rufus; the grammarian Evanthius; the rhetors Exsuperius, Patera,

Minervius Burdigalensis, Victorinus, Donatus, Alcimius, Delphidius, and Mamertinus the younger; the Christian Latin writer Gregorius Boeticus.

"The same year" (Clint.), date of an inscription on the "thermae" or "baths" of Constantine at Rome: where also, the temple of Concordia was rebuilt with increased costliness and endowments. The Sarmatae, expelled by servile insurrection, received by Constantine, and "more than three hundred thousand" distributed throughout "Thrace, Scythia, Macedonia, and Italy."

"335 A. D." (Clint.), of the provinces, Gaul governed by Constantine the younger; the East, by Constantius; Pontus, by Hannibalianus; Illyria, Italy, and Africa, by Constans; while the Gothic frontier was guarded by Dalmatius. Coins of Dalmatius, and of Hannibalianus, are extant.

"The same year" (Euseb., Clint., and T. Wright), by Constantine, a church dedicated at Jerusalem; in the Chronicon Paschale called "tōu agiōu staurōu" of the holy Cross. A synod of Arians also held in this year at Jerusalem (Theodoret., and Clint.). By Constantine also, the edict against the Jews modified; so as to permit them to enter the city "once a-year, to wail over the desolation of the 'holy and beautiful house' in which their fathers worshipped God" (Kitt. cycl. bibl.).

"May 8th" (cod. Theodos., and Clint.), at Carthage, a law issued to protect Jews from maltreatment.

"336 A. D." (Socrat., and Clint.), Marcellus deposed, and succeeded as bishop of Ancyra by Basilus.

The "eight months" of Marcus, thirty-second bishop of Rome—referred to this year by Alsted, and Nicolas.

"The same year" (Alst. pp. 341 and 368), by a synod at Carthage, the clergy prohibited from holding office or taking part in the administration of government.

Embalmed bodies or *mummies* of "the time of Constantine,"—and some perhaps "a century later," are mentioned by Birch. So late even as the visit of Baumgarten i. 16 (Churchill coll.), the Egyptians are described as not burying their dead; "but having anointed and embalmed them with a great deal of art, they lay them either in houses or in the open air;" usually "in vaults built on purpose on the tops of their houses; and value themselves mightily, if they can shew that they have accommodated their dead friends within their houses."

"337 A. D." (Hieronym., and Clint.), at Nicomedia, Constantine, in daily expectation of death, declaring his intention of becoming a Christian and receiving baptism from the Arian bishop Eusebius. Christianity thus becoming the religion of the State.

"May 22d" (chron. Pasch., and Clint.), Constantine succeeded by his three sons: Constantine the Younger, Constantius II., and Constans.

"338 A. D." (Hieronym., and Clint.), in Mesopotamia, Nisibis besieged by the Persians under Sapor II., and saved through the intercession of Jacobus, bishop of the city.

"340 A. D." (Socrat., and Clint.), Eusebius the chronologer succeeded as bishop of Caesarea in Palestine by Acacius.

"The same year" (cod. Theodos., and Clint.), death of Constantine the younger at Aquileia; warring against his brother Constans.

In this year (= 331 + "9 years reign" in Mahavams. xxxvii.), Dattatissa succeeded by his son Buddaduwsa, now king of Ceylon.—In his reign, the "Scripture in Palee was translated into Cingalese."

"341, Feb. 12th" (cod. Theodos., Athanas., and Clint.), Constantius II. attending an Arian synod at Antioch. By this synod, Athanasius was deposed and Gregorius appointed bishop of Alexandria. Withdrawing to Rome, Athanasius was received by Julius, thirty-third bishop:—who in the following year issued a letter, claiming that the diocese of Alexandria was by itself insufficient, and that the bishop of Rome ought to have been consulted.

Letter of Constantius II. to Aëzanas and Sazanas, kings of Axum, requiring them to send Frumentius to Alexandria for re-consecration (Athanas. apol.). In a Greek *inscription at Axum* (M. Russel p. 248), Aëzanas enumerates as under his dominion the Axomites, Homerites, Raeidan, Ethiopians, Sabeans, Zeyla, Tiemo, Boja, and Taquie, and mentions his brother Saiazana.

"The same year" (cod. Theodos., and Clint.), a law promulgated, abolishing the ancient religious rite of *sacrifices*.

"342 A. D." (Idat., and Clint.), at Constantinople, sedition on account of the bishop, Paulus; whose expulsion had been ordered by the Arians and Constantius II. In Gaul, the Franci defeated by Constans, and reduced to suing for peace.

"343, Jan. 25th" (cod. Theodos., and Clint.), Constans at Boulogne, on his way to Britain; a journey as yet untried in the winter season. He returned in June.

"In or about this year" (Philostorg. iii., and Percev. i. 111), the Indian bishop Théophilus sent by Constans to Marthad, tobba of Yemen, with the request that churches might be erected for the Christian traders. Leave being granted, a church was built at Zhafar, the seat of government; another at Aden, and a third in the principal seaport city on the Persian Gulf. Circumcision at this time generally practised among the Arabs — according to Philostorgius.

"The same year = 'kien-youan,' 1st year of Kang-ti, of the Tcin" or Ninth dynasty — (Chinese chron. table).

"344 A. D." (in the opinion of Ideler, see Leps.), the Jewish reckoning in years of the World established by rabbi Hillel Hanassi. Whose computation (according to Alsted) was reduced from a more ancient one of R. Adæ. — The reckoning continues to be followed by the Jews to the present day (see Menes).

"345 A. D. = 'young-ho,' 1st year of Mou-ti, of the Tcin" or Ninth dynasty — (Chinese chron. table).

"April" (chron. Pasch., and Clint.), at Constantinople, building of the "thermae" or "baths" of Constantius II.

About this time, "343 to 347 A. D." (Clint.), the treatise by Firmicus Maternus, addressed to Constans and Constantius II. against the temples.

"346, June 6th" (Clint.), eclipse of the sun. Immediately following the Second siege of Nisibis, by the Persians under Sapor II.

"The same year" (Alst.), by a synod at Agrippina (Cologne), the bishop there, Euphratas, condemned for denying the divinity of Christ.

"348 A. D." (Clint.), remark of the historian Victor, suggested by the name "Philippus" of one of the consuls, that this was the Eleven hundredth anniversary of the founding of Rome, and that there was no celebration. At Singara, Constantius II. foiled by his troops attacking the Persians in the night.

"The same year" (Socrat., and Clint.), Maximus deposed by the Arians, and Cyrillus appointed bishop of Jerusalem.

Damogeron may have been at this time writing. — He is mentioned by Palladius, and Apuleius Barbarus.

Balsamita vulgaris of the West Mediterranean countries. Called in Egypt "belsamæ" or "melsane," at Constantinople "kōsta" (Forsk.), in which we recognize the garden KOCTOU of Damogeron — (geopon. vii. 13, and xi. 27) and the "ahlal kostha" of Gafeki, and Ebn Baitar. *B. vulgaris* was observed by Forskal in gardens at Constantinople, its leaves strewn on lettuce for ornament; by him, and Delile, in the gardens of Egypt. Westward, the cultivation of "costum" is enjoined in the capitularia of Charlemagne: *B. vulgaris* is termed "tanacetum balsamita" by Linnæus; and is known to grow in Italy, Switzerland, and Southern France to the base of the Pyrenees (Pers.).

"349, about January" (Athanas., and Clint.), by the Alexandrians, Gregorius the Arian bishop slain. And after some months, Athanasius sent back to Alexandria by Constantius II.

"350 A. D." (Idat., and Clint.), at Helena in the Pyrenees, death of Constans. Constantius II. now sole emperor.

"351 A. D." (Jul. ep. 51, and Clint.), secret determination of Julian at the age of "twenty," to abandon the Christian faith in which he had been brought up.

"In this year" (Socrat., Clint., and Nicol.), a synod assembled at Sirmich by Constantius II., and Photinus bishop of the city condemned for denying the Trinity. He was answered by Basilus of Ancyra.

"352 A. D." (Vict., and Clint.), the Jews revolting; several cities in Judea burned, and the revolt suppressed by Gallus Caesar.

"353 A. D." (Jul., and Clint.), in Gaul, death of Magnentius, defeated for the third time by Constantius II. Coins of Magnentius are extant.

Ajuga chamæpithys of Caucasus and the Talysch mountains. Called in Britain *yellow bugle* or *ground pine* or *field cypress* or till the beginning of the present century *forget-me-not* (Prior); in which we recognize the "chamæ cypri" of the Cosmian Antidote — mentioned by Marcellus 29: *A. chamæpithys* is described by Tragus f. 30 (Spreng.), Lobel, Dalechamp, and was already in Britain in the days of Lyte, and Gerarde (Prior); is termed "c. lutea vulgaris sive folio trifido" by Tournefort inst. 208; was observed by Scopoli in Carniola (Steud.); and is known to occur in stony cultivated and fallow ground in Italy, Spain, France, and as far as Denmark (fl. Dan. pl. 738, Pers., and A. Dec.). Eastward, is known to grow on Caucasus and the Talysch mountains both in cultivated ground and wild situations (Bieb., and C. A. Mey.); but notwithstanding Sibthorp's statement seems unknown in Greece, as well as in European Turkey, Sicily, and Algeria (Griseb., Reut. and Marg., Guss., Munby, and A. Dec.). By European colonists, was carried to Virginia, observed there by Clayton, but has since disappeared (A. Gray. See *A. Chia*, and *Veronica chamædrys*).

"355 A. D." (Sulpic. Sev., and Clint.), by a synod at Milan, Constantius II. being present, Liberius thirty-fourth bishop of Rome exiled and Felix appointed in his place: at the same time, Eusebius bishop of Vercelli in Italy also exiled, together with Lucifer bishop of Sardinia, and Hilaris Pictavensis. — At the end of two years, by advice of Fortunatianus, Liberius returned and subscribed to the Arian faith (Hieronym. cat. 97).

"In this year" (Bartol. Borghesi, and Sm. b. d.), Pasiphilus praelect of the city: probably the person to whom Palladius dedicates his fourteenth book on agriculture. — Palladius is mentioned by Isidorus Hispalensis, and Cassiodorus.

Crataegus monogyna of the Mediterranean countries. Called in Greece "trikōkkia" or "tzap-ōurnia" (Sibth.); and the SPINUS of Palladius iii. 25 on which pears and apples can be grafted, — may be compared: *C. monogyna* is termed "m. apii folio sylvestris spinosa sive oxyacantha" by Tournefort inst. 642; is known to grow in middle Europe (Jacq. austr., fl. Dan. pl. 1161, and Sibth. oxon. 156) but chiefly in the South (Pers.). Eastward, was observed by Sibthorp in the Peloponnesus and on Zacynthus, often with pears or plums grafted on the stem; is known to grow also towards Caucasus (Pall. fl. ross. i. pl. 12); but is regarded by Bory as not distinct from *C. oxyacantha*.

"356 A. D." (Athan., and Clint.), by Constantius II., Athanasius exiled and Georgius of Capadocia appointed bishop of Alexandria. Athanasius now retired into the Desert.

"357, April 30th" (Ammian., and Clint.), arrival in Rome of Constantius II. And by his direction, an obelisk (now called "the Lateran obelisk") brought there in the same year from Egypt.

"358, August" (Ammian., Idat., and Clint.), by a severe earthquake, Nicomedia overthrown, and "one hundred and fifty" other cities, in Macedonia, Asia Minor, and Pontus, more or less injured.

"359 A. D." (Ammian., and Clint.), the historian Ammianus Marcellinus at Samosata in Mesopotamia; and his mission to the satrap of Corduene.

Rheum palmatum of Eastern Thibet and its mountainous prolongation into China. The *rhubarb* of commerce is called in Bengalee "reuchini," in Hindustanee "rewand" or "rewand chini" (D'roz.), and is mentioned by Ammianus Marcellinus — (according to voyag. Belg.): the "rheum barbarum" of Isidorus Hispalensis viii. 3 and xvii. 9, and Nicolaus Myrepsus i. 21. 155, is referred here by Sprengel; the "rheum indicum" or "chinense" is mentioned by Matthaeus Sylvaticus pand. 589, and other medieval writers (Spreng.); the "rawand," by Rhazes, Mesue simpl., Averrhoes, and Ebn Baitar · rhubarb was seen by Rubruquis in Central Asia, brought by caravans (Pouchet); by Marco Polo, procured from Succur in Tanguth (Royle); by Vertoman or Barthema, sold in Korasan; and according to Rehman, the trade is in the hands of one Bucharian family, who farm the monopoly from the Chinese government and reside at Si-ning. The living plant is known to grow in clefts of rocks on the high and arid mountains around lake Kokonor, and the Sue-chan or snowy mountains in the Chinese provinces of Kansu and Letchuen (Royle ill. Him.). Of all the kinds seen by Guibourt under cultivation, *R. palmatum* alone resembled exactly in odour and smell the rhubarb of China; is even according to Stevenson and Churchill "extensively cultivated near Banbury for the supply of the London market" (Lindl.).

"360 A. D." (Ammian., and Clint.), Julian passing the winter in Paris; and Lupicinus sent into Britain to repel an invasion of the Scots and Picts. Death of Helena wife of Julian.

Calendula officinalis of Eastern Asia. Called in Britain *marigold*, by Treveris "mary gowles," by old English poets "golde" (Prior), in Anglo-Saxon glossaries "solsequa" (Cockayne), in France "souci" (Nugent), in Germany "ringelblume" (Grieb), at Constantinople "hamōuvuōrēta," in Yemen "zobejde" (Forsk.), in Hindustanee "gul-i-mariyam" or "phirkj" or "genda," in Bengalee "genda phul" (D'roz.), in Burmah "htat-ta-ya" (Mason), at Lahore "adsrioön" (Honigb. 379, and J. F. Wats.), by the Ainos "urajenekina," by the Japanese "kin-sen-kwa" (Sieb.); and the CHRUSANTHUS of the Culex 404 — (attributed to Virgil), may be compared: "winking marybuds" with "golden eyes" and the "marigold" are mentioned by Shakespeare cymb. ii. 3 and w. t. iv. 3, and the garden flower according to Persoon, and Lindley, springs up spontaneously in cultivated ground in Southern Europe. Eastward, the "adsrioön" is mentioned by Ebn Baitar · *C. officinalis* was observed by Forskal under cultivation at Constantinople and on the mountains of Yemen; by Delile, in the gardens of Egypt; by Graham, "in gardens" at Bombay; by Mason, "exotic" in Burmah; and by Siebold, on Yeso. By European colonists, was carried to Northeast America before 1670 (Joss.), where it continues in gardens. Formerly according to Lindley "much employed as a carminative, it is chiefly used now to adulterate saffron."

"At this time" (Hieronym., and Clint.), "in the name of peace and the king," the Arians in communion with all Christian churches.

"361, November" (Hieronym., and Clint.), Constantius II. succeeded by Julian, now forty-fifth Roman emperor. Ancient Heathenism once more and for the last time becoming the religion of the State. Julian however tolerated all religions.

"362 A. D. = 'loungho,' 1st year of Ngai-ti, of the Tcin" or Ninth dynasty — (Chinese chron. table).

The four great festivals of Greece, the Olympic, Pythian, Isthmian, and Nemean games, continued to be celebrated. "About midsummer," arrival of Julian at Antioch: where a temple of Apollo was soon afterwards destroyed by fire.

Aetius recalled, under a general remission of exile to all Sects of Christians. Titus bishop of Bostra, was however banished; and at Alexandria, Georgius was slain by the populace, and Athanasius returning was driven back by order of Julian.

Hardly later than this date (Graha Munjari tables, Puranas, and Benti.), Tapovati reigning in Hindustan.

"363 A. D." (Ammian., and Clint.), edict of Julian on his way to the Euphrates, providing for rebuilding the temple at Jerusalem. Building operations were soon arrested by the emperor's death; in battle "June 26th," his physician Oribasius being present (Sm. b. d.).

Myosurus minimus of Northern climates. A diminutive herb called in Britain *mouse-tail* (Prior): the ΜΟΥΡΟΝ prescribed against dropsy by Oribasius excerpt. 52 — (Daremb.), may be compared: *M. minimus* was observed by Sibthorp in cultivated ground around Constantinople. Westward, is described by Lonicer (Spreng.); is termed "*ranunculus gramineo folio flore caudato seminibus in capitulum spicatum congestis*" by Tournefort inst. 293; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 406). Farther West, was observed by Elliott at Augusta in Georgia (Chapm.); by Short in Kentucky (there and in Illinois in "alluvial ground" according to A. Gray); by Nuttall, "around towns" in Arkansas; and by myself, frequent and to all appearance indigenous along the shores of Puget Sound. "*M. aristatus*" has been observed on the high hills of California and Chili, and in New Zealand (J. D. Hook. and A. Dec.).

Lobelia tenella of the East Mediterranean countries. The ΑΠΟΙΟΝ by some called ΧΑΜΑΙΡΕΦΑΝΟΝ prescribed against dropsy by Oribasius excerpt. 52 — (Daremb.), may be compared: *L. tenella* is termed "*rapuntium creticum minimum bellidis folio flore maculato*" by Tournefort inst. 9; and was observed by Sibthorp in "uliginosis" on Crete and Cyprus. Westward, was observed by Bivona as far perhaps as Sicily (Steud.). Compare also *Campanula rapunculus*.

Styrax benzoin of the Siamese countries and neighbouring Malayan archipelago. A tree whose imported product is called in commerce *benzoin*, in Egypt "djai" (Forsk.); and the ΙΝΔΗ adhesive plaster of Oribasius exc. 143, — may be compared: benzoin is mentioned by Susrutas sutr. 36 to chik. 15 (according to Hessler); and "in former years" constituted "a considerable article of export" from "the province of Mergui" in Burmah, "produced by a tree" not seen by Mason v. 486: *S. benzoin* is described by Houttuyn act. harl. xxi. 257; is known to grow in Siam, Sumatra, Java, and Borneo (Dryand. phil. trans. lxxvii. pl. 12, and Hayne). Westward, "*benzoë*" was found by Forskal mat. med. imported from India into Egypt; was an ingredient in the "bachur" ointment of the Muslim population of Portugal and Spain (Jao de Sousa); and is mentioned by Amatus Lusitanus: is according to Lindley resinous and acrid, "a local irritant," employed in Europe in certain popular medicines and "in coating over the adhesive plaster called *court plaster*." According however to Bontius, benzoin of the best quality is procured from an arborescent vine growing on Java. (See *Terminalia angustifolia*).

Iris tuberosa of the East Mediterranean countries. The root called in Egypt "chamire" or "surendjan;" in which we recognize the "surandschan" identified by Serapion, and Mesue, with the ΕΡΜΟΔΑΚΤΥΛΟΣ of Oribasius, — Alexander Trallianus, Paulus Aegineta, and Nicolaus Myrepsus: the "surandschan" is also mentioned by Avicenna, and Ebn Baitar; the root, according to Alpinus, and Rouyer drog., is esteemed indispensable and eaten by the women of Egypt; and according to Forskal mat. med., is besides made into pills, is brought from "Alexandria and Barbary and exported to Constantinople," but according to Rouyer is imported "from Syria." Farther North, *I. tuberosa* was observed by Sibthorp, and Chaubard, in Southern Greece. Westward, is described by Matthioli p. 778, Dodoens p. 249, and Cæsalpinus x. 45; is termed "*hermodactylus folio quadrangulo*" by Tournefort cor. 50; was once cultivated as a medicinal plant throughout Europe as far North as Britain, and in various localities remains growing spontaneously to the present day (Rob., Wats., and A. Dec.).

Scolopendrium hemionitis of Western Europe? The ΗΜΙΟΝΙΤΙΝ called ΠΙΟΝΙΤΙΝ prescribed in nephritic complaints by Oribasius excerpt. 63 — (Daremb.), may be compared with this fern: *S. hemionitis* is described by Dodoens p. 467, and Clusius hist. ii. p. 214 (Spreng.); is known to grow in various parts of Europe, but has not been observed in Greece. (Compare also *Ceterach officinarum*).

Aspidium fontanum of Europe and the adjoining portion of Asia. A diminutive fern: the ΒΡΥΟΠΤΕΡΙC prescribed by Oribasius xi — (Dod. pempt. iii. 5. 4), may be compared: *A. fontanum* is termed "*filicula saxatilis omnium minima elegantissima*" by Tournefort inst. 542; was

observed by Sibthorp in Greece, in shaded springy places; and is known to grow throughout middle Europe as far as Britain (Engl. bot. pl. 2024).

"June" (Eutrop., and Clint.), Julian succeeded by Jovian, forty-sixth Roman emperor. Who, ceding five provinces, concluded peace with the Persians and retreated from the Euphrates. Jovian, while protecting the followers of the ancient religion, declared himself a Christian, and issued an edict placing Christianity upon a legal basis.

"304, Feb. 17th" (Idat., and Clint.), Jovian succeeded by Valentinian, forty-seventh Roman emperor. Who, taking up his residence in Italy, gave the Eastern portion of the Empire to his brother Valens. Valentinian appointed Vettius Praetextatus, proconsul of Achaia under Julian and a heathen priest, "praefectus urbi;" whose house is the scene of the imaginary conversation between Aurelius Symmachus, Flavianus, Servius the grammarian, and Caesina Albinus, in the work of Macrobius.

"The same year = 2d year of the 'hing-ning' of Ngai-ti" (Chinese chron. table), beginning of the Fifty-first cycle.

365 A. D. (— "290 an. jav. = 240 + 50 years" of Nata Kasuma, Raffles x.), death of Gutaka. After governing for "fifty" years the Hindu colony at Giling Wesi on Java, he succeeded in transferring his authority to his son Raden Sawela.

"In this year" (Ammian., and Clint.), inroads of Alamanni across the frontier of "Germaniae" into "Gallias Raetiasque;" of "Picti Saxonesque et Scotti et Atacotti" into Britain; and of predatory bands of Goths into Thrace.

"About this time" (Clint. iv. p. 455), a party of "Scotos gentem Britannicam humanis vesci carnibus" Scots a people of Britain who eat human flesh, seen by Hieronymus during his visit to Gaul.

"366 A. D. = 'tai-ho,' 1st year of Ti-y II., of the Tcin," or Ninth dynasty (Chinese chron. table).

"The same year" (Japanese chron. transl. Nicholai, and Bickmore), the Japanese after several years fighting defeated and their general killed by the Ainos.

"The same year" (Hieronym., Prosp., and Clint.), death of Liberius, and Damasus ordained "thirty-fifth" bishop of Rome (the Arian appointment of Felix not counted). Shortly afterwards, Ursinus ordained in opposition.

One hundred and fortieth generation. Sept. 1st, 367, mostly beyond youth: Nicolaus of Laodicea: the Greek philosophers, Pappus, and Theon the younger; the rhetors, Himerius, Themistius, and Libanius: the Christian Greek writers, Aquilius Severus of Spain, Eunomius bishop of Cyzicus, Agellius, Ambrosius of Alexandria, Theotimus, Severianus, Sophronius, and Apollinarius of Laodicea: the Latin writers, the rhetor Drepanius Pacatus; the Christian Latin writers, Phoebadius, Optatus of Carthage, Pacianus, and Tichonius.

"The same year" (Ammian., and Clint.). Theodosius sent into Britain, where "Dicalidonas et Vecturiones" the two tribes of the Picti, together with Attacotti and Scotti, were laying waste the country. In Gaul also, inroads made by Franci and their neighbours the Saxones.

Euzoius, successor of Acacius as bishop of Caesarea in Palestine, at this time writing; engaged besides in restoring the injured portions of the *Library* of Origen and Pamphilus.

"368 A. D." (Ammian. xxvii. 8. 6, and Clint.), arrival of Theodosius at "Lundinium vetus oppidum, quod Augustam posteritas adpellavit" London an ancient town to be called by posterity Augusta. On reaching the seat of war, he soon routed the predatory bands. In this year also, Moguntiacum (Mayence on the Rhine) during a Christian solemnity, surprised and plundered by a German prince named Rando.

"In this year" (Max Mull. p. xviii), death of Budhadasa, in whose reign the Sutras were translated by a priest into the Singhalese language (Mahanam. mahav. p. 247).

"369 A. D." (Ammian., and Clint.), the Rhine fortified by Valentinian, by building castles in elevated and suitable situations all the way from the Raetian Alps to the Ocean.

In this year (— 340 + "29 years reign of Mahavamsa xxxvii."), Budhadasa succeeded by his son Upatissa, now king of Ceylon.

"370 A. D." (Ammian., and Clint.), Saxones invading Roman territory by sea, the Burgundii induced by Valentinian to advance an army to the Rhine; when Theodosius from Rhaetia attacked and defeated the Alamanni.

"371 A. D. = 'hien-gan,' 1st year of Kian-wen-ti, of the Tcin" or Ninth dynasty — (Chinese chron. table).

"The same year" (Amphiloc., and Clint. iv. p. 475), Basilus ordained bishop of Caesarea in Cappadocia.

"373 A. D. = 'ning-kang,' 1st year of Hiao-wou-ti, of the Tcin" or Ninth dynasty — (Chinese chron. table).

"The same year" (Proter., and Clint.), death of Athanasius, and Petrus ordained twentieth bishop

of Alexandria (not counting the Arian appointments). Petrus was however immediately expelled by the Arian bishop Lucius. Faustinus succeeded as bishop of Iconium by Amphilochius.

About this time, "369 to 381 A. D." (Alst. pp. 191 and 324), the scriptures translated into the *Gothic language* by Ulfilas, an Arian bishop. A portion of this version is extant.

"374 A. D." (Klapr. note to San kokf), independent of the Chinese characters long known, an *alphabet* invented by the Coreans: — which continues in use to the present day.*

"In this year" (Ammian., and Clint.), Illyricum ravaged by the Quadi. Who complained, that Valentinian had built fortresses beyond the Danube upon their territory; and that their king Gabinius, while modestly expostulating, had been murdered.

"375 A. D." (Hieronym., and Clint.), at Milan on the death of Auxentius, sedition among the people; Ambrosius ordained bishop, and return of all Italy from Arianism.

"November" (Idat., and Clint.), death of Valentinian; his colleague Gratian now becoming forty-eighth Roman emperor. Religious liberty now no longer permitted; the Christians having gained the ascendancy, beginning to extend persecutions towards the followers of the ancient religion, and certain Sects among themselves.

About this time, "370 to 380 A. D." (Steinschneid. i. 4), "at Tiberias" in Palestine, the Talmud Yerushlami compiled; a body of collective Hebrew literature.

Luffa Arabum of Equatorial Africa. A Cucurbitaceous vine bearing quadrangular fruit and called in Egypt "luff" (Forsk.): the 𐤋𐤍𐤏𐤍 of the Talmud 5. 2 — is referred here by Sprengel: — the "luffah" is mentioned by Ebn Baitar: *L. Arabum* was observed in Egypt by Vesling pl., Forskal. Delile, and Clot-Bey, cultivated for ornament, and the sponge-like interior of its fruit employed in bathing: the *towel gourd* was observed by Grant growing "wild over the garden fences, Unyanyembé 5° S. to Nile banks 9° North." Eastward, *L. Arabum* was observed by Rumphius v. pl. 148 on Ceylon (Pers.). Transported to Europe, is termed "*momordica luffa*" by Linnæus, "*luffa Arabum*" by Miller (Steud.).

"376 A. D." (Ammian., and Clint.), Goths expelled by the Huns, "gens monumentis veteribus leviter nota ultra paludes Maeoticas glaciale Oceanum accolens, a people little known in the records of antiquity, dwelling beyond the Sea of Azof along the Icy Ocean." The expelled Goths were allowed by the Romans to cross the Danube and settle in Thrace.

"378, August" (Ammian., and Clint.), rebellion among the harboured Goths, caused by famine, and Valens defeated by them and slain. Afterwards, with associated Hunni and Alani, the Goths advanced laying waste the country to the very gates of Constantinople.

"The same year" (Clint.), end of the chronicle of Hieronymus. On other subjects, he continued writing.

"Between 378 and 383" (Gildas hist. 12, and Usher), Arianism introduced into Britain by Agricola, a disciple of Arius.

"379 A. D." (Clint.), the poet Ausonius, prefect of Gaul and now in old age, one of the consuls for this year: which he calls the "eleven hundred and nineteenth" of the city, placing therefore "the foundation at B. C. 740."

"January" (Idat., and Clint.), by Gratian, Theodosius appointed over the Eastern portion of the Empire. Who in successive battles defeated the Goths and their allies, and expelled them from Thrace.

"The same year" (Prosp., and Clint.), "Longobardi ab extremis Germaniae finibus Oceanique protinus litore Scandiaeque insula," Lombards from the farther frontier of Germany, from the shore of the Ocean and Scandinavia, make their first appearance, seeking new homes: and under "Iborea" (Ivor) and "Aione," conquer the Vandals.

"The same year" (Agath., and Clint.), death of Sapor II., and accession of his brother Artaxerxes V., now ninth Sasanid king of Persia.

* *Hibiscus mutabilis* of Corea. The name of the mountain Fou-young-chan in Corea sometimes written with characters signifying mountain of this shrub — (geogr. chin. transl. Klapr. in San-kokf p. 100): *H. mutabilis* is called "fujoo" in Japan (Kaempf., and Thunb.); and is figured in Chinese paintings. Farther South, is common in gardens at Manila, and regarded by Blanco as indigenous in the Philippines, though devoid of a native name; is also described by Rumphius iv. pl. 9. Westward, enumerated by Mason as "exotic" in Burmah; observed in Hindustan by Rheede vi. pl. 38, Roxburgh, Royle, Wight, and according to Graham called *changeable rose*, or by the Portuguese "inconstante amante" inconstant lover, "a common shrub in gardens," the flowers "large, white in the morning, changing to red in the course of the day." Eastward from the Philippines, *H. mutabilis* was observed in the West Indies by Descourtilz, who further states, that it was carried by Bentinck in 1690 to England; the shrub however is described by Morison ii. 5. pl. 18.

The Avadana Asoka written hardly later than this date. The end of the Mauriya dynasty is mentioned, and it contains legends * — quoted by Fa-hian (Burn i. 358 to 423).

"380 A. D." (Marcellin., and Clint.), by Theodosius, the Arians expelled from the Churches, held by them nearly "forty" years. "Nov. 26th," he appointed the younger Gregorius of Nazianzus bishop of Constantinople: and in "December," he restored Cyrillus as bishop of Jerusalem, after having been four times expelled.

"381 A. D." (Idat., and Clint.), death of Athanaric king of the Goths.

"May" (Socrat. and Clint.), Second general Council of ecclesiastics. Convened by Theodosius at Constantinople: and consisting of "one hundred and fifty" bishops, including Timotheus of Alexandria, Gregorius of Nyssa (a "married bishop," Alst. p. 368), Amphilocheus, Pelagius of Laodicea, Diodorus of Tarsus, and Gelasius of Caesarea in Palestine. The doctrine of the Council of Nice was confirmed: and a Creed formed (the so-called "Nicene Creed" of the English Articles, except that "a single expression is omitted, which in the English Liturgy is added") Maximus the cynic was adjudged not to be a bishop. Patriarchal bishops were instituted, each confined to his own diocese: and after declaring Constantinople next in dignity to the diocese of Rome, "as being New Rome," the younger Gregorius of Nazianzus resigned, and in his place Nectarius of Tarsus was elected "bishop of Constantinople." — The authority of this Council continues to be recognized by the Greek church (E. A. Soph.).

Meletius dying while attending the Council was succeeded under the approval of the Asiatic churches by Flavianus, now bishop of Antioch. Flavianus changed the words of the doxology from "thōxa patri thi' uiōu ēn agiō pnēmāti" glory to the father by means of the son in holy spirit, and "thōxa patri ēn uiō kai agiō pnēmāti" glory to the father in the son and holy spirit, to "thōxa patri kai uiō kai agiō pnēmāti" glory to the father and son and holy spirit (Philostorg., and E. A. Soph. lex.). Acting in conjunction with Diodorus, he also "first introduced the practice of the alternate singing or chanting of the psalms, and the division of the choir into parts" — "which afterwards became universal in the church" (Sm. b. d.).

"382 A. D." (Idat., and Clint.), dissatisfied with their treaty of peace with the Romans, the Goths elect Alaric as their king.

"383, August" (Marcellin., and Clint.), death of Gratian; and through the support of Theodosius, Valentinian II. acknowledged forty-ninth Roman emperor. Maximus however maintaining himself in Britain and Gaul.

"The same year" (Agath., and Clint.), Artaxerxes V. succeeded by Sapor III., tenth Sasanid king of Persia.

"384 A. D." (Prosp., and Clint.), Damasus succeeded by Siricius, "thirty-sixth" bishop of Rome.

In this year (as appears from Libanius), the *Destruction of temples* not yet commenced. — Soon however, orders from Theodosius were directed against particular temples; and these were demolished by soldiers, aided by bands of fanatics.

385 A.D. (= "310 an. jav. = 290 + 20 years" of Nata Kasuma, Raffles ix. and x.), at Giling Wesi in Java, Raden Sawala succeeded by Gutama. Who removed the seat of government to Astina, his successor Dasa Bahu of Hindu descent being "ten years of age." — A temple or mosque at Kediri is called "Astana Gedong," and "great expense and labour has been bestowed to demolish" and mutilate the surrounding antiquities.

"In this year" (cod. Justin., and Clint.), edict against *augury*, and the practice of examining the liver of victims to learn futurity.

"August" (Hieronym., Clint., and T. Wright), sailing of Hieronymus from Italy. Landing on Cyprus, he with his companions was received by Epiphanius. Proceeding next to Antioch, he enjoyed the society of "pontificis confessorisque Paulini;" — and reached Jerusalem in mid winter,

* *Nauclea cadamba* of the Siamese countries. A large tree called in Sanscrit "kadamba," in Telinga "kadapa-chettu" (J. F. Wats.) or "rudrashakamba," in Tamil "vella cadamba," in Hindustanee "cuddum," in Bengalee "kudum" (Drur), in the environs of Bombay "nheu" or "cadamba" or "cuddam" (Graham), in Assam "kadam" (Robinson), in Burmah "ma-oo" (Mason); in which we recognize the "kadamba," the "holiest of Indian trees" and third "shadow-giving" tree on the mythological mount Meru, mentioned besides in the Avadana Asoka — (Burn. i. 397) and by Valmiki v. 74 (transl. Gorr.), Bhavabhuti 7, Jayadeva, Kalidasa kum. iii. 68, Susrutas, and in the Vishnu purana ii. 2: N. cadamba was observed by Rheede iii. pl. 33 in Malabar; by Graham, "common about villages in the Southern Concan," its fruit "about the size of a small orange" eaten by the natives; by Roxburgh, and Robinson, as far as Bengal and Assam, but is regarded by Wight as not a native of the peninsula; was observed by Mason "sometimes cultivated" among the Burmese.

where he saw Christian pilgrims from India (Coq.-Montbret in rec. voy. et mem. 27). He next proceeded to Egypt, and visited "the hermits of the Thebaid;" at this time regarded in the regular routine of "the Pilgrimage."

The perfume *MVSCVS musk* mentioned by Hieronymus — (Ainsw.), by the Armenian writer Moses Chorinensis 365 (Spreng.), and by Aetius (Greenhill). *Moschus moschiferus*, the deer-like animal yielding this perfume, is described by Cosmas Indicopleustes xi. p. 101, Abu Hanifa (in Serapion); and by Benjamin de Tudela as inhabiting Thibet, its well-known native home. The imported perfume is mentioned by Ebn Masawia, Honain, and Symeon Sethus; and its sale in Egypt, by Leo Africanus.

Soon after the departure of Hieronymus (Clint., and T. Wright), Paula followed: and landing at Sidon, "visited the tower of Elijah." Approaching Jerusalem, she passed the tomb of "Helena queen of Adiabene;" and after reaching the city, went to the church of the Holy Sepulchre. On her way to Bethlehem, she visited the "sepulchre of Rachel;" at Sichem, "entered the church built over the well of Jacob, where our Saviour spoke to the Samaritan woman;" and in Sebaste or Samaria, saw the sepulchre of John the baptist.

"386 A. D." (Greg. Turon., and Clint.), Maximus in a personal interview, forbidden by Martinus bishop of Tours to carry the sword into Spain to slay heretics. He had already killed Priscillianus.

Manuscripts of the "Fourth century" (De Wailly pl. ii. 1), presenting the following form of the letter l.

"387 A. D." (Liban., and Clint.), at Antioch, sedition, and the statues of Theodosius, his sons, wife, and father, thrown down by the populace. The "second year" of the preaching of Joannes Chrysostomus.

"The same year" (Mason ii. 20), two copies of the sacred Buddhist books brought from Ceylon to Thatung in Burmah.

The Sutta sagitti written as early perhaps as this year. Mention is made of various-coloured Benares stuffs * — (Burn. ii. 486 to 825).

"388 A. D." (Idat., and Clint.), Maximus having entered Italy, slain near Aquileia; and the Western division of the Empire restored entire to Valentinian II. by Theodosius.

England deprived of its young men and military resources in the wars of Maximus, invaded from the North by the Picts and Scots:—whose depredations continued many years (Gildas hist. 14 to 24).

The same year (inscript. at Kermanslah, Agath., and Clint.), Sapor III. succeeded by Vararam IV., eleventh Sasanid king of Persia.

"389 A. D." (Prosp., and Clint.), on account of the death of Priscillianus, his accusers Ithacius and Ursacius deprived of the communion of the church.

"390 A. D." (Sozom., and Clint.), massacre at Thessalonica: and at Milan, Theodosius excluded by Ambrosius from the church, for "eight months" until Christmas.

"At the close of the year" (Clint.), the great temple of Serapis at Alexandria demolished. The building contained the *Alexandrian Library* (see Tertull. apol. 18, Aphthon. 12, Oros. vi. 15, Ammon. Hermead., and Joann. Philopon.). Among those who on this occasion fled from Alexandria, were the two grammarians, Helladius "priest of Jupiter," and Ammonius "priest of the ape" (Socrat. v. 15).

"391 A. D." (Clint.), the orator Symmachus one of the consuls for this year.

"392, May 15th" (Epiphan., and Clint.), death of Valentinian II.; Theodosius now becoming in regular order the fiftieth Roman emperor. Marcellus of Bourdeaux, sometimes termed "archiater," holding the office of "magister officiorum" under Theodosius (Sm. b. d.).

* *Pentapetes phœnicea* of Tropical Eastern Asia. Herbaceous with shewy flowers, and called in Sanscrit "bandhukamu" or "bandhujivamu" or "bandhujivakamu" (J. F. Wats.); in which we recognize the "bandhudjiva" of the Sutta sagitti — (Burn. ii. 826), Valmiki ram. iv. 29 (transl. Gorr.), Jayadeva, lips like its ruddy flowers, and Susrutas sutr. 6 to kalp. 1: *P. phœnicea* was observed by Rheede x. pl. 56 in Malabar; by Graham, "in gardens Bombay," flowers axillary, "of a beautiful bright red colour;" by Roxburgh, and Wight, in other parts of Hindustan; by Mason, indigenous in Burmah; by Blanco, once at Manila; and is termed by Rumphius v. pl. 100 "flos impius" from the flowers never looking upward.

Pontederia hastata of Tropical Hindustan. The "umma" having blue flowers according to the Sutta sagitti — is referred here by Burnouf ii. 826: *P. hastata* was observed by Nimmo in the environs of Bombay, "rice fields and margins of tanks, Concans" (Graham); by Roxburgh cor. ii. pl. 111 in other parts of Hindustan. Transported to Europe, is described by Plukenet alm. pl. 220, and Morison iii. 15. pl. 4.

Aconitum anthora of the Pyrenees and mountains of middle Europe as far as Siberia. The ἀντὺρὰ of Marcellus — (Dod. pempt. iii. 4. 14), or “anthora” growing according to Matthæus Sylvaticus in the same situations with the “tora” and an antidote to its poison, its flowers “subrubei” (Caesalp. xiv. 8), mentioned also by Simon Januensis, and Arnoldus Villanova, is referred heré by writers: *A. anthora* is described also by Clusius hist. ii. pl. 98; is known to grow on the Pyrenees (Pall. it., and Steud.) and mountains of Switzerland (Jacq. austr. pl. 382, Pers., and Hausman fl. Tyrol i. 31) confined apparently to calcareous soil (Mohl, and A. Dec.). “*A. Pallasii*” is regarded by Lindley as a variety only.

Ranunculus aconitifolius of the mountains of middle Europe. One or more species is called in Britain *bolt* (Prior); and the ἑρβὰμ called in Gaul bluttthaggio, growing according to Marcellus 9 LOCIS HUMIDIS, its juice instilled in the ear, — may be compared: the “bolte” is translated “petilum, tribulum” by Galfridus pr. pm. *R. aconitifolius* is termed “pie di cornacchia” by Matthioli; is known to grow along streams on the mountains of Switzerland, the flowers white (Willd. p. 1316, Curt. mag. pl. 204), the double-flowered variety is called in France “bouton d’argent” (Pers.).

Impatiens balsamina of the mountains of Southern Hindustan. Called in Britain *balsam*, in France “balsamine” (Nugent), in Germany “balsamine” (Griehl), by the Turks “knetziziék” (Forsk.), in Egypt “areteneh” (Clot-Bey); in which we recognize the βάλσαμ whose seeds are prescribed by Marcellus 20, — and one of the ornamental flowers whose culture is enjoined by Charlemagne: *I. balsamina* is described by Fuchsius pl. 190, Matthioli, and Cæsalpinus vi. 63; is well known in the gardens of Europe (Blackw., and Pers.); was observed by Forskal in the gardens of Constantinople; by Clot-Bey, in those of Egypt; and by Forskal, under cultivation in Yemen. Farther East, was observed by Rheedé ix. pl. 52 in Malabar; by Graham, “everywhere” around Bombay “towards the close of the rains” and called “teerda;” by Mason v. 433 and 704, “exotic” in Burmah but abounding both cultivated and springing up spontaneously. By European colonists, was carried to Northeast America, where it continues a favourite garden flower.

Malva althæoides of the Mediterranean countries. Annual: yet possibly the bruised or ground root of the μάλβα ἐραεικὰ ἐλβαὲ prescribed against colic by Marcellus 27: — *M. althæoides* was observed by Cavanilles ii. pl. 13; in Spain, the flowers white (Pers.); by Sibthorp, and Chaubard, in the Peloponnesus and Attica.

Brassica arvensis of the Mediterranean countries. The βράσσις ἐρατικὰ of Marcellus 10, the juice of its bruised root to be inserted in the nose, — may be compared: also the “perfoliata sive herba umbilicorum” of the Ortus sanitatis pl. 350: *B. arvensis* is termed “*b. campestris perfoliata flore purpureo*” by Tournefort inst. 220; is known to occur in moist cultivated ground in Southern Europe (Pers.); was observed by Boccone pl. 25 in Sicily; by Sibthorp, in the moist cultivated fields of Greece.

Malcolmia maritima of the shores of the Mediterranean. Called in France “giroflée de Mahon” (Pers.): the κερᾶτιθός, an ἑρβὰμ that we call *VIOLAM MARINAM*, prescribed by Marcellus 27, — may be compared: *M. maritima* is termed “*hesperis maritima supina exigua*” by Tournefort inst. 223; is known to grow wild on the seashore of France, and is besides cultivated to ornament lawns. Eastward, by Forskal, and Sibthorp, on the seashore of Greece and the Greek islands as far as the Dardanelles; by Chaubard, inland in the Peloponnesus colouring the ground in patches with its rose-violet flowers; by Forskal, the “*cheiranthus Chius? foliis dentatis siliquis subulatis*” in the gardens of Egypt. “*C. lyratus*” with pods “*erectiusculis rigidis pungentibus*,” observed by Sibthorp on Cyprus, is regarded by Chaubard as probably not distinct.

Draba verna of Europe and Northern Asia. Called in Britain *whitlow grass* or *nailwort* (Prior); and the UNGUINALIS of Marcellus — may be compared: *D. verna* was observed by Sibthorp in sunny situations from the Peloponnesus to Cyprus; is known to grow also about Caucasus (Bieb.). Westward, is described by Brunfels ii. 34, Lobel adv. p. 106 and obs. p. 249, Thalius pl. 7 (Spreng.), and Parkinson th. p. 556; is termed “*alysson vulgare polygoni folio caule nudo*” by Tournefort inst. 217; and is known to grow throughout middle and Northern Europe as far as Denmark and Iceland (fl. Dan. pl. 983, Hook., and Pers.). By European colonists, was carried to Northeast America, where it has become naturalized from upper Carolina (Chapm.) throughout our middle and Northern States, but according to A. Gray is “not found north of Lower Canada.”

Saxifraga tridactylites of Europe and Northern Asia. Also called in Britain *whitlow grass* and *nailwort* (Prior); and possibly included in the “*unguinalis*” of Marcellus: — *S. tridactylites* was observed by Sibthorp, and Bory, frequent in the Peloponnesus. Westward, is described by Lobel pl. 469 (Bory); is termed “*s. verna annua humilior*” by Tournefort inst. 252; and is known to grow in Italy and throughout middle and Northern Europe as far as Lapland and Iceland (Pers., Hook., Dec., and Wats.).

Trifolium repens of Europe and the adjoining portion of Asia. Called in Greece "triphulli" (Sibth.), in Britain *white clover* or *Dutch clover*, in Ireland *shamrock* or "seam-og" holy trefoil; in which we recognize the Celtic name of clover VISUMARUS sheep-sumar in Marcellus 3 — (Prior): *T. repens* was observed by Sibthorp, and Chaubard, in grassy situations from Crete and the Peloponnesus to Cyprus and Constantinople; is known to grow also about Caucasus (Bieb.) and the Talusch mountains, and throughout Siberia as far as Lake Baikal (Gmel., and Ledeb.). Westward, the "hwite clæfran" is mentioned in the Anglo-Saxon Leechbook i. 20. 21 (Cockayne); is termed "t pratense album" by Tournefort inst. 404; is known to grow in Barbary (Boiss. i. p. 170) and throughout middle and Northern Europe as far as Lapland and Iceland (fl. Dan. pl. 990, Hook., and Wats.). By European colonists, was carried to Madeira and the Azores (Lem., and Wats.); to Jamaica (Dec.); to Northeast America, where it has become naturalized, multiplying especially in grassy clearings; to Austral Africa (Meyer, and A. Dec.); and to New Zealand, as verified by myself.

Ervum hirsutum of Europe and the adjoining portion of Asia. Called in Britain *tine-tare* from enclosing and imprisoning other plants, in Anglo-Saxon "tynan" (Prior); and the HERBA TINIA TICIA of Marcellus 17 — may be compared: *E. hirsutum* is termed "vicia minima" by Tragus (Spreng.), "v. segetum cum siliquis plurimis hirsutis" by Tournefort inst. 397; and is known to occur as a weed in grain-fields in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 639, Pers., and Lenz). Eastward, was observed by Sibthorp in the environs of Constantinople. By European colonists, was carried to Northeast America, where it continues to occur sparingly in waste and cultivated ground from Massachusetts to Virginia and Carolina (Raf., A. Gray, Chapm., and myself).

Potentilla comarum of Northern climates. Called in Britain *purple-wort* or *purple marshwort* or *purple marshlock* (Prior); and the IANTHIDIS HERBAE growing in HUMIDIS LOCIS prescribed by Marcellus 17 — may be compared: *P. comarum* is described by Plukenet phyt. pl. 212; was observed by Scopoli in North Italy; and is known to grow in marshy ground throughout middle and Northern Europe as far as Lapland (Crantz, Gilibert, Lamarck fl. fr., fl. Dan. pl. 636, and Wats.); was observed by Pallas between the Yenisei and Baikal; and by Gmelin, throughout Siberia. Westward, by Hooker on Iceland; is known to grow on Greenland; was observed by Lappalaie from Lat. 52° on Newfoundland; by Michaux, from Hudson Bay to Quebec; by myself, along the Atlantic as far as 42°; by Torrey to 41°; by Nuttall, as far West as the Missouri; by Mertens, at Norfolk Sound on the Pacific; and is known to grow from Bear Lake to Bering's Straits (Hook.). Has been used medicinally, according to W. Coles simpl. 27 as "an excellent remedy against the purples" (Prior).

Cirsium lanceolatum of Europe and the adjoining portion of Asia. The juice of the HERBAM CAROLI AGRESTIS expressed in a mortar, prescribed by Marcellus 6, — may be compared: also the "scearpe thistel" of the Anglo-Saxon Leechbook iii. 12: *C. lanceolatus* is termed "c. lanceatus latifolius" by Tournefort inst. 440; was observed by Scopoli in Carniolia, by Forskal on Malta; and is known to occur in North Africa (Wats.), and in waste and fallow ground throughout middle and Northern Europe as far as Sweden (fl. Dan. pl. 1173, and Pers.). Eastward, was observed by Sibthorp around Constantinople; and is known to occur in cultivated ground in the Tauro-Caspian countries (Bieb.). By European colonists, was carried to Iceland (Hook.); and to Northeast America, where it has become naturalized, though chiefly occurring along roadsides and in fallow ground as far South according to Chapman as Augusta on the Savannah.

Artemisia vallesiaca of Western Europe. The ABSINTHII GALLICI prescribed by Marcellus 15 — may be compared: *A. vallesiaca* is termed "absinthium vallesiicum tenuifolium candidum sive herba alba" by Bauhin hist. 179; is known to grow in sandy situations in Italy, Switzerland, France, and Spain (All., Lam., and Pers.); and is enumerated by Lindley among medicinal plants.

Primula auricula of the mountains of middle Europe. Called in Britain *French cowslip* or from the shape of its leaves *bear's-ears*, in medieval Latin "ursi auricula" (Prior); and the HERBAM called in Gaul VERNETUS according to Marcellus 9, its juice to be instilled in the ear, — may be compared: *P. auricula* is described by Gesner, and Matthioli (Spreng.); is known to grow wild in alpine situations in Switzerland and France (Jacq. austr. pl. 405, Villars ii. 469, Pers., and Beckm.). Transferred to gardens, it has become a favourite flower, cultivated under numerous varieties throughout Europe, and has been carried to Northeast America.

Lathræa squamaria of middle Europe. From the tooth-like scales at the base of the stem called in Britain *toothwort* (Prior); and the HERBAE PEDUNCULARIÆ SICCÆ prescribed by Marcellus 8 — may be compared. *L. squamaria* is termed "squamaria orobanche" by Scopoli, "clandestina penduliflora" by Lamarck fl. fr. (Steud.); and is known to grow in deep shade as far as Britain and Denmark (fl. Dan. pl. 136, and Pers.).

Convallaria majalis of Europe and the adjoining portion of Asia. Called in Britain *wood lily*

or *lily of the valley* or *muguet*, in France “muguet,” in Old French “musquet” from “muscatus” scented with musk (Prior), in Greece “krinōs” (Sibth.) or at Constantinople “margaritaria” (Forsk.); and the $\text{LILII SYLVATICI SUCCUS}$ prescribed by Marcellus 16—may be compared: the “hamai-kērasōs” of Euporist. i. 154, a small herb with fragrant flowers having the odour of musk succeeded by cherry-like fruit, is referred here by Gesner, and Sprengel: *C. majalis* was observed by Sibthorp in the Peloponnesus; by Forskal, in gardens at Constantinople; is known to grow wild on Caucasus and in the Tauro-Caspian countries (Bieb.), and in Siberia as far as but not beyond the Ural and Irtysh (Gmel., and Pall.). Westward, the “*lilium convallium*” is mentioned by Platearius, and in the Vulgate translation of Cant. ii. 1: *C. majalis* is figured in *Ortus sanitatis* 256; is described also by Joannes Manardus (Spreng.), Bruinfels i. 211, Fuchsius, Dodoens, and Lobel; is termed “*l. convallium album*” by Tournefort inst. 77; was observed by Brotero only under cultivation in Portugal; but is known to grow wild in wooded mountainous situations in middle Europe, and throughout Northern Europe as far as Russia and Lapland (fl. Dan. pl. 854, Pers., Dec., and Wats.). By European colonists, was carried to Northeast America, where it continues a favourite garden flower, and has become naturalized along the Sassafras river in the Delaware peninsula (Baldw.), at the Sweet Springs among the mountains of Virginia (B. S. Bart.), and on the tops of the Alleghanies in Carolina (Mx.).

Stratiotes aloides of the Malayan archipelago? From its sword-like leaves called in Britain *knight's wort* or *knight's woundwort* or *knight's pondwort* or *water soldier* or *water sengreen* (Prior); and the juice of the $\text{HERBAE GLADIATORICIDAE}$ prescribed by Marcellus 16—may be compared: *S. aloides* is described by Dodoens p. 588; is known to occur in slow-moving waters in Britain and Denmark (fl. Dan. pl. 337, and Pers.); and recently introduced into France, has extended itself in certain localities, although not producing seeds from the presence of one sex only (A. de Juss., and A. Dec.). Eastward, according to Kunth en. iii. 8, grows wild from Malabar to Java and the Moluccas.

Eriophorum vaginatum of Northern climates. The LANUGINEM from VIRIDI PAPYRO , on the summit $\text{QUASI PANICULAE EMINENTIS}$, prescribed by Marcellus 34—may be compared: *E. vaginatum* is known to grow from Lapland and Russia to France and Switzerland (fl. Dan. pl. 236, Dec. fl. fr., and Wats.); was observed by Gmelin throughout Siberia. Westward, by Hooker on Iceland; by Lappalaie, on Newfoundland; by myself, as far as Lat. 42° near Boston; by Baldwin, as far as 39° 30' in Delaware; and by Pursh, from “Canada to Virginia.”

Polypodium phegopteris of Europe and the adjoining portion of Asia. The roots of the FILI CULAE called in Gaul RATIS and growing often IN FAGO , prescribed by Marcellus 25—may be compared: *P. phegopteris* is known to grow in Britain (Engl. bot. pl. 2224); and was observed by Sibthorp as far as the Peloponnesus.

“394 A. D.” (Philostorg., and Clint.), in Gaul, Eugenius defeated by Theodosius, and put to death. Coins of Eugenius are extant.

“395, Jan. 17th” (Socrat., and Clint.), death of Theodosius; after dividing the Empire between his two young sons, Arcadius and Honorius. — The partition proved final; the community of interest hitherto felt in regard to foreign invasions, soon becoming greatly weakened.

Arcadius thus became head of the Byzantine branch of the Roman empire. Through the intrigues of Rufinus, the Huns and Goths under Alaric at once commenced their ravages: and Stilicho guardian of Honorius, crossing the mountains, found Thessaly already plundered by them.

“396 A. D.” (Zosim., and Clint.), Second expedition of Stilicho. From Sicily sailing direct to the Peloponnesus, he encountered the Goths in Arcadia. Priscus and other priests of the ancient religion had been put to death by them.

The art of *painting on glass* (according to Pouchet) began in the “Fourth” century, with the first churches erected by Christians.

The basilica *S. Paolo fuori le mura*, a church “four hundred and four” feet long, built at Rome “at the end of the Fourth century” (Lubke and Lutrow). — It was burned in “1823.”

“Apparently in the fourth century” (Weber, and Ermerius ed. Sor. p. xvii), Caelius Aurelianus writing on medicine, and especially translating from Soranus Ephesius.

“397 A. D. = ‘loun-ngan,’ 1st year of Ngan-ti II., of the Tcin” or Ninth dynasty* — (Chinese chron. table).

* *Panax quinquefolium* of Northeast America. The *ginseng* is called by the Mohawks “ka-lon-daggough” (Hawley), also in aboriginal American “garent-oguen” (Forst. cat. 47, but Osbeck found the name “garentouges” human-thighs in use in China), by the Tartars Northeast of China “orhota” captain of the plants (Jartona): “from the dynasties of the Tsin and Song down to that of the Tang there was no physician of reputation who did not constantly make use of” jin-seng — (receipts in chin.

"The same year" (Zosim., and Clint.), revolt of Gildo at Carthage; cutting off the supply of corn from Rome; as at this time (according to Claudian), Constantinople received all the corn of Egypt.

"In this year" (Idat., and Clint.), general destruction of temples. A Christian, Synesius, at this time ambassador from Cyrene to Arcadius.

"The same year" (Abulpharag., and Clint.), Vararam IV. succeeded by Yesdejerd or Isdejerd, twelfth Sasanid king of Persia. Christians at this time numerous in Persia.

"400; Jan. 1st" (Clint.), homily of Asterius, against the festive observance of the Calends.

"In this year" (ann. Jap., transl. Tits.), Nin-tok succeeded by Ri-tsiou, eighteenth daïro of Japan. Flowers of "sakoura" * fell into the drinking-cup of Ri-tsiou while once sailing on an artificial lake.

"In this year" (Burm. ann., Bigandet, and Max Mull. p. xvi), Budhaghosha of Thaton visiting Ceylon, where he transcribed the Buddhist scriptures, making use of "Burmese or rather Talaing characters." In this form these scriptures were now first communicated to the people living on the shores of the Gulf of Martaban. — The visit of Budhaghosha is placed at least eleven years later by the Ceylon historian Mahanama (Mahavams. xxxvii).

Excavating a "stone temple" or "stone cave." is mentioned by Budhaghosha parab. xviii.

Diospyros hirsuta of Ceylon. Affording the most valuable cabinet-wood of the island, surpassing rosewood in beauty and durability, and from early times in the greatest repute: "ebony forests" are mentioned by Budhaghosha parab. iii: † — *D. hirsuta* was received from Ceylon by the younger Linnaeus; and according to Drury, grows "chiefly in the southern provinces and especially in the forests at the foot of Adam's Peak," but having been prodigally felled "has become exceedingly rare."

herbal, Du Halde 217; doubtless from the root occasionally resembling the human form): according to the emperor Kang-hi, from the frontier of China to Hei-tong-kiang and from the eastern sea a good distance westward are forests so dense that they hide the sun, some of pine and some of cedar, and in these dark woods grows the "gin-cheng" (mem. Chin. iv. 465); or according to Kaempfer i. 4, "in the provinces of Corea and Fakuai, as also in Siansai, a province of the neighbouring Tartary:" ginseng is described by P. Jartona in making his map of Tartary, and "in 1709" the emperor ordered ten thousand Tartars to go in quest of the root, and so procured twenty thousand katye or Chinese pounds, Osbeck further found the Chinese in their "apothecary shops always selling ginseng:" among the productions of Yeso, "ninzin" or "ginsen" is enumerated in the San-kokf. and by Siebold; the Ainos of Yeso are known to have long held communication with the Aleutian Islands, and though the plant has not been seen growing in Alaska (Rothr. in Smith's report for 1867), ginseng has been enumerated among Alaskan articles of commerce; I have in fact met with no direct evidence that the plant has been seen growing in Asia, and the law of geographical distribution requires either two species, or else China has always been supplied with ginseng from North America. *P. quinquefolium* was discovered in Northeast America in "1715" by the jesuit P. Lasitan (Hardie's tablet, and Holmes); "in 1752," its root was extensively collected by the Mohawks and brought to the colonists on the Hudson for exportation to China (G. Hawley hist. coll. iv. 53); "in 1775," Thunberg in Japan found ginseng root "imported unadulterated only by the Chinese," and that "brought by the Dutch, said to come from America," strictly prohibited: *P. quinquefolium* seems to grow chiefly on and around the Alleghanies, as far according to Kalm as a little North of Montreal; was observed also in Canada by Michaux, and Cleghorn (Hook.); by Pursh, from Canada to Tennessee; by A. Gray, in "rich mountain woods, becoming rare;" by Conrad, as far East as the vicinity of Philadelphia, and by Darlington near West Chester; by Eliot, on the Alleghany mountains of Carolina; and by Chapman, in "rich woods along the mountains, Georgia and northward."

* *Cerasus karinka* of Japan and Yeso. A cherry tree called by the Ainos "karinka," in Japan "sakura" (Sieb.), and clearly the "sakoura" in question: — enumerated by Siebold among the edible and useful plants of Yeso.

† *Diospyros chloroxylon* of Eastern Hindustan. A thorny species yielding a kind of ebony, very hard and durable timber, known from early times: — observed by Roxburgh cor. pl. 49 (Pers., and Drur.).

Diospyros cordifolia of Eastern Hindustan. A tree armed with branching thorns and yielding a kind of ebony, timber from early times used for many economical purposes: — observed by Roxburgh cor. pl. 50 (Pers., and Drur.).

Diospyros tomentosa of the Northern parts of Bengal. A tall and elegant tree, deciduous-leaved and shaped somewhat like the cypress; its black hard heavy timber known from early times: — observed by Roxburgh (Drur.). From transported specimens, described by Poiret (Steud.).

Jasminum angustifolium of Southern Hindustan. A woody twiner called in Tamil "caat-

Capsicum frutescens of Tropical America. The *red pepper* or *chilly* is called in Aitian "axi" (Ovied.), in Peruvian "uchu," in Mexican "chilli" (Humb. iv. 9), in Tagalo "pasitis," but in ancient times "lara," a name extant among the Pampangos (Blanco), in Burmah "gna-yoke" (Mason), in Telinga "merapu-kai," in Tamil "mollaghai," in Malabar "capoo mologoo," in Bengalee "gach-murich" (Drur.), in the environs of Bombay "lal mirchee" (Graham), in Yemen "dar felfel," in Greece "pipérics" (Forsk.), in Egypt "felfel ahmar" (Del.); and "red pepper" is mentioned by Budhaghosha parab. 21 as inducing violent sneezing when powdered; — is prescribed by Susrutas sutr. 46: *C. frutescens* was observed by Rheede ii. pl. 56 in Malabar, is described also by Rumphius v. pl. 88; was observed by Gibson, and Graham, "in every garden" in the environs of Bombay, "also all over the Deccan and Kandesh," and "extensively cultivated about Poosasowlee" and "sent to the Concan markets;" by Roxburgh, and Drury, in other parts of Hindustan as far as Nepaul; by Mason, "exotic" in Burmah; by Blanco, seemingly indigenous on the Philippines: by myself, on the Feejeean and Tongan, by other members of our Expedition on the Samoan Tahitian and Hawaiian Islands, brought by Polynesian voyagers from America. A brother of Manco Capac was named Agar Uchu (G. de la Veg. i. 18): Columbus on his first voyage found "axis" the pepper used by the inhabitants of Aiti or Hayti "very hot, some of it long and some round" (F. Columb. 34 to 36); the "axi" is described by Oviedo gen. hist. vii. 7 as a substitute for pepper; by Gomara, as "especia que les quemo la lengua;" but in the wild state *C. frutescens* seems unknown (A. Dec.). Westward from Hindustan, although observed by Forskal under cultivation in Yemen, and by myself on Zanzibar, by Schweinfurth in Central Africa, *C. frutescens* appears to have remained unknown in the Mediterranean countries and Europe until the discovery of America; is described by Tragus, Cordus, Fuchs, Matthioli, Lobel, and Clusius exot. pl. 340; was observed by Forskal, and Delile, in Egypt; by Hasselquist, near Jerusalem; by Forskal, and Chaubard, in Asia Minor and Greece. By European colonists, was however introduced into Northeast America.

One hundred and forty-first generation. Jan. 1st, 401, onward mostly beyond youth: Rab Ashe: the Greek philosopher Plutarchus of Athens; the historians, Eunapius, and Olympiodorus; the grammarian Orion; the rhetor Troilus; the Christian Greek writers, Arsacius, Atticus, the chronologers Annianus and Panodorus, Chrysanthus, Evagrius of Antioch, the ecclesiastical historian Sisinnius, Philippus of Side. Maximianus, and Theodorus of Mopseusta: the Latin writers, the poets Claudianus and Rutilianus Numatianus; the Christian Latin writers, the ecclesiastical historian Sulpicius Severus, Dexter, Cassianus, Marius Mercator, Petronius, Prudentius, Coelestius, Julianus, and Orosius.

"In the very beginning of the fifth century" (Journ. Asiat. v. p. 103 to 138, and Elphinstone iii. 3 to 10), the Chinese traveller Fa-hian entering Hindustan visited Behar, at this time the capital; describes also an extensive *Budhist* cave. "He found Buddhism flourishing in the tract between China and India, but declining in the Panjab, and languishing in the last stage of decay in the countries on the Ganges and Jamna. Capila, the birthplace of Budha, was 'a wilderness untenanted by man.' His religion was in full vigour in Ceylon, but had not yet been introduced into Java:" — which island Fa-hian visited on his way back to China, "in ships manned by crews professing the *Braminical* religion" (see below 428).

The impression attributed to Guatama's foot on a mountain in Ceylon is mentioned by Fa-hian, — also in the Mahavamsa i. 1. 7, but by Arab travellers from the Ninth to the Fourteenth century is attributed to Adam (Marco Polo 215, and Burn. ii. 622).

"402 A. D." (Prosp., and Clint.), Anastasius succeeded by Innocentius, "thirty-eighth" bishop of Rome.

On the "third of the ides of November" (Idat.), *eclipse of the sun*. "Towards the close of the year" (Clint.), the Goths under Alaric enter Italy.

"404 A. D." (Gothofred., and Clint. iv. p. 379), *gladiatorial exhibitions* finally suppressed by Honorius. In Asia Minor, ravages by Isaurians; from beyond the Taurus chain of mountains.

"The same year" (Blair), the kingdom of Scotland "revived by Fergus."

"405 A. D." (Prosp., and Clint.), in Italy, more than "two hundred thousand" Goths under Radagaisus, shut in among the mountains at Fesulae and defeated by Stilicho.

"406 A. D." (Zosim., and Clint.), Vandali, Alani, and Suevi, crossing the Rhine enter Gaul.

mallica," in Hindustanee "ban-mallica," in Telinga "adevie-mallie" (Drur.), in the environs of Bombay "reoutee" (Graham); and from early times, its bitter root used medicinally in ringworm: the wrapped up relics of a Buddhist saint are compared by Budhaghosha xxviii to a jasmine-bud: — *J. angustifolium* was observed by Rheede vii. pl. 53 in Malabar; by N. L. Burmann pl. 2. Ainslie, Roxburgh, Wight, and Drury, from Travancore to the Coromandel forests, constantly covered with bright shining green foliage and well-adapted for arbours; by Graham at Bombay, only "in gardens."

At this time (as appears from Vigilantius, Hieronymus, Alsted, and Clint.), image-symbols, lighting of candles, relics of saints, and invocation of saints, already used in Christian worship. Vigilantius writing also against prayers for the dead, vigils, and the celibacy of the clergy.

"In this year" (ann. Jap., transl. Tits.), Ri-tsiou succeeded by his brother Fan-sio, now nineteenth daïro of Japan *

"The same year = beginning of the Thirteenth manwantara" among the Hindus — (Graha Mun-jari tables, and Benth.)

"407 A. D." (Idat., and Clint.), Hieronymus, Joannes bishop of Jerusalem, Eulogius bishop of Caesarea, Epiphanius of Cyprus, and Theophilus of Alexandria, all seen by Idatius, now in early youth.

"The same year" (Prosp., and Clint.), in Britain, revolt of Constantine a Roman soldier; who taking advantage of his name, extended his authority over the people and crossed into Gaul. Coins of Constantine are extant.

"May 1st" (Prosp., and Clint.), Arcadius succeeded by Theodosius II., at the age of "eight years" second Byzantine emperor. The work of demolishing the temples of the ancient religion continued to be zealously prosecuted (Sm. biogr. dict.); for Monumental history, a disastrous measure.

"The same year" (Zosim., and Clint.), Stilicho put to death at Ravenna. When "thirty thousand" of his troops joining the Goths, Alaric marched and laid siege to Rome. Terms however were offered, and Alaric withdrew.

"409 A. D." (Zosim., and Clint.), second siege of Rome by the Goths. Spain invaded and overrun by the Vandali. Alani, and Suevi: the Vandali continuing beyond into Africa.

"410 A. D. (= 418" of Sam. Aniens., J. Nicholson in Kitt. cycl. bibl.), the *Armenian alphabet* invented by Miesrob; who at the same time commenced a version of the Bible — More than twenty-one years elapsed before the version was completed; Moses of Chorene being part of the time employed on it. This version is the earliest known example of the *Armenian language*.

"Aug. 24th" (Cedren., and Clint.), after a third siege, Rome captured and plundered by the Goths under Alaric. Who, dying shortly afterwards, was succeeded as king by Ataulfus.

411 A. D. (= 369 + "42 years reign" of the Mahavams. xxxvii.), Upatissa succeeded by his brother Maha-nawma, now king of Ceylon.

Bauhinia acuminata of Tropical Africa? The *white Bauhinia*, a shrub six to ten feet high, called in Burmah "ma-ha-hlæ-ga-phyoo" (Mason); and from early times, cultivated for its large blue-white fragrant flowers: the "mahanel" flower exhaling fragrance according to the Mahavamsa i. p. 8, — may be compared: *B. acuminata* was observed by Mason v. 405 to 771 "exotic" in Burmah. Westward, by Rheede i. pl. 34 in Malabar; by Roxburgh, and Wight, in other parts of Hindustan; by Graham, "in gardens common" around Bombay, and notwithstanding the opinion of Desvaux, he regards the "farek" seen by Bruce vii. pl. 18 in Abyssinia as possibly identical.

Morinda citrifolia of Tropical shores from the Seychelles and Hindustan throughout the Malayan archipelago and neighbouring Polynesian islands. A small tree called in Hindustanee "al" or "atchy," in Telinga "molagha" or "maddichettoo," in Tamil "manja-pavattay" or "noona" (Drur.), in the environs of Bombay "aal" (Graham), in Martaban and Pegu "nie-pa-hsæ," in Tenasserim "nyau" (Mason), in Ylocano "apatot," in Pampango "talianlar," in Tagalo and Bisaya "bancudo" or "palcudo" or "bangcoro" or "mambog" or "tumbong aso" or "tacpus" or "culit" or "lino" or "nino" (Blanco), on the Tarawan coral-islands "non," on the Otafuan coral-islands and the Tongan, Samoan, and Tahitian rocky groups "nono," on the Marquesas and Hawaiian

* *Tilia cordata* of Japan. Its bark from early times used for bast and making musquito-nets — (see Jap. centen. comm. 77).

Pueraria Thunbergiana of Japan. From early times used for making cordage and coarse cloth — (see Jap. c. c. 76).

Wistaria Chinensis of Eastern Asia. A shrubby twiner called in Japan "too" or "fudsi" (Thunb.), and from early times used there for making cordage and coarse cloth, also for braiding hats and other articles, and planted for arbours in gardens — (see Jap. c. c. 76 to 81): observed in Japan by Kaempfer v. 856, and Thunberg, described also by Houttuyn viii. pl. 64.

Salix Buergeriana of Japan. A *willow* from early times used for making bast — (see Jap. c. c. 76).

Musa basho of the Philippines. Called in Tagalo "abaça" (Blanco), yielding *Manila hemp*, and from early times used in Japan for making cordage and coarse cloth — (see Jap. c. c. 76). Farther South, observed by Dampier only on Mindanao; by Blanco, a most useful plant carefully cultivated in Camarines and other parts of the Philippines.

Islands "noni" (Hale) : the "hal-trees" of the Mahavamsa ii. p. 30 — may be compared : *M. citrifolia* was observed by Rheede i. pl. 52 in Malabar; by Graham, "common in Bombay, extensively cultivated in Kandesh, Berar, Surat, and about Punderpore," its roots "used in dying;" by Drury, the scarlet dye "exported in large quantities from Malabar to Guzerat and the northern part of Hindoostan;" by Roxburgh, and Wight, the tree occurring as far as Coromandel; by Mason v. 112, "exotic" in Burmah, cultivated for the red dye obtained from the roots; is known to occur in Anam, its fruit used medicinally; was observed by Bontius 97, and Rumphius iii. pl. 99, in the Malayan archipelago, by myself to all appearance indigenous there; by Blanco, on the Philippines. Farther East, by myself seemingly indigenous on the Feejeean, Tongan, Samoan, and Taheitian islands, occurring also throughout the Paumotuian coral-archipelago, but on the Hawaiian Islands only cultivated and naturalized, its root further ascertained by Rich to be used for dyeing by Polynesians. Westward from Hindustan, was observed by Bojer on the Seychelles and Gallega, but by European colonists was carried to the Mauritius Islands and cultivated.

"In this year" (Augustin., and Clint.), at Carthage, conferences with the Donatists: "two hundred and seventy nine" Donatist bishops being present; and "two hundred and sixty-six Catholicae partis," including Augustinus.

"412 A. D." (Socrat., and Clint.), Theophilus bishop of Alexandria succeeded by Cyrillus.

"23d day of 1st lunat." (ann. Jap., and Klapr.), Fan-sio succeeded by his brother In-kio, now twentieth daïro of Japan.

"Nov. 21st" (Percev. i. 244 to 415), commencement of the Naci era of the Arabs.

"413 A. D." (Prosp., Blair, and Clint.), commencement under Gundicar of the Burgundian kingdom: Westward of the Upper Rhine.

At this time, lake-temples dedicated to local deities in various parts of Northern and middle Europe; one being mentioned in the following inscription found at Autun in Burgundy, "licnos contextos ieuu Anvalonnacu canecosedlon," — the last word translated "domum lacustrem" "lake-house" by A. Pictet (Trojan p. 198). Gregorius of Tours glor. confes. ii. speaks of a lake on Mount Helanus in Gévaudan having been an object of worship; furious storms arising on the occasion of offerings, the phenomenon ceasing only after a church had been built near by and the people converted to Christianity: again in miracul. ii., he speaks of a sacred fountain and lake at Brioude sur l'Allier, into which the people cast the idols after their conversion to Christianity. A pit filled with water and consecrated to demons at Vierzon among the Bituriges, is mentioned in the life of St. Sulpice de Bourges (act. Benedict. ii. p. 172): and Gervasius Tilberiensis (Leibniz i. 982) speaks of an invisible palace of demons on Mount Cavagum in Catalogne, in a lake, into which if a stone be thrown a storm at once arises: the superstition of storms arising from throwing a stone into a lake, also occurs in the traditions of Germany and Finland (Grimm mythol. Deutsche 388).

"414 A. D." (Theodoret., Sozom. ix. 4. Plate, and Clint.), at Suza, a fire-temple destroyed by the Christian bishop Abdis. Who, when ordered by king Yesdejerd to rebuild it, refused, and was put to death. Some persecutions against Christians ensued in Persia.

"415 A. D." (Socrat., and Clint.), at Alexandria, Hypatia daughter of the philosopher Theon, murdered.

Cedrela toona of Tropical Hindustan, Burmah, and the Malayan Archipelago. An Egyptian harp made of *East Indian mahogany*. — was seen by Rosseline in Florence (athenæum July 22d 1837, and Royle antiq. hind. med. p. 130). Eastward, *C. toona* is called in Bengalee "toon" or "lood" (Lindl.); is described by Rumphius iii. pl. 39; was observed by Graham in "ravines at Kandalla, the beautiful timber is not inferior to mahogany, the flowers are used in Mysore in dying cotton a beautiful red colour, while the bark is considered equal" to that of the Soymida "as an antiperiodical in fevers;" and according to Roxburgh cor. iii. pl. 238, Wight, and Lindley, the trunk is "erect, of a great size and height," the "bark a powerful astringent, and though not bitter, a tolerably good substitute for Peruvian bark" in "remitting and intermitting fevers." Farther East, enumerated by Mason v. p. 539 as found by Nuthall "in Aracan," by McClelland "in Pegu," and furnishing the *toon* timber of commerce: observed also by Blume bydr. 199, and Horsfield, in Java.

"The same year" (Prosp., and Clint.), death of Ataulphus in Spain, and Sigericus elected king of the Goths. After "seven days," he was succeeded by Vallia or Wallia.

"417 A. D." (Olympiodor., and Clint.), marriage of the Roman general Constantius with Placidia, daughter of Theodosius and widow of the Gothic king Ataulphus.

"The same year" (Alst., and Nicol.), Innocentius succeeded by Zosimus, thirty-ninth bishop of Rome.

"418 A. D." (Idat., and Clint.), in Spain, the Vandali and Alani defeated and nearly exterminated by the Goths; who returning into Gaul, received through Constantius the province of Aquitania, from "Tolosa to the ocean." Their king Wallia dying in this year, succeeded by Theodores.

On the "fourteenth of the Calends of August" (Marcellin., and Clint.), *eclipse of the sun*.

"The same year" (Prosp., and Clint.), the decree of a synod at Carthage against Pelagius submitted to the bishop of Rome; approved by Zosimus, and everywhere accepted by the churches. A synod at Carthage afterwards assembled, Augustinus and Prosper being present (Alst. pp. 344 and 368), and a decree issued, That no appeal, nor any authority over the African bishops should henceforward be conceded to the bishops of Rome.

Appuleius Barbarus possibly identical with L. Appuleius M. Mago mentioned by Augustinus — (Gesen. inscript. phoen. 383).

Thalictrum aquilegifolium of middle and Eastern Europe. A species of *meadow-rue*; and the *ERYPHION* called by the Italians *RUTÀM AGRESTEM*, having according to Apuleius Barbarus 126 the form of *apil* and the flower *PURPURE SIMILEM*, — mentioned also by Serapion (Trag. 335), may be compared: *T. aquilegifolium* is described by Dodoens (Spreng.); is termed "*t. alpinum aquilegiæ foliis florum staminibus purpurascens*" by Tournefort inst. 270; "*t. atropurpureum*" by Jacquin austr. pl. 348: is known to grow on the mountains of Austria and Switzerland (Pers.); and was observed by Sibthorp in woods from the Peloponnesus to mount Haemus.

Potentilla tormentilla of Europe and the adjoining portion of Asia. Called in Britain *septfoil* (Prior); in which we recognize the "*seofenleafe*" identified in the Anglo-Saxon version with the *heptaphyllon* or *septifolium* of Apuleius Barbarus 118: — the "*tormentilla*" is mentioned in the *Liber Saladini*, and the *Ortus Sanitatis* pl. 481: *P. tormentilla* is termed "*t. sylvestris*" by Tournefort inst. 298; is known to grow in Britain, Denmark, and throughout middle Europe (fl. Dan. pl. 589, Engl. bot. pl. 863, Vill. delph., and Pers.). The root according to Lindley is "very astringent," and "produces its astringent effects without causing excitement."

Trichodesma Africana of the Egyptian portion of the Desert. An herb called in Egypt "*lus-seq*" or "*horreyq*" (Forsk., and Del.); in which we recognize the *CORRÀGO* given as the original name of borage by Apuleius Barbarus, — also the "*horraik*" identified by Ebn Baitar with the "*banat elnar*" of Elbasri, and others: *T. Africana* was observed by Forskal, and Delile, as far North as Cairo, growing in the Desert.

Scorzonera resedifolia of Egypt and the Mediterranean countries. Called in Greece "*lagō-psōmi*" (Sibth.), in Egypt "*jamrur*" (Forsk.); in which we recognize the *LACTUCA LEPORINA* of Apuleius Barbarus 113: — *S. resedifolia* was observed by Sibthorp, and Fraas, in Southern Greece; by Forskal p. 144, and Delile, growing in the Egyptian Desert. Westward, by Boccone xiii. pl. 7 in Sicily, by Desfontaines ii. p. 226 in Barbary, is known to grow also in Spain and France (Pers., and Steud.).

Picridium vulgare of the Mediterranean countries. Called in Greece "*tōu lagōu tō psōmi*" (Sibth.), and possibly included in the "*lactuca leporina*" of Apuleius: — *P. vulgare* was observed by Forskal, Sibthorp, and Chaubard, from Asia Minor and Cyprus to the Greek islands and the Peloponnesus. Westward, is described by Lobel pl. 236; is termed *sonchus* "*lævis angustifolius*" by Tournefort inst. 475; and is known to grow in Barbary and Southern France (Allioni ped. pl. 16, Lam. fl. fr., Pers., and Steud.).

Nepeta cataria of Europe and the adjoining portion of Asia. Called in Britain *nep* or *cat-mint* (Ainsw., and Prior), in Italy "*cataria*" or "*erba gattaria*" (Lenz), in which we recognize the "*nepte*" identified in the Anglo-Saxon translation with the *NEPITAMON* of Apuleius Barbarus 95: — the "*nepeta*" of the capitularia of Charlemagne is referred here by Antony, and Sprengel; is mentioned also by Walafridus Strabus p. 225; and the "*nepte*," by Nicolaus Præpositus 126: *N. cataria* is described by Brunfels pl. (Spreng. præf.), Dodoens i. 4. 14, and Gerarde p. 544; is termed "*cataria major vulgaris*" by Tournefort inst. 202; is known to occur in waste places in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 580, Pers., and Lenz). Eastward, was observed by Sibthorp around Constantinople. By European colonists, was carried prior to 1670 (Joss.) to North-east America, where it has become frequent around dwellings and along roadsides, and is called *cat-nip*. In conformity with the statement of Dodoens I have found it perhaps the only plant noticed by cats, and have seen them smell and rub against it: according to Lindley, "it is said to have been advantageously exhibited in amenorrhœa."

Digitaria sanguinalis of the Malayan archipelago. A grass called in Germany "*hahnenbein*" (cocksleg), in which we recognize the *CRUS GALLI* of Apuleius Barbarus 45, — identified in the Anglo-Saxon version with the "*attorlathe*," mentioned also in the Leechbook, and from figures in manuscripts G. T. A. referred here by Cockayne: the "*venich*" of Hildegard, is also referred here by Sprengel: *D. sanguinalis* was once regularly cultivated in Europe (Beckm.); but was growing spontaneously in Britain in the time of Gerarde p. 25, Parkinson, and Ray, as after occasional introduction to the present day (Wats.); is described by Lobel pl., and Camerarius pl. . . ; is termed "*gramen dactylon folio latiore*" by Tournefort inst. 520; was observed by Desfontaines in Barbary; and is known to occur in waste ground in various parts of Europe, as in Northwestern France and the outlying Jersey isles (Schreb. pl. 16, Leers pl. 2, Curt. lond. iv. pl. 7, Pers., Piquet, and A. Dec.).

Eastward, was observed by Forskal, Sibthorp, and Chaubard, in cultivated ground in Greece, the Greek islands, and around Constantinople and Smyrna; and by Hasselquist, Forskal, and Delile, in Lower Egypt. Farther East, was observed by myself in the Malayan archipelago; by Polynesian colonists, carried to New Zealand, and if not indigenous to Tongatabu, the Samoan, Taheitian, and Hawaiian groups, but seemed absent from the Feejeean. By European colonists, was carried to Madeira (...); to St. Helena, ascertained by myself; and to Northeast America, where it has become an abundant weed, observed even in Arkansas by Nuttall. "*D. humifusa*," by many writers regarded as a distinct species, was observed around Paris by Richard (Pers.); in Sweden by Fries p. 80; in Southern Russia by Bieberstein (Steud.); in Japan by Thunberg, but no native name is given; in Northeast America, has been observed by myself in waste and cultivated ground and in the sand of the seashore, and is described by A. Gray as "in some places appearing as if indigenous, but probably an introduced plant."

Aspidium obovatum of the Mediterranean countries. The *herbā m rādōiolū m* by others called *FELCINAM*, resembling *FELICI* according to Apuleius Barbarus 84 and having two rows of gold dots on each leaf,—may be compared: *A. obovatum* is described by Viviani, as observed by him in Lybia or Cyrene; was observed by Bory in the Peloponnesus; and was received by him from Calabria, Corsica, and the Hieres Isles.

"419 A. D. = 'youan-hi,' 1st year of Koung-ti, of the Tcin." Which dynasty was replaced in this year by the Soung, the seat of government remaining at Nan-king—(Chinese chron. table).

"The same year" (Socrat. and Clint.), a schism among the Arians of "thirty-five" or perhaps "twenty-five" years standing, brought to a close.

"The same year" (Alst., compare Nicol.), Zosimus succeeded by Bonifacius, fortieth bishop of Rome.

"420 A. D. = 'young-tsou,' 1st year of Wou-ti III." or Lieou-yu, head of the new dynasty of the Northern Soung—(Chinese chron. table, and Pauth.).

"The same year" (Agath., and Clint.), Yesdejerd succeeded by Vararam V., thirteenth Sasanid king of Persia. The persecution against Christians was continued by Vararam V.

"The same year" (Blair), beginning, on the Lower Rhine under Pharamond, of the kingdom of the French.

"423 A. D. = 'king-ping,' 1st year of Ying-yagg-wang" or Chao-ti, of the Northern Soung or Tenth dynasty—(Chinese chron. table, and Pauth. p. 274).

"The same year" (Cedren., and Clint.), death of Honorius; leaving Theodosius II. sole emperor. Joannes notwithstanding established himself at Rome over the West.

"424 A. D. = 'youan-ki,' 1st year of Wen-ti II.," of the Northern Soung or Tenth dynasty (Chinese chron. table), beginning of the Fifty-second cycle.

"425 A. D." (Prosp., and Clint.), Joannes slain; and Valentinian III. established over the Western Empire through Theodosius II. Incursions of the Vandali in Mauritania.

The *ΤΑΥΡΕΛΕΦΑΚ* of Abyssinia mentioned by Philostorgius iii. 11 p. 482. —and Nicephorus ix. 19, and described by Cosmas Indicopleustes xi. p. 334 as wild and untameable unlike the Indian species, the accompanying figure also corresponding, is clearly the *African buffalo*, *Bos Caffer*.

"The same year" (Sm. b d.), end of the Ecclesiastical history of Philostorgius.

"The same year" (cod. Theodos., and Clint.), efforts of Theodosius II. to restore learning: his edict at Constantinople making honorable mention of the Greek grammarians Helladius and Syrianus, the Latin grammarian Theofilus, the rhetors Martinus and Maximus, and the jurist Leontius.

"426 A. D." (Blair), Britain abandoned by the Romans.

"428 A. D." (Pauth. 274), embassy from Hindustan, from the "king of Kapila," bringing to Wen-ti II. "diamonds, precious rings, bracelets, and other ornaments of chased gold, and two parrots, one red and the other white." (The event is placed in 408 by Elphinstone iii. 3, who further remarks, that Capili is "the birthplace and capital of Budha, which the Chinese have put for all Magada," and that the Hindu king "Yue gnai" is perhaps Yajna).

The "red" parrot was doubtless a *lory*; brought originally from the extreme Southeastern portion of the Malayan archipelago, or from the neighboring Australian coast.

The "white" parrot was of course a *cockatoo*; derived originally from the same quarter: *—

* *Doryanthes excelsa* of Southern Australia. A liliaceous plant twenty-four feet high, the stem roasted and eaten by the Australians—(geogr. plant. lond. tract soc.). Transported to Europe is described by Correa (Steud.).

Xanthorrhæa hastilis of Southern Australia. The tender inner leaves esculent, and far from disagreeable, having a milky taste with a slight balsamic flavour—(lond. tract soc.): called *grass-tree* by the colonists; and observed by myself in Australia, the trunk two to five feet high, crowned with a tuft of grass-like leaves from which the true stem arises.

"bianchi pappagalli" are mentioned by Valmiki ramayan. vi. 11 (transl. Gorres.); cockatoos, "papa-gaus tous blanche come nois et ont les pies et le bec vermeil," were seen in Hindustan by Marco Polo 180.

"The same year" (Prosp., and Clint.), the Franci or the French along the Rhine, defeated by the Roman general Aetius; sent by Valentinian III.

"429 A. D." (Prosp., and Clint.), the churches of Britain recalled from the Pelagian opinions of Agricola, by Germanus; sent there for this purpose by Celestinus, forty-first bishop of Rome.

Hardly earlier than this date (Graha Munjari tables, Puranas, and Bentr.) Vichitrāsena reigning in Hindustan.

"430 A. D." (Socrat., and Clint.), death of Barbas, Arian bishop of Constantinople. About this time, the Burgundians receiving Christianity.

"To this year" (Steinschneider. i. 5), in Palestine, Hillel being Jewish patriarch, the *new moons* "determined by testimony" (officially witnessed and announced). — A practice continuing among the Muslims at the present day.

"431 A. D." (Idat., Prosp., and Clint.), on account of the depredations of the Suevi, the mission of Idatius to Aetius in Gaul. Palladius ordained, and sent by Celestinus as first bishop of the Scots.

"The same year" (Clint.), Third general ecclesiastical Council. Convened at Ephesus; "two hundred" bishops being present, and Cyrillus of Alexandria presiding. Nestorius bishop of Constantinople was deposed, and his opinions condemned. — The authority of this council continues to be recognized by the Greek church (E. A. Soph.).

Hardly later than this year (= 410 + "21 yrs.," Kitt. cycl. bibl.), Moses of Chorene employed on the Armenian Version of the Bible.

Scleranthus annuus of Europe and the adjoining portion of Asia. Called in Britain *knawel* (Prior), in Sweden "tandgras" (Linn.); and the worm dyeing red, found according to Moses of Chorene about the root of a grass that grows on Ararat, — is referred by Sprengel to *Coccus radialis*, occurring within certain geographical limits on *S. annuus*: a plant mentioned by Lobel adv. 183 (Spreng.), termed "knafwel" by Dodoens pempt. 115, "polygonum minus alterum" by Tabernæmontanus 1217, "vermiculata nova planta" by Columna ecphr. i. pl. 294, "k. folio et flore viridi" by Ruppius 85, and known to occur from Sweden and Russia throughout middle Europe (C. Bauh., Tourn., fl. dan. pl. 504, engl. bot. pl. 351, and Wats.): was observed by Linnæus in Sweden, everywhere in cultivated and fallow ground, the vapour of its decoction among the Swedes and Germans drawn into the mouth to cure toothache; was observed by Persoon in France, in cultivated and especially calcareous soil; by Sibthorp, on the Bithynian Olympus; by Bieberstein, in fallow ground about Caucasus. Westward, by Hooker on Iceland; clearly by European colonists was carried to North-east America, where it seems naturalized in sunny situations and on rocks, observed by myself from the environs of Salem to Philadelphia; by A. Gray, in "sandy waste places" in the State of New York.

Nonnus of Panopolis in Egypt may have been at this time writing. — He is mentioned among recent poets and is quoted by Agathias (Sm. b. d.).

Dipterocarpus lævis of Burmah. The ΔΕΝΔΡΟΝ ΑΘΗΝΗC distilling oil from the ends of its branches in the forest beyond the Hydaspes, according to Nonnus dion. xxii. 27, — seems to imply knowledge of the *oil tree*. *D. lævis* is described by Buchanan; and according to Mason v. p. 493 and 516, is "one of the most widely diffused trees" in the forests of Burmah, yielding a gum "used by the natives to make torches," also oil in large quantities similarly employed and emitting "a brilliant and durable light," the timber besides much used; the exported product is one of the *wood oils* of commerce, "used for house varnish," and as "a good substitute for fish oil in currying leather," dissolves caoutchouc, but is properly a balsam identical in chemical composition with copaiva.

About this time, "422 to 451 A. D." (tab. hist. de l'Asie, and Pauth. 283), the art of making *coloured glass* brought into China by a merchant from Youe tchi or Scythia. Previously, specimens had been imported "from the West," and sold at high prices.

433 A. D. (= 411 + "22 yrs reign" of the Mahavams. xxxvii.), Maha-nawma succeeded by his son Sangot, and soon afterwards by Samatissa, now king of Ceylon. — He reigned "one year."

One hundred and forty-second generation. May 1st, 434, onward mostly beyond youth: the Syriac ecclesiastical writer Isaac of Antioch: the Armenian writer Moses of Chorene: the Greek poets, Ammonius, and Cyrus of Panopolis; the philosopher Hierocles; the medical writer Jacobus; the grammarian Hyperechius; the rhetors, Lachares, and Nicolaus; the Greek ecclesiastical writers, Paulus the Novatian, the three ecclesiastical historians Socrates and Sozomenus and Theodoretus; Euthalius, and Thalassius: the Latin ecclesiastical writers, Possidius, Eucherius, Vincentius Lirinensis, Philippus presbyter, and Musæus of Massilia.

"The same year" (Marcellin., and Clint.), Honoria excluded from the palace by her brother Valentinian III.; and her message, inviting Attila king of the Huns into Italy.

About this time (see Alst.), the Irish converted to Christianity by Patricius.

"435 A. D." (Prosp., and Clint.), the Burgundians under Gundicar, defeated by Aetius.

Aghastier or Agastya, translator of Sanscrit medical writings into Tamil (the language of Southern Hindustan) as early possibly as this date. — He is mentioned in the Ramayana (Wils., and Royle antiq. hind. med. p. 48).

"436 A. D." (Prosp., and Clint.), Narbo in Gaul besieged by the Goths: who were in other directions exceeding their limits.

"The same year" (Elphinst. iii. 3), in Hindustan, end of the reign of Pulimat or Pulomarchish, and of the Andra dynasty.

"437 A. D." (Prosp., and Clint.), in North Africa, bishops maintaining the "catholicam fidem" persecuted by Genseric king of the Vandals; who sided with the Arians.

"438 A. D." (Clint.), the Theodosian codex of laws published; having been accepted in Rome by the Senate.

"439 A. D." (Prosp., and Clint.), Carthage captured by Genseric king of the Vandals.

Datisca cannabina of the mountains of Asia Minor and Crete. The XUMENION of Zosimus — is referred here by Stapel 721: *D. cannabina* is termed "*cannabina cretica florifera etiam fructifera*" by Tournefort cor. 52; and was observed by Sibthorp pl. 960 on mount Sipylus in Phrygia. Farther South, the imported seeds are enumerated by Forskal mat. med., and Delile, as used in Egypt for an emetic and called "djabal hendi."

"440 A. D." (Prosp., and Clint.), invasion of Sicily by Genseric. Death of Xistus; and after some days, Leo Magnus ordained "forty-third bishop" of Rome. Many writings of Leo Magnus are extant.

"The same year" (Agath., and Clint.), Vararam V. succeeded by Yesdejerd II., fourteenth Sasanid king of Persia.

"441 A. D." (Marcellin., and Clint.), irruption of the Huns into Illyricum.

"443 A. D." (Idat., and Clint.), mission of the poet Merobaudes into Spain.

"In or about 445 A. D." (Percev. i. 236), the Coraysh under Cossay, having obtained the charge of the Caba or temple at Mecca, building dwellings around it: the founding of the city of Mecca.

"446 A. D." (Gildas, and Clint.), letter to Aetius from the people of Britain, complaining of the Picts and Scots: "repellunt nos barbari ad mare, repellit nos mare ad barbaros: inter haec oriuntur duo genera funerum, aut jugulamur aut mergimur," the barbarians drive us to the sea, the sea drives us back on the barbarians, and we have two kinds of funerals, we either have our throats cut, or are drowned. Aetius warring against Attila was unable to extend aid.

"447 A. D." (Beda, Clint., see also Blair), invited by king Vortigern, the "gens Anglorum sive Saxonum" in "three long ships" first come into Britain. — Instead of aiding, they turned against their employers (Gildas hist. 23).

On the "ninth of the calends of January" (Idat., and Clint.), *eclipse of the sun*.

"448 A. D." (Prisc., and Clint.), plot of Theodosius II. to assassinate Attila. — To whom Maximinus and the historian Priscus were afterwards sent as ambassadors.

"449, October" (Clint. iv. p. 675), Flavianus bishop of Constantinople deposed, and succeeded by Anatolius.

Manuscripts of the "Fourth or Fifth" century (De Wailly pl. ii. 2) presenting the following forms of the letters, h, p. The form p also in Coptic inscriptions of the "Fifth" century (Silvest. i. pl. 4).

"450, July" (Marcellin., and Clint.), Theodosius II. succeeded by Marcian, third Byzantine emperor.

"451 A. D." (Neumann transl. Elis.). Yesdejerd II. attempting to force fire-worship or the Magian religion throughout his dominions, opposed by the Armenians, a Christian nation. "June 2d," the Armenians finally defeated on the river Dekhmund, and their leader Vartan slain. The account is given by Elisaeus, a cotemporary historian, eye-witness of many of the events he relates.

In the Armenian language "bun" signifies ground or nature, and is therefore the equivalent of the Chinese "pun" signifying basis or nature (Neum. note 33 p. 6).

"Fourteenth of the calends of July" (Idat., and Clint.), a comet beginning to appear: was in the West on the "calends of August."

"After Sept. 27th" (Idat., Isidor., and Clint.), Attila defeated at Chalons by the Romans under Aetius aided by the Goths. The Gothic king Theodores or Theodoric, slain in the battle, succeeded by his son Thorismus or Torismond.

"In autumn" (Marcellin., and Clint.), Fourth general ecclesiastical Council. Convened at Chalcedon; consisting of "six hundred and thirty" bishops; and attended "Oct. 25th" by the emperor Marcian. Jerusalem was declared a patriarchate (Kitt. bibl. cycl.), and the opinions of Eutyches were condemned: a measure equivalent to excommunication of Egypt, where these opinions were

general, — and where they prevail among the Christian population to the present day. About a century after the condemnation, the proscribed Sect received the name of "Jacobites" (from Jacobus of Edessa, pronounced Yacobus); and hence apparently the term "Copts," employed by Europeans but unknown in Egypt. The authority of this Council continues to be recognized by the Greek church (E. A. Soph.).

Pulmonaria officinalis of Europe and the adjoining portion of Asia. An herb called in Britain *lungwort*, in medieval Latin "pulmonaria," and from its spotted leaves supposed to be a remedy for diseased lungs (Prior): possibly the *pulmonaria* of the Italians, notwithstanding the statement of Vegetius: — *P. officinalis* is described by Ruelii. 116 to 145; is termed "*p. italorum ad buglossum accedens*" by Tournefort inst. 136; is known to grow in woods in middle Europe (Pers.); but in Britain is regarded by Borrer, and Watson, as perhaps exotic and only naturalized. Eastward, was observed by Sibthorp, and Chaubard, in cool shaded situations in the Peloponnesus and other parts of Greece. (See *Helleborus foetidus*.)

"452 A. D." (Jornand., and Clint.), Venetia and the country North of the Po ravaged by Attila. Who on the Mincius was met by Leo bishop of Rome, and persuaded to retire to his own country beyond the Danube. The founding of Venice is referred here by some writers, the location affording protection against ravages by land (Blair).

"The same year" (Idat., and Clint.), Torismond succeeded as king of the Goths, by his brother Theodoric II.

"The same year" (cod. Justin., and Clint.), Proterius ordained bishop of Alexandria.

"453 A. D." (Cassiod., and Clint.), death of Attila. Followed by wars for the succession among his sons.

"454 A. D. = 'hiao-kien,' 1st year of Hiao-wou-ti II., of the Northern Soun" or Tenth dynasty (Chinese chron. table).

"In this year" (ann. Jap., transl. Tits.), In-kio succeeded by his son An-ko, now twenty-first dairo of Japan.

"The same year" (Blair), a Saxon kingdom established in South Britain.

Cardiospermum helicacabum of Subtropical North America. The *balloon-vine* or *heart-pea* is called in Tagalo "bangcoton" (Blanco), in Burmah "malamai" (Mason), has a Sanscrit name (Pidd.), is called in Bengalee "shibjool" or "nuphutkee," in Telinga "budda-kanka-rakoo" or "nellagoolisienda," in Tamil "moodacottan, in Malabar "palloolavum ulinja" (Drur.); in Yemen "hadk" or "dharu æsuæd" (Forsk.); has a native name in Dongola (Caill.); and the *ανδραποδου* of the antidote of Theodoretus — (Theoph. Nonn. 35), also mentioned by Aetius (Royle antiq. hind.). Paulus Aegineta, Nicolaus Praepositus, and Nicolaus Myrepsus, may be compared: *C. helicacabum* is described by Valerius Cordus, Tragus, Fuchsius, and Matthioli, continues under cultivation in gardens, and in Southern Spain springing up spontaneously in cultivated ground (Boissier, and A. Dec.); was observed by Delile in gardens at Cairo; by Cailliaud, in Dongola; by Grant, in Equatorial Africa, "common, 7° S. to 2° N., leaves are made into spinage by the Wahiyou;" is known as far as Guinea and Cape Verd (Benth. fl. nigr.); was observed by myself seemingly wild on Zanzibar; by Forskal, in moist places near the base of the mountains of Yemen; by Graham, in the environs of Bombay, "common in hedges etc. during the rains," but appeared to me only naturalized: by Rheede viii. pl. 28, in Malabar, rubbed up with water and applied in rheumatism and stiffness of the limbs; by Ainslie, Roxburgh, Wight, and Drury, "common everywhere" in Hindustan, and used for various medicinal purposes. Eastward, by Mason v., "exotic" in Burmah, "raised in great quantities by the natives, but more as a vegetable than a medicine;" by Blanco, on the Philippines, employed by the natives medicinally; by Rumphius vi. pl. 24. on the Moluccas, its leaves cooked as a vegetable; by myself, occurring a weed on the Feejeean, Tongan, Samoan, Tahitian, and Hawaiian Islands. Farther East, by E. James, "native" on the Canadian branch of the Arkansas and on the Missouri (Torr.); was received by Pursh from "Kaskaskias" (below the mouth of the Missouri); was observed by Chapman in "South Florida, apparently native, and not uncommon in cultivation;" by Maycock, on Barbadoes. By European colonists, was carried to our Middle and Northern Atlantic States, where it continues in gardens; and to the Mauritius Islands (Boj.).

"455, March 16th" (Prosp., and Clint.), Valentinian III. slain; succeeded by Maximus as Western emperor. At the end of about two months, Maximus was slain, and by invitation of the widow of Valentinian III., the Vandals under Genseric entered and pillaged Rome. Through the intercession of the Roman bishop Leo, Genseric was afterwards persuaded to retire.

"The same year" (Clint.), end of the chronicle of Prosper Aquitanus. Chiefly a continuation of that of Hieronymus.

Hardly earlier than this date (Graham Munjari tables, and Bentl.), Vichitra reigning in Hindustan.

"456" (Idat., and Clint.), by Marcian, Avitus acknowledged Western emperor: and a poem

addressed to him by Sidonius Apollinaris. But before the close of the year, Avitus was deposed and ordained bishop of Placentia.

"The same year" (Idat., and Clint.), expedition of the Gothic king Theodoric II. into Spain, and the king of the Suevi captured by him at a place called "Portucale." In this year also, the Heruli, "about four hundred men in seven ships," make their appearance on the Northern coast of Spain, plundering.

"457, Jan. 26th to Feb. 7th" (Marcellin., and Clint.), Marcian succeeded by Leo, fourth Byzantine emperor. Who was crowned by a priest:—an innovation adopted by Christian potentates generally, and from which in the words of Gibbon, the clergy eventually "deduced the most formidable consequences."

"April 1st" (incert. Chron., and Clint.), at Rome, accession of Majorianus as Western emperor.

"The same year" (Clint.), the *Paschal cycle* of "five hundred and thirty-two" years, invented by Victorius of Aquitaine.

"In this year" (ann. Jap., transl. Tits.), An-ko succeeded by his brother You-riak, now twenty-second daïro of Japan.

"458 A. D." (Agath., and Clint.), Yesdejerd II. succeeded by Firoze, fifteenth Sasanid king of Persia.

"In this year = 4th of the 'ta-ming' of Hiao-wou-ti" (Hoei-chin trav., and Klapp.), Buddhism introduced into Fou-sang (Yeso?) by five priests from Ki-pin (Bokhara according to Leland and lond. sat. rev. 1875).

"459 A. D." (Max Müll. p. xi) accession of Dhatusena or Dasen Kelliya through the influence of his uncle the historian Mahanama, author of the Mahavamsa. — Dhatusena ruled Ceylon until "477."

"461 A. D." (Marcellin., and Clint.), Majorianus succeeded by Severus as Western emperor. Also in this year, Leo Magnus succeeded by Hilarus or Hilarius, "forty-fourth" bishop of Rome.

"462 A. D." (Idat., and Clint.), Eudoxia widow of Valentinian III., returned by Genseric to Constantinople. The Vandals under him ravaging Italy in this, — and the spring of the two succeeding years.

"464, July 20th, Monday" (Idat., and Clint.), *eclipse*. — Determined to this date by Petavius.

"465 A. D. = 'tai-chi,' 1st year of Ming-ti IV., of the Northern Soung" or Tenth dynasty — (Chinese chron. table.).

"The same year" (Marcellin., and Clint.), at Rome, Severus succeeded by Anthemius as Western emperor.

"466 A. D." (Idat., and Clint.), Theodoric II. king of the Goths, succeeded by Euric.

One hundred and forty-third generation. Sept. 1st, 467, mostly beyond youth: the Syriac ecclesiastical writer Samuel of Edessa: the Greek philosophers, Pamprepius, and Marinus; the historians, Malchus, and Candidus; the grammarian and naturalist Timotheus of Gaza; the chronologer Eustathius; the Greek ecclesiastical writers, Gelasius of Cyzicus, and Theodulus of Coele-Syria: the Latin ecclesiastical writers, Fulgentius, and Victor Vitensis.

The use of *sympathetic ink* (according to Jost iv. p. 35, note in Steinschneid. i. 4), mentioned in the Talmud Jer. sabb. ii.

"Sept. 25th" (Steinschneid. i. 4), death of Mar, son of Rab Ashe, and regarded as the last Talmudical authority. — Within "eight" years, the redaction of the Talmud Babeli (Babylonian) was completed by R. Jose. A gap follows in *Jewish literature* (Leps. eg. and sin. p. 456); until the "Eighth" century and the Seder Olam Rabbih, "one of the first writings of the Rabbis" next succeeding.

"468 A. D." (Idat., and Clint.), Hilarus succeeded by Simplicius, "forty-fifth" bishop of Rome. End of the chronicle of Idatius.

"470 A. D." (Jornand., and Clint.), "twelve thousand Britons" under king Riethimus landing at Biturigas to assist the Romans, intercepted and defeated by the Goths under Euric.

"In this year" (Elph. iv. 1), accession of the Rathor dynasty of Hindu kings at Canouj.

"471 A. D." (Vict. Tun., and Clint.), Anatolius bishop of Constantinople succeeded by Gennadius; and before the close of the year, by Acacius.

"472 A. D." (Vict. Tun., and Clint.), at Rome, Anthemius succeeded by Olybrius as Western emperor; and before the close of the year, by Glycerius.

"November" (Marcellin., and Clint.), *eruption* of Mount Vesuvius, covering all Europe with minute dust. — An event commemorated afterwards at Constantinople annually.

In this year (= "16th of You-riak," Klaproth note to ann. Jap.), "muriers" (*Morus alba*?) planted in all the provinces of Japan by order of the daïro You-riak.

"473 A. D. = 'Youan-hoei,' 1st year of Tchou-yu" or Tsang-wou-wang, of the Northern Soung or Tenth dynasty — (Chinese chron. table).

"474 A. D." (Marcellin., and Clint.), the emperor Glycerius expelled from Rome by Julius Nepos, and ordained a bishop. Julius Nepos had been recognized by Leo; and coins issued by him are extant.

"Feb. 3d" (Clint.), Leo succeeded by Leo II., fifth Byzantine emperor. Coins issued by Leo II. are extant: but he reigned a few months only, and before the close of the year was succeeded by Zeno.

"The same year" (Clint.), end of the chronicle of Nestorianus.

"In this year" (palm-leaf ann. Jag., and W. W. Hunter, Stirling giving 473), the Yavanas expelled from Orissa by Yayati Kesari, founder of the Kesari dynasty. — Yayati brought back the image of Jagannath to Puri, and commenced the Siva temple-city at Bhuvaneswar.

"475 A. D." (Marcellin., and Clint.), flight of Julius Nepos from Rome; Orestes having entered Ravenna with an army, and further declaring his own son Romulus Augustus (called "Augustulus") emperor. Coins of Romulus Augustus are extant.

"The same year" (Marcellin., and Clint.), the emperor Zeno driven from Constantinople by Basiliscus. Coins of Basiliscus are extant.

"476 A. D." (Jornand., and Clint.), capture of Rome by Odoacer king of the Turcilingi, aided by Sciri, Heruli, and other tribes, and the Western empire brought to a close. Odoacer remaining, established himself as king; but did not wear the "purple and royal insignia."

About this time (Beda 16, Geoff. Monm. viii. 12 to 24, and Nenn. 48), Aurelius Ambrosius the "great king among the kings of Britain" warring against the Saxon invaders. He brought great stones to the cemetery on Salisbury plain, and built *Stonehenge* for a royal burial place: — was himself buried there "within the Giants' Dance;" as were afterwards his successors, Uther, and Constantine.

"477, January" (Clint.), death of Genseric king of the Vandals. In "July" after "twenty months" absence, return of Zeno to Constantinople and his negotiations with Julius Nepos and Odoacer.

"The same year = 'ching-ming,' 1st year of Chun-ti II., of the Northern Soung" or Tenth dynasty (Chinese chron. table).

"479 A. D. = 'kien-youan,' 1st year of Kao-ti" or Siao-tao-tching, head of the new dynasty of the Tshi (Chinese chron. table, and Pauth.). He had murdered the last two emperors.

"480 A. D." (ann. Jap., transl. Tits.), accession of Sei-nei, son of You-riak and now twenty-third dairo of Japan. He was born with white hair (albino), and is called the white-haired dairo.

"Sept. 24th" (Marcellin., and Clint.), *severe earthquakes*, beginning at Constantinople. They continued "forty days."

Hardly earlier than this date (Graha Munjari tables, Puranas, and Bentr.), Nirmoha reigning in Hindustan.

"482, in the beginning of the year" (Greg. Tur., and Clint.), Childeric succeeded by his son Chlodovechus (Clovis) as king of France.

"The same year" (Agath., and Clint.), Firoze succeeded by Balas or Palasch, sixteenth Sasanid king of Persia.

"The same year" (. . .) the edict "Henoticon" issued by Zeno: allowing the Egyptians some liberty in choosing their creed, and proposing a general union, including Eutychians and Catholics.

"483 A. D. = 'young-ming,' 1st year of Wou-ti IV., of the Tshi" or Eleventh dynasty — (Chinese chron. table).

"March 1st" (Clint.), Simplicius succeeded by Felix, "forty-sixth" bishop of Rome.

"484 A. D." (Clint.), Theodoric king of the Ostrogoths (Eastern Goths) one of the consuls for this year.

"Jan. 13th" (Fabric., and Clint.), *eclipse of the sun*, preceding the death of Proclus.

"The same year = 2d year of the 'young-ming' of Wou-ti IV." (Chinese chron. table), beginning of the Fifty-third cycle.

"485 A. D." (Jornand., and Clint.), Euric succeeded by his son Alaric II., as king of the Visigoths (Western Goths); whose kingdom now included all Spain, Gaul, and Burgundy.

"In this year" (ann. Jap., transl. Tits.), Sei-nei succeeded by Ghen-so, now twenty-fourth dairo of Japan.

"486 A. D." (Clint.), Balas succeeded by Cabades (Kobad), seventeenth Sasanid king of Persia.

"487 A. D." (Marcellin., and Clint.), by Theodoric, Constantinople threatened and the country around laid waste.

"488 A. D." (ann. Jap., transl. Tits.), Ghen-so succeeded by his brother Nin-ken, now twenty-fifth dairo of Japan.

"Four or five centuries A. D." (Jap. centen. comm. 45), beginning of stone-foundations for dwellings in Japan: until now all houses "built upon wooden piles driven into the ground."

"489 A. D." (Marcellin., and Clint.), entrance of Theodoric with an army into Italy: Odoacer retiring into the city of Ravenna.

490 A. D. (—"415 an. jav." of Nata Kasuma, Raffles x.), at Astina in Java, Suantana of Hindu descent succeeded by Abiasa, sixth lineal descendant from Tritresta or Aji Saka, and now chief of the Hindu colony. Abiasa and his father Pula Sara are mentioned in the Madura traditions.

"In or about this year" (Percev. i. 121), Dhoul-Chenatir succeeded by Dhoul-Nowas, now tobbā of Yemen. He declared in favour of Judaism, — which under his reign made great progress in Yemen. He is called Dimion or Dimnus or Dunaan by Syrian and Greek historians.

"491, April 9th" (Clint.), Zeno succeeded by Anastasius, seventh Byzantine emperor.

"492 A. D." (Vict. Tun., and Clint.), Felix succeeded by Gelasius, "forty-seventh" bishop of Rome.

"493 A. D." (Clint.), Gennadius of Massilia writing, mentions Salvianus, Eugenius bishop of Carthage, Julianus Pomerius, and Joannes Antiochenus, as all living.

"The same year" (Cassiodor., and Clint.), capture of Ravenna, and Odoacer slain; Theodoric now becoming second Gothic king of Italy.

Petrus archiater, physician to Theodoric, — is mentioned by Aetius (Sm. b. d.).

Alpinia galanga of Tropical Eastern Asia. The imported root is called in Britain *galangal* (Johns.), in Germany "galgant" (Grieb); in Old Spanish "garingal," in current Spanish and Italian "galanga" (Prior), in Egypt "chaulendjan aqarbi," in which we recognize the "galangae" of Aetius — (Royle antiq. hind. med. p. 77), Nicolaus Myrepsus, Macer Floridus 70; and the "chawlandschan" of Ebn Masawia, Ebn Amran, I. B. Amran, Rhazes, Avicenna, Serapion, and Ebn Baitar: "galanga" from "India" was observed by Alpinus, and Forskal mat. med. in the drug-shops of Egypt. Farther East, was met with by Marco Polo 126; is called in Sanscrit "koolunjuna" or "koolunyoga" or "dhumoola" or "soogundha" (Lindl.), in Bengalee "chandramul" or "bhumichanpa," in Hindustanee "kulenjin" or "khulinjan" (D'roz.); the living plant is described by Rumphius v. pl. 63; was observed by Nimmo in the Southern Concan (Graham); is known to grow wild on Sumatra and is cultivated on other islands of the Malayan archipelago (Lindl.); was observed by Loureiro wild as well as cultivated in Cochinchina, the fresh roots used to season fish and for other economical purposes. The "galanga major" of commerce is enumerated by Lindley as "a pungent acrid aromatic, forming a kind of substitute for ginger."

"494 A. D. = 'kien-wou,' 1st year of Ming-ti V., of the Tshi" or Eleventh dynasty — (Chinese chron. table).

"496 A. D." (Vict. Tun., and Clint.), by a synod assembled by the emperor Anastasius, Euphemius, defender of the Council of Chalcedon and bishop of Constantinople, deposed. In the West, Gelasius succeeded by Anastasius, forty-eighth bishop of Rome: who (according to Alsted) "was a patron of Eutychians and Nestorians."

"The same year" (Avit. Vienn., Greg. Tur., and Clint.), vow of Clovis, engaged in battle against the Alamanni: gaining the victory, he was baptised shortly afterwards on Christmas day. Christianity now adopted by the French.

"497 A. D." (Alst. p. 369), letter of the bishops of Germany and Gaul, affirming. That the authority of the Councils was superior to the single authority of the bishop of Rome, Anastasius.

"498 A. D." (Clint.), Anastasius succeeded by Symmachus, "forty-ninth" bishop of Rome.

Manuscripts of the "end of the Fifth century" (De Wailly pl. ii. 3), presenting the following form of the letter d.

"499 A. D. = 'young-youan,' 1st year of Tchou-pao kiouan" or Thoungh-houen-heou, of the Tshi or Eleventh dynasty — (Chinese chron. table).

"In this year = 1st year of the 'young-yuan' of Fi-ti of the Tshi dynasty" (Li-yan-tcheou hist. and Klapp.), Hoei-chin, a Buddhist priest, arriving in China from Fou-sang; * a country far Eastward

* *Morus Indica* of Yeso and the neighbouring countries. The *Aino mulberry* is called in the environs of Bombay "toot" (Graham), in Hindustanee and Bengalee "tut" (D'roz.), in Burmah "po-sa" (Mason), by the Japanese "kwa," and by the Ainos "tesimani" (Sieb.); and the "fou-sang" tree, whose sprouts and red pear-shaped fruit according to Hoei-chin are eaten, and its bark made into paper and cloth, — may be compared: *M. Indica* is enumerated by Siebold among the edible and useful plants of Yeso; and was observed by Thunberg in Japan. Southward and Westward, by Loureiro in Anam, preferred to all other species for feeding silkworms; by Mason v. 455, "exotic" in Burmah, cultivated "extensively where the silk worm is raised," and in Tenasserim producing its "very agreeable black berry in great quantities." Farther West, the "kramuka" of Susrutas chik. 28, is referred here by Hessler; *M. Indica* according to Roxburgh is the species cultivated in Bengal for feeding silkworms; was observed by Rheede i. pl. 49 (Pers.) in Malabar; by Graham,

where there are no wars and the people go unarmed, are however acquainted with writing, employ long-horned *cattle* for carrying burdens, have besides *horses* and domesticated *deer* (*Cervus rangiferinus*); and (according to a more extended extract in *lond. sat. rev.* 1875) were acquainted with *iron*, *copper*, *silver*, and *gold*. (Fou-sang, as appears from Klaproth, is one of the names of Japan).

Hoei-chin had heard of country to the Eastward of Fou-sang, where the women were said to be entirely covered over with long hair — (a possible reference to the Kurile Islands.)

"In this year" (*ann. Jap., transl. Tits.*), Nin-ken succeeded by his son Bou-rets, now twenty-sixth daïro of Japan.*

"The same year = 421 *ann. Saca*," the Vernal equinox at the beginning of Aswini — according to the rule for *precession* given by the Hindu astronomer Varaha-Mihira (*Bentley as. res. viii.* 195 to 243). Varaha-Mihira was born at Ujen in 530, and died 587 (*Hunter oriss. i.* 225).

"The same year" (*Clint. iv. p.* 718), first appearance of the Bulgarians. — After "three" years, they entered and ravaged Thrace.

"The same year" (*Nicol.*), a synod assembled in Persia: in favour of the marriage of priests and monks.

The emperor Anastasius continuing the policy of his predecessor in refusing to enforce the decrees of the Council of Chalcedon, and the Western empire having ceased to exist, anathematized by Symmachus bishop of Rome (perhaps the earliest instance of ecclesiastical influence exerted against royal authority).

Christianity (according to Lepsius *eg. and sin. p.* 158 to 230), penetrated "from Abyssinia" to the Nubians "as early as the Sixth century." Remains of a Coptic Christian monastery occur however at Gebel Barkal; with inscriptions on the tomb-stones "partly Greek, partly Coptic;" also at or near Meroe, a marble slab with the letters Greek or Coptic, but not the language, except the proper names ΓΕΥΡΓΙΟ, and on another piece ΙΑΚΩΒ. — At a later date, a *Geez inscription* occurs in one of the pyramids at Meroe: of the mounds of brick near Soba, "some are perhaps the remains of Christian churches described by Selim of Assuan in the Tenth century" (*Macrizi*): and "throughout the whole province of Dongola," remains of Christian churches are "numerous."

One hundred and forty-fourth generation. Jan. 1st, 501, onward mostly beyond youth: the Arab poets, El-Azdee, and Zuheyr (see *Fresnel*, and *Lane dict.*): the Greek poet Christodorus; the philosopher Agapius; other Greek writers, Agapetus; the Greek ecclesiastical writers, Basilus of Cilicia, Flavianus the younger of Antioch, Severus of Antioch, Paulus of Antioch, Euphrasius, Epiphanius of Constantinople: the Latin ecclesiastical writers, Avitus Viennensis, Ennodius; the traveller Aculfé (*Voyag. Belg.*).

"The same year = 'tchoung-hing,' 1st year of Ho-ti, of the Thsi" or Eleventh dynasty (Chinese *chron. table*). The last year of the Thsi dynasty.

"The same year" (*Pagius*, *Blair*, and *Clint.*), by Aredius, counsellor to king Gundobagaud or Gundebald, publication of the "Laws of the Burgundians."

"About this time" (*Assemani iv.* and *Percev. i.* 128), the inhabitants of Nadjran in Yemen converted to Christianity by a Syrian named Faymiyoun.

"502 A. D. = 'thian-kian,' 1st year of Wou-ti V." or Kao-tsou wou-ti, head of the new dynasty of the Liang — (Chinese *chron. table*).

In this year (= "415 *an. jav. + 12 years*" of Nata Kasuma, *Raffles x.*), at Astina, abdication of Abiasa in favour of his son Pandu Dewa Nata, now "at the age of fourteen" chief of the Hindu colony on Java. Pandu Dewa Nata is mentioned in the Madura traditions.

around Bombay, its "dark red" fruit sold in the bazars for making tarts etc. (See *Broussonetia papyrifera*, and *Hibiscus rosa-Sinensis*).

Bimonia tomentosa of Japan. The "thoung" tree whose leaves are compared by Hoei-chin to those of the "fou-sung," — is referred here by Klaproth: *B. tomentosa* is mentioned by Ma-touan-lin (*Remus. mel. iii.* 225); was observed by Kaempfer *amoen. pl.* 860 in Japan, and according to Thunberg *trav.* is one of the plants yielding oil for burning and eating.

Dryandra cordata of Japan. The "thoung" tree in question — according to other authorities (*lond. sat. rev.* 1875): *D. cordata* was observed by Kaempfer *pl.* 23, and Thunberg *pl.* 27, in Japan. Westward, oil of the tree called "thoung" was found by a Chinese official in 1296 imported from China into Cambodia. From transported specimens, *D. cordata* is termed "*d. oleifera*" by Lamarck, "*aleurites cordata*" by R. Brown.

* *Dioscorea Japonica* of Japan. Bou-rets compelled persons to dig with their fingers the root "yama-no imo," — referred here by Klaproth: *D. Japonica* was observed in Japan by Thunberg, the root esculent and sometimes three feet long; and according to Klaproth, called by the Chinese "chu-yu."

"506 A. D." (Blair), by Anien, chancellor of Alaric II. king of the Western Goths, the Theodosian codex of Laws reformed and published.

"The same year" (Cassiodor., and Clint.), letter of Theodoric, endeavouring to mediate between Alaric II. and Clovis; calling upon the Burgundian king Gundebald to interpose; also upon the kings of the Heruli, Guarni, and Thoringi, and threatening Clovis with combined forces should he persist in war.

Hardly earlier than this date (Graha Munjari tables, Puranas, and Bentl.), Dhritiman reigning in Hindustan.

"507 A. D." (Greg. Tur., and Clint.), by Clovis, Alaric II. defeated, Tolosa occupied, and the Goths driven from Spain.

"The same year" (Chron. Pasch., and Clint.), the Long Wall in Thrace built by Anastasius.

"In this year" (ann. Jap., transl. Tits.), Bou-rets succeeded by Kei-tai, now twenty-seventh daïro of Japan.

"In this year under the dynasty of Leam" (Nansu, Ven-hien-tum-kaō, and lond. sat. rev. 1875), a Chinese vessel blown by a tempest on an unknown island where the people ate small beans, wore dresses made of a kind of cloth,* and the walls of their houses were built of earth raised in a circle: the women resembled those of China, but the men had faces and voices like dogs, and the Chinese could not understand them. (The term "dog" being applied in China to all savages, the above account is regarded by Leland as referring to America: and indeed there seems some correspondence with the Northern extreme of California, provided the "small beans" can be identified with small seeds collected for food by the Sacramento tribes).

"510 A. D." (Blair), Paris made the capital of the French dominions.

"511, July 10th" (Act. Concil., and Clint.), a synod convened by Clovis at Aurelianum (Orleans). In "November," death of Clovis at Paris, and accession of his son Theoderic as king of the French.

"The same year" (Theophan., and Clint.), Macedonius bishop of Constantinople, the successor of Euphemius, deposed and banished.

512 A. D. (523 + "25 — 35 years" of Cosm. Ind. ii. and xi. = 513). As early probably as this date, the voyage of Sopater to $\Gamma\text{Q}\text{U}\Delta\text{I}\text{Q}$, Ceylon, an island according to the inhabitants three hundred $\Gamma\text{Q}\text{U}\Delta\text{I}\text{Q}$ (the Tamil "naliguai") in length and breadth: a small vessel from Persia arriving at the same time, both parties were summoned before the king of the maritime district, and being asked Which of their rulers was the most powerful? Sopater by exhibiting gold coins obtained a decision in favour of $\text{P}\text{W}\text{M}\text{E}\text{U}$ (Constantinople). He was treated with high honours, and conducted on an elephant throughout the city. — The above particulars were obtained from Sopater and some of his companions by Cosmas Indicopleustes at Adulë.

"514 A. D." (Marcellin., Blair, and Clint.), revolt of the Scythian or Goth Vitalianus; and his fleet before Constantinople burned by a brazen speculum invented by Proclus.

"The same year" (Lib. pontif., and Clint.); Symmachus succeeded by Hormisdas, fiftieth bishop of Rome.

515 A. D. (Theophan., and Clint.), irruption of Huns through the "Caspian Pylae," and Armenia, Cappadocia, Galatia, and Pontus, laid waste by them.

*516 A. D. (= "491 an. jav. — 50 years" of Nata Kasuma, Raffles x.), at Astina in Java, accession of Suyudana as ruler of the Hindu colony. The children of Pandu Dewa Nata being excluded, were sent by their grandfather Abiasa "with a thousand families to establish a new country," which they called Amerta.

"518, July 9th" (Clint.), Anastasius succeeded by Justin, eighth Byzantine emperor. Unlike

* *Apocynum* sp. of California. — Closely resembling but appeared to me distinct from our *A. cannabinum* or "Indian hemp," and said to furnish fishing-lines and the fringe-cincture worn by the women along the Sacramento. The plant observed by myself frequent on the river-flat.

Linum perenne of Siberia and Northwest America. — The *perennial flax* observed by R. Brown jun. near Klamath lake, and used by the natives for making nets, twine, and ropes (bot. soc. Edin. 1868) "flax growing wild" was seen by Cornado in 1540 in the buffalo country Northeast of Culiacan; "L. Lewisii," by E. James at the sources of the Arkansas; by Nuttall, as far East as Fort Mandan on the Missouri; by Lewis and Clark, in the untimbered valleys of the Rocky mountains; and according to Hooker, grows along the Pacific as far as the Arctic Sea. Westward, *L. perenne* or "*L. Sibericum*" was observed by Gmelin from Kamtchatka throughout Siberia, growing according to Pallas from 69° on the Yenisei. Transported to Europe, was naturalized in Britain before the days of Ray angl. iii. 362 (Pers.), and Miller (Steud.), and according to Watson occurs also in Switzerland: clearly by European colonists was carried to Southeast Australia, where it has become naturalized even in the Interior (Th. Corder in phytol. 1845, and A. Dec.).

his predecessor, he carried out the decree of the Council of Chalcedon, and adopted energetic measures against the Eutychians. — And after his reign, this continued the settled policy.

"The same year" (Procop., and Clint.), treaty with Vitalianus. — Who in the following year was recalled by Justin to Constantinople. Coins of Vitalianus are extant.

"519 A. D." (Alst., and Clint.), end of the chronicle of Cassiodorus. On other subjects, he continued writing.

"The same year" (Blair), king Arthur defeated by the Saxons under Cerdic. Giving rise to the Saxon kingdom of Wessex.

"The same year" (Nicol.), by a synod in Wales, David (St. David) "elected archbishop of that country."

"520 A. D." (Malalas, and Clint.), at Antioch, the Olympic games discontinued.

"The same year" (Gildas hist. 26, Matth. of Westm., and anonym.), the Saxons defeated by king Arthur at the siege of Kair Badon, near the mouth of the Severn.

"In or about this year" (scholiast, ann. ulst., and Cockayne iii. 397), a hymn in the *Irish language* written by Brogan in honour of Brigita or St. Brigit; who founded the abbey of Kildare about twenty miles from Dublin, — and who died five years later. The hymn is published by Colgan iii. 515.

"522 A. D." (Theophan., and Clint.), Tzathus vassal of Kobad and king of the Lazi in Colchis, on visiting Constantinople, converted to Christianity and marries a Christian wife.

"523 A. D." (Clint.), Boethius in prison writing "De consolazione philosophia." — In the following year, he was put to death by Theodoric. Boethius has been termed "the last Roman."

"August" (Lib. pontif., and Clint.), Hormisdas succeeded by Joannes "fifty-first" bishop of Rome.

"End of October" (Percev. i. 128), the Christian inhabitants of Nadjran in Yemen massacred by the tobba Dhou-Nowas.

"The same year" (Cosm., Theophan., and Clint. iv. p. 787), Cosmas Indicopleustes at Adulë, and the Abyssinian king Elesbas warring against the Homerites (Himyarites of Yemen). — Parts of the work of Cosmas were written "in 535," and other parts at least twelve years later (Montfaucon, and Yule cath. i. p. xlvii).

At this time, there were Christians throughout Arabia and among the Homerites (Himyarites); in Ethiopia, Axum and the whole region around; on the island of Dioscoridis (Socotra), speaking Greek; among the Persarmenians, Medes, Elamites, Bactrians, "Ounnöis," and other Indians, churches and bishops being very numerous throughout all Persia; a church in "Malë" (I have heard Malabar people termed "Malay" at Mocha), a bishop in "Kalliana" (Calicut) ordained in Persia (Nestorian), and a church under a presbyter on Ceylon; but Whether there are Christians beyond? not known to Cosmas Indicopleustes iii. p. 178 and xi. p. 336.

Pterolobium lacerans of Abyssinia. A shrub six or eight feet high called "kantuffa" (Bruce), and the thorns composing the hedge on which the Axumites after passing through the Agau country traded for gold in Sas, mentioned by Cosmas ii. 138, — may be compared: *P. lacerans* was observed by Bruce in Abyssinia, in some parts of the country growing so thickly as to impede the march of armies (R. Brown, and Grev.).

In sailing from the Red Sea to the Persian Gulf, Cosmas Indicopleustes i. p. 132 and xi. p. 337 met with great numbers of the bird called COYCFQ (*Sula*?) a little more than twice as large as kites, when the crew afraid of being driven into the main ocean and lost turned to the left and kept along the Arabian coast. He describes "Sinthou" as the beginning of India, separated from Persia by the Indus; the "Ounnöi" (Moguls), white people occupying the Northern portion of India under their king Gollas, who has two thousand *elephants* and a large force of cavalry and rules all India, CMAPAΓΔON being in great request, and imported by "Aithiöpēs" who obtain them through the "Vlemnuōn" (from the *emerald* mines of Upper Egypt); other people of India whose kings have elephants, are "Sinthou, Orrötha" (Mahratta?), "Kalliana" (Calicut) producing *copper* and CHCAMINQ EYQA (*Dalbergia*), "Sivör," and "Malë" (Malabar) having five emporia from which *pepper* is exported, "Parti, Maggaröuth, Salöpatana, Nalöpatana, Pöuthapatana;" commerce with all this part of India being carried on from Persia, the Homerites, and Adulë. He further describes India as producing *gola*, ΠΕΖΕΡΩΤΑ or ΑΝΘΡΑΚΑ (*rubies*), and ΙΑCΠΙΝ or ΛΙΘΟΝ ΠΡΑCΙΝΟΝ (*aquamarine*?).

The island of "Siëläthiva" (Ceylon) however, the principal emporium, and ruled by two hostile kings: one holding the district producing ΥΑΚΙΝΘΟΝ (*sapphires*?), of which one of extraordinary size is said to be kept in a temple; and the other king holding the remainder of the island, including the seaports frequented by ships from all India, Persia, and Ethiopia. Among the exports, are ΑΛΟΗΝ and ΤCΑΝΔΑΝΑΝ ; ΚΟΧΛΙΟΥC (*pearl oysters*) from "Marallö" on the main land (a pearl-fishery at the mouth of the river near Tinnevely is mentioned in the Raghu-vansa iv. p. 50, res. Asiat. viii. p. 330); ΑΛΑΒΑΝΔΗΝΟΝ (compare *nutmegs* produced principally on Banda) from

"Kavër" (Nicobar Islands?); *καρυοφυλλον* from the next region; and at last *μεταειν* (*silk*) from "Tsinista" (China), beyond which there is nothing but ocean Eastward.

Pterocarpus santalinus of Southern Hindustan. Called in Bengalee "rutka-chundun" or "chundana," in Sanscrit "chandana;" in which we recognize the *ΤΖΑΝΔΑΝΑΝ* exported from Ceylon in the days of Cosmas Indicopleustes xi. p. 337:—*red sandalwood* was found by Hieronymo de Santo Stephano so abundant in Coromandel that houses were built of it (R. H. Major in soc. Hakl.); and is known to be the product of *P. santalinus*, a lofty tree growing on the Palicat mountains (Pers.). The imported timber is described as heavy and of a deep red colour, marked with blackish veins; but according to Lindley, is "chiefly used by the dyers and colour manufacturers of the present day."

Caryophyllus aromaticus of the Moluccas. The *καρυοφυλλον* brought from the far East to Ceylon in the days of Cosmas Indicopleustes,—and known in the Mediterranean countries to Paulus Aegineta vii. 3, and Symeon Sethus, is admitted to be *cloves*: among the Arabs, cloves are mentioned by Rhazes, and Avicenna; I met with a quantity imported by the way of Mecca into the Thebaid; and the medicinal use in Egypt of "qurumfil abjad" is enumerated by Forskal mat. med. Even in the Moluccas, *C. aromaticus* is perhaps unknown in the wild state (A. Dec.); an indigenous tree producing buds that are not aromatic being regarded by Rumphius ii. pl. 1 to 3 as the origin: the cultivation of the aromatic kind, unknown elsewhere until recently, has been successfully introduced by the Arabs into Zanzibar, the climate in both instances being strictly Equatorial. Besides the use as a spice, cloves are "stimulant and carminative," and the oil "is a common remedy for toothach" (Lindl.).

"524 A. D." (Wathen soc. calcutt. iv. 480, and Elph. iv. 1), in Guzerat, the Ballabi dynasty of kings terminated by an invading army of barbarians (supposed by Tod to be Parthians). It was succeeded by the Chauras, another Rajput tribe.

"525 A. D." (Alst. p. 404, Holmes from Beda hist. p. 28 places in "567"), the earliest instance of the use of the *Christian Era*. In the writings of Dionysius Exiguus, a Scythian monk.—This substitution for the Diocletian Era was by degrees adopted throughout Europe: but the original computation has continued uninterrupted among the Christian population of Egypt to the present day (Lane).

"In this year" (Percev. i. 130), through the cooperation of Justin and the patriarch of Alexandria, Dhoul-Nowas defeated and slain by the forces of the Abyssinian king Elesbas or Caleb: the victorious general Aryat becoming governor or viceroy of Yemen.

Manuscripts of about this date, "523 to 526 A. D." (De Wailly pl. iii. 1 and 2), presenting the following forms of the letters *ƒ, m, n*.

"526 A. D." (Lib. pontif., and Clint.), Joannes bishop of Rome returning from Constantinople, imprisoned at Ravenna by Theodoric; and dying "May 25th," his body transported to Rome, and Felix ordained his successor.—Theodoric is called "Dietrich of Bern" (Verona) in the Niebelungen-Lied (Sm. b. d.).

"Aug. 30th" (Paul. Diac., Lib. pontif., and Clint.), death of Theodoric, and accession at Ravenna of his grandson Athalaric, third Gothic king of Italy.

"In the Sixth century under the Eastern Gothic government" (Lubke and Lutrow), the basilica S. Apollinare built near Ravenna.—"This wonderful church is still well preserved."

Aetius about this time writing.—He is mentioned by Alexander Trallianus (Sm. b. d.).

Eryngium? lateriflorum of the East Mediterranean countries. A singular plant, dividing above into numerous branches (Pers.): the "eryngium montanum" of Aetius, having small narrower leaves, and yellow flowers in the form of an eye,—may be compared: an "eryngium" having "aureum vel galbineum" flowers is mentioned also by Vegetius i. 17 to iii. 2 (Dod. iv. 4. 13): *E. lateriflorum* was mistaken for a grass by Tournefort cor. p. 39 and termed "gramen orientale spicatum;" is known to grow "in Oriente" (Pers.); but according to Delaroche is not an *Eryngium* (Steud.).

Thymus graveolens of Greece. The black *θυμοκ* called *ελλαεβορος*, to be avoided according to Aetius—(Caesalp. xi. 47), may be compared: *T. graveolens* is described by Sibthorp pl. 576, as observed on mount Parnassus.

Serapias rubra of Europe and the adjoining portion of Asia. An orchid called in Germany "ragwurtz" (Fuchs.); and the *ΤριΟρχις* of Aetius.—and Paulus Aegineta, may be compared: *S. rubra*, triple-rooted, is termed "triorchis serapias mas" by Fuchsius pl. 550, "helleborine montana angustifolia purpurascens" by Tournefort inst. 156; was observed by Crantz in Austria, by Haller pl. 42 in Switzerland; and is known to grow from Denmark throughout middle Europe (fl. Dan. pl. 345. Engl. bot. pl. 437, and Pers.); was observed by Sibthorp in woods on mount Parnassus.

"527, April to July 31st" (coins, Cedren., and Clint.). Justin succeeded by Justinian, ninth Byzantine emperor.

"In or about this year" (Bentl. as. res. viii. 233), the positions of the colures found by Brahma

Gupta to differ "23° 20' from the time of Parasara. Brahma Gupta founded a new System with a period of millions of years, and no Sanscrit writing following the new System earlier therefore than this date.*

"Under Justinian" (Sharpe), traces of an independent Egyptian *coinage* again make their appearance: the inscriptions continuing in Latin; but the abbreviated name of Alexandria is in Greek letters, and the system of weights differs from that of Constantinople.

"At this time" (Leontius act. Sanct. Jan. xxiii.), corn carried in Alexandrian ships to Cornwall in Britain, and exchanged for *tin*.

528 A. D. (Pauth. 277), after reigning "twenty-six" years, Wou-ti V. abdicating, became a convert to *Budhism*, and made himself a bonze or priest. He was however brought back to the palace by the chief men, and reinstated. — From this time Budhists and Budhist temples became numerous in China.

The teocallies or pyramids or Teotihuacan, the most ancient *Mexican monuments*, built before the arrival of the Toltecs — (Humb. atl. pict.; see A. D. 648).

Phaseolus vulgaris of Tropical America. The *kidney-bean*, called in the bay of St. Lawrence "sahe" (J. Cart.), on the Roanoak "okindgier" and a smaller kind "wikozowa" (Har.) in the Quichua language of Peru "purutu," in Mexican "ayacotli;" and cultivated by American tribes from the earliest times — (Humb. . . . iv. 9): "a sort of beans" was found by Columbus under cultivation on Cuba, and "red and white beans" were afterwards seen by him in Honduras (F. Columb. 28 to 90): beans were found by De Soto cultivated by the aborigines in Florida. "febues" were seen by J. Cartier in the bay of St. Lawrence: beans of various colours, by Hariot on the Roanoak, also a smaller kind little differing in form but more like pease (De Bry i.): "beanes" were seen by Newport in 1607 in ascending the James river: "beans of various collours," by the English colonists in 1620 on first landing on Cape Cod; and "Indian beans falsely called French beans" are enumerated by Josselyn rar. 56: *P. vulgaris* is known to be cultivated in Northeast America from Florida nearly to 48°. By European colonists, may have been carried from Canada by the way of France to England; was already in Europe in the days of Fuchsius 708, Matthioli, and Dodoens; was observed by Chaubard in Greece; by Forskal, "lubia Frandji" in Egypt; by Royle, under cultivation at Cashmere (A. Dec.); by Graham, "commonly cultivated" in the environs of Bombay, but not seen by myself; by Wight, in other portions of peninsular Hindustan; by Thunberg, in Japan; also by European colonists was carried to the Hawaiian Islands, verified by myself.

Phaseolus coccineus, by some considered a variety only, probably also known to the tribes of Northeast America: — it is called *scarlet runner*, and continues to be planted with the preceding, as though by borrowed custom. Transported to Europe, is termed "*faseolus puniceo flore*" by Cornuti pl. 185, as cultivated for ornament at Paris; is described also by Linnæus, and Kniphof cent. xii. 75 (Steud., and Pers.); and was observed by Chaubard on the Greek islands.

Manihot utilisima of Eastern Equatorial America. The *cassava* or *tapioca* shrub, called in the West Indies "yuca" (Ovied.), and cultivated by American tribes from the most remote antiquity — (Humb. iv. 9): "cazabi" seasoned with "axis" was found by Columbus the principal diet of the natives of Aiti or Hayti (F. Columb. 34 to 36; and a kind of bread called "caçabi," made of roots of the "yuca," is mentioned by Oviedo nat. hyst. f. 6; is known to have also been cultivated by the native tribes throughout Brazil (Pohl): *M. utilisima* was observed also in and around the West Indies by J. Acosta, Plumier, and Sloane. By European colonists, was carried to Equatorial Africa (Thonn. guin., and Benth. fl. nigr.), observed by Grant in Interior Africa South of the Equator, ascertained by myself to be cultivated by the Unyamuezi, observed also on Zanzibar; was carried also to the Mauritius Islands (Thomas stat. Bourb. ii. 18, and A. Dec.); "by the Portuguese" to Hindustan, observed by Ainslie, and Graham, in gardens as "an ornamental shrub," but now according to Drury extensively cultivated in the Southern districts and called in Malabar "maracheenie," in Tamil "maravallie," the poorer classes living on the root during three months of the year; to Burmah, where it is called "pu-lau-pe-nang-myook," and its root boiled and eaten by Karens and Burmese (Mason v. 507); and to the Philippines, where it is called in Tagalo "camoting cahoi," and many varieties are cultivated (Blanco).

* *Hiptage madablota* of Tropical Hindustan and Burmah. A large woody climbing plant called in Hindustan "madhavilata" (W. Jones), in the environs of Bombay "bokhee" or "utimookta" (Graham); a favourite with Sakuntala, who terms it "delight of the woods," — mentioned also by Jayadeva, and Kalidasa (W. Jones as. res. iv. 282), and the "atimukta" by Susrutas chikits. 19 to kalp. 7: *H. madablota* was observed in Hindustan by Rheede vi. pl. 59, Roxburgh, and Wight; by Graham, "in great abundance on the Ghauts," the flowers fringed and very beautiful, one of the petals yellow and the other four white; the bark according to Lush "a very good sub-aromatic bitter." Farther East, is enumerated by Mason as indigenous in Burmah.

Manihot aipi of Eastern Equatorial America. The second species of *cassava*, differing in the leaves and its crude sap not poisonous, also cultivated by American tribes from remote antiquity — (Humb. iv. 9) ; with the preceding throughout Brazil, Guayana, and the warmer parts of Mexico (A. Dec.) ; and the “aipim” by the Purus of the Upper Amazon (Spruce in Markh. edit. p. 347) ; the “aipimakaxera” roasted according to Nieuhoff can be eaten without danger ; the “wild mandihoca” figured in Piso and Marcgraf 55, is referred here by Pohl ; but *M. aipi* has not been found in the indigenous state. By European colonists, was carried to Equatorial Africa, for “mahogo” is mentioned by Grant as the staple food of the Zanzibar people, where some kinds are “eaten raw ;” to Hindustan, where besides instances of poisoning, Drury states that the natives “cook the raw root for curries ;” to the Philippines, where according to Blanco the “digitata” variety is the most abundant, and its roots are cooked and eaten without further preparation.

“529, April 16th” = “16th of the calends of May” (cod. Justin., Blair, and Clint.), publication of the Justinian codex of Laws.

“After Sept. 1st” (Malal., and Clint.), edict transmitted to Athens by Justinian, prohibiting the teaching of “philosophy and astronomy.” Damascius of Syria, Simplicius of Cilicia, Eulamius of Phrygia, Priscianus of Lydia, Ermeias and Diogenes of Phoenicia, and Isidorus of Gaza, withdrew in consequence into Persia.

“530 A. D.” (Lib. pontif., and Clint.), Felix succeeded by Bonifacius, fifty-third bishop of Rome.

“531 A. D.” (Procop., and Clint.), treaty of alliance between Justinian and the Abyssinians and Homerites (Himyarites or emirs of Arabia) ; the latter engaging to invade the Persian territory.

In connexion apparently with this opening of intercourse with Abyssinia, the fortified monastery on Mount Sinai built by Justinian. — But according to Lepsius (eg. and sin. p. 558), the earliest bishop of Mount Sinai, Jorius, died in “1033.”

“Sept. 13th” (Agath., Malal., and Clint.), Cabades succeeded by Chosroes (Khoosroo surnamed Nushirwan), eighteenth Sasanid king of Persia.

The ΤΖΑΓΓΑ, boots of Persian kings and Byzantine emperors, of *red leather* : none of their subjects were allowed to wear red leather (Procop. iii. 247. 14. and Cedren. ii. 47. 14.) — The Greek word is regarded by E. A. Sophocles as the origin of the German “schenkel,” Anglo-Saxon “scanc,” and English and Swedish “shank.”

In “the reign of the Persian king Nooshirwan,” 531 to 579 A. D., the Fables of Pilpay translated from Sanscrit into Pehlevi by the physician Barzouyeh, who brought the original with other books from Hindustan (De Sacy, and Royle antiq. hind. med. 68).

“532 A. D.” (Lib. pontif., and Clint.), Bonifacius succeeded by Joannes Mercurius, fifty-fourth bishop of Rome.

“533 A. D.” (Marcellin., and Clint.), ratification by Justinian of the treaty of peace with Chosroes ; and return from Persia of Damascius, Simplicius, and the other philosophers.

“534 A. D.” (Procop., and Clint.), by Belisarius, Carthage captured, Gelimer taken prisoner, and the rule of the Vandals in North Africa closed.

“In the spring” (Paul. Diac., and Clint.), death of Theoderic king of the French. At Ravenna, the accession of Theodahad, fourth Gothic king of Italy : coins of whom, are extant.

One hundred and forty-fifth generation. May 1st, 534. onward mostly beyond youth : the Arab poets El-Muhelhil, Ebn-El-Abras, Ebn-Kamee-ah, El-Akbar, Abou-Du-ad, Ebn-Damreh, and Ebn-Kureya (see Lane dict.) : the Greek historians, Joannes Rhetor, Petrus Patricius, Hesychius of Miletus, and Joannes Lydus ; the grammarian Hermolaus ; the jurist Tribonianus ; the architect Anthemius ; the Greek ecclesiastical writers, Ephraimius of Antioch, Menas, Eutychius of Amasia, and Theodosius of Alexandria : the Latin writer Corippus ; the Latin ecclesiastical writers, Aprigius, Justinianus of Spain, Liberatus Justus, Facundus and Martinus Dumiensis.

“The same year” (Clint.), end of the chronicle of Marcellinus Comes.

“In this year” (ann. Jap., transl. Tits.), accession of An kan, twenty-eighth dairo of Japan.

“535 A. D.” (Procop., and Clint.), war against the Italian Goths ; Belisarius, consul for this year entering and occupying Sicily.

“May” (Lib. pontif., and Clint.), Joannes Mercurius succeeded by Agapetus, fifty-fifth bishop of Rome.

“536 A. D.” (Act. concil., and Clint.), death of Agapetus at Constantinople ; and Silverius appointed fifty-sixth bishop of Rome by Theodahad, and afterwards regularly ordained. Silverius was a “son of Hormisdas” the fiftieth bishop (Alst.).

“August” (Clint.), death of Theodahad, and accession of Witiges, fifth Gothic king of Italy. Coins of Witiges are extant.

“Dec. 9th” (Procop., and Clint.), after capturing Naples, entrance of Belisarius into Rome.

“In this year” (ann. Jap., transl. Tits.), An-kan succeeded by his brother Zin-kwa, now twenty-ninth dairo of Japan.

"537 A. D." (Lib. pontif., and Clint.), Silverius deposed by Belisarius, and Vigilius ordained fifty-seventh bishop of Rome. Before the close of the year, Belisarius, besieged in Rome by an army of Goths under Witiges, sent the historian Procopius on a mission to Naples.

"In or about this year" (Percev. i. 141), Aryat slain and succeeded by Abraha, now second Abyssinian governor of Yemen. — Under his rule, Gregentius sent by the patriarch of Alexandria to Zhafar as bishop.

"538 A. D." (Procop., and Clint.), after a siege of "a year and nine days," withdrawal of the Goths from Rome. Although followed by Belisarius, Witiges reached, and aided by the Burgundians laid siege to Milan.

In this year (= 543 B. C. — "1080 years" in Mahavams. xli), accession of Ambaharanasala as king of Ceylon. — He "destroyed all the wicked priests and burned their books" (Braminical), and reigned "thirteen years."

Sida stipulata of Tropical Africa and Asia as far as Burmah. Called in Burmah "pyen-dan-gna-len" (Mason), and probably from early times known there and in Hindustan: — observed by Mason v. 519 indigenous in Burmah, growing in company with *S. acuta* * from which it is "not

* *Sida acuta* of Tropical Eastern Asia. Branching and shrubby, four to six feet high, called in Tagalo and Bisaya and Pampango "mamalis" or "pamalis" or "vavalisin" or "higot balato," in Ylocano "taquing baca" (Blanco), in Tamil "malay-taynghe" or "arrooa-manopondoo," in Telinga "vishaboddee," in Bengalee "kureta" (Drur.); and from early times, its intensely bitter root valued as stomachic: — observed by Rheede x. pl. 53 in Malabar; by Graham, immediately around "Bombay, not common;" by Burmann, Retz, Ainslie, Roxburgh, as far as Bengal. Farther East, by Mason v. 479 to 519 indigenous, and "the most troublesome weed in Tavoy," affording "a very fine hemp" and its "bitter" root "deemed cordial and stomachic;" by Loureiro, in Anam; by Rumphius vi. pl. 18, on Java (Pers.); by Blanco, on the Philippines, its stamens moving on being touched with a needle. Transported to Europe, is described by Plukenet mant. x. pl. 334.

Hydnocarpus odoratus of Eastern Hindustan. A large Pangoid tree called in Silhet "chaulmoogra" or "petarkura" (Lindl.); and from early times, its seeds employed extensively in Hindustan to cure cutaneous disorders, especially leprosy: — known to grow in Silhet and Assam (Roxb. cor. pl. 299, Wight, and Drur.).

Chickrassia tabularis of Burmah and the mountainous country East of Bengal. A mahogany-like tree, its timber called in Bengalee "chikrassee," in Tamil "aglay marum" (Drur.), and known from early times: — growing on the Dindigul hills and in Chittagong, its close-grained elegantly-veined wood much employed by cabinet-makers, and one of the kinds called in commerce *Chittagong wood* (Roxb., and Drur.); observed by McClelland growing "with teak" in Pegu (Mason v. 539). The bark according to Lindley is powerfully astringent without bitterness.

Celastrus paniculatus of Hindustan. A woody climber called in Tamil "valuluvy," in Telinga "bavungie," in Hindustanee "malkunganee" (Drur.), in the environs of Bombay "kangoonee" or "karung-kangoonee" (Graham); and from early times, a black or deep-scarlet oil procured from its seeds, used medicinally, but principally for horses: — observed by Graham "common on the Ghauts and throughout the hilly parts of the Concan," and found by Murray "at Mahableschwur; by Roxburgh, Royle, Wight, and Powell, from the Punjaub and Dheyra Dhoon to the Neilgherries, Mysore, and the Circar mountains. The oil, according to Royle ill. 167 and antiq. hind. med., and Malcolmson, is "a stimulant and useful medicine," has been found a successful remedy in "beriberi" (Lindl., and Drur.).

Phyllanthus virosus of Eastern Hindustan. Erect, woody, with numerous ascending branches; and from early times, its strong astringent bark thrown into water to intoxicate fish: — observed by Roxburgh on mountains and in the forest (Lindl.). From transported specimens, described by Willdenow (Pers.).

Caturus spiciflorus of Southern Hindustan. A Euphorbiaceous shrub called in Malabar "wattatalli" (Drur.); and from early times employed medicinally: — observed by Rheede, Rumphius iv. pl. 37 (Pers.), Burmann pl. 61, from Malabar to Travancore; the flowers according to Lindley "said to be a specific in diarrhoea and similar disorders."

Sapium Indicum of Tropical Hindustan. A small Euphorbiaceous tree with pendulous branches sometimes ending in thorns; called in Bengalee "hoorooa" (Lindl.), and from early times, its seeds used for intoxicating fish: — observed by Rheede iv. pl. 51 in Malabar; by Nimmo, in "various parts in the S. Concan" (Graham), nearly as far as Bombay; by Buchanan, and Roxburgh, as far as the "delta of the Ganges," its "juice highly poisonous" (Lindl.).

Tragia involucreta of Tropical Hindustan. A twining Euphorbiaceous annual having stinging hairs on the leaves, called in Bengalee "bichitee" (Lindl.), in Telinga "doolaghondi," in Tamil "canchoorie" (Drur.), in the environs of Bombay "kooltee" (Graham); and from early times, its

usually distinguished;" by Wight prodr. 57, in Southern Hindustan. Westward, by Bojer, "truly spontaneous" on the Mauritius Islands; and is known to grow in Western Equatorial Africa (Benth. fl. nigr.). Clearly by European colonists, was carried to the West Indies (A. Dec.).

root used medicinally: — observed by Rheede ii. pl. 39 in Malabar; by Graham, "on bushes above Kandalla tank," in the environs of Bombay; by Burmann pl. 92, on Ceylon; by Ainslie, and Roxburgh, in hedges and shady places as far as Bengal.

Tephrosia purpurea of Tropical Hindustan. A branching Leguminous plant, its bitter root from early times used medicinally: — observed by Rheede i. pl. 55 in Malabar; by Brown, and Graham, "common both in the Concan and Deccan" as far as Bombay, "appearing with the rains and flowering towards the close of them, when it dies away;" by Burmann pl. 32, on Ceylon; by Ainslie, Roxburgh, and Wight, as far as the Coromandel coast, its root in decoction prescribed by native physicians in "dyspepsia, lientery, and tympanitis" (Lindl.); was observed by Mason indigenous in Burmah.

Acacia (Albizia) odoratissima of Tropical Hindustan and Burmah. An unarmed tree thirty to forty feet high, called in Tamil "kurroo-vaga," in Telinga "shinduga" (Drur.); and its particularly hard and strong durable timber valued from early times: — observed by Rheede vi. pl. 5 in Malabar; by Graham, in "the Concans" as far as Bombay; by Roxburgh, Wight, and Drury, as far as the Carnatic and Coromandel, "common everywhere" and "one of the most valuable jungle timbers;" by Mason v. 529, indigenous in Burmah. Transported to Europe, is described by Plukenet pl. 351.

Kandelia Rheedi of the tide-waters of Hindustan and Burmah. A mangrove shrub or small tree called in Malabar "tsjeron-kandel" (Drur.); and from early times, its bark employed medicinally: — observed by Rheede vi. pl. 35 in Malabar; by Graham, as far as Bombay; by Drury, common in "the back-waters in Travancore," its bark "used for tanning purposes at Cochin;" by Roxburgh, and Wight, in the deltas of the Ganges and Coromandel coast; by Mason v. 512 to 515, in the "mangrove swamps" of Burmah, its bark "used by the Tavoy women in dying red," probably "as a mordant."

Trichosanthes cordata of Tropical Hindustan. A climbing Cucurbitaceous vine called in Hindustanee "boomee-koomura" (Lindl.); and from early times, its tuberous root employed medicinally: — growing on the banks of the river Megna near its mouth, and described by Rheede, Ainslie, and Roxburgh, its root as large as "a man's head" used by the natives "as a substitute for calumba root" (Lindl., and Drur.).

Hymenodyction excelsum of Western Hindustan. A Cinchonaceous tree fifty feet high called in Bengalee "bundaroo" (Lindl.), in the environs of Bombay "kurwah" or "kurdwah" or "koodyee" (Graham); and from early times, its fine close-grained wood used for various purposes: — observed by Graham "common along the Ghauts" as far as Bombay; by Roxburgh cor. ii. pl. 106, and Wight, as far as the Circars, the two inner layers of the bark possessing all "the bitterness and astringency of Peruvian bark, and when fresh in a stronger degree" (Lindl., and Drur.).

Gardenia campanulata of the forests of Chittagong. A low Cinchonaceous tree, its fruit from early times used in Hindustan as cathartic and anthelmintic: — observed by Roxburgh, its straight trunk "soon dividing and subdividing into numerous stiff erect and spreading branches" (Lindl., and Drur.).

Willughbeia edulis of Eastern Hindustan. A very large Apocynous climber called in Bengalee "luti-am" (Drur.); and from early times, its fruit eaten: — growing in the forests of Sylhet and Chittagong, and when wounded, yielding copiously juice that changes "into an indifferent kind of caoutchouc" (Roxb., and Lindl.).

Cicendia hyssopifolia of Hindustan. An herbaceous annual called in Tamil "vallarugu," in Telinga "nella-gullie" or "golimidi" or "chevukurti," in Bengali "kirota," in Hindustanee "chota chiretta" (Drur.); the whole plant bitter, and with other Gentianaceæ, employed in Hindustan from early times as a stomachic: — *C. hyssopifolia* was observed by Burmann afr. pl. 74, Retz ii. 15, Roxburgh, and Wight, from the banks of the Jumna to Coromandel, in "moist uncultivated grounds" (Pers., Lindl., and Drur.).

Ocimum suave of Tropical Hindustan. A Labiate plant from early times used there medicinally: — probably as at the present day, for "a stomachic, and a cure for infantile catarrh" (Lindl.). From transported specimens, the plant is described by Willdenow (Steud.).

Geniosporum prostratum of Western Hindustan. A Labiate herb, prostrate and much branched, and from early times used as a febrifuge, — as at the present day at Pondicherry (Pers., Burnett, and Lindl.): observed by Rheede x. pl. 92 in Malabar; by Nimmo, in "S. Concan" (Graham), nearly as far as Bombay; by Burmann pl. 70, on Ceylon.

Meriania Bengalensis of Eastern Hindustan. A straggling Labiate shrub, cultivated from early times: — observed by Graham "in gardens" at Bombay, the "taste and odour of the leaves stronger than that of sage;" by Ainslie, and Roxburgh, as far as Coromandel and Bengal, its "trunk sometimes

Curcuma angustifolia of Southern Hindustan. A stemless Scitamineous plant called in Malabar "kooghei" or "kooa," in Tamil "kooa," in Hindustanee "tikhur" (Drur.); and from early times, arrowroot prepared from its tubers eaten by the natives:—observed by Roxburgh in "forests from the banks of the Sona to Nagpore," the product "sold in the markets of Benares" (Lindl.); by Drury, abounding especially in Travancore, its product "a favourite article of diet among the natives," and largely exported under the name of *East Indian arrowroot*.

"539 A. D." (Procop., and Clint.), Milan captured by the Goths and Burgundians: and entrance into Italy of "a hundred thousand" French under Theudibert. Who after laying waste the country, form a treaty with Belisarius and retire.

as thick as a man's arm," the "leaves similar in smell and taste to those of" garden sage and "applied to the same uses" (Lindl.); but Wallich remarked "an odour like camphor" when the plant is rubbed. *Indian sage*, "*Salvia Indica*," described by Morison iii. pl. 13, and called "seotee" in the environs of Bombay where it is also "cultivated" (Graham), is regarded by Nimmo as perhaps not distinct.

Congea villosa of Eastern Hindustan. A Verbenaceous plant, its leaves from early times used in fomentations, — and according to Roxburgh having "a strong heavy disagreeable smell" (Lindl.).

Premna integrifolia of Tropical shores, from Hindustan throughout the Malayan archipelago and Polynesian islands to Taheiti and beyond. An elliptic-leaved Verbenaceous shrub, from early times occasionally used in medicine (Lindl.):—observed by Rheede i. pl. 53 in Malabar; by Graham, "by the sea shores Bombay," the bruized leaves having "a very peculiar and rather unpleasant smell;" by N. L. Burmann pl. 41, Ainslie, and Roxburgh, as far as the Eastern coast; is termed "*folium hirci*" by Rumphius iii. p. 134; and was observed by myself facing the sea along the Feejeean, Samoan, and Taheitian islands as far as Metia.

Callicarpa lanata of Tropical Eastern Asia. A Verbenaceous shrub or small tree called in Tagalo "palis" or "tubang dalag" from being used to intoxicate fish (Blanco), in Tamil "caat comul," in Bengalee "massandarie," in Hindustanee "bastra" (Drur.), in the environs of Bombay "eisur" (Graham); and from early times employed medicinally:—observed by Rheede iv. pl. 60 in Malabar; by Graham, in the environs of Bombay, and on "the Parr and Rotunda ghauts" as far as "Mahableschwur;" by Ainslie, Buchanan, Roxburgh, and Royle, as far as Travancore and Coromandel, its root employed in Upper Hindustan "in cutaneous complaints," and in Chittagong a fibre procured from the inner bark, called *arvosha fibre* but not much valued (Drur.); is known to grow also on Ceylon (fl. Zeyl.), where its sub-aromatic slightly bitter bark "is chewed by the Cingalese instead of betel-leaves." Farther East, was observed by Loureiro i. 70 common in the hedges of Anam; by Blanco, well known on the Philippines.

Urtica crenulata of Eastern Bengal. Known doubtless from early times, — and according to Leschenault de la Tour one of the most venomous of the tribe, but Roxburgh iii. 591 is silent on this point (Drur.).

Piper sylvaticum of the mountainous Northern border of Bengal. Perennial-rooted, with branches creeping on the ground or rooting ivy-like on trees; called "pahari peepul" *mountain long-pepper*, and known from early times:—observed by Roxburgh, the spikes "used in Bengal both green and ripe as long pepper" (Lindl.).

Homalomena aromatica of Chittagong. A caulescent Araceous plant, with sub-sagittate leaves; called "cuchoo-gundubee" (Lindl.), and from early times, the medicinal virtues of its root in high estimation in Hindustan:—observed by Roxburgh, the root when cut diffusing "a pleasant aromatic scent something like that of Zingiberaceæ" (Lindl.).

Anomum aromaticum of valleys on the Eastern frontier of Bengal. A Scitamineous herb called in Bengalee "morung elachi" (Lindl.); and its spicy seeds known from early times:—observed by Roxburgh, its "fruit similar in quality to cardamoms for which it is sold" in the drug-shops of Hindustan, "the seeds are similar in their shape and spicy flavour" (Lindl.).

Elettaria medium of Eastern Hindustan. Called there "do-keswa" (Lindl.); and its spicy seeds known from early times:—growing in the hilly country in the neighbourhood of Sylhet, and "from the form of the capsule and the acrid aromatic taste of the seeds" suspected by Roxburgh to be the "cardamomum medium" of European writers on materia medica. The "semina cardamomi majora" or "wild cardamoms from Calcutta" examined by Pereira in the drug-shops of Europe, are considered by him belonging perhaps to this species (Lindl.).

Curcuma leucorhiza of Eastern Hindustan. Called "tikor" (Lindl.), and known from early times:—observed by Roxburgh in the forests of Bahar, its tubers yielding a kind of arrowroot (Lindl. and Drur.).

Curcuma rubescens of Eastern Hindustan. Known from early times:—observed by Roxburgh in Bengal, its "pendulous tubers" yielding "a very beautiful pure starch like arrow-root," which the natives "prepare and eat" (Lindl.).

"In this year" (Humb. cosm. i.), a comet; the second one whose orbit is known from Chinese observations.

"540 A. D." (Clint.), by Belisarius, Ravenna captured, and Witiges taken prisoner, and conveyed to Constantinople. Ildibad was now elected sixth Gothic king of Italy.

"In this year" (ann. Jap., transl. Tits.), Zin-qua succeeded by his brother Kin-meï, now thirtieth dairo of Japan.

"541 A. D." (Procop., and Clint.), accession of Eraric, seventh Gothic king of Italy. He reigned "five months;" and in "autumn" was succeeded by Totilas. Coins of Totilas are extant.

"The same year" (Clint.), end of the annual consulships; Fl. Basilius being appointed sole consul. — The next "twenty-four" years were numbered in his consulship.

"542 A. D." (Malal, and Clint.), pestilence; beginning in Egypt at Alexandria, and gradually extending, — Eastward in the following year to Persia, and Westward to Italy; spreading over and desolating all parts of the known world.

"The same year" (Usher) in Britain, king Arthur slain in battle at Camelon in Cornwall. He is said to have been succeeded by Constantine: — who was buried close by Uther within the structure of stones called *Stonehenge* (Geoff. Monm. xi. 4).

"543 A. D." (Procop., and Clint.), capture of Naples by the Goths under Totilas; who next besieged Dryus, and marched towards Rome.

In the most ancient times, according to Peruvian tradition (Salcam. edit. Markh. 70), "all the nations of Ttahuantin-suyu came from beyond Potosi in four or five armies arrayed for war," and "settled in the different districts as they advanced." After the country became peopled, the land proved "insufficient, there were wars and quarrels, and all the nations occupied themselves in making fortresses, and every day there were encounters and battles." At length there arrived "a bearded man" called Tonapa or Tarapaca, having "long hair," dressed "in a rather long shirt," and travelling with a staff. He "spoke all languages," performed miracles, healing by touch, and taught "the natives with much love." His teachings were in general not much regarded, by some of them were recorded by "marking and scoring sticks."

On visiting the town of Tiyahuanacu, Tonapa found the inhabitants drinking and dancing, and as they would not listen to him, denounced them: on his departure, "all the people who were dancing were turned into stones, and they may be seen to this day" (Salcam. 73. see also C. de Molina). The great unfinished buildings at Tiahuanaco, regarded as the most ancient in Peru, are composed of huge blocks of stone, some of them "thirty-eight feet by eighteen and six deep" (Acost. vi. 14. 419), and brought from a distance. — The district was conquered by Mayta Capac, the fourth inca (Mark. edit. Ciez. p. 378).

On the Vifaque river not far from Guamanga on the Peruvian Andes remains of "great and very ancient edifices," built (according to the natives) by "bearded and white people" who "many ages before" the incas came to these parts "and formed a settlement here." — They resembled the European strangers, and the buildings together with some others seen by Cieza de Leon lxxxvii "were square," and not "long and narrow" like those of the incas.

Further (according to tradition among the inhabitants of the Collao), before their country was conquered by the incas, one of their two great lords Sapana and Cari found upon the large island in Lake Titicaca "a white people who had beards," fought with and exterminated them — (Ciez. C.).

In the anterior ages, * — or perhaps "in the time of the Toltec monarchy" (Humb.), Mexico visited by Quetzalcohuatl, a bearded white man, accompanied by other strangers wearing black garments in the form of cassocks (compare the black dress of the Anamese, and Terminalia catappa used for dyeing black on the Philippines).

* *Aquilegia formosa* of Northwest America. A species of columbine, its root from early times eaten by the natives — (R. Brown jun.): observed by Mertens on Norfolk Sound; and received from Northwest America by Fischer; but regarded as possibly not distinct from *A. Canadensis*.

Achlys triphylla of Western Oregon. From early times used medicinally by the natives, in decoction for pain in the breast — (R. Brown jun.): growing according to Hooker at the mouth of the Columbia.

Acer macrophyllum of Western Oregon. A maple called by the Cowichans "kammalep" (R. Brown jun.), and from early times used for making paddles, gambling disks and polished sticks: — observed by Lewis and Clark on the Columbia river (Pursh); and according to Hooker, confined to the mountains along the coast from 50° to 40°.

Acer circinatum of Western Oregon. The vine maple, from early times used by the natives for making bowls — (R. Brown jun.): observed by Lewis and Clark at the rapids of the Columbia; by myself, tangling swamps between the mount Rainier ridge and the Pacific; and according to Hooker, grows along the coast from 49° to 43°.

"544 A. D. = 10th year of the 'ta-thoung' of Wou-ti V." (Chinese chron. table), beginning of the Fifty-fourth cycle.

The Tchouds or Tchoudaki, ancient gold miners whose diggings are scattered over the Ural

Cupressus Nutkanus of Alaska. A *cypress*, from early times used for making bowls and boxes by the Tsimpshians — (R. Brown jun.): received from Northwest America by Fischer, and termed "thuiopsis borealis."

Vicia gigantea of the Columbia. A species of *vetch*, its seeds from early times eaten by the natives — (R. Brown jun.): received by Hooker from the Columbia river.

Rosa fraxinifolia of Western Oregon. From early times, its young shoots eaten by the natives — (R. Brown jun.): growing according to Hooker only along the Pacific.

Rubus Nutkanus of Alaska and Oregon. From early times, its tender shoots eaten by the natives, and its berries collected and dried — (R. Brown jun.): observed by Mertens at 57° on Norfolk Sound; and according to Hooker, grows along the Pacific from 43° to 50°, also at the sources of the Columbia.

Rubus spectabilis of Alaska and Western Oregon. The *salmon-berry*, its fruit from early times collected and dried by the natives — (R. Brown jun.) observed by Lewis and Clark on the Columbia (Pursh); by Menzies, along the Pacific; by Mertens, at 57° on Norfolk Sound; and according to Hooker, grows on Unalaska.

Pyrulus rivularis of Alaska and Western Oregon. The *Alaska crab apple*, its fruit from early times collected by the natives and preserved in bags — (R. Brown jun.): observed by Douglas, and according to Hooker, growing from the Columbia to Nootka and Northward.

Cerasus mollis of Northwest America. The *Oregon cherry*, its fruit from early times eaten by the natives — (R. Brown jun.): observed by Douglas, and according to Hooker, growing at the mouth of the Columbia and at its source.

Megarhiza Oregona of Western Oregon. A prostrate bryony-like Cucurbitaceous plant, its huge root from early times placed in ponds by the natives to stupefy deer coming to drink — (R. Brown jun.): observed by myself in the flowery prairies around Fort Nisqually, its root sometimes a yard in diameter.

Ribes divaricatum of Alaska. From early times, its berries collected and dried by the natives — (R. Brown jun.): observed by Douglas common along the Pacific from 48° to 52° (Hook.).

Heuchera cylindrica of Oregon. From early times among the Nisqually tribe, bruised and applied to boils — (R. Brown jun.): observed by Douglas west of the Rocky mountains (Hook.).

Eulophus leiocarpus of Western Oregon. Perhaps the "*peucedanum leucocarpum*" whose stem has been eaten from early times by the natives — (see R. Brown jun.). *E. leiocarpus* was received by Hooker from Fort Vancouver, near the mouth of the Columbia.

Eulophus triternatus of the Columbia river. Its "fusiform root" from early times eaten by the natives, "baked or roasted" — (Pursh); observed by Lewis and Clark on the Columbia.

Ferula nudicaulis of the Columbia river. Its tops from early times boiled by the natives "in their soups" — (Pursh); observed by Lewis and Clark on the Columbia.

Ligusticum Scoticum of the Subarctic seashore. The *sea lovage* known from early times to the natives of Northwest America, and its green stem eaten — (R. Brown jun.): known to grow from the mouth of the Columbia along the Pacific to Bhering's Straits, also in Labrador (Hook.) and from 67° in Greenland (Wats.); was observed by Hooker in Iceland; by Lapylaie, in Newfoundland; by Michaux, at the mouth of the St. Lawrence; by myself, along the seashore of New England as far as 41° 30' at the mouth of Narragansett Bay. Eastward, across the Atlantic, was observed by Sibbald in Scotland (Spreng.); is described also by Plukenet alm. pl. 96 (Pers.); and is known to grow on the Hebrides, and on the seashore of Norway, Lapland, and Northern Siberia (fl. Dan. pl. 207, Dec., and Wats.).

Gaultheria shallon of Western Oregon. Called "salal" (R. Brown jun.), and its berries from early times collected and dried by the natives: — observed by Menzies along the Pacific; by Lewis and Clark, at the falls of the Columbia; by myself, a shrub two to three feet high, forming patches around Puget Sound.

Vaccinium ovalifolium of Oregon. The *le brou* plant, its berries from early times made into a cake, considered a dainty by the natives — (R. Brown jun.): *V. ovalifolium* was observed by Menzies along the Pacific; by Lewis and Clark, on the Columbia (Pursh).

Vaccinium salicinum of Alaska. The berries of various species of *Vaccinium*, from early times collected and dried by the natives of Northwest America — (R. Brown jun.). *V. salicinum* was observed by Chamisso on Unalaska.

Pinus monticola of Oregon. From early times its bark used for weaving blankets, and its wood for the long wooden spoons with which the *le brou* cake is supped — (R. Brown jun.).

mountains and the Altaian, were unacquainted with iron, and appear to have had their chief dwelling-place among the mountains on the Upper Yenisei: where are magnificent tombs containing finely-worked gold ornaments and other precious articles, but their picks and other mining utensils as well as their knives daggers and arrow-points are all of *copper*. They used however an oval stone mallet grooved around to receive a thong, and were acquainted with the manufacture of *leather*. On the contrary, the Mongols and Tartars have always possessed the art of smelting *iron*, but to the present day know nothing of copper. The tombs were found by Pallas iii. 333 to 421 much resembling some he had seen in Brandebourg and other parts of Germany.

Allium fistulosum of the Altaian mountains. Distinguished by its ventricose leaves and called in Britain *welsh onion* from the German "walsch" foreign (Prior), in Germany "schnitzwiebel" (Lenz), in Greece "pikra krömmuthia" (Fraas), by the Russians among the Altaian mountains "boutoun" (Pall.) and known there from early times; — termed "cepa rupestri radice turbinata dulci Stelleri" by Gmelin i. 64; observed by Pallas iii. 204 to 484 abounding on all the higher parts of the Altaian mountains, pleasant to the taste, suitable for culinary purposes, and succeeding in gardens. Westward, was observed by Fraas under cultivation in Greece, besides springing up spontaneously; and from Germany was introduced into Britain (Prior).

Ribes (Grossularia) saxatile of the Altaian mountains. Called there "krasnaia smorodina" or "kislitza," its acid red fruit, large as raisins, mixed with water from early times as a refreshing drink; — observed by Pallas iii. 220 near Golzofka.

Spiraea laciniata of the Altaian mountains. Called by the Russians "irga" or "kizilnik," known from early times, — and its stems used for ramrods (Pall.); observed by Laxmann near Kolivan (Steud.); by Pallas iii. 264 also among the Altaian mountains.

Rhododendron Dauricum of East Siberia. Called on the Upper Yenisei "bagounnik" and known from early times, — observed by Pallas iv. 129 in all the pine woods from Oudinsk to beyond Lake Baical. From transported specimens, is described by Linnaeus and Andrews repos. pl. 4.

"The same year" (Humboldt atl. pict., Clavigero i. 84 gives "596"), commencement of the migration of the Toltecs: * who were now leaving their own country, Huehuetlapallan or Tlapallan.

Abronia arenaria of the seashore of Oregon and California. Herbaceous and decumbent, its roots from early times eaten by the Chinooks — (R. Brown jun.): observed by Menzies in California (Hook.).

Abies Menziesii of Alaska and Western Oregon. A *spruce*, from early times furnishing hats for the sea-going tribes — (R. Brown jun.): observed by Douglas.

Abies Mertensiana of Oregon. A *spruce*, its liber or inner bark from early times used by the natives medicinally, for sticking-plaster — (R. Brown jun.).

Endosmia Gardneri of Western Oregon. Called by the Nisqually "s'hah-gok" (R. Brown jun.), and from early times its root eaten by the natives. — From transported specimens, described by Hooker and Arnott.

Calochortus elegans of the Columbia. Its root from early times "eaten by the natives;" — observed by Lewis and Clark "on the head-waters of the Kooskoosky" (Ph).

Xerophyllum tenax of the Rocky mountains. Its "very tenacious leaves" from early times woven by the natives into "water-tight baskets, which they use for cooking their victuals in;" — observed by Lewis and Clark "on high lands near the Rocky mountains" (Ph).

Rhodymenia sp. of shallow water of the ocean-margin of Northwest America. An esculent *sea-weed*, from early times compressed by the natives into cakes for winter use — (R. Brown jun.).

Phyllophora Menziesii of the ocean-margin of Northwest America. A *sea-weed*, its long stipes from early times furnishing the natives with excellent fishing-lines — (R. Brown jun.). Transported to Europe, described by Agardh.

* *Aesculus Californica* of California. The *California horse-chestnut*, its nuts from early times ground into a gruel or soup by the natives — (R. Brown jun.): observed by Nuttall.

Trifolium involucreatum of Nevada and California. From early times, *clover* as well as *grass* eaten by the Digger tribe — (R. Brown jun.). T. involucreatum according to Hooker grows in California, from the Rocky mountains to the Pacific. By Spanish colonists, was carried to Cuba (Ortega, and Pers.); and to Valparaiso in Chili (Hook.).

Arctostaphylos glauca of California. The *manzanilla*, its berries eaten by grizzly bears, and from early times by the natives — (R. Brown jun.).

Quercus sp. of the Sacramento. Its acorns from early times pounded and ground into gruel, cooked in water-tight baskets by the natives: — observed by myself growing in a scattered manner to a short distance on either side of the Sacramento, the only tree throughout its middle course.

Quercus sp. of Northwest America. The acorns of several species of *oak* from early times eaten by the natives — (R. Brown jun.).

Of the arts attributed to the Toltecs, *smelting* metals, cutting the hardest stones, *weaving* cloth, and dyeing with *indigo*, do not appear to have originated in America; but were brought from Asia, though certainly not by Polynesians.

One of the traditional Toltec leaders was Wotan or Wodan, — and at the time of the Spanish conquest, a family in the village of Teopixa boasted of being descended from Wotan (Humb. cosm. iv). A mythical connexion traceable perhaps through the Ainos of the Kurile Islands and Northern Japan.

"The same year" (Procop., and Clint.), by Justinian, Belisarius recalled from the East, and sent with insufficient forces into Italy.

"545 A. D." (Alst. p. 369), on the authority of the before-mentioned synod at Carthage, the pretensions of the bishop of Rome opposed by the Ligurian, Venetian, and Istrian bishops.

"546, Dec. 17th" (Procop., and Clint.), Rome betrayed to Totilas; who entering in the night, pillaged the city, set it on fire, and destroyed a third of the city wall. He was however soon repelled by Belisarius; who rebuilt the wall and fortifications.

"547, February" (Malal., and Clint.), arrival in Constantinople of Vigilius bishop of Rome; invited by Justinian.

"The same year" (Procop., and Clint.), irruption of Slavonians into Illyricum. Slavonian Czekhes (according to Talvi iii. 1) displacing the Celtic Boii from Bohemia, — which country they occupy to the present day.

"548 A. D." (Marius, and Clint.), death of Theudebert; and accession of his son Theudebald as king of the French.

"549 A. D." (Procop., and Clint.), Belisarius having left for Constantinople, Rome again captured by Totilas; who thence proceeded South to Tarentum and Rhegium, and invaded Sicily.

"550 A. D. = 'ta-pao,' 1st year of Kian-wen-ti" or Kian-wen II., of the Liang or Twelfth dynasty — (Chinese chron. table).

"The same year" (= 9th of Sridharasena, Jacquet, and Gildem. 43), date of a Hindu poem composed at Valabhi in Guzerat (Bhattik. xxii. 35).

As early as this date (see Percev. i. 292), the "Djazzm" or *Arabic alphabet* invented at Anbar in Irak by Moramir of the Yemen tribe of Tay. — The invention was carried to the Coraysh tribe at Mecca by Harb "in or about 560" (De Sacy). The diacritic points were added under the first Omniad khalifs.

"551 A. D." (Theoph., and Clint.), the Roman bishop Vigilius remaining in Constantinople, ordered by Justinian to be seized; and taking refuge at the altar, assaulted there.

"The same year" (Theophan. Byzant. in Phot. bibl. cod. 64), living *silkworms*, Bombyx mori, brought from Eastern Asia to the Mediterranean countries; and the manufacture of silk now intro-

Pinus ponderosa of Southern Oregon. From early times, dug-out canoes made of its trunk by the natives — (R. Brown jun.).

Pinus Lamberiana of Southwestern Oregon and the adjoining portion of California. From early times, a kind of manna or purgative sugar obtained by the natives by scorching its trunk — (Brack., and R. Brown jun.): observed by Douglas in California between 40° and 43°; by Brackenridge, on our land-expedition from the Lower Columbia to the Sacramento.

Taxus brevifolia of Western Oregon and the adjoining portion of California. A species of *ycw*, called among the native tribes by names signifying "fighting wood," and from early times used for bows; the arrows being of cedar, or various species of reeds, tipped with poison obtained from the rattle-snake — (R. Brown jun.): *T. brevifolia* was observed by Nuttall: by myself on the mount Rainier ridge, a slender spruce-like tree sometimes fifty feet high; by R. Brown jun., abundant about Shasta mountain.

Chlorogalum pomeridianum of California. The *amole* plant, its bulbous root from early times used by the natives as a substitute for soap, — also by their successors, the Spanish settlers (R. Brown jun.): detached roots were shown me at the Bay of San Francisco. The plant from transported specimens is described by Kunth.

Hordeum jubatum of the seashore and Interior salines of North America. A tasseled grass, its seeds from early times especially held in request among the Shoshones of Southern Oregon — (R. Brown jun.): observed by myself in salt-marshes along the Atlantic from 45° to 42°; by Nuttall, in Massachusetts and on the Missouri; by E. James, along the Missouri and Platte; by Lewis and Clark, on the Missouri; by Drummond, as far as 54° near Fort Cumberland; and according to A. Gray, grows on the shore of the Great Lakes; according to Hooker, as far as Mackenzie river and the confluence of the Columbia with the sea. In the Southern Hemisphere, was observed by J. D. Hooker at Port Famine in the Straits of Magellan; and he thinks a species found by Hænke in Chili will prove identical (A. Dec.). From transported specimens, described by Linnæus (Steud.).

duced. — Silkworms are mentioned soon afterwards by Georgius Pisides (Pouchet). But for some centuries continued to be fed on leaves of the *black mulberry*, *Morus nigra* (Crescenzio, Targioni, and A. Dec.).

"552 A. D. = 'tching-ching,' 1st year of Hiao-youan-ti" or Youan-ti IV., of the Liang or Twelfth dynasty — (Chinese chron. table).

"The same year" (Paul. Diac., and Clint.), Totilas defeated by Narses, and slain. He was succeeded by Teias, ninth Gothic king of Italy.

"At this time" (Clint.), Jornandes finishing his history of the Goths.

"In this year (= 13th of Kin-mei," ann. Jap., transl. Tits.), by the king of Fiaksaï (in Corea), an ambassador bearing an image of Budha and the classic books of his religion sent to Kin-mei. The introduction of *Budhism* into Japan.

"553 A. D." (Procop., and Clint.), Teias defeated by Narses, slain, and Gothic rule in Italy terminated. The Goths agreeing to quit the country.

"May 4th" (Clint., and Nicol.), Fifth general ecclesiastical Council. Convened by Justinian at Constantinople. The proceedings of the four previous Councils were confirmed; and the opinions of Anthemius, Theodorus, and Origen, condemned (Alst.). — The authority of this Council continues to be recognized by the Greek church (E. A. Soph.).

The worship of Isis and Osiris continuing at Philæ in the latter half of the "Sixth" century (Champ.-Fig. p. 228).

"554. August" (Malal., Clint., and others), notwithstanding the immunity attributed by ancient writers to Egypt, a severe *earthquake* felt at Alexandria by Agathias. — Earthquakes have also been experienced in Egypt by modern travellers.

"The same year" (Marius, and Clint.), Theudebald king of the French succeeded by his father's uncle Clothacarius (Chlothaire); who had reigned already "forty-four" years.

"555 A. D. = 'tchao-tai,' 1st year of King-ti II., of the Liang" or Twelfth dynasty — (Chinese chron. table).

"The same year" (Anonym., Lib. pontif., and Clint.), Vigilius succeeded by Pelagius, fifty-eighth bishop of Rome.

"556 A. D. = 1st year of the 'tai-ping' of King-ti II.," end of the Liang dynasty — (Chinese chron. table).

"557 A. D. = 'young-ting,' 1st year of Wou-ti VI.," now head of the new dynasty of the Tchin — (Chinese chron. table).

"The same year" (Procop., Agath., and Clint.), under the superintendence of Isidorus of Miletus, the church of St. Sophia at Constantinople restored.

Rosa spinosissima of Europe and the adjoining portion of Asia. The $\epsilon\pi\iota\gamma\epsilon\iota\alpha$ roses described in the addition to Diosc. i. 130 as $\alpha\Gamma\rho\iota\alpha$, simple-flowered, smaller and for many purposes more efficacious than the garden kinds, — may be compared: *R. spinosissima* was observed by Sibthorp in the open portions of Southern Greece. Westward, is termed "*r. campestris spinosissima flore albo odoro*" by Tournefort inst. 638; and is known to grow throughout middle Europe as far as Britain (Engl. bot. pl. 187).

Rosa arvensis of Western Europe. The "*ἐπιγῆια*" roses in question — are however referred here by Sprengel: *R. arvensis* is termed "*r. serpens*" by Ehrhart, "*r. prostrata*" by Decandolle, "*r. procumbens*" by Seringe (Steud.), and is known to grow from Denmark to France (Oeder fl. dan., engl. bot. pl. 188, Dec. fl. fr., and Pers.); was observed by Pollich in Germany; by Scopoli, in Carniola; but has not been found in Greece.

Mathiola tricuspidata of the East Mediterranean countries. The $\lambda\epsilon\upsilon\kappa\omicron\iota\omicron\iota\omicron\iota\omicron\theta\alpha\lambda\alpha\kappa\kappa\iota\omicron\iota\omicron\iota\omicron$ or $\iota\omicron\iota\omicron\theta\alpha\lambda\alpha\kappa\kappa\iota\omicron\iota\omicron\iota\omicron$ identified in the cod. Cantacuz addition to Diosc. iii. 128 with the $\beta\iota\omicron\lambda\alpha\mu\alpha\rho\iota\eta\iota\alpha$ of the Romans, — is referred here by Sibthorp: *M. tricuspidata* was observed by Sibthorp, and Chaubard, frequent in the maritime sands of Greece; and farther South, by Forskal, and Delile, on the Mediterranean border of Egypt. Westward, is termed "*hesperis maritima latifolia siliqua tricuspidi*" by Tournefort inst. 223, and is known to grow as far as Tripoli (Pers.).

Linum hirsutum of the Mediterranean and Tauro-Caspian countries. The $\iota\kappa\alpha\tau\iota\kappa\alpha\alpha\Gamma\rho\iota\alpha$ described in the addition to Diosc. ii. 216 as having blue or purple flowers, $\sigma\tau\alpha\upsilon\rho\omicron\epsilon\iota\delta\eta$ and rough fruit, with the contained seed as if separated by five equal leaflets, — may be compared: *L. hirsutum* was observed by Sibthorp, and Chaubard, frequent from the Peloponnesus to Cyprus and the Bithynian Olympus, the flower "*cæruleo et rubro*;" is known to grow also in Tartary (Pers.); and farther South, was observed by Savigny in Syria, and as far as the border of Egypt (Del.). Westward, is described by Morison v. pl. 26; is termed "*l. sylvestre latifolium hirsutum cæruleum*" by Tournefort inst. 339; was observed by Scopoli pl. 11 in Carniola; and by Lapeyrouse, as far as the Pyrenees (Steud.).

Linula Britannica of Europe and the adjoining portion of Asia. The $\tau\rho\iota\tau\omicron\iota\omicron\kappa\omicron\upsilon\zeta\eta\kappa$

growing in watery places according to the addition to Diosc. iii. 126, its stem thicker and softer, leaves intermediate, and odour stronger and less agreeable, — is referred here by writers : I. Britannica was observed by Forskal, and Sibthorp, frequent in watery situations in Greece as far as Constantinople, and according to Fraas corresponds in the leaves and odour. Westward, is described by Lobel adv. p. 121, and Dalechamp p. 1082 (Spreng.); is termed "*aster palustris luteus folio longiori lanuginoso*" by Tournefort inst. 483; and is known to grow throughout middle Europe as far as Denmark (All., Lam. fl. fr., fl. Dan. pl. 413, Pers., and Steud.).

"558 A. D." (Malal., and Clint.), pestilence; continuing "six months" at Constantinople, and apparently, from the description, the *plague*.

"560 A. D." (inscript., Lib. pontif., and Clint.), Pelagius succeeded by Joannes the third, fifty-ninth bishop of Rome.

"561 A. D." (Marius, and Clint.), death of Chlothaire, and accession of Sigibert as king of the French.

"564 A. D." (Gild. hist. 26, and pref. by J. Stevenson), in Britain, Gildas writing. He speaks of the two rivers "*Thamesis ac Sabrinæ*" Thames and Severn, formerly ascended by boats bringing foreign luxuries: of idols "*portenta ipsa diabolica*" remaining on the site of deserted towns: gives a sad account of the morals of the Christian clergy, official station from the bishop downwards being for sale by princes: is equally severe and particular in enumerating the misdeeds of the judiciary and princes: and thinks, that the national historical records, if any, have either been burned in the wars, or carried abroad by exiled citizens.

The Arab poet Imra-el-Keys as early as this date — (Lane dict.). He is the author of one of the seven Moallakats preserved at Mecca.

Dianthus caryophyllus of the Mediterranean countries. Called in Britain *carnation*, by Lyte, and Spenser *coronation*, in mediæval Latin "*vettonica coronaria*," by Chaucer "*clove giroffe*" (Prior), in Greece "*karuôphullôn*" (Sibth.), in Egypt "*gurumfil*" (Forsk.), in which we recognize the scented "*karanfoli*" of Imra-el-Keys, — referred here by W. Jones iv. p.: *D. caryophyllus* was observed by Forskal, and Delile, under cultivation in Egypt; and by myself, often kept in vases by the Arabs. Farther North, was observed by Forskal in gardens at Constantinople, and wild on Imros; by Sibthorp, wild in the Peloponnesus. Westward, the "*tunici*" of Manfredus de Monte Imperiali, growing according to Jacobus de Manliis wild in Lombardy, is referred here by Sprengel; *D. caryophyllus* is described by Ruellius, *Dodoens* ii. 18, and *Tabernæmontanus* ii. 1; is termed "*caryophyllus simplex flore minore pallide rubente*" by Tournefort inst. 332; is known to grow wild in Italy and along the Pyrenees, and has become naturalized in Britain and Northern France (Noulet, and A. Dec.). Eastward from Egypt, was observed by Roxburgh, and Graham, in the gardens of Hindustan; by Kaempfer, and Thunberg, in Japan, and called "*mondo*" or usually "*iammasuje*" or "*sogaif*." By European colonists, was carried to Northeast America, where it continues under cultivation as a garden flower.

Cadaba farinosa of Tropical Africa and Arabia. A shrub called in Yemen "*korrah*" or "*særah*" or "*asal*" (Forsk.): the "*dentifrices of esel-wood*" of Imra-el-Keys — (transl. W. Jones iv. p.) may be compared: *C. farinosa* was observed by Forskal p. 68 along the mountains of Yemen, the fresh branchlets masticated or pulverized and eaten as an antidote against poison. Westward, was observed by Grant "*at Madi 3° N.*" on the Nile, called "*kana*" and spinage "*made from the leaves.*"

"565, Nov. 13th" (Theophan., and Clint.), Justinian succeeded by Justin II., tenth Byzantine emperor.

"In the beginning of the reign of Justin II." (Agath. hist. v. p. 149, and Sm. b. d.), Agathias commencing his history. In which he names Alexander Trallianus as a contemporary.

Sedum album of Europe and the adjoining portion of Asia. Called in Britain *worm-grass* (Prior), in Anglo-Saxon "*wyrmwyr*" (Cockayne), and the ΕΛΜΙΝΘΟΒΟΤΑΝΟΝ of Alexander Trallianus verm. 6 — may be compared: *S. album* was observed by Sibthorp, and Chaubard, frequent on the rocks of the Greek islands and mountains, Taygetus, Parnassus, and Athos. Westward, is termed "*s. minus teretifolium album*" by Tournefort inst. 262; was observed by Forskal near Marseilles; is known to grow on rocks as far as the Northern coast of France (fl. Dan. pl. 66, and Pers.); but in Britain, where it occurs on old walls, is regarded by Watson, and A. Decandolle, as probably exotic and introduced at an early period.

Sium bulbocastanum of middle Europe. The ΒΟΛΒΟΚΑΣΤΑΝΑ of Alexander Trallianus vii. 2. 8 — (changed to "*valanökastana*" by Goupyl and Guinter) is referred here by Dodoens p. 333, and Sprengel: *S. bulbocastanum* has not been observed in Greece. Westward, is described by Dalechamp p. 774, and Morison ix. pl. 2; is known to grow in France and middle Europe as far as Denmark, and has a tuberous edible root (fl. Dan. pl. 220, Gouan ill. 10, and Pers.).

Scabiosa Africana of the Mediterranean countries. An evergreen shrub three or four feet high

called in Greece "iva artētēka" (Sibth.), in which we recognize the ἀρτυτική of Alexander Trallianus: — S. Africana was observed by Sibthorp on the island of Zacynthus. Westward, "seme arte-tice" are prescribed medicinally by Franciscus Pedemontium ff. 186 and 201; S. Africana is described by Hermann parad. pl. 219; is termed "s. africana arborescens maxima foliis rugosis et crenatis integris major" by Tournefort inst. 465; and is attributed by Persoon to Africa as well as the East. By European colonists, has recently been introduced by the way of Austral Africa into Hindustan (Graham).

Daphne mezereum of middle Europe? A shrub called in Greece "mēzairēōn" (Sibth.), and the imported drug at Patna on the Ganges "mameera" (Irvine 256); in which we recognize the μαμεῖρα of Alexander Trallianus ii. 5, — "mamēra" of Paulus Aegineta, "mezereum" of Apuleius Barbarus 111, and "mazariun" of Elhur, Hobaisch, Elthabari, and Ebn Baitar: D. mezereum was observed by Sibthorp in the Peloponnesus; is described by old English writers as growing in Germany and cultivated in gardens in Britain, where it has since become completely naturalized (Mill, and Wats.); is termed "thymelæa lauri folio deciduo" by Tournefort inst. 595; and is regarded as indigenous in Germany and France (fl. Dan. pl. 268, Pers., and A. Dec.). The bark according to Lindley is "excessively acrid," is collected in Germany "and dried for medicinal use," is employed in France "under the name of 'garou' to produce vesication," and in Britain "is frequently employed as a topical remedy for toothach."

"In this year" (. . . Humb. cosm. i.), a comet; the third one whose orbit is known from Chinese observations.

"In this year" (Cockayne note to Leechb. i. 40), the *small pox* in France, — and "in 572" appeared in Arabia. The disease is described also by Ahrun (Spreng. hist. med. vi. 5), Maserjawia (Steinschn. ii. 22), Abu Zeid, and "in 923" by Rhazes.

"566 A. D." (Coripp., and Clint.), consulship of Justin II. — The years in which, were again numbered consecutively.

"The same year" (Clint.), end of the chronicle of Victor Tununensis. Also, of the chronicle of the anonymous continuator of Marcellinus.

In this year (= "491 an. jav." of Nata Kasuma, Raffles x.), after the conclusion of the Brata Yudha or war of the Pandus, death of Suyudana. Punta Dewa, son of Pandu Dewa Nata, now became ruler at Astina over the united Hindu colonies on Java.

"567 A. D." (Joann. Abbas, and Clint. iv. p. 824), at Narbo, Athanagild succeeded by Liuva, as Gothic king of Spain.

"The same year" = 'kouang-ta,' 1st year of Tchou-pe-tsoung, of the Tchin" or Thirteenth dynasty (Chinese chron. table).

One hundred and forty-sixth generation. Sept. 1st, 567, onward mostly beyond youth: Jacobus of Edessa (Alst. p. 389): the Greek historians. Menander Protector, Joannes of Epiphaneia, Joannes Malalas, and Theophanes of Byzantium; the Greek ecclesiastical writers, Eulogius of Alexandria, and the ecclesiastical historian Evagrius: the Latin ecclesiastical writers, Joannes Biclariensis, Venantius Fortunatus.

"568, April" (Paul. Diac., Blair, and Clint.), by invitation of Narses who had been deprived of his command, the Lombards under their king Alboin leaving Pannonia establish themselves in Italy. — From Constantinople, exarchs were sent to Ravenna against the Lombards.

"The same year" (Isidor., and Clint.), Liuva Gothic king of Spain, succeeded by his brother Leuvigild.

"The same year" (Menand. Protect., Theophan. Byzant., Joann. Epiphan., and Clint.), arrival in Constantinople of an embassy from a distant people called "Tourkoi" (Turks); now first mentioned in history.

"In this year" (Humb. cosm. i.), a comet; the fourth one whose orbit is known from Chinese observations.

"569 A. D. = 'tai-kien,' 1st year of Hiouan-ti II." or Siouan-ti, of the Tchin or Thirteenth dynasty — (Chinese chron. table, and Pauth. 279).

"In this year" (Menand. 380, and Klapp. mem. ii. 389), Zemarkh sent by Justin II. to Dizaboul khan of the Turks, encamped among the Altai mountains. Dizaboul, by the Chinese called Ti theou pou li, received the ambassador Zemarchus, and presented a κερχικ female slave. According to Humboldt cosm. i, the Kirghis, originally a Finnish tribe, — are called "kirkiz" by Abulgazi hist. mong.; life on the Steppes inducing among them, the Baschkirs (Fins), the Turks (Ti Tuki), the Torgodi and Dsungari (Mongolians), the same nomadic habits, including felt tents carried on wagons and pitched among herds of cattle.

Artemisia pauciflora of the Uralian plains. Called by the Kirghis "juschann," and from early times supplying feed for sheep in the winter — (Pall.): observed by Gmelin ii. pl. 52 along the Volga (Pers.); by Pallas trav. i. 367 and 770, abounding in arid subsaline soil on the Yaik, exceedingly fragrant, and its bitterness not unpleasant.

Ceratosperrum papposum of the plains of middle Asia from the Caspian to Tropical Arabia. Called in Yemen "senâam" or "sælaam" (Forsk.), by the Cossacks on the Yaik "vetlovnik," and known from early times, — observed on the Yaik by Pallas trav. i. 435; by Forskal p. 48, on the basal portion of the mountains of Yemen, the clustered flowers lanate and pappus-like. *C. lanatum*, observed by Lewis, and Nuttall, on the Upper Missouri, may prove distinct.

Scorzonera caricifolia of the Uralian plains. Called by the Kirghis "idschelik," and eaten as greens from early times, — observed by Pallas iii and v. 512 beyond Omsk, and frequent in the sandy plains of the Kirghis Desert.

Crambe Orientalis of the Uralian plains. Called by the Cossacks on the Lower Volga "white katran," and from early times its stem and root eaten crude, — observed by Pallas v. 170; received by Bieberstein from the country around the Taurian mountains and termed "c. aspera." In Britain has recently escaped from a garden near Fochabers, but is not as yet completely naturalized (Wats. cyb. i. 115, and A. Dec.).

Cytisus Wolgaricus of the Uralian plains. A beautiful many-stemmed bush called "tamahnes-chil-ebessyn" camel-sinew, and from early times valued as feed for horses and sheep, but not eaten by camels, — observed by Pallas v. 203 to 510 from the Lower Volga to tributaries of the Don.

Astragalus cicer of the Uralian plains. Called on the Lower Volga "chlopounzi," and from early times its seeds eaten crude, — observed there by Pallas v. 329; by Sestini, near Constantinople (Sibth.); is termed "glauz" by Rivinus tetrap. pl. 108, "a. luteus perennis siliqua gemella rotunda vesicam referente" by Tournefort inst. 416; and is known to grow as far West as Austria, Germany, Switzerland, and Italy (Jacq. austr. pl. 251, Moench, and Pers.).

Astragalus arenarius of the Uralian plains. Called by the Cossacks of the Upper Irtych "tchiltchasnaia-trava," and from early times given to horses afflicted with the strangles — (Pall.): observed by Gmelin iv. pl. 21 in Siberia; by Pallas iii. 143, on the Irtych beyond Omsk.

Chrysocoma villosa of the Uralian plains. Called by the Cossacks on the Yaik "stepnaia polin" (Pall.), and known from early times: — observed by Gmelin ii. pl. 52 in Siberia and Tartary; by Pallas i. 111 to 435, from 55° on the Volga to the Yaik.

Saussurea amara of the Uralian plains. Called by Cossacks of the Yaik "gorkaia trava" (Pall.), strongly but agreeably bitter, and from early times employed medicinally in intermittent fevers, and applied to animals suffering from poisonous bites: — termed "jacea erecta minor latioribus foliis" by Buxbaum cent. i. pl. 15; observed by Pallas i. 593 on the Lower Yaik; and known to grow in Siberia (Pers.).

Euphorbia agraria of the Uralian plains. Called on the Lower Yaik "koura," and known from early times, chickens losing their eyesight by feeding on it, — observed by Pallas i. 224 to 600 on the Lower Volga and Yaik; described also by Bieberstein (Steud.).

Nitraria Shoberi of the Uralian plains. Called on the Lower Yaik "samanicha," and known from early times, — observed by Pallas trav. i. 606 frequent there.

Anabasis cretacea of the Uralian plains. Called by the Cossacks of the Yaik "joujovnik" also "kislaiia trava," and known from early times, — observed by Pallas trav. i. 691 on chalky hills within the Calmuck district.

Calligonum Pallasii of the Uralian plains. A shrub three or four feet high, called by the Kirghis and Calmuks "torlok" (Pall.), and known from early times: — observed by Pallas ii. 548 frequent throughout the sandy plains from the Lower Volga to the Yaik and along the Caspian, said to grow also in the Kirghis district.

Sophora orientalis of the Uralian plains. Called by the Cossacks on the Upper Irtych "prounez," and from early times used medicinally, — observed there by Pallas iii. 187.

Ephedra monostachya of the Uralian plains. Called by the Kirghis "kisiiltsha," by the Russians "stepnaia-malina" (Pall.), and its berries eaten from early times: — observed by Pallas iii. 189 on the Upper Irtych; and known to grow as far West as Hungary (Pers.).

Artemisia santonica of the Uralian plains. Its seeds from early times brought under the name of "semen sanctum" from Tartary and Persia — (Pers.): the plant observed by Gmelin ii. pl. 51 in Siberia; by Pallas i. to iii. 290, from the Yaik to the Altaian mountains. From transported specimens described by Lobel icon. 756 (Pers.).

Crypsis aculeata of the Uralian plains. A grass known from early times: — observed by Pallas iii. 186 to 482 in arid saline situations from the Upper Irtych to the Yaik; by Forskal p. 18, Delile, and myself, from Alexandria to Cairo, no native name given; by Sibthorp, and Chaubard, from the base of the Bithynian Olympus to the Peloponnesus; is described also by Matthioli pl. 709; and is known to occur in Italy, Southern France, Spain, and Barbary. By European colonists was carried to North America, observed by myself in the streets of Philadelphia. "*C. schoenoides*," differing only from growing in more sheltered and fertile situations, was observed by Delile, and myself, in Egypt.

Hemerocallis flava of the Uralian plains. Called on the Upper Obi "tepaia-trava," and from early times made into small mats by the peasants and Tartars to place under saddles, — observed by Pallas iii. 391 on the Upper Obi, becoming frequent towards the Yenisei. Westward, is known to occur seemingly wild on the plains of Hungary and as far as Switzerland (Pers.); is termed "lilium non bulbosum" by Dodoens 204 (Spreng.); and has become a well known garden flower (Linn., and Jacq. hort. pl. 137). By European colonists was carried to Northeast America, where it continues in gardens.

"570 B. C." (Percev. i. 143 to 269, and Badger edit. Varthem. 32), Abraha, having failed to divert the pilgrimage to his church at Sana, and the building having been defiled by a native of Mecca, at the head of an army invading Mecca; riding on an elephant, an animal never before seen there. The Abyssinians were defeated, — and about five years later, with the aid of Persian forces arriving by sea, were expelled from Yemen.

"572 A. D." (ann. Jap., transl. Tits.), Kin-mei succeeded by his son Bin-dats, now thirty-first dairo of Japan.

"573 A. D. (= 1116th year after Gaudama's death," Mason ii. 21), at the mouths of the Irrawaddy in Burmah, founding of the city and state of Pegu.

"574 A. D." (Shan annals, Richardson, and Mason iv. 72). on the upper Meinan, the city of Labong founded by the Siamese or Shans. The Karen tribes at this time entering Burmah.*

* *Dipterocarpus* . . . *sp.* of the mountains of Burmah. Called by the Karens "ka-nyeen-phu" *lard tree* from the consistence of its oil (Mason); known from early times, — and according to Mason v. 528 to 757 growing on mountains in the Interior.

Agyneia impubes of the Siamese countries. A curious-flowered Euphorbiaceous herb called in Burmah "hta-hmen-ksoke-gyee" (Mason); and from early times, its roots used medicinally by the Karens: — described by Buchanan (Steud.); observed in Burmah by Mason v. 503; and known to grow as far as China (Linn., and Pers.).

Syndesmis Tavoyana of Burmah. A Terebinthoid tree called in Burmah "khyæ" (Mason); its wood from early times made into handsome furniture, by steeping in ferruginous mud rendered jet black like ebony, — as the cylinder knobs one or two inches in diameter worn in the ears of Karen women at Tavoy: observed by Wallich, and Mason v. 514 to 540. The valuable dye-wood called in commerce *Mergui red-wood*, is regarded by Mason as probably identical.

Erythrina toung-ka-theet of Burmah. A fine-looking Leguminous tree called "toung-ka-theet" (Mason); and from early times, selected by the Karens in preference to all others on which to train their betel vines: — observed by Mason v. 523 to 531 not uncommon in the Interior, affording "reddish" timber. The wood of two species of *Erythrina* was found by McClelland to furnish the charcoal for making gunpowder; and according to Mason, "a very tolerable" *gunpowder* is made by the tribes in Northeastern Toungoo, substituting for sulphur "juice of the orange, lime, and some other fruits," which "it is said increases its inflammability."

Dalbergia theet-hsonk-yo of Burmah. A Leguminous tree termed *egg tree* by the Karens (Mason); its hard fine-grained wood known from early times, — "much used for chisel handles:" observed by Mason v. 530 common in the forests.

Paratropia digitata of Southern Hindustan and Burmah. A small Araliaceous digitate-leaved tree called in Malabar "unjala," in Hindustanee "dain" (Drur.), in Burmah "ba-loo-let-wa" (Mason); and from early times, an infusion of the leaves used for many internal diseases by the Karens: — observed by Mason v. 503 indigenous in Burmah. Westward, by Roxburgh, and Wight, on the Circars and Courtallum hills; by Rheede vii. pl. 28, in Malabar, but by Graham in a "garden" at Bombay: according to Drury, "a valuable oil is procured from sections in the trunk."

Marsdenia tinctoria of Silhet and Burmah. An Asclepiaceous plant, from early times known to the Karens. — cultivated by them "and sometimes the Burmese" as affording "quite a good" *indigo-blue dye*; observed by Mason v. 510 indigenous in Burmah. Westward, by Roxburgh, and Wight, indigenous in Silhet, and cultivated in Northern Hindustan for its "superior indigo" (Drur.).

Crawfordia? sp. of the mountains of Burmah. A small herb having the taste and properties of Gentian; and from early times, used in decoction in fevers by the Karens: — frequent according to Mason v. 494 "on the mountains of Toungoo."

Gmelina sp. of Burmah. A Verbenaceous tree, apparently called "yamamee" (Mason); and from early times, its light white wood made into canoes by the Karens in some districts, and by the Burmese into clogs: — observed by Mason v. 526 in the forests.

Laurus (Sassafras) ka-rwae of Burmah. A very large tree called "ka rwae," and by the Karens from its fragrance *tree galanga* (Mason); known from early times: — according to Mason v. 542, scattered sparsely throughout Tenasserim.

Piper ribesioides of Burmah. A kind of *wild betel* called "tau-kwon" (Mason); and from early

"The same year" (Clint.), Joannes the third, after an interval of "more than ten months," succeeded by Benedictus, sixtieth bishop of Rome. Who founded the earliest *monastic Order*, that of the Benedictines. — To the monks of this order, the preservation of many ancient writings is attributed.

"In this year" (Humb. cosm. i.), a *comet*; the fifth one whose orbit is known from Chinese observations.

"575 A. D." (Marius, and Clint.), Sigibert king of the French succeeded by his son Childebert II.

"578, Sept. 26th" (chron. Pasch., and Clint.), Justin II. succeeded by Tiberius Constantinus, eleventh Byzantine emperor.

"The same year" (Nicol.), by a synod in Egypt, Paulus Beth-Ucham Jacobite patriarch of Antioch deposed.

The "katas" of ashy plumage described by Schanfara as flying all night long to reach a pool of water, — doubtless a species of *Pterocles* or long-winged grouse. Flocks of *Pterocles* flying high overhead constitute a marked feature of the Desert, as witnessed by myself in Upper Egypt.

Grewia tenax of Tropical Arabia. Called there "chadar" or "nabba," in which we recognize the long yellow bow of Schanfara, — or the "naba" of which both bows and arrows are made according to a poet quoted by Djewhari, Ebn-Doreid, and the Kamous (De Sacy chrest.): *G. tenax* was observed by Forskal p. cxiv among the mountains of Yemen.

"The same year" (Lib. pontif., and Clint.), Benedictus succeeded by Pelagius the younger, sixty-first bishop of Rome.

"579 A. D." (Theophylact., and Clint.), Second campaign of Mauricius in Persia: and in "March," death of Chosroes, and accession of his son Hormisdas III., nineteenth Sasanid king of Persia.

Barleria noctiflora of Tropical Arabia and the neighbouring Desert portion of Hindustan. Called in Yemen "sokæjt;" the "Dhou-schatth" or "Dhou-tobbak" where gazelles drop their young, mentioned by Taabbata-scharran, — may be compared; "schatth" and "tobbak" being plants giving name to these places, according to Djewhari (De Sacy chrest.): *B. noctiflora* was observed among the mountains of Yemen by Forskal. Farther East, was received from the vicinity of Tanschaur "in aridis" by Linnæus suppl. 290 (Pers.).

"580 A. D." (Nicol.), by a synod at Braine, Gregorius of Tours justified.

"The same year" (Chinese chron. table), end of the Tch'in dynasty.

"581 A. D. = 'kai-hoang,' 1st year of Wen-ti III.," head of the new dynasty of the Soui (Chinese chron. table). He promulgated a new *code of laws*; and among other innovations, wished to introduce the division of the people into four castes — (Pauth. 280).

"The same year" (Clint. iv. p. ix), end of the chronicle of Marius Aventicensis.

"582, Aug. 13th" (Clint. iv. p. 827), Tiberius Constantinus succeeded by Mauricius, now twelfth Byzantine emperor. Learning and the arts were protected and encouraged by Mauricius.

times, its leaves used as a substitute for those of the true betel: — observed by Wallich; and according to Mason v. 495 indigenous in "the Karen forests."

Dioscorea sp. of Burmah. From the size and shape of the root called *elephant-foot yam* (Mason); and from early times, cultivated by the Karens: — observed by Mason v. 464 abundant "in Karen gardens, but is rarely seen among the Burmese or in market," the root white internally.

Dioscorea fasciculata of Tropical Eastern Asia. The *potato yam* is called in the environs of Calcutta "soosnialoo" (Drur.), in Burmah "ka-dwæ-oo" (Mason); and from early times, extensively cultivated by the Karens: — observed by Mason v. 464 "exotic" in Burmah, the root "not much larger than a kidney potato which it much resembles both in appearance and taste." Westward, by Roxburgh, in the vicinity of Calcutta, largely cultivated and a starch made from its tubers (Drur.).

Dioscorea atropurpurea of the Siamese countries. The *dark-purple yam* is called in Burmah "myouk-nee" (Mason); and from early times, cultivated extensively both by Karens and Burmese: — described by Roxburgh; observed in Burmah by Mason, enumerated as indigenous.

Dioscorea damona of Burmah. Called "kywæ" (Mason); and from early times, its root though very acrid eaten with that of other indigenous species by the Karens in times of scarcity: — described by Roxburgh; and observed in Burmah by Mason v. 465. (See *D. pentaphylla*).

Bolbophyllum sunipia of the Siamese countries. An epidendric Orchid called in Burmah "tazeen-ban" (Mason); and from early times, its sweet-scented straw-coloured flowers worn by Karen youths in the lobe of the ear, and by maidens in their hair: — observed by Mason abounding in the jungles. Transported to Europe, is described by Lindley.

"586 A. D." (ann. Jap., transl. Tits.), Bin-dats succeeded by his brother You-meï, now thirty-second daïro of Japan.

"In this year" (Isidor., and Clint. iv. p. 824), at Narbo, Leuvigild Gothic king of Spain succeeded by Recared.

"587 A. D." (Cockayne iii. 447), Æscwine succeeded by his son Sledda; one of the two being the first king of Essex or of the East Saxons.

"588 A. D." (ann. Jap., transl. Tits.), You-meï succeeded by his brother Siou-zioun, now thirty-third daïro of Japan.

"The same year (=15 yrs. after Pegu," Mason 21), in Burmah, the city of Sitang founded.*

* *Murraya* . . . *sp.* of Burmah. The fragrant bark from early times used generally for a cosmetic by the Burmese, — is attributed according to Mason v. 500 to an "indigenous" species (see M. exotica).

Xanthoxylum budrunga of Assam and Burmah. A woody creeper called in Burmah "ka-theet-hsoo" (Mason), and known from early times: — observed in Burmah by McClelland; and suspected by Mason v. 500 to furnish the woody tubercles sold in market as "an inferior cosmetic." Farther North, growing in Assam, its warm spicy seeds having the fragrance of lemon-peel and used medicinally by the natives (Drur.). From transported specimens, described by Decandolle.

Elæodendron Orientale of Burmah. A Celastroid tree called "let-pet-ben," its leaves from early times used by the natives for tea, — was observed by McClelland indigenous, and is referred by him to this species (Mason v. 505). *E. Orientale* from transported specimens is described by Jacq. rar. i. pl. 32, and Jussieu gen. (Pers., and Steud.).

Pongamia tetrapetala of Burmah. A Leguminous tree, known from early times: — observed in Pegu by McClelland, its seeds yielding *karunj* oil, like those of *P. glabra* (Mason v. 504).

Amherstia nobilis of Siam or Tropical China. Leguminous and the most ornamental flowering tree known, called in Burmah "a-thau-ka," and probably by some Buddhist pilgrim — introduced from the Shan States or China (Berdmore) — discovered by Wallich on the Salwen and first made known to Europeans, but observed by Morton seemingly wild "in the neighbourhood of Belin" (Mason v. 400 to 770).

Indigofera sp. of Burmah. An indigo shrub, from early times occasionally used in forming a *blue dye*: — observed by Mason v. 511 indigenous in Burmah.

Desmodium triquetrum of Tropical Hindustan and Burmah. Branching and shrubby, called in Burmah "moke-hso-hlan-ma" (Mason); and from early times, the root valued for its medicinal properties: — observed by Mason v. 503 indigenous in Burmah. Westward, by N. L. Burmann pl. 52, Roxburgh, and Wight, in Hindustan; by Burmann pl. 81, on Ceylon; by Graham, "common" around Bombay.

Cerbera manghas of Tropical shores from Ceylon throughout the Malayan archipelago. An ornamental Apocynous tree called in Tagalo "toctoc calo" (Blanco), in Burmah "ka-lwa" (Mason); and from early times, oil obtained from the fruit by the Burmese for burning and to anoint their heads: — observed by Burmann pl. 70 on Ceylon; by Mason v. 515, abounding in Tenasserim as far as tide-water extends; by Waiz on Java, its leaves and bark similar in action and substituted for senna (Lindl.); by Blanco on the Philippines, not common and hardly known to the natives; and is described by Rumphius ii. pl. 81. A *Cerbera* with white bracts or floral leaves, a medium-sized tree, was observed by myself to all appearance indigenous on the Feejeean Islands, but on the Samoan perhaps introduced, and under cultivation on Taheiti. (See *C. tanghin*).

Wrightia coccinea of Tropical Eastern Asia. An Apocynous timber tree (Roxb.), the most beautiful of its tribe, and its light fine wood known perhaps from early times: — observed by Mason v. 417 to 525 "exotic" in Burmah, planted especially by Europeans, its orange-red flowers exhaling the grateful fragrance of the pine-apple. Westward, by Roxburgh in Hindustan; and from Bengal, was introduced by Nimmo into the environs of Bombay (Graham).

Convolvulus (Lettsonia) setosus of Burmah. A large red-flowered twiner, known from early times: — described by Roxburgh; observed in Burmah by Mason v. 438 to 784, indigenous, and "during the rainy season on almost every hedge."

Clerodendrum fragrans of Tropical Eastern Asia. A Verbenaceous plant, indigenous in the most arid parts of the forests of Burmah (Mason); and the "hnen-eik," apparently only a fragrant double variety, cultivated from early times: — observed by Mason v. 413 to 792. Westward, the "double variety" is enumerated by Graham as "now pretty common in Bombay gardens." Transported to Europe, is described by Ventenat malm. pl. 70, and Jacquin schoenbr. pl. 338 (Pers., and Steud.); and from Europe has been carried to Northeast America, where it continues in green-houses.

Curcuma elata of Burmah. Having a coma of a deep rosy or crimson colour, and known from

Santalum ka-ra-mai of the Siamese countries. An inferior kind of *sandal wood* known in commerce as early perhaps as this date; — produced according to Mason v. 500 “by a tree in the southern part of Mergui.”

“589 A. D.” (Nicol.), a synod at Alexandria. On a dispute between the Jews and Samaritans respecting Deut. xviii. 15.

“The same year” (Steinschneid. i. 4), Chanan, head of a leading Jewish school in Babylonia and the “first to bear the title of Gaon” (meaning excellence).

“590, Sept. 3d” (Clint. iv. p. 841), Pelagius the younger succeeded by Gregorius Magnus, sixty-second bishop of Rome. Who disputed precedence with the bishop of Constantinople.

“Also in September” (Eutyck., and Clint. iv. p. 842), death of Hormisdas III., nineteenth Sasanid king of Persia.

• “The same year” (art de verif.), Japan divided into seven districts.

“The same year (= 4th year of Recared,” Clint.), end of the chronicle of Joannes Biclarisensis.

“591, summer” (chron. Pasch., Theophylact., and Clint. iv. p. 830), Bahram or Vararam defeated by the forces of Mauricius, and Chosroes II. restored as Sasanid king of Persia.

“592 A. D.” (Mason ii. 21), in Burmah, Wemala succeeded by his son Katha as king of Pegu. Katha was devoted to Buddhism; — built monasteries and zayats, excavated tanks, made offerings to the priests, and reigned “seven” years.

Diospyros tau-boke and *D. pen-lay-boke*, “two species of *ebony* in Tavoy,” — the one growing near the sea and called sea-“boke,” the other in the Interior and called jungle-“boke” (Mason v. 542). In seeming connexion with “Bookin,” the name of Madagascar among the Soahili of Zanzibar (see *D. reticulata*).

“March 19th” (Theophylact., Zonar., Theophan., and Clint.), Mauricius on his way to Thrace, and a great *eclipse* of the sun.

“The same year” (M. Russell p. 111), possession of the Arabian and Abyssinian ports acquired by a Persian armament.

Pennisetum dichotomum of the Egyptian and Arabian Desert. A grass called there “tummam” or “thumam” (Forsk.), in which we recognize the “thumam” identified with the “djelit” of Nabega Dhobyani, — alluded to by Lobid as marking an abandoned encampment, mentioned also by Djewhari, and A. A. Elhafits, and by Ebn Baitar as growing in Egypt and the Hedjaz: *P. dichotomum* was observed by Forskal p. 20 frequent in the Arabian Desert, eaten by camels and donkeys, and employed besides for filling in and thatching the walls and roof of dwellings; was observed by Delile in Desert-ravines near Suez; and farther West, the “*Cenchrus rufescens*” of Barbary is regarded by him as perhaps identical.

“593 A. D.” (ann. Jap., transl. Tits.), Siou-zioun succeeded by his sister Soui-ko, widow of his brother Bin-dats and now thirty-fourth dairo of Japan; the first woman who attained that position.

“In the reign of Suiko” (Jap. centen. comm. 60), “the pagoda of the temple of Koriuji, province of Yamato, was built of *bricks*.”

“In the reign of Suiko” (Jap. centen. comm. 83), “the manufacture of *paper*, together with the tree * yielding the best raw material,” introduced by the Corean priest Donchio into Japan.

early times: — received from Burmah by Roxburgh fl. 25; and enumerated by Mason as indigenous there. “From Bengal” was introduced by Nimmo into the environs of Bombay (Graham).

Curcuma petiolata of Burmah. Having small yellow flowers, and known from early times: — received by Roxburgh fl. i. 37 from Pegu; and enumerated by Mason as indigenous. “From Bengal” was introduced by Nimmo into the environs of Bombay (Graham).

* *Broussonetia papyrifera* of Tropical Eastern Asia. The *paper mulberry* is called on Celebes “kaili” (Royle fibr.), in Japan “kodzu,” is cultivated as far as central Nippon, and furnishes material so tough that it is sometimes cut into strips and woven like cloth — (Jap. c. c. 77 to 84): *B. papyrifera* was observed by Kaempfer, and Thunberg, frequent in Southern Japan. Farther East, by myself under cultivation by the natives of the Feejeean, Tongan, Samoan, Taheitian, and Hawaiian Groups, though the bark of other woody *Urticaceæ* was sometimes substituted for beating “tapa” or *paper-cloth*. Even on Celebes, Navarrete in 1658 met with people wearing cloth made “from bark beaten with a stone.” Westward from Japan, paper is said to be sometimes made from the bark by the Chinese; and the “coarse paper” of the peculiarly-folded Burmese books is often furnished by this tree, which is at hand indigenous “in the forest” (Mason v. 522; see *Morus Indica*).

Hibiscus (Abelmoschus) manihot of Subtropical Eastern Asia. Herbaceous, called in Japan “tororo,” and “the gummy infusion of” its root used in making paper — (Jap. c. c. 85). Eastward, was carried to Feejeean Islands, and clearly by Polynesian colonists to the Tongan, Samoan, and Taheitian Islands, as verified by myself; was received by Cavanilles iii. pl. 63 from the “Indiis”

"596 A. D." (Clint. iv. p. 829), end of the reign of Childebert II., king of the French.

"At this time" (Cockayne iii. p. 450) Bercta, daughter of Chariberht king of the Franks, already married to Æthelbryht king of Kent on condition that she have liberty to celebrate Christian worship.

"597 A. D." (Blair), Augustinus with "forty monks" sent by Gregorius Magnus, to Britain, to revive Christianity. Landing at Thanet, he held an interview with Æthelbryht king of Kent; performed service in an old church of Roman times called Berctas; obtained leave to build and restore churches; and recovered an old Roman church for the cathedral at Canterbury (Beda h. e. i. 33, and Cockayne iii. 450).

As early perhaps as this year, Valmiki writing the Ramayana, regarded as probably the oldest work in secular Braminical literature (Wils., and Royle antiq. hind. med. 48). Vrihaspati, Agastya, Kasyapa, Bhrgu, and the priest Vasistha, are mentioned.

Sethia Indica of Tropical Hindustan and Burmah. A small Erythroxyloid tree called in Telinga "adevi gerenta," in Tamil "semmanatty" or "tevdarum," on the Deccan "dewadar" (Drur.); in which we recognize the "deva-daroo" of Valmiki ram. i. 12. — and the "dibdair" described by Ebn Baitar as an Indian herb: *S. Indica* is termed "erythroxyton monogynum" by Roxburgh cor. i. pl. 88; was observed by him, Wight, and Drury, from Malabar and Travancore to the Circars; the young leaves and tender shoots according to Ainslie mixed with gingely-oil and applied as a liniment, and the bark occasionally administered in infusion; the wood excellent and fragrant, substituted in Mysore for sandal-wood (Madr. exh. rep.). Farther East, was observed by Mason indigenous in Burmah.

(Pers.); and from the beginning of the present century has been found along the banks of the Mississippi (A. Dec.). Transported to Europe, is described by Dillenius pl. 156.

Hydrangea paniculata of Japan. Called there "nori-no-ki," and "the gummy infusion of" its root used in making paper — (Jap. c. c. 85): *H. paniculata* was observed and described by Siebold.

* *Pilea speciosa* of Tropical Asia, from Hindustan throughout the Malayan archipelago. A large and beautiful tree called in Tamil "uva-maram," in Telinga "uva-chitta," in Malabar "syalita," in Bengalee "chalita" (Drur.), in the environs of Bombay "moota kurnul" (Graham), and affording sustenance to man in its fruit and thick fleshy calyx-leaflets: the "shleshmatuka" of Valmiki ram. i. 12 — is referred here by Carey and Marshman: *D. speciosa* was observed by Nimmo in "the Southern Concan;" by Rheede iii. pl. 38, in Malabar; by Roxburgh, and Wight, as far as Assam and Chittagong; by McClelland, in Pegu; by Thunberg, on Java; by Blanco, on the Philippines, called in Tagalo "catmon," the acid juice of the fruit serving among the natives for vinegar: and "*D. elliptica*" regarded as not distinct, was observed by Rumphius ii. pl. 45 on Celebes and Amboyna (Pers.).

Nymphaea edulis of Eastern Hindustan. White-flowered with entire leaves, and called in Telinga "koteka," in Bengalee "chhota-sundhi" (Drur.); and from early times, its tubers eaten and employed medicinally, its capsule and seeds also eaten; and the white-flowered lotus having an edible root according to Valmiki iii. 76, — may be compared: *N. edulis* was observed by Roxburgh, and Wight, from the Circars to Bengal (Drur.).

Cratogeomys religiosa of Tropical Eastern Asia? A small tree called in Sanscrit "varana" or "varuna" or "tapia" or "tikta shaka," in Bengalee "tikto-shak," in Tamil "narvala" (J. F. Wats.) or "mavilinghum," in Telinga "maredoo," in Hindustanee "birmi" or "tapia" (Drur.), in the environs of Bombay "varvunna" (Graham), in Burmah "ka-dat" (Mason), in Ylocano "balai namoc" (Blanco); in which we recognize the "tapie" flowers of Valmiki iii. 79 — (transl. Gorr.), and the "varuna" or "tikta" prescribed by Susrutas sutr. 38 to chik. 16, mentioned also by Hariyansa 126: *C. religiosa* was observed by Rheede iii. pl. 42 in Malabar; by Graham, "generally to be met with about temples and Muselman tombs;" by Roxburgh, Ainslie, and Wight, as far as Mysore and Eastern Hindustan. sometimes employed medicinally by the natives (Drur.); by Mason, "exotic" in Burmah; by Blanco, on the Philippines, called "tapia" around Santa Cruz in the Ilocos district, but known besides to the natives; by Forster prodr., on the Society Islands, planted near the abodes of the dead. the same as in India (Graham).

Flacourtia cataphracta of Tropical Hindustan. A thorny tree called in Bengalee "paniyala," in Hindustanee "talisputri," in Telinga and Malabar "talishaputri" (Drur.), in Tamil "thalisaputhee-ree," in Sanscrit "talisha" or "vidara" (J. F. Wats.); in which we recognize "talisi" on the mountains mentioned by Valmiki iv. 44 — (transl. Gorr.), and the "talisa" or "vidara" prescribed by Susrutas sutr. 46 to chik. 17: *F. cataphracta* was observed by Rheede v. pl. 38 in Malabar; by Roxburgh, and Ainslie, as far as the Warree country, Behar, Assam and Nepal, the fruit edible, the leaves and young shoots bitter and astringent, and employed medicinally (Drur.).

Pterospermum suberifolium of Tropical Hindustan. A tree called in Sanscrit "mucha-koonda" (Pidd.), in the environs of Bombay "muchucunda" (Graham): flowering "pterispermi" are men-

Wrightia antidysenterica of Tropical Hindustan and Burmah. Its bark is called in commerce *conessi*, its imported seeds in Arabic "lissamul asafir," in Persian "ahir," and the living shrub in Sanscrit "cheeree" or "kutaja," in Tamil "veppalei," in Telinga "pala codija" or "manoopala"

tioned by Valmiki ram. iii. 76 to 79 — (transl. Gorr.), and the "muchucunda" is prescribed by Susrutas chik. 18: *P. suberifolium* was observed by Nimmo in "the Concans," its flowers fragrant.

Shorea tumbagaia of Southern Hindustan. A large Dipterocarpous tree called in Malabar "tembagum," in Tamil "tumbugai" (Drur.); and from early times, its valuable timber used in house-building: possibly the "shoree" distinguished from the "sale" by Valmiki v. 54 — (transl. Gorr.): *S. tumbagaia* was observed by Roxburgh, Wight, and Beddome, in the "Palghaut forests, Cuddapah, North Arcot," a dammer exuding from the trunk (Drur.).

Xanthochymus pictorius of Western Hindustan. A Calophylloid tree called in Telinga "iwaramemadee," in Hindustanee "dampel" (Drur.); and "xanthocymi" are mentioned by Valmiki ram. iii. 79 — (transl. Gorresio): *X. pictorius* according to Roxburgh cor. ii. pl. 196, Wight, and Drury, grows in the Concan, its yellow orange-like fruit eaten, and before ripening yielding a gamboge-like resinous gum that "makes a pretty good water-colour."

Dalbergia frondosa of Western Hindustan. A pinnate-leaved tree thirty feet high, its bark and leaves from early times employed medicinally, and an oil obtained from its seeds: possibly included in the "dalbergie" trees of Ceylon mentioned by Valmiki v. 16 — (transl. Gorr.): *D. frondosa* was observed by Roxburgh, Wight, and Drury, from Travancore to Courtallum.

Pueraria tuberosa of Tropical Hindustan and Burmah. A woody Leguminous climber called in Telinga "daree" or "goomodee" (Lindl.); and the "hedysaro" enumerated among woody plants by Valmiki vi. 96 — (transl. Gorr.), may be compared: *P. tuberosa* was observed by Kaempfer pl. 25, Roxburgh, and Wight, in Hindustan, its roots made by the natives into cataplasms to reduce swellings in the joints (Drur.); by Graham, as far as Bombay, having the habit of *Desmodium* but "running over high trees;" by Mc Clelland, in Burmah, its root esculent and termed by him *Batraj yam* (Mason v. 465).

Bauhinia racemosa of Tropical Hindustan. A small crooked tree with rigid branches called in Bengalee "bun-raj," in Telinga "arree" (Drur.); and from early times, the bark of its green branches made into ropes: the "bauhinie" is mentioned by Valmiki iv. 29 — (transl. Gorr.): *B. racemosa* was observed by Graham "common on the Ghauts and hilly parts of the Concan" from beyond Bombay; by Roxburgh, and Wight, as far as Mysore and Bengal, its thick bark used by matchlock-men for their matches, which as prepared burn "long and slowly" (Drur.).

Bauhinia Vahlia of Tropical Hindustan. An immense woody climber, its branches one hundred to three hundred feet long running over the highest trees, called in Telinga "adda," in Hindustanee "mahwal" (Drur.), in the environs of Bombay "chambaour" or "chamboolee" (Graham); and from early times, its large leaves a foot in diameter sold for dishes, its seeds eaten, and ropes made from its bark: included perhaps in the "bauhinie" of Valmiki iv. 29: — *B. Vahlia* was observed by Graham on "the Tull ghaut" and in "ravines at Kandalla" near Bombay; by Roxburgh, and Wight, in mountainous districts of the Circars and Bengal, its ropes occasionally used for suspension bridges over the Himalayan mountain-torrents (Royle, and Drur.).

Barringtonia racemosa of Tropical Eastern Asia and the Malayan archipelago. A Gustavioid tree having large flowers in pendulous racemes and called in Tagalo "potat" (Blanco), in Tamil "samutra-pullum," in Malabar "samudra-poo" or "sam-stravadi" (Drur.); from early times, its slightly bitter root prescribed by Hindu physicians: "barringtonie" are mentioned among flowering trees by Valmiki iii. 79 — (transl. Gorr.): *B. racemosa* was observed by Rheede iv. pl. 6 in Malabar; by Graham, and Nimmo, in "the Concans" as far as Bombay; by Ainslie, Roxburgh, and Wight, as far as Coromandel, the root "not unpleasant," and considered by the natives "aperient, deobstruent, and cooling" (Lindl. and Drur.); was observed by Blanco frequent in places inundated by the sea or by fresh water on the Philippines; the "white-flowered" species called "kyai-gyee," observed by Mason in Burmah, may also be compared.

Barringtonia acutangula of Tropical Hindustan and the Siamese countries. A large tree called in Telinga "karpa," in Malabar "sjeria-samstravadi" (Drur.), in Burmah "kyai-tha" (Mason); and perhaps included in the "barringtonie" of Valmiki. iii. 79: — the "nichula" of Susrutas chik. 16 to 19, is referred here by Hessler: *B. acutangula* was observed by Rheede iv. pl. 7 in Malabar; by Gibson, Law, and Graham, "thinly scattered throughout the Ataveesy," but around Bombay "in gardens;" by Roxburgh, and Wight, as far as Travancore and Bengal, its root and seeds employed medicinally (Powell punj., and Drur.), and according to M'Clelland its wood is hard and of a fine grain and equivalent to mahogany; was observed by Mason indigenous in Burmah.

Ixora bandhuka of Tropical Hindustan. A spreading shrub called in Sanscrit "bandhuka" or

(Ainsl.), or "kutajamu" (J. F. Wats.) in the environs of Bombay "koora" or "inderjot" (Graham); in which we recognize the "kutaja" of Valmiki ram. i. 18, — Bhavabhuti mal. 9, furnishing according to Kalidasa ragh. xix. 37 wreaths of flowers, and prescribed medicinally by Susrutas: W. antidysen-

"bandhujivamu" or "bandhujivakamu" (J. F. Wats.), in the environs of Bombay "buckoollee" (Graham): mentioned by Valmiki v. 74 — (transl. Gorr.); and the "nipa" freshly blooming of the Mrichchhakati 5, having flame-coloured flowers according Harivansa 66, staining with their pollen according to Kalidasa ragh. xix. 37, prescribed medicinally by Susrutas, is referred here by Hessler: I. banhuka was observed by Rheede ii. pl. 13 in Malabar; by Graham, in the Southern Concan as far as Bombay, common but "generally under the shade of other bushes;" by Roxburgh, in other parts of Hindustan.

Verbesina calendulacea of Tropical Hindustan and Ceylon. A creeping yellow-flowered triennial called in Bengalee "keshoorya," in Tamil "postaley-kaiantagerai," in Telinga "patsoo-poola-goontagalijeroo," on the Deccan "peelabhungra" (Drur.); and from early times, its leaves seeds and flowers employed medicinally: possibly the "verbesine" of Valmiki iii. 79 — (transl. Gorr.): *V. calendulacea* was observed by Rheede x. pl. 42 in Malabar; by Graham, in "moist places throughout the Concans," to and beyond Bombay; by Roxburgh, and Wight, as far as Coromandel and Bengal (Drur.); by Burmann pl. 22, on Ceylon.

Symplocos ferruginea of Tropical Hindustan. A tree called in Sanscrit "lodhra" (J. F. Wats.); and the "symplochi" of the Himalaya mentioned by Valmiki iv. 44 — (transl. Gorr.) may be compared; also the "lodhra" of Bhavabhuti mal. 9: *S. ferruginea* is described in the hort. Bengalensis; and was observed by Honigberger, probably in the vicinity of the Northern Tropic.

Symplocos racemosa of Tropical Hindustan. A tree called in Bengalee "lodh," in Telinga "loduga" (J. F. Wats.); and possibly the "symplochi" of Valmiki iv. 44: — the "lodhra" of Bhavabhuti mal. 9, Susrutas sutr. 6 to chik. 1 and kalp. 4, furnishing according to Kalidasa kum. vii. 9 a powder mixed in oil, mentioned also by Harivansa 126, is referred here by H. H. Wilson and others: *S. racemosa* was observed by Roxburgh, and Fleming, from the Western Ghauts and Kotah jungles to Bengal, its bark used to dye red, and exported (Don fl. nepal., and Drur.). A very beautiful tree, called "hoora" and perhaps not distinct, was observed by Murray "on the table land of Mahableshwur" (Graham).

Echites (Chonemorpha) macrophylla of Tropical Eastern Asia. A splendid woody climber with large white flowers (Graham); and the "echite" of Valmiki iv. 29 — (transl. Gorr.), may be compared: *C. macrophylla* was seen by Rheede ix. pl. 5 and 6 in Malabar; was "introduced by Nimmo in 1833" into the environs of Bombay (Graham); and is enumerated among the plants of Hindustan by Roxburgh fl. ii. 13. Farther East, "an indigenous creeper" yielding *caoutchouc* of excellent quality, was seen by Parish in Tenasserim, and is regarded by him as probably "*E. macrophylla*" (Mason v. 523).

Convolvulus (Calonyction) bona-nox of Eastern Hindustan and Burmah. The *moon flower* is called in the environs of Bombay "gool" or "chandnee" or "soma deva" (Graham), in Burmah "nway-ka-zwon-a-phyoo" (Mason): the moon enlivening the nocturnal flowers, is mentioned by Valmiki ii. 1; — the rising moon dear to the night-flower, by Bhavabhuti uttar. 5; the night-flower whose fragrance is stifled by the day-star, and the "oskadhi" whose flowers are kindled by the moon, by Kalidasa sacont.: *C. bona-nox* was observed by Rheede xi. pl. 50 in Malabar; by Graham, "in gardens Bombay," the flowers "three to six inches in diameter" and pure white, "open at sun-set and close up the following morning;" by Roxburgh, Long, and Drury, common everywhere in other parts of Hindustan, the bark of the root used by the natives as a purgative; by Mason v. 437 to 783, indigenous in Burmah, and cultivated besides for its snowy blossoms. By European colonists, was carried to Western Equatorial Africa (Benth. fl. nigr. 465): and to Tropical America (Sloane pl. 96, Pers., and A. Dec.). Transported to Europe, is termed "buenas noches" by Clusius exot. 44 (Spreng.), "ipomaea bona-nox" by Linnæus.

Justicia (Rhinacanthus) nasuta of Western Hindustan. A poor looking shrub four to five feet high, called in Sanscrit "yoothica-purnee," in Bengalee "jooi pana" (Lindl.), in Hindustanee "palek-joohie," in Tamil "nagamully," in Telinga "nargamollay" (Drur.); and from early times, its leaves root and seeds employed to cure ringworm: the "pluksha" wood on which sacrifices were made, also the "purnin" of Valmiki ii. 12, — may be compared: *R. nasuta* observed by Rheede ix. pl. 69 in Malabar; by Graham, "in gardens," and wild on "the rocky part of the Rotunda ghaut, Mahableshwur;" by Ainslie, Roxburgh, Wallich, Royle, and Wight, as far as Travancore (Drur.); by Mason, "exotic" in Burmah.

Cordia angustifolia of Western Hindustan. A tree with slender drooping branches and sub-opposite leaves called in Tamil "narroovalli," in Telinga "nukkeru," in Hindustanee "goond" (Drur.), in the environs of Bombay "goond" or "goondnee" (Graham); and from early times, its

terica was observed by Rheede i. pl. 47 in Malabar; by Graham, "very common on the Ghauts and hilly parts of the Concan;" by Roxburgh, Royle, and Wight pl. 439, in other parts of the peninsula as far as Chittagong, its seeds highly valued by the natives in dysenteric affections (Drur. 245); by

fruit eaten, its tough wood used for carriage-poles, and strong ropes made from its bark: included perhaps in the "cordie" trees of Ceylon by Valmiki v. 17—(transl. Gorr.): *C. angustifolia* was observed by Gibson, and Graham, at Bombay and "about villages in the Deccan and Guzerat;" by Buchanan, in Mysore.

Cordia Macleodii of the Godavery forests. A tree called in Telinga "botka," in the Jubbulpoor forests "deyngan" (Drur.); and its very beautiful wood known from early times: included perhaps in the "cordie" trees of Ceylon by Valmiki v. 17—(transl. Gorr.): *C. Macleodii* according to Beddome, and Drury, "is abundant in the forests near Mahadeopur but does not extend to the Circars," is "supposed" to be the "*Hemigymnia Macleodii*" of Griffith.

Vitex altissima of the mountains of Ceylon and Southern Hindustan. A large ternate-leaved tree, its timber valued from early times: "vitici" are mentioned among flowering trees by Valmiki iii. 79—(transl. Gorr.): *V. altissima* was observed by Roxburgh, and Drury, "somewhat common in subalpine forests;" was received by the younger Linnæus from Ceylon; and apparently the same species was seen by Graham in the Bombay district, in a ravine near Nagotnah.

Vitex alata of Western Hindustan. A small ternate-leaved tree called in Malabar "maileloa" (Rheede); and from early times, its timber valued: included perhaps in the "vitici" of Valmiki iii. 79:—*V. alata* was observed by Rheede v. pl. 1 in Malabar; by Law, at Duddi in the Southern Mahratta country, and by Graham on hills near Bombay; by Rottler, Roxburgh, and Drury, as far as Tranquebar.

Myristica Malabarica of Western Hindustan. A species of *wild nutmeg* tree called in Malabar "panam palea" (Rheede), its fruit hardly aromatic, but an oil obtained from it from early times applied medicinally: "myristiche" are mentioned among the trees of Hindustan by Valmiki v. 74—(transl. Gorr.): *M. Malabarica* observed by Rheede iv. pl. 5 in Malabar; by Nimmo, in "S. Concan" (Graham), nearly as far as Bombay; by Waring pharm. ind., and Drury, in the forests of Travancore.

Amaranthus frumentaceus of Southern Hindustan. Called in Tamil "poong-kirai" (Drur.); and from early times, cultivated for the flour of its seeds as an article of diet; and possibly the "amaranti" of Valmiki iii. 79—(transl. Gorr.): *A. frumentaceus* was observed by Buchanan, Roxburgh, and Wight, from Mysore to the Coimbatore district, where it is extensively cultivated (Drur.).

Curcuma aromatica of Hindustan. Called by English residents *wild turmeric*, in Hindustanee "jungle-huldee," in Bengalee "bun-huldee" (Drur.), in the environs of Bombay "bun-huldi" or "apavisha" or "vishabs" or "nirbishi" or "ca-nirvisha" (Graham); and "wild turmeric" is enumerated by Carey and Marshman among the ten drugs in the "survoushudhee" of Valmiki ii. 1:—*C. aromatica* was observed by Graham "in moist shady places throughout the Concans," its roots "sold in the bazars and used as a perfume;" by Roxburgh, Wight, and Drury, in the Travancore forests and from Malabar to Bengal.

Saccharum spontaneum of Tropical Hindustan and Burmah. A reed called in Hindustanee "kagara," in Bengalee "kash," in Telinga "relloogaddy" (Drur.), in the environs of Bombay "kerpa" (Graham), in Burmah "thek-kay-gyee" (Mason); and seems the species pointed out to W. Jones as. res. iv., in a clump of which according to the Puranas the Hindu god of war was born: the "kasha" is mentioned by Valmiki ram. ii. 24—*S. spontaneum* was observed by Rheede xii. pl. 46 in Malabar; by Graham, in the environs of Bombay, "ten or twelve feet" high, having "a very graceful appearance with its large feather-like panicle;" by Roxburgh, in Bengal, the bright silvery wool around the base of the flowers making "a most conspicuous and gaudy appearance," its leaves eaten by buffaloes, used also for mats and for thatching houses (Drur.). Farther East, is very abundant along the banks of the Irrawady forming "a striking object in the landscape" (Roxb.); was observed also by Mason v. 524 in Burmah, one of the two grasses employed in the Interior for thatching native dwellings. (See *S. sara*).

Arundo (Trichoon) karka of Tropical Hindustan. A reed called in Sanscrit "dhumuna" or "nuda" or "nula" or "potugula," in Hindustanee "nal" or "nul" (J. F. Wats), in Bengalee "nar nul," in Telinga "naga sara" or "maitantos" (Drur.), in the environs of Bombay "null" (Graham): mentioned by Valmiki v. 74—(transl. Gorr.); the "d'hamana" or "nada" or "nala" or "potagala," by Susūtas sutr. 29 to chik. 35; and the third Gangetic monarch of Orissa measured his kingdom with "nal" reeds (Hunt. oriss. i. 318): *A. karka* was observed by Royle in Scinde, the stems made into chairs, and flower-stalks beaten to fibres called "moonyah" used for strings and ropes; by Graham, on "the banks of rivers and tanks" in the environs of Bombay; by Retz obs. iv. 21, and Roxburgh, as far as Bengal, the common "durma" mats at Calcutta made of the split stems (Drur.)

Burmah pl. 77, on Ceylon; by Mason v. 479, indigenous in Burmah, and its bark used medicinally. By European colonists, was carried to the Mauritius Islands (Lindl., not mentioned by Bojer). Its bark called in commerce *conessi*, "has been introduced into European practice on account of its astringent febrifugal qualities" (Lindl.).

Asclepias (Calotropis) gigantea of Tropical Hindustan. Called in Bengalee "akund," in Telinga "nella-jilledoo," in Tamil "yercum," in Malabar "yerica," in Hindustanee "mudar" or "ark" (Drur.), in the environs of Bombay "arka" or "akaree" or "rowee" (Graham), in Burmah "ma-yo" (Mason), in Tagalo "capal capal" (Blanco); in which we recognize "searching for the herb 'acun' but only desire its milk" of the Ramayana — (transl. W. Jones), honey in the "arkka" flower of a Sanscrit proverb (Wils. edit. Sankh. karik. 11), and the "arka" yielding milk prescribed by Susrutas sutr. 36 to chik. 1 to 25: *C. gigantea* is termed "madorius" by Rumphius vii. pl. 14 auct. 24; was observed by Rheede ii. pl. 31 in Malabar; by Graham, "common everywhere" as far as Bombay, its powdered root "given to horses," and according to Twemlow an intoxicating liquor called "bar" obtained from the plant by "the hill people about Mahableschwur;" by Ainslie, Roxburgh, and Wight, throughout the peninsula, employed for various medicinal and economic purposes, and according to Royle yielding a kind of manna called mudar-sugar (Drur.); was observed by Mason "exotic" in Burmah; by Blanco, on the Philippines, white-flowered. The plant according to Lindley furnishes the singular substance by Duncan called *mudarinc*, "possessing the property of coagulating by heat and becoming again fluid by exposure to cold." (See *C. procera*.)

Datura metel of Tropical and subtropical Asia. A species of *thorn-apple* called in Egypt "el-nefyr" the trumpet (Del.), in Yemen "mandj" or "bendj" (Forsk.), in Sanscrit "datoura" (A. Dec.), in Bengalee "dhootora," in Hindustanee "sada-dhatoora," in Telinga "tella-oomatie," in Tamil "vellay-oomatay" (Drur.), in Burmah "pa-daing-phoo," in Tagalo and Pampango "talamponai," in Bisaya "tacbibung" (Blanco); and the "dature" of Valmiki ram. iv. 29 — (transl. Gorr.) may be compared: *D. metel* is termed "stramonium indica" by Rumphius v. pl. 87 (Buchan linn. trans. xiv. 232); was observed by Rheede ii. pl. 28 in Malabar; by myself, around Bombay; by Graham, "among rubbish about villages all over the country" and "fatally used by Bombay thieves" "to deprive their victims of the power of resistance;" by Ainslie, Roxburgh, Wight, and Drury, throughout Hindustan, employed also medicinally; by Mason, "exotic" in Burmah and frequent "around native dwellings;" by Loureiro i. 110, in Anam; by Blanco, on the Philippines, its leaves "algo vellosas." Westward from Hindustan, the "jawz methil" of Gafeki grows according to Ebn Baitar in Africa and Spain and has "a large white flower:" *D. metel* was observed by myself in waste places on Zanzibar; by Forskal, among the mountains of Tropical Arabia; by him, and myself, frequent in waste places in Egypt; by Belon, and Chaubard, on Crete and the Peloponnesus; by Matthioli pl. Gussone, Moris, and Boissonade, naturalized on Sicily, Sardinia, the Canary Islands (Pers.), and in Southern Spain. By European colonists, was carried to America where it has become naturalized in Mexico, around Guayaquil, and in Southern Brazil (Cham., Dunal, Sellow, and A. Dec.). *D. fastuosa*, with "frequently double flowers," the "krishnad'hattura" or "krurad'hurtaraka" of Susrutas according to Hessler, and "zamr el-sultan" sultan's trumpet of Egypt (Del.), observed by Rheede ii. pl. 29 in Malabar, by Graham as far as Bombay, by Ainslie, Roxburgh, and Buchanan, in other parts of Hindustan, by Mason "exotic" in Burmah, and by Blanco on the Philippines, is regarded as probably not distinct. (See *Hyoscyamus muticus*.)

Vitex negundo of Tropical Hindustan. A large shrub called in Arabic "fenjengisht" (J. F. Wats.), in Sanscrit "sindoowara" or "sindooka" or "indrasoorusa" or "indranika" or "nirgoondi," in Bengalee and Hindustanee "ni-sinda" (Lindl.), in Telinga "wayala," in Tamil "vellay noochie" (Drur.), in the environs of Bombay "neergoonda" (Graham): "vitici negundi" are mentioned by Valmiki v. 74 — (transl. Gorr.); the "phenegsenkeset," by Avicenna; the "sinduvara" by Kalidasa kum. iii. 53, its flowers substituted for pearls, is mentioned also by Susrutas: *V. negundo* was observed by Rheede ii. pl. 12 in Malabar; by Graham, "in large patches both in the Concan and Deccan," as also by myself; by Buchanan, Roxburgh, and Wight, as far as Deyra Dhoon and Bengal, its root fruit and leaves employed medicinally by the natives, the dried leaves smoked by the Moham-medans in cases of headache and catarrh (Drur.).

Vitex trifolia by some writers regarded distinct, its leaves hoary beneath, is called in Telinga "neela vayalie," in Tamil "neer-noochie" (Drur.), in Burmah "kyoung-ban" (Mason); was observed by Rheede ii. pl. 11 in Malabar; by Roxburgh, and Ainslie, as far as Coromandel, its root fruit and leaves also employed by the natives medicinally (Drur.); by Burmann pl. 109 on Ceylon; by Mason v. 413 to 479 "exotic" in Burmah and "much cultivated" by the natives, the leaves applied in "diseases of the spleen." Farther East, was observed by Blanco common along the seashore of the Philippines, called in Bisaya "gapasgapas," in Ylocano "dangla," in Tagalo "lagundi," its leaves used by the natives medicinally; is termed "lagondium vulgare" by Rumphius iv. pl. 18 as observed on the Moluccas.

"The same year" (. . . Cockayne iii. 453), Sledda succeeded by his son Sæberht as king of Essex. — He was converted and baptized in "604."

"From the Sixth century" (Julien, and Pouchet), *wood-engravings* in use among the Chinese: — and "from the end of the Fourteenth century," in Holland.

Manuscripts of the "end of the Sixth century" (De Wailly pl. ii. 5), presenting the following form of the letter *y*.

600 A. D. = "525 an. jav." (of Adi Mang'gala = omitting the two kings of Guj'rat "491 + 2 + 27 + 5 years" of Nata Kasuma, Raffles ix. and x.), death of Jaya Misana, and founding of Brambanan the "first capital of Java" by Sawela Chala. Who came with a fleet of vessels from Guj'rat and made an alliance with Aru Bandan "recently arrived from the Moluccas," to whom he confirmed the "eastern provinces including Balambangan." — The temples at Brambanan "are stated to have been constructed during" the first three reigns "by artists invited from" Hindustan, and (as appears from the very extensive ruins) are exclusively Braminical.

One hundred and forty-seventh generation. Jan. 1st, 601, onward mostly beyond youth: the Chinese historian Li-yan-tcheou (Klapr.): the Arab poets Tarafa, Lebid, Antar, Zohair, Amru, and Hareth (six of the seven authors of the Moallakat preserved at Mecca), Ascha d. 628-9: the Greek grammarian Joannes Philoponus; Secundus historian of the Lombards; the Greek writers, Joannes of the Climax, Anastasius Sinaites, Joannes Moschus: the Latin ecclesiastical writer Jonas Hybernas of England (Alst. p. 404).

"The same year = 'jin-cheou,' 1st year of Wou-ti VII., of the Soui" or Fourteenth dynasty — (Chinese chron. table).

"The same year" (Alst. p. 369), Hesychius or Isychius bishop of Jerusalem enumerating various evidence of the truth of Christianity in his "Commentary on Leviticus."

Pterocarpus dalbergioides of Tropical Eastern Asia. Called in commerce *Andaman red wood*, in Telinga "erra-vegisa" (J. F. Watson); and the crimson "andami" wood of Zohair — may be compared: *P. dalbergioides* is described by Balfour for. ind. 196.

"The same year" = "20th year of Mauricius" (Clint. iii. p. 574), the last year marked in the Alexandrian chronicle: — the chronicle ending "Nov. 22d" in the following year.

"602, Nov. 23d" (Clint. iii. p. 574), Mauricius succeeded by Phocas, thirteenth Byzantine emperor. Who issued an edict for the "baptism of all the Jews in his dominions" (. . .).

"603 A. D." (Bed. hist. eccl. i. 34), by Aedilfrid king of Northumbria, the Scots defeated at "Degsastan" i. e. "Degsa lapis," and compelled to quit English territory. The name of the battle-field includes an early example of an English word.

"604 A. D. = 4th year of the 'jin-cheou' of Wou-ti VII." (Chinese chron. table), beginning of the Fifty-fifth cycle.

"In the time of the Soui" (topog. Cant., and Pauth. 473), Chinese ambassadors sent to the surrounding nations. "Mention is also made of a tribe Mozin" (Ainos) "living in the mountains Northwest of" Japan (Sieb. elucid. Vries p. 122).

"In the reign of Suiko" (Jap. centen. comm. 116), "the first notions concerning *gardening*" introduced by a Corean into Japan.

"March 12th" (Clint.), death of Gregorius Magnus, sixty-second bishop of Rome. He was succeeded by Sabinianus.

"605 A. D. = 'ta-ye,' 1st year of Yang-ti, of the Soui" or Fourteenth dynasty (Chinese chron. table). He constructed the Southern and earliest portion of the Great canal; from Hang-tcheou North, as far as Hoai-ho in Kiang-nan (Pauth. 280 and 365).

"The same year" (Nicol.), a synod at Canterbury; "to confirm the foundation of the abbey of St. Peter and Paul, the first" one built in England.

"606 A. D." (Alst., Blair, and Nicol.), precedence granted by Phocas to the bishop of Rome. And Sabinianus succeeded by Bonifacius the third, now made head-bishop of the Christians, or arch-bishop. A column standing in the Roman forum, has recently been ascertained to be dedicated to the emperor Phocas (Hillard trav. in Ital. x. 3).

"607 A. D." (Alst., and Nicol.), at Rome, Bonifacius the third succeeded by Bonifacius the fourth, second archbishop.

"610 A. D." (Pauth. 282), by the emperor Yang-ti, an expedition sent against the Lieou-khieou (Loo-choo) Islands: and "more than five thousand" of the islanders of both sexes transported into China. A treaty of peace also concluded with the Coreans, recognizing their independence.

"The same year" (Alst. pp. 346 and 392), in a synod at Rome, the institution by the fourth Bonifacius of "All the saints" festival; after, by leave of the emperor, removing from the Pantheon the statue of Cybele, and substituting the Virgin Mary.

"Oct. 5th, Monday" (Clint. iv. p. 827), Phocas slain. He was succeeded by Heraclius, fourteenth Byzantine emperor.

"Dec. 23d" (Percev. i. 409), Mohammed commencing his mission.

Cissus glandulosa of Tropical Arabia. Sometimes but improperly called in Yemen "haluæk" or "hælvæk" (Forsk.): the plant with juice resembling honey in taste and consistence but of a very strong savour, supposed to have given rise to a passage in kor. 66 — (Al Zamakh, and Al Beidawi), may be compared: *C. glandulosa* is described by Forskal p. 34 as observed by him in Yemen, its tuberous roots called "mimiæ" sweet to the taste, but leaving behind a burning sensation on the tongue.

Inga sassa of Abyssinia. The account by Mohammed kor. 56 of "talh" trees loaded from top to bottom with their produce — may include the "sassa" of Abyssinia; observed by Bruce trav. v. pl. 4 and 5 exuding gum in such quantity as to appear deformed by the size of the concretions. This gum examined by Guibourt is classed by him among the false tragacanth (Lindl.). The "samgh arabi" brought according to Forskal mat. med. from the Hedjas, and from Nigritia by the way of Sennar, may be compared. (See *Acacia gummiifera*.)

Laurus (Camphora) officinarum of Formosa and Japan. Knowledge of the drug *camphor* is implied by the "cafur" fountain of Mohammed kor. 74 — (Al Beidawi, and others): "cafur" is mentioned also by Meseab, Mesarguil, Ebn Masawia, Maserjawia, Isaac Ebn Amran, Rhazes, Elbasri, Mosih, Avicenna, Serapion, and Ebn Baitar; "kamphōra," by Leo Medicus iii. 1, and Matthæus Sylvaticus (Hase); "kaphōra," by Symeon Sethus, and Michael Psellus; oil of camphor by Symeon Sethus (Alpin. bals. 5); and according to Clot-Bey the living tree has been recently introduced into Egypt. Eastward, the drug camphor is mentioned by the Sanscrit writer Bhavabhuti malat. vi. 3; was met with by Marco Polo 157; was known to Masudi as the product of a tree growing in the Indian seas and China (Ebn Wafid); and according to Reeves (med. bot. trans. 1828), is chiefly produced on the island of Formosa, and brought in very large quantities to Canton to be distributed. *C. officinarum* was observed by Kaempfer, and Thunberg, growing abundantly in Japan, and called "sjo" or usually "kus-no-ki" or "damo" or "surno-fa." By European colonists, was carried in 1833 to the environs of Bombay (Graham); and at different times to other "warm parts of the world," where it continues under cultivation (Lindl.).

"611, May" (Theophan., and Clint.), Syria invaded by the Persians.

Coix lachryma of Tropical Eastern Asia. A reedy grass called in Britain *Job's tears* (Prior p. 127), in France "larme de Job" (Fée), translations of "dima Ayoub" the current name in Egypt (Forsk., and Del.), in Egyptian ΤΕΛΛΕ tears — (ms. Par. 44 p. 381): the current name containing a Scriptural allusion, seems to imply the Early Christian period of Egypt: *C. lachryma* was observed by Forskal growing spontaneously around Cairo. Northward and Westward, the "xulōmakarōs kōēkōis" is mentioned by Leo medicus v. 10 (Erm. p. 220): *C. lachryma* is described by Dodoens, Lobel, Clusius, and Bauhin hist. ii. 450; is cultivated in Italy, France, and Spain, especially in convent gardens (A. Dec.), and has become naturalized on Sicily and the Canary Islands (Guss. ii. 568, and Webb). Eastward from Egypt, has a Sanscrit name (Pidd.); was observed by Rheede xii. pl. 70 in Malabar, and called "cafre" infidel; by Graham, "in rice fields, margins of tanks etc, both Concans, Deccan. and Guzerat;" and is termed "*lachryma Jobi indica*" by Rumphius v. pl. 75. Farther East, was observed by Mason "exotic" in Burmah and called "ka-le-thee," by Blanco, well known to the natives on the Philippines, and called in Tagalo "tigbi;" by Kaempfer, and Thunberg, frequent in Southern Japan and called "iokui" or "iokui nin," or usually "dsud-sudama;" by myself, carried by natives to the Feejeean, Tongan, and as far as the Samoan Islands. By European colonists, was carried to Madeira, where it has become naturalized (Webb); to Northeast America, where it continues in gardens.

Coix, possibly a distinct species. — The "ka-le-pouk-pouk" or *coix millet*, according to Mason v. 476 to 522 is "cultivated very extensively by the Red Karens" of Burmah, and its large seeds are "parched" and "often for sale in the bazars:" other varieties or species are also cultivated, and their seeds used for embroidering and ornamenting dresses.

"612 A. D." (Royle antiq. hind. med. p. 74), death of Warka son of Naefal, who is mentioned in the Koran, and who first translated the Old Testament into Arabic.

"613 A. D." (Blair), by Clotaire II., "mayres du palais" instituted as regents of the French kingdoms united by him.

"614 A. D." (Alst. p. 346), a synod of Bavarians, French, and Burgundians. Against the new ceremonies through which Columbanus and Gallus were beginning to oppress the people, contrary to the institutions of their forefathers.

"June" (Chron. Pasch., and Clint.), the forces of Heraclius defeated, and Jerusalem captured by the Persians. — "A year afterwards" (Kitt. bibl. cycl.), "peace was concluded," and "Heraclius entered Jerusalem in solemn state."

"615 A. D." (Alst., and Clint.), at Rome, Bonifacius the fourth succeeded by Deodatus, third archbishop.

In this year (= "5th year of Heraclius and 4th year of Sisibut," Isid.), in Spain, the Jews baptized by order of the Gothic king Sisibut. The latest event mentioned in the Chronicle of Isidorus Hispalensis, — who died "April 4th, 636" (Sm. b. d.).

Alchemilla arvensis of Europe and the adjoining portion of Asia. A small annual called in Britain *breakstone* or *parsley-breakstone* from being administered against calculus, or *parsley-piert*, in France "percepiere" (Coles, and Prior); and the ΣΑΧΙΨΡΑΓΑ of Isidorus breaking up stone in the bladder — (Braunsw. transl. Ort. San.), may be compared: the "percepiere" was seen by Lobel n. stirp. 324 near Bristol in England: *A. arvensis* is termed "a. montana minima" by Tournefort inst. 508; is known to grow from Denmark throughout middle Europe (fl. Dan. pl. 973, and Pers.); and was observed by Sibthorp, and Chaubard, in cultivated ground from the Peloponnesus to Constantinople. By European colonists, was carried to Northeast America, observed by myself naturalized in the Delaware peninsula, by Chapman in "waste places North Carolina and Virginia."

Cneorum tricocon of the West Mediterranean countries. The ΚΙΤΟΚΑΤΙΔ of Isidorus xvii. 9. 65, — and Hildegard ii. 141, is referred here by Dodoens p. 363: *C. tricocon* is described also by Matthioli p. 871; and is known to grow in Italy, Southern France, Barbary, and Spain (Lam. ill. pl. 27, Pers., and Spreng.).

Utricularia vulgaris of Northern climates. Called in Britain *bladder-wort* (Prior): the ΤΥΦΥΣ ΗΕΡΒΑ inflating itself out of the water, of Isidorus xvii. 9. 101, — may be compared: *U. vulgaris* is described by Lobel pl. 791 (Spreng.); is termed "millefolium aquaticum lenticulatum" by C. Bauhin pin. 141; was observed by Gussone in Sicily, by Savi in Italy, by Brotero in Portugal, and is known to grow throughout middle Europe as far as Britain and Ireland (Pers., and Engl. bot. pl. 253). Eastward, was observed by Sibthorp in the Peloponnesus; and is known to grow in middle Asia (A. Dec.). Farther East, was observed by Drummond at Cumberland House Lat. 54° in central North America; by E. James, along the Platte (Torr.); by Nuttall, along the Arkansas; and is known to grow throughout our Atlantic States as far as North Carolina (Pursh, A. Gray, and Chapm.).

"About November" (Percev. i. 388), by advice of Mohammed, sixteen of his partisans, "twelve men and four women," to avoid persecution escaping to Abyssinia. They were soon joined by others, making in all "eighty-three men and eighteen women;" and the Abyssinian king, on hearing extracts from the Koran, protected the refugees and refused to deliver them up to the Coraysh envoys.

"616 A. D. (= 12th year 'tai-nie' of Yang-ti," Remus.), Tchín-la or Cambodia beginning to send tribute and ambassadors to China.

"In this year" (Theophan., and Clint.), Egypt once more invaded by the Persians. Who capturing Alexandria and establishing themselves there, — held possession of the country ten years.

About this time (Sharpe), arrival in Alexandria of the Syrian bishop Thomas, to correct the Syriac version of the New Testament made a century before by Philoxenus. He compared the gospels with three Greek manuscripts in the monastery of St. Anthony: and his corrected Edition, is the last effort in sacred criticism attempted at Alexandria or in any part of the East.

"Black *amberggris*" of "the purest fragrance" is mentioned by a poet — quoted in the Arab romance of Antár (Hamilton's vers. i.). The "ambar" of Haly Abbas, Temimi, Avicenna, Serapion, Symeon Sethus, Edrisi, and Ebn Baitar, is referred by F. Adams to amberggris: and according to Marco Polo 189 to 192, "la balenne fait l'anbre," abounding at "Scotra," some islands between there and Hindustan, also at "Zanghibar," and "Madeigascar." The perfume is further noticed by Paludanus; is known to be chiefly brought from the shores of the Indian Ocean; and according to Beale and others, is derived from the *sperm whale*, *Physeter*.

"617 A. D. (= 13th year tai-nie," Remus. mel. i. 77), ambassadors bearing tribute sent from Cambodia to China. They were received with honour by Yang-ti.

"In this year" (Blair), refusal of peace by Chosroes II. of Persia; unless Heraclius "would abandon Christianity and adore the sun."

"The same year" (Nicol.), at Rome, Deodatus succeeded by Bonifacius the fifth, fourth archbishop.

"The same year" (Cockayne iii. p. 449), Æthelbryht succeeded as king of Kent by his son Eadbald. — Who followed the ancient custom of marrying his father's second wife: but on being converted by Laurentius, abandoned the connexion (Bed. ii. 6).

"In this year = 'y-ning,' 1st year of Koung-ti II., of the Soui" or Fourteenth dynasty (Chinese chron. table): the last ruler of the Soui dynasty.

"Under the Soui dynasty and in the time of Dagobert king of the Franks" (Humb. cosm. iv.), Chinese maps of the country between the Yellow river and Caspian, on which the Kuen-lun and Thian-shan mountain-chains are delineated (but according to the Biograph. univers., Dagobert began to reign "in 622").

"618 A. D. = 'wou-te,' 1st year of Kao-tsou II., head of the new dynasty of the Thang"—(Chinese chron. table).

"622, July 16th, Friday" (Blair, and Nicol.), the *Hejira*, or Mohammedan Era. The flight of Mohammed from Mecca to Medina on the "68th day" afterward, is fixed to "Sept. 21st, fourteen days before the 12th year of Heraclius was ended" (Clint.). At this time, Oman under the rule of Habkar and Abd, descendants of Julanda (Abulfed., and Badger edit. Salil-ibn-Razik p. 7).

"The same year" (Theophan., and Clint.), successful campaign of Heraclius, as far as Armenia, where his army wintered. Georgius Pisides accompanying this expedition.

"623, April 20th" (Theophan., and Clint.), Heraclius and his army entering Persia. At the end of the campaign he wintered in Albania.

The poet Ascha on his way to join Mohammed induced by the Koreisch tribe to change his purpose—(De Sacy chrest.).

Plumieræa gen. . . . of Burmah. The "lances of Alkhatt" mentioned by Ascha,—Djewhari, and in the Kamous, and the letter of the Karmatians to the Egyptian sultan. made according to De Sacy at Alkhatt on the coast of Bahrein from wood imported from India. The "myet-hna-ban" tree was observed by Mason p. 543 not uncommon at Tavoy, the "timber possessing the properties of lancewood" and called in commerce *Tenasserim lancewood*. A kind of wood called "myet-hna-ban" was found by Berdmore "used in making furniture, bows, etc."

"624 A. D." (Theophan., Cedren., and Clint.), after a victory, Heraclius and his army winter in the enemy's country.

"In this year" (Sm. b. d. ii. p. 404), the remaining portion of the Greek dominions in Spain and on the opposite coast of Africa appropriated by the Gothic king Suinthila.

"625, March" (Theophan., and Clint.), Heraclius and his army crossing the Euphrates. After this campaign, he wintered near the Halys.

"626 A. D." (Alst., and Nicol.), at Rome, Bonifacius the fifth succeeded by Honorius, fifth archbishop. Who is "accused by the Greeks of favouring the Monothelites."

"July 29th" (Geo. Pisid., Theophan., and Clint.). Constantinople assaulted by Slaves, Huns, Scythians, Bulgarians, and Medes, all in alliance with the Persian king; the assault continued "ten" days, the enemy retiring on "Friday, Aug. 8th." Heraclius absent for three years, had planned the defence by letter; and invited the Chazars or Eastern Turks, who passing the Caspian Gates now enter Persia.

"627 A. D. = 'tching-kouan,' 1st year of Tai-tsoung, of the Thang" or Fifteenth dynasty (Chinese chron. table). A treatise by this emperor, on the art of government, is extant.*

"In or about this year (= beginning of the years tching-kouan," Remus. i. 84), Fou-nan annexed by Cha-li-yi-kin-na, king of Cambodia.

"628, Feb. 28th" (Chron. Pasch., and Clint.), Chosroes II. slain. Succeeded by Siroes as Persian king. The war with Persia having now terminated, Heraclius and his army returned in the "7th year" to Constantinople.

Death of Chosroes, the latest historical fact recorded by Theophylactus Simocatta†—(Yule cathay i. p. li).

"May 15th, in the eighteenth year of Heraclius" (Clint. iii. p. 594), end of the Paschal Chronicle.

"629 A. D." (Clint.), Siroes succeeded by Adeser as Persian king; and before the close of the year, by Toorandokht.

"The same year" (Theophan., Eutych., Clint. and Plate in Sm. b. d.), Heraclius on his way to Jerusalem met by an ambassador from Mohammed, and summoned to embrace the new religion. As a matter of condescension, Heraclius entered into a treaty of friendship:—which was soon broken by the Arabs.

"In this year" (ann. Jap., transl. Tits.), Soui-ko succeeded by Zio-meï, grandson of Bin-dats and now thirty-fifth daïro of Japan.

Other plants suitable for making paper discovered in Japan as early perhaps as this year, as the

* *Magnolia yulan* of China. The yu-lan began to be cultivated under the Thang dynasty,—is mentioned by Han-pao-tcheng, and Li-chi, and under the Ming dynasty was brought from the South to Pekin; its buds are preserved, and are used medicinally, also to season rice (Cibot in mem. Chin. iii. 443). Transported to Europe, is described by Desfontaines, Correa, and Salisbury; and from Europe, was carried to Northeast America, where it continues in gardens in our Middle States.

† *Cupressus patula* of Japan. The "nodding cypresses" lining the banks of the two great rivers flowing through Khubdan (Singanfu in the Chinese province of Shensi), described to Theophylactus vii. 9,—may be compared: *C. patula* is described by Thunberg 265 as observed by him in Japan (Pers., and Steud.).

"kaji" (*Broussonetia kaji-no-ki*, S.) "but seldom used now;" the "gampi *Wickstroemia canescens* Meisn., or *Passerina gampi*, S. and Z.)" yielding "a fibre of particular beauty and fineness, used mostly for the best writing and printing paper;" the "mitsumata (*Edgeworthia papyrifera*, S. and Z.);" the "karasz-sugi, a kind of *Cryptomeria*;" "a sort of wild cherry (*Pseudo-cerasus*);" the "kawayanagi (*Salix japonica*);" the "hanzi (*Lespedeza cyrtobotria*, Miq.);" and the "niga-ki (*Picrasma ailanthoides*, Planch.); the bark of all these trees and shrubs" used—(Jap. centen. comm. 84).

"630 A. D." (Theophan., Cedren., Zonar., and Clint.), Heraclius at Hierapolis, conferring with Athanasius the Jacobite patriarch.

"631, Apr. 9th (= 219 years of the Naci = 73 series of 3 years," Percev. i. 413), commencement of the 10th year of the Hejra, in which the Naci Era was abolished by Mohammed.

"632 A. D." (R. H. Major in soc. Hakl., and Gildem. p. 43), three years after leaving home, the Chinese traveller Hiouen-thsang entering Guzerat; where Dhruvasena or Dhruvabhata was reigning, the successor of Sridharasena II.—and predecessor of Sridharasena III. He returned to China in "645" after an absence of "seventeen years" in the Western countries, principally in Hindustan.

Smilax china of China, Corea, and Japan. Called in commerce *china-root* (Lindl.), in Japan "sankira" or "bakats" or usually "kuakuara" (Thunb.); and the "fo-ling" known to Hiouen-Thsang 10*—is referred here by Stanislas Julien: *S. china* was observed by Kaempfer, and Thunberg, in Japan, growing about Papenberg and Kosido, and employed medicinally; is known to grow also in Corea (chin. geogr. transl. Klapp.); and in "wild places in China among fern and brambles," its root eaten by the Chinese as invigorating (Lindl.). Westward, the imported root first became known in Europe "in 1535" (C. Bauhin pin.); is mentioned by Vesalius, Amatus Lusitanus, Garcias, Monardes, and Linschoten; continues to be sold in the drug-shops of Europe (Lindl.); and was observed by Alpinus, and Forskal mat. med., employed medicinally in Egypt:

"June 8th" (Abulf., and Clint.), death of Mohammed. He was succeeded on the same day by Abubekr; and the proposed expedition into Syria was delayed a month.

Nageia Arabica of the mountains of Yemen. Called there "katam," in which we recognize the "katam" employed with henné for staining himself by Abubekr—(Desverg. arab.): the "katam" is mentioned also by Abu Hanifa, Gafeki, and Ebn Baitar; and *N. Arabica* was observed on the mountains of Yemen by Forskal p. 159.

"June 16th" (Blair, and Clint. iii. p. 368 and iv. p. 240), *Era of Yazdejerd*, "3624 days after the Hejira;" commemorating the accession of Yazdejerd III. as Persian king.

"633, Aug. 12th" (letter of Khaled to Abubekr, and Clint.), battle at Ajnadin in Syria, gained by the Muslims under Khaled.

One hundred and forty-eighth generation. May 1st, 634, onward mostly beyond youth: the Jewish writer, Abu Hafs Jezid of Yemen: the Greek mathematician Stephanus; the ecclesiastical writers Maximus Confessor, and Eligius; the poet and historian Georgius Pisides (Blair); the Greek writer Theophilus Protospatharius; Hadrianus bishop in Scotland; Esaias the abbot; Dado or Audoenus.

"Aug. 23d" (Blair, and Clint.), Damascus captured by the Muslims, and on the same day, death of Abu-bekr. He was succeeded as khalif by Omar; who is supposed (Wilkinson theb. and eg. p. 533) to have used the Persian Sasanid dies for his *coins*, adding his own name.

635 A. D. = "9th year of the 'tching-kouan' of Tai-tsong" (inscript. at Si-ngan-fou, Pauth. 297, and Yule cath.), Christianity brought into China by a Nestorian named O-lo-pen—(compare Ulpianus). The sacred books were translated into Chinese; and a decree in favour of the new religion obtained from Tai-tsong three years later is preserved in the same Inscription.

"November" (Clint.), in Syria, Hems or Emesa besieged by the Muslims under Abu Obeidah, and a truce granted to Heraclius for a year.

"In this (= 14 A. H. comm. Feb. 24th) or the following year" (Gildem. p. 36), Basra on the Euphrates near its entrance into the Persian Gulf, founded by khalif Omar.

* *Smilax lanceafolia* of the Eastern frontier of Bengal. Called in Hindustanee "gootea-shook-china" (Lindl.); and probably the species seen by Hiouen-Thsang,—for the root according to Roxburgh is not to be distinguished from china-root, and is much used by the natives, the juice of the fresh tuber taken inwardly and the refuse applied externally in rheumatism (Lindl., and Drur.).

Smilax glabra of Sylhet and the Garrow country on the frontier of Bengal. Called in Hindustanee "hurina" or "hurina-shook-china" (Lindl.); and possibly also seen by Hiouen-Thsang:—its root according to Roxburgh is not to be distinguished by the eye from china-root, and at the present day is used in decoction by the natives of Sylhet and the Garrow country in sores and venereal complaints (Lindl., and Drur.).

The Mahabharata, a Sanscrit epic poem on the wars of the Pandus, hardly earlier than this date. *Solanum melongena* of Equatorial Africa. The *brinjal* or *egg-plant* is called in France "aubergine" (A. Dec.), at Constantinople "mélisana" or by the Turks "patlisana" (Forsk.), at Aleppo "melanzana" (Rauw.), in Egypt and Yemen "badindjan" (Forsk.), in Hindustanee "badanjan" or "baingan" (Pidd.), in Sanscrit "bhuntakee" (Wall), in Telinga "wankai," in Tamil "valoothalay" (Drur.), in Burmah "kha-yan" (Mason), in Tagalo "talong" (Blanco): the "melongene" is mentioned in the Mahabharata i. 1020 to 2197—(transl. Pavie 91): *S. melongena* was observed by Rheede x. pl. 74 in Malabar; by Graham, around Bombay "extensively cultivated for the sake of its fruit," and "next to the potatoe perhaps" the "most useful of Indian vegetables;" by Roxburgh, and Drury, cultivated "all over India;" by Mason, "exotic" in Burmah; by Loureiro, in Anam; by Blanco, universally known to the natives on the Philippines; is termed "trongum hortense" by Rumphius v. pl. 85. Westward from Hindustan, the "badinschan" is mentioned by Ebn Masawia, Rhazes, Avicenna, Serapion, Edrisi, Ebn Baitar, and Makrizi: *S. melongena* was observed by myself cultivated and naturalized on Zanzibar; is known to be also cultivated in Western Equatorial Africa (Benth. fl. nigr. 473); was observed by myself in Yemen, the fruit in market at Mocha; by Forskal, under cultivation in Yemen and Egypt; by Rauwolf in 1574 in gardens at Aleppo; by Forskal, and Chaubard, cultivated at Constantinople and in Southern Greece; is described also by Dodoens pempt. 458, and C. Bauhin pin. 167. By European colonists, was carried to the Mauritius Islands (Boj.); to the West Indies (Hughes), and our Southern and Middle States, where it continues abundantly cultivated.

"636, November" (Clint.), battles on the river Yermouk, continuing several days and deciding the fate of Syria in favour of the Muslims.

"637 A. D." (Blair, and Clint.), Jerusalem captured by the Muslims; and death of Sophronius, the last bishop there.

"The same year" (Clint.), the Muslims under Saëd ravaging Persia, and the Persians defeated by them in a great battle near Jaloulah; Yazdegerd III. retiring to the Persian city of Ferganah.

"638, before July 4th" (Clint.), flight of Heraclius from Antioch, followed some weeks later by the surrender of the city to the Muslims. Other cities surrendering, the conquest of Syria was completed "six years" after the death of Mohammed.

"Not before September" (Clint., and Nicol.), edict of Heraclius in favour of the Monothelites. It was confirmed by a synod at Constantinople.

"In this year" (Biograph. univers.), end of the reign of Dagobert, king of the Franks.

"638 or 639 A. D." (Mason iii. 43), the *Burman era* established by king Poukpasau:—in use among the Burmese to the present day.

"639 A. D." (Clint.), pestilence in Syria, the Muslims losing "twenty-five thousand" men, including Abu Obeidah; who was succeeded by Moawiyah as lieutenant in Syria. "June 6th," a Muslim army under Amrou entering Egypt.

"640 A. D." (Elphinst. iii. 3), a Chinese traveller writing in this year, that Pataliputra on the Ganges "was a mass of ruins," when visited by him.

"In this year" (Klapr. mem. ii. 360), the Chinese attacking the Kao tchhang or Ouigour, and meeting with success, built there the city of Thing tcheou, — from "702" called Pe thing tou hou fou, and identified by Klaproth with Ouroumtsi and Bich-balik.

"The same year" (Nicol., and Clint.), at Rome, Honorius succeeded by Severinus; and before the close of the year, by Joannes the fourth, seventh archbishop.

Cassia acutifolia of Nubia and Tropical Arabia. Among articles deposited in ancient Egyptian tombs as early probably as this date, leaves and fragments of *senna* — have been met with (Wilk.): the drug *senna* is mentioned by Abix, Abu Ziad Elarbi, Serapion the elder, Abi Solt, Abu Hanifa, Honain, Hobaisch, Rhazes, Haly Abbas, Ebn Amran, Edrisi, and Mesue: "zinôphullôu" or "zênô-phullôu" is mentioned by Theophanes Nonnus 173, "sēnē" by Demetrius Pepagomenus podagr. 34, and Actuarius (Bernard), and "senna alexandrina sive foliis acutis" by C. Bauhin pin. 397. The proper Alexandrian *senna*, called in the drug-shops of Egypt "sena lesan el-a'sfour" or "sena sa'ydy," was found by Delile to consist of leaves of *C. acutifolia*, and the living plant was observed by him near Syene on the border of Nubia: was observed by Forskal p. cxi and 85 in Tropical Arabia, collected in large quantities in the district of Abu arish; and the stored *senna* in the warehouses of Mocha and Muscat was found by myself to consist exclusively of this species. Farther East, "*C. elongata*" according to Graham "indigenous in Goozerat," and observed in Interior Hindustan by Roxburgh, and Royle ill. pl. 37, is regarded by Wight as perhaps not distinct and only naturalized (Lindl.).

Acacia heterocarpa of Nubia. Also pods of this tree — (Champoll.-Figeac 157), called at present "faraeh:" the fruit of "fara ufarfara" is enumerated by Forskal mat. med. as frequently employed in sickness as a fumigatory, and he was informed that the tree occurred in gardens at

Cairo: pods of *A. heterocarpa* were found by Delile in the drug-shops of Egypt, and he met with the living tree near Kosser on the Red Sea.

"Dec. 22d, Friday" (Eutyeh., Elmak., Clint., and Marcel.), Alexandria captured by Amrou; the Muslims now obtaining possession of Egypt. They appear to have been hailed as deliverers from a foreign yoke.

IX. THE EARLY MUSLIM PERIOD.

The disposal of the collective agricultural produce of Egypt, throws light on many historical events. The corn of Egypt, fed armies: and in the days of Xerxes, was indispensable to his movement against Greece (compare Herodot. vii. 25). At a later period (see Jos. bell. Jud. iv. 10. 5), it formed an element in making and unmaking Roman emperors. But from the time when the Muslims entered Alexandria, European rulers ceased to control the corn of Egypt.

The further establishment of the *pilgrimage to Mecca* tended to increase the intercourse between India and Europe; now altogether in the hands of the Muslims. There remained indeed some choice of routes, between the Euphrates and the Persian Gulf: but living Tropical plants, perhaps without exception, reached the Mediterranean by the way of Egypt.

In *monumental history*, there is now a striking change, in the exclusion from Muslim countries of representations of external objects: the moon and stars only excepted. — In Egypt, this ceasing of "image-making," marks an epoch in the annals of mankind.

In regard to Europeans, Egypt seems withdrawn from their knowledge; — and for more than eight hundred years. During which interval indeed, Europe supplies very little light on her own condition: the records of European nations, the Greeks and Italians excepted, hardly extending as far back as the Muslim conquest; and in general, the popular mind is everywhere limited to the national Literature.

"In or about this year" (Cockayne iii. 447), the abbey of Folkstone founded by Eanswith, daughter of Eadbald king of Kent: — She was buried in this abbey.

"641, Feb. 11th, Sunday" (Niceph., and Clint.), death of Heraclius. He was succeeded by his son Constantinus III.; "May 24th," by another son Heracleonas; and before the close of the year, by a third son Constans.

A Japanese *coin*, "said to be 1135 years old," — presented in 1776 to Thunberg iv. p. 123. With others respectively "758, 748, 718, 651, 596, and 566 years old," it was "of *copper*, with a square hole in the middle."

"The same year" (Chinese annals transl. by De Guignes, Elphinst. iii. 3), arrival in China of ambassadors "from Ho-lo-mien, of the family of Kie-li-tie, a great king in" Hindustan: * (neither the king's name, nor that of the dynasty, has been identified).

"642 A. D." (Clint.), Joannes the fourth at Rome succeeded by Theodorus, eighth archbishop.

"In this year" (ann. Jap., transl. Tits.), Zio-meï succeeded by his widow Kwo-gok, now thirty-sixth daïro of Japan.

"643 A. D." (Clot-Bey), at Fostat, near the site of Cairo, a mosque built by Amru: of which, from frequent repairs, "a very small portion of the original" remains. Another mosque built by Amru at Assuan, is in better preservation; and presents the usual round arches at that time in vogue in the Mediterranean countries (Wilk. Theb. and Eg. p. 310 and 455).

Myristica moschata of the Moluccas. Called in Persian "*jouz-bewa*" (Lindl.); in which we recognize the "*jawz buwwa*" of Ahrun, — Ebn Masawia, Miscaben, Albasari, Rhazes, Isaac ben Amran, Serapion (F. Adams), Avicenna, and Ebn Baitar: *nutmegs* are known to have been at first imported overland into Europe, and are mentioned under the name of "*karua arōmatika*" in the addition to Aetius, also by Symeon Sethus (Spreng.). Eastward, were seen by Marco Polo 163; are called in Sanscrit "*jīy-phalu*," in Bengalee "*jati phal*" or "*jayphal*," in Hindustanee "*jaephāl*" (D'rozar.), and the living tree introduced was observed in Hindustan by Roxburgh cor. iii. pl. 274, and Graham. Farther East, *M. moschata* is enumerated by Mason as "*exotic*" in Burmah and called "*za-te-pho*;" but is known to be indigenous in the Moluccas, growing especially on Banda (Rumph. ii. pl. 4). The nutmeg has not as yet been successfully cultivated beyond its natural limits; one sex only occurring among the trees introduced by the Arabs into Zanzibar up to the time of my visit.

* *Bassia butyracea* of Nepal and Eastern Hindustan. The *Indian butter-tree* called in Bengalee "*phulwara*" (Drur.), and known from early times: — growing on the Almora hills and in Nepal (Roxb. res. asiat. viii. 477, Don fl. nep. 146, and Royle); and according to Drury, its fruit is eaten, the kernels yield a pure vegetable butter called "*choorie*" sold at a cheap rate, and sugar made from the flowers is also sold in the Calcutta bazaar.

In this year ("22 A. H., comm. Nov. 29th 642," Gildem.), Khorasan subdued by the Muslim general Ahnaf ben Kais. Ubaidalla is said to have advanced as far as the Indus, but could not obtain permission from Omar to cross the river.

"644 A. D." (art de verifier des dates, and Blair), Omar slain in the temple at Jerusalem, which he had converted into a mosque. He was succeeded by Othman, third khalif.

"645 A. D." (ann. Jap., transl. Tits.), Kwo-gok abdicating (the first instance in Japanese history), succeeded by her brother Ko-tok, now thirty-seventh daïro of Japan.

"648 A. D." (Blair), conquest of Cyprus by the Muslims under Mu'awiyah.

"The same year" (Clavig., and Humboldt), entrance of the Toltecs upon Anahuac or the Mexican table-land. The Toltecs were acquainted with word-painting, communicating intelligence by paintings: — they built roads, cities, and the Great teocalli or pyramid at Cholula, after the model of the more ancient teocallis at Teotihuacan.

Among the tribes of Northwest America, the "medecine men" always mere sorcerers,* the healing art proper being in the hands of old women — (R. Brown jun.).

* *Clematis Douglasii* of the sources of the Columbia. Known to the natives from early times, — its root placed by them in the nostrils of exhausted horses (R. Brown jun.): observed by Douglas at the sources of the Columbia (Hook.).

Geranium sp. of Interior Oregon. Its root from early times used among the Lilloets of British Columbia to prevent women bearing children — (R. Brown jun.).

Psoralea physoides of Interior Oregon. Leguminous, and from early times employed by the natives medicinally, as a poultice — (R. Brown jun.): observed by Douglas from the Rocky mountains to the Great falls of the Columbia (Hook.).

Rubus leucodermis of Northwest America. Its berries from early times collected and dried by the natives — (R. Brown jun.): observed by Douglas.

Philadelphus Lewisii of Oregon. A species of *mock-orange*, a shrub, its leaves from early times used by the natives as a substitute for soap — (R. Brown jun.): observed by Clark on the North branch of the Columbia; and according to Hooker, growing in pine woods.

Philadelphus Gordonianus of Oregon. Its leaves also used by the natives from early times as a substitute for soap — (R. Brown jun.).

Lewisia rediviva of the unwooded portion of Interior Oregon. Called "petlum-ard-ilse-nemare," and from early times its root boiled and eaten by the Kootanie, Colville, and other tribes — (R. Brown jun.): observed by Clark on the North branch of the Columbia (Pursh); by Nuttall on the Flat-head river; by myself, towards the Spokane conspicuous in the distance, its large flower rising out of the bare ground at intervals, like a land Nymphæa.

Ribes niveum of Northwest America. Its berries from early times collected and dried by the natives — (R. Brown jun.). From transported specimens, described by Lindley.

Eulophus ambiguus of Interior Oregon. An Umbelliferous plant, its root called *white biscuit root*, from early times collected and dried by the natives — (R. Brown jun.): on the hills of the Upper Yakima, our party fell in with a body of natives engaged in digging biscuit root, and procuring a supply, found advantage from it before reaching our destination: described by Nuttall, as observed on the Flat-head river.

Peucedanum feniculaceum of Interior Oregon. An Umbelliferous plant, its root also from early times eaten by the natives — (R. Brown jun.): observed by Nuttall.

Valeriana sp. of British Columbia. Called "kunko," and from early times used by the M'Leod Lake and other Takali tribes in rheumatism — (R. Brown jun.).

Symphoricarpos racemosus of Interior North America. The *snowberry*, a shrub from early times in British Columbia used medicinally about Lilloet in colds — (R. Brown jun.): observed by Michaux at Lake Mistassins; by Short, in Kentucky; by Nuttall, from Niagara to Lake Huron and the Missouri; according to A. Gray, grows "from Western Vermont to Pennsylvania and Wisconsin:" according to Hooker, as far as the Saskatchewan and Columbia; and was received by Decandolle from Nootka. Has become a favourite ornamental plant in gardens.

Salix Scouleriana of Oregon. The *cottonwood willow*, canoes from early times sometimes made from it — (R. Brown jun.). From transported specimens, described by Hooker.

Thuja gigantea of the Rocky mountains. The *Oregon arbor-vita*, canoes made from it, its bark textile, and its twigs smoked as a substitute for tobacco — (R. Brown jun.): observed by Nuttall among the Rocky mountains.

Pinus contorta of Interior Oregon. From early times used by the natives for torches, and its liber or inner bark in times of scarcity eaten in the passes of the Rocky mountains — (R. Brown jun.).

"649 A. D." (Alst., Clint., and Nicol.), at Rome, Theodorus succeeded by Martinus, ninth archbishop.

"650 A. D. = 'young-hoeï,' 1st year of Kao-tsoung, of the Thang" or Fifteenth dynasty — (Chinese chron. table). He continued to patronize Olopen and the new religion (Christianity).

Polygonum tinctorium of China. The large flat stone and large round mallets, used in procuring the blue dye of the "nimi-lan," and celebrated by ancient poets, — are referred here by Cibot (mem. chin. v. 499): *P. tinctorium* was observed by Loureiro in China; and "*P. Chinense*" called "ai" or "itadori," and yielding a blue dye like indigo, was observed by Thunberg around Nagasaki in Japan. By J. Blake "in 1776," *P. tinctorium* was carried to England (Ait. ii. 51); and from France, according to Clot-Bey and Figari, has recently been introduced into Egypt.

"In this year" (ann. Jap., transl. Tits.), Ko-tok dying, the government resumed by the empress Kwo-gok, now under the name of Zai-meï as thirty-eighth daïro of Japan. The first instance in Japanese history of the same person reigning twice.

"651 A. D." (Plate in Sm. b. d.), naval expedition by the Muslims against Sicily. Rhodes captured by them, and the celebrated *colossus* sold and broken up.

"In this year" (Bed. hist. eccl. iii. 25 and chron.), Aidan succeeded by Finan as bishop of the Scots. On the island of Lindisfarne, Finan built a church suitable for the episcopal see, but after the Scottish fashion of hewn oak timber roofed or thatched with "*harundine*" (*Phragmites communis*).

Psamma arenaria of the seashore of the Mediterranean and North Atlantic. Called in Britain *bent* or *sea-reed* or *mat-weed* from its use in making mats, or *maram* from the Gaelic "*muram*" or Frisian and Danish "*marhalm*" sea-straw (Prior): the "*foeno*" used in the thatching — is referred here by James Raine, the same material being used on Lindisfarne to the present day; "*bent*" is mentioned in Account Rolls of 1344-5 and 1346-7 (G. Johnston east. bord.): *P. arenaria* is termed a "*grassie* or rather *rushie reede*" by Gerarde p. 39, "*gramen spicatum secalinum maritimum maximum spica longiore*" by Tournefort inst. 518; was observed by Desfontaines in Barbary, by Brotero in Portugal, and is known to grow on the Atlantic seashore as far as Lapland and Iceland (Moris. viii. pl. 4, Pers., Hook., and Wats.). Eastward, was observed by Sibthorp, and Chaubard, in the maritime sand of the Peloponnesus; and by Delile, on the Mediterranean shore of Egypt. Westward from Iceland, is known to grow in Greenland (Wats.), Newfoundland (Lapyl.), on the shores of Lakes Michigan and Superior (A. Gray), and on our Atlantic sea-beaches, ceasing as observed by myself in about Lat. 39°.

"653 A. D." (Cockayne iii. p. 447), Sigeberht succeeded by Sigeberht II. the Good, as king of Essex of the East Saxons; a dependent on Oswin king of Northumbria.

"About this time, 650 to 655 A. D." (Pauth. 301), war carried by the Muslims into the region of the Oxus; and an ambassador sent by them to the Chinese emperor.

"654 A. D." (Alst., and Clint.), at Rome, Martinus succeeded by Eugenius, tenth archbishop.

About this time ("650 to 660 A. D.," Assem. iii. 1. 127, and Gildem. 59), letter in Syriac from the Nestorian Yeshuyabus Adiebenus, complaining of interruption of communion with the Persian and Indian churches.

The *Mrichchhakati*, the earliest Sanscrit drama, written before self-immolation by burning, and intermarriage of Bramins with Sudra females, were prohibited; Buddhist mendicants and convents continuing throughout Hindustan.

Pinus Sabiniana of Oregon. Its seeds from early times eaten by the natives — (R. Brown jun.): observed by Douglas.

Allium reticulatum of Oregon. A wild onion, its root from early times eaten by the natives — (R. Brown jun.): observed by Nuttall.

Gamassia esculenta of Northwest America. Called "*gamass*," and from early times its onion-like bulb eaten by nearly all the tribes from the Rocky mountains to the Pacific — (R. Brown jun.): observed by Lewis and Clark on the Upper Missouri near the Rocky mountains (Pursh).

Brodiaea grandiflora of Oregon. From early times its root eaten by the natives — (R. Brown jun.). Transported to Europe, described by Smith (Steud.).

Erythronium grandiflorum of Interior Oregon. From early times, its root eaten by the natives, regarded also as a love-philtre — (R. Brown jun.): observed by Lewis and Clark on the Kooskoosky river (Pursh), now called Clearwater; and by N. Wyeth, on his first journey to the Pacific (Nutt.).

Fritillaria lanceolata of the Rocky mountains. From early-times, its root eaten by the natives — (R. Brown jun.): observed by Lewis and Clark at the sources of the Missouri and Columbia (Pursh).

Trillium ovatum of Interior Oregon. Its root from early times used by the natives for a poultice — (R. Brown jun.): observed by Lewis and Clark at the rapids of the Columbia (Pursh); by Nuttall, on the Rocky mountains and Flat-head river.

Siva and the unwieldy Mahadeva emblem are mentioned in the Mrichchhati i and iv.: the deg-hop or dome-like stone emblem of the Braminical cave-temples appeared to me unprovided for in the original construction of those temples, and inserted at a subsequent period. Some approximation to the date may be inferred from one of the Elephanta cave-temples, filled with earth and thus concealed until shortly before my visit, but found on clearing to contain a deg-hop.

Garcinia pictoria of the mountains of Tropical Hindustan and Burmah. A tall tree called in Sanscrit "tamala," in Telinga "tamala-chettu" or "tamalamu" (J. F. Wats.), in Tamil "mukki" (Drur.), in Burmah "tha-nat-dau" (Mason); in which we recognize the "tamala" tree of the Mrichchhakati 5, — and of Jayadeva, termed lofty by Kalidasa ragh. xiii. 15 to 49, and prescribed medicinally by Susrutas: *G. pictoria* was observed by Cleghorn, in Mysore along the Western Ghats at the elevation of from two to three thousand feet; by Roxburgh, and Wight, as far as the high mountain-lands of Wynaad; by Mason v. 481 and Journ. as. 1847, in Burmah, abounding on the hills bordering "the valley of the Tavoy river," and one of the two trees yielding the *gamboge* of commerce. (See *G. elliptica*.)

Clitoria Ternatea of the mountains of Madagascar and the Mauritius Islands. A twining herbaceous plant having Sanscrit names (Roxb., and Pidd), and called in Malabar "shlongo kuspi" or "shunkoo-pushpa," in Telinga "nulla-ghentana," in Tamil "karka kartun," in Bengalee "upara-jita," in Hindustanee "khagin" (Drur.), in Burmah "oung-mai-phyoo" (Mason), in Tagalo "colocantang" (Blanco); and the "blue clitoria" is mentioned as a garden flower in the Mrichchhakati 4* — (transl. H. H. Wils.): the "kumari" or "gavakshi" or "girikarni" or "sveta" or "hansapada" prescribed by Susrutas chik. 8 to 30, is referred here by Hessler: *C. Ternatea* was observed by Rheede viii. pl. 38 in Malabar; by Graham, in gardens "hedges and jungles everywhere" in the environs of Bombay; by Roxburgh, Wight, and Drury, common in other parts of the peninsula; by Mason 413 to 479, "exotic" in Burmah and only naturalized, its root "emetic;" by myself, in the Malayan archipelago; by Blanco, frequent throughout the Philippines, the pods sometimes eaten and the flowers used for dyeing blue; the flowers on Amboyna according to Rumphius v. pl. 31 used to tinge boiled rice a cerulean color. Westward, is known to occur in Tropical Arabia (A. Dec.); was observed by Bojer on the mountains of Madagascar, Mauritius, and Bourbon. By European colonists, was carried to the West Indies, where it continues in cultivated ground, observed on Cuba, Barbadoes, and St. Thomas (Humb., Maycock, Schlecht., and A. Dec.).

Jasminum fruticans of the Southern border of the Caspian. The *yellow jasmine* is called by the Turks "sari-jasemin" (Sibth.), in Sanscrit Hindustanee and Bengalee "hema-pooshpika" (J. F. Wats.); and according to H. H. Wilson is enumerated among garden plants in the Mrichchhakati 4: — the "yut'hica" called "hemapushpika" golden-flowered, not seen by W. Jones as. res. iv. 246, appears to be *J. fruticans*, the "elegant looking shrub" observed by Graham "in gardens and flower pots" at Bombay. Westward, the yellow-flowered "iasmin" is distinguished by Ebn Masawia (Rhaz. contin., and Spreng.), Isa Ebn Masah, Ishak Ebn Amran, Ebn Joljol, Avicenna, Serapion 176, Ebn Alwam, and Ebn Baitar: *J. fruticans* is described by Gesner f. 278, Dodoens pempt. 571, and C. Bauhin pin. 298; is termed "*j. luteum vulgo dictum bacciferum*" by Tournefort inst. 597; is known to occur seemingly wild at the base of the Talusch mountains and Caucasus, and along

* *Butea superba* of Tropical Hindustan and Burmah. A woody climbing species called in Telinga "tiga-muduga" (Lindl.): the "kimsuka" as distinguished from the "dhak" in the Mrichchhakati viii, — may be compared: the "kinsuka" is mentioned by Kalidasa ragh. ix. 27, and Susrutas (Hessl.): *B. superba* was observed by Roxburgh cor. i. pl. 22, and Wight, among the Circar mountains, its stem "as thick or thicker than a man's leg" and "very long, running over large trees:" its sensible properties according to Lindley are "altogether the same as in *B. frondosa*." Farther East, was observed by Mason in Burmah, and called "pouk-nway."

Benincasa cerifera of Tropical Eastern Asia. The *white pumpkin* is called in Guzerati and in the environs of Bombay "pandree-chickee" (J. F. Wats., and Graham), in Burmah "kyouk-phayung" (Mason); and the "preserved pumpkin" of the Mrichchhakati i., that if kept too long smells badly — (transl. H. H. Wils.), may be compared: also the "pushpap'hala," enumerated among pot-herbs by Susrutas sutr. 46: *B. cerifera* was observed by Rheede viii. pl. 3 in Malabar; by Graham, "commonly cultivated in Bombay and the Deccan," its "fruit sub-rotund, twelve or fifteen inches in diameter, hairy when young, smooth with a whitish bloom when ripe;" is termed "cucurbita pepo" by Roxburgh iii. 718, and was observed by him, Wight, and Drury 167, common throughout Hindustan; by Mason v. 470, "exotic" in Burmah and cultivated by both Burmese and Karens as "a valuable addition to their curries," but "never eaten by Europeans:" the "cucurbita pepo aspera," observed by Blanco on the Philippines and called in Tagalo "condol," may also be compared.

the Black Sea (Thirke, Bieb., Ledeb., and C. A. Meyer); was observed by Sibthorp in woods throughout Phrygia and as far as Smyrna; by Forskal, in gardens at Constantinople; by Bové, frequent in Algeria; is known to occur seemingly wild in Portugal, Spain, and as far even as France (A. Dec.). "*J. humile*" observed by Bory in Southern Greece, also "*J. odoratissimum*" from Madeira, are regarded as not distinct.

"655 A. D." (Plate in Sm. b. d.), the Greeks defeated by the Muslims in *naval combat*.

"656 A. D." (art de verif.), Othman succeeded by Ali, fourth khalif. Copper *coins* supposed to have been issued by him or preceding khalifs, are figured by Marcel p. 26.

"657 A. D." (Clint.), in Rome, Eugenius succeeded by Vitalianus, eleventh archbishop.

"In this year" (Badger edit. Salil-ibn-Razik p. 374), first serious dispute among the Muslims respecting the Imamate: revolt of the Khawarij, of "twelve thousand men" taking offence at Ali's submitting his right to the Khalifate to arbitration.

"658 A. D." (Blair), peace obtained from the Byzantine emperor Constans, the Muslims "agreeing to pay him one hundred thousand crowns annually."

"As late as the Seventh century," Aino tribes spread over the Northern portion of Nippon as far as "Lat. 38°" (Sieb. elucid. Vries p. 97): but "in this year" (Klapr. in transl. San-kokf 215), by the daïro-empress Zai-mei in her "fourth" year, a fleet sent under the command of Abe-no Omi against the Ainos.* With the aid of Aino tribes of Southern Yeso, certain districts were conquered,—others were added in the following year, and a government over Yeso established at Siri-besa.

"659, in the autumn" (Nipponki, Klapr., and Jap. mann. 377), an embassy from Japan to the Chinese emperor taking two natives of Yeso (Ainos) as curiosities. The emperor expressed great astonishment at their strange appearance, and was informed that their country does not produce corn, the people living on animal food, have no houses, but dwell under the trees in the mountains. They presented a white deer-skin, with a bow † and eighty arrows to the emperor. The narrative written by a Corean named Yukino Murazi.

"660 A. D." (Beda h. e. iii. 22, Cockayne iii. 453), Sigebert II. assassinated by relatives who thought him deficient in rigour. He was succeeded as king of Essex by Swithelm.

"661 A. D." (art de verif.), assassination of Ali. He was succeeded by Hasan; and at the end of six months, by the Muslim general Mu'awiyah of the Ommiah family. Who removed the seat of government from Medina to Damascus.

Paulus Aegineta writing in the latter half of the Seventh century—according to Abu-l-faraj (Sm. b. d.).

* *Pedicularis verticillata* of Arctic and Subarctic climates. The leaves of "*P. lanata*" employed as a substitute for tea by the inhabitants of the Kurile Islands—(Ainsl. mat. ind. i. 1. 228). *P. verticillata* is known to grow in Siberia, on the Oby in "Lat. 67°" (Pall.), on the mountains of Daouria: and farther East, on the islands of Alaska generally as far as Sitka and Kotzebue Sound (Rothr. in Smiths. report for 1867); at Igloodik in Arctic America (Hook.); and in the alpine districts of Europe (Jacq. austr. pl. 206, and Pers.).

† *Taxus cuspidata* of Japan, as far as Yeso. A species of *yew* called by the Ainos "tarumani," in Japan "araraki" (Sieb.) or "ichii" (Jap. c. c. 30); and from early times bows made from its wood by the Ainos—(Sieb.).

Wistaria Japonica of Yeso and the neighbouring countries. Called "kutsuts," or by the Japanese "ko-fudsi" (Sieb.); in which we recognize the "fousi" whose fine interior bark is used by the Ainos for bow-strings—(according to the San-kokf transl. Klapr.); the use for bow-strings is noted by Siebold; and farther South, W. Japonica was observed by him in Japan.

Gen. ignot. of Yeso. Bow-strings also made by the Ainos of the "ayi;" a creeping plant unknown in Japan—(San-kokf transl. Klapr.).

Aconitum Kamtschaticum of Yeso and the neighbouring countries. Called "sjosinosjurk," and wild beasts killed by the Ainos with arrows poisoned with juice of the root (Sieb.; or according to the San-kokf transl. Klapr.), with bruised seeds of the *Aconitum* called "bou-si (fou-tsu)," mixed with "araignées à longues pattes" (regarded as probably "*Phalangium araneoides*)." From transported specimens, *A. Kamtschaticum* is described by Pallas.

Sinapis Chinensis of Yeso and the neighbouring countries. Called "kurasuf" or by the Japanese "karasi" (Sieb.); in which we recognize the "to-karasi" whose bruised seeds are mixed in the above poison—(San-kokf transl. Klapr.), so rapid in its action that the blood of the wounded bear, wolf, or other animal putrefies in a few minutes (Langsdorff ii. 287). Westward, *S. Chinensis* was received from China by Linnæus (Dec. prodr.); and in Hindustan (according to Lindley), the "seeds considered by Mahometan and Hindoo practitioners stimulant, stomachic, and laxative."

Veronica serpyllifolia of Europe and Northern Asia. The ΚΕΣΤΡΟΝ ΛΕΠΤΟΚΛΩΝΟΝ of Paulus Aegineta — is referred here by Turner, who further contributed an English name *Paul's betony* (Prior): *V. serpyllifolia* was observed by Sibthorp, around Constantinople and among grass on the Bithynian Olympus; is known to grow also on Caucasus and the Himalaya mountains and throughout Siberia (Ledeb., Wats., and Benth.). Westward from Greece, is termed "exfragia nobilis" by Brunfels ii. 20 (Spreng.), "*v. pratensis serpyllifolia*" by Tournefort inst. 144; was observed by Desfontaines in Algeria; and is known to grow throughout middle and Northern Europe as far as Lapland and Iceland (Hook., and Fries). From Asia, may have been carried by colonists, Ainos or Russian, to the Pacific shore of America, where it was observed by Mertens at Norton Sound: by European colonists was carried to Madeira (Lemann); to Northeast America, where it has become extensively multiplied along roadsides and in grass-grown clearings; to the mountains of Jamaica, where it was observed by Bertero; to the environs of cities on the Andes, Santa-Fe-de-Bogota, Quito, and Quindiu (Kunth); to the Falkland Islands (Gaud., and J. D. Hook.); and to Austral Africa (Benth., and A. Dec.).

"In this year (= 1st of the 'loung-so' of Kao-tsoung," hist. Thang, and Klapr. note to geogr. Chin.), arrival in China of an embassy from Tan-lo (Quelpaerts Island): where the inhabitants wear only skins of a kind of swine, live in huts of leather, and in winter in caves, have no cattle, but cultivate grain by means of an instrument with iron points for harrowing the soil. — A second embassy arrived in "665 = 2d year of the 'lin-tě' of Kao tsoung."

"In the reign of Saimei" (Jap. centen. comm. 59), the art of manufacturing *tiles* brought by a Korean to Japan.

"662 A. D." (ann. Jap., transl. Tits.), Kwo-gok or Zaï-meï succeeded by her son Ten-tsi, now thirty-ninth daïro of Japan.

"In the reign of the emperor Tenji" (Jap. centen. comm. 82), folding fans invented by a native of Tamba in Japan; the material at first employed being thin boards of *Chamaecyparis obtusa*. — The invention was afterwards introduced from Japan into China, as admitted in Chinese books.

"664 A. D. = 1st year of the 'lin-te' of Kao-tsoung" (Chinese chron. table), beginning of the Fifty-sixth cycle.*

* *Uvaria odorata* of Tropical China and the Philippines. A tree called in Burmah "ka-dat-gnan" (Mason), and from early times known in China — (Rumph. ii. pl. 65). Westward, is known to occur on Java (Pers.); was observed by Mason v. 407 to 740 "exotic" in Burmah, planted around native dwellings along the coast for ornament. The "*U. Sinensis*" and "*Unona odoratissima*" called in Tagalo "alañgilan," observed by Blanco on the Philippines, may be compared.

Triphasia trifoliata of Tropical China. An Aurantiaceous shrub called in the environs of Bombay "China limboo" (Graham); and from early times known in China, — bearing the "berry like an orange in miniature often found in Chinese preserves" (Mason): *T. trifoliata* was observed by Kaempfer v. 801, and Thunberg in Japan, growing spontaneously near villages, also planted for hedges, and employed medicinally. Westward, was observed by Mason v. 453 "exotic" in Burmah, in gardens of European residents; by N. L. Burmann 35 (Spreng.), in Hindustan; by Graham, common "in gardens" around Bombay, probably introduced from China, but found by Nimmo seemingly "wild in S. Concan." From transported specimens, is described by Linnæus.

Murraya exotica of the Tropical base of the Himalayas as far as Anam and China. An Aurantiaceous tree called in the environs of Bombay "koontee" (Graham), in Burmah "tha-nat-kha" (Mason); in Anam "cay nguyet qui," in China "cao li yong" (Lour.) and from early times cultivated for its fragrant flowers: — termed "*camunium sinense*" by Rumphius v. pl. 18; and observed by Loureiro 331 seemingly wild "agrestis" in China and Anam. Southward and Westward, occurs as a shrub only under cultivation in Amboyna and Java (Lour.); was observed by Mason v. 760 "exotic" in Burmah; by N. L. Burmann 104, and Wight, in Hindustan; by Graham, an ornamental shrub "in gardens" at Bombay, "probably introduced from China," but found by Royle wild "all along the jungly tract at the foot of the Himalayas." From transported specimens described by Linnæus.

Nephelium longan of Tropical Eastern Asia. The *wild ramboutan* of the Malays is a large pinnate-leaved tree called in the environs of Bombay "wumb" (Graham), in Burmah "kyet-mouk" (Mason), in Anam "cay nhon" or "laong nhan," in China "lum yen" (Lour.), and from early times cultivated for its fruit: — *N. longan* was seen in China by Navarrete; grows according to Osbeck on the summit of the highest mountains, its fruit eaten with tea; but was observed by Loureiro 288 under cultivation in Anam and China. Westward, by Mason v. 454, indigenous in Burmah, bearing an agreeable fruit; by Roxburgh, and Wight, in Hindustan; by Graham, principally constituting "a forest" in "a ravine near Parr" in the environs of Bombay.

Quisqualis Indica of Tropical Eastern Asia. A woody climber called in Burmah "da-way-hmaing" (Mason), in Tagalo "niogniogan" or "tagarao," in Ylocano "tartarao," in Bisaya "tango-

"The same year" (Alst., and Nicol.), a synod at Phare in England. On the mode of observing Easter, shaving among the clergy, and other Catholic ceremonies as yet unknown to the English and Scotch.

"In this year (= 44 A. H." of Ferisht., Elph.), first appearance of the Mahometans in India, proceeding from Merv Cabul, where they made "twelve thousand" converts. A detachment under Mohalib penetrated as far as Multan, and brought back prisoners.

"666 A. D." (Alst.), order of the archbishop of Rome, Vitalianus, for the use of the Latin language in church services.

One hundred and forty-ninth generation. Sept. 1st, 667, onward mostly beyond youth: Khaled ben-Yezid: Anastasius of Nice; the poet Aegidius; the theologians, Caesarius abbas Lirinensis (Alst.), Kilianus of Scotland, Julianus of Toledo: the Welsh bard Myrddyn or "enchanter Merlin" (Thierry in Pouchet).

"The same year" (Clavig. ii.), accession of Chalchiutlanetzin, first Toltec king of Mexico.

Eugenia pimenta of the West Indies and neighbouring warm portion of Mexico. Known to grow in the Vera Cruz district, and the use of its product, *pimento* or *allspice*, introduced by the Toltecs *—

lon," in Pampango "havebave" (Blanco), in Anam "cay tlun" or "su cuon tu," in China "xi kiun tsu" (Lour.), and from early times its nuts employed as a vermifuge:—observed by Loureiro 336 along hedges and the banks of rivers in Anam and near Canton in China; also by James Reed near Canton, and specimens shown me; by Blanco, on the Philippines, its fruit eaten by boys; by Rumphius v. pl. 38, on the Moluccas, its seeds long in repute as anthelmintic (Drur.). Westward, by Mason 421, "exotic" in Burmah, cultivated for its "sweet-scented flowers" that change "from white to rose, and with the clouds at sunset, deepen into the richest crimson;" by N. L. Burmann pl. 35, Roxburgh, and Wight, in the gardens of Hindustan; by Graham, "common in Bombay gardens, but no where wild." By European colonists, was carried to the Mauritius Islands, where it is called "liane vermifuge" (Drur.).

Ixora coccinea of Anam and Tropical China. A flowering shrub called in Burmah "pan-sa-yeik" (Mason), in Anam "boung tlang do" (Lour.), in China "kan-long-fa" (Osbeck), and doubtless from early times familiarly known:—observed by Osbeck "everywhere on hills" around Canton; by Loureiro 95, in shrubby places in Anam; by Blanco, on the Philippines, planted for ornament by the natives around their dwellings; is termed "flamma sylvarum" by Rumphius vi. pl. 47. Westward, was observed by Mason v. 415 to 786 "exotic" in Burmah, cultivated for ornament; by Burmann pl. 57, on Ceylon; by Rheede ii. pl. 12, in Malabar; by Wight, in peninsular Hindustan; by Graham, only "in gardens about Bombay," but found by Law seemingly "wild" in the Southern Mahratta country. Transported to Europe and North America, is described by Plukenet alm. pl. 59, and has become frequent in greenhouses.

Clerodendrum squamatum of Tropical China. Known there from early times;—and observed by Kaempfer pl. 58 in Japan (Pers., and Steud.). Westward, was observed by Mason v. 413 to 793 "exotic" in Burmah, cultivated for ornament, also to all appearance "naturalized." Transported to Europe, is described by Vahl, and Jacquin rar. iii. pl. 300.

Amaranthus tristis of Tropical Eastern Asia. An esculent herb from early times known in China—(Pers.). Westward, was observed by Mason v. 779 "exotic" in Burmah; is termed "blitum indicum secundum" by Rumphius v. pl. 82; was observed by Roxburgh in Hindustan; by Graham, in the environs of Bombay, "cultivated in almost every garden," but he gives no native name. By European colonists, was carried to the Mauritius Islands, and to the West Indies (Moq., and A. Dec.).

Aponogeton monostachyum of Tropical Eastern Asia. An aquatic plant called in Hindustanee "ghechoo," in Malabar "parua-kalanga," in Tamil "kotee-kalangoo," in Telinga "nama" (Drur.); and from early times known in China:—observed there and in Anam by Loureiro i. 173. Westward, by Voight, along the Irrawaddy in Burmah (Mason v. 474); by Ainslie, and Roxburgh, in Hindustan, its tuberous roots eaten by the natives and nearly as good as potatoes; by Rheede xi. pl. 15, in Malabar; by Nimmo, and Graham, "margins of tanks" in the Concans as far as Bombay.

Gracilaria tenax of the China Seas. A somewhat gelatinous, slippery, filiform, dichotomous *fucus*, from early times used very extensively by the Chinese for the same purposes as glue or gum arabic—(Turner fuc. pl. 125, Agdth., Lindl., and Mason v. 508).

* *Eugenia acris* of the West Indies.—The *wild clove* is a small tree "supposed to have been confounded with *E. pimenta*, in whose aromatic qualities it altogether participates" (Lindl.); is known to grow on Antigua, Barbados, and Jamaica (Jacq. obs., Swartz fl. ii. 909, and Pers.), and according to Lunan its berries and sweetly aromatic leaves are used for culinary purposes. By European colonists was carried "from America" to Hindustan, observed by Graham at Bombay, in gardens not common, and called "lung;" by Wight, and Drury, at Courtallum, Travancore, and Madras, its timber hard and heavy. Transported to Europe, is described by Plukenet alm. pl. 155 f. 3, and is distinguished as "*caryophyllus racemosus*" by Miller (Steud.).

(Humb. iv. 9): *E. pimenta* was observed by Swartz obs. 202 in the West Indies. Transported to Europe, is described by Plukenet alm. pl. 155. f 4, Blackwell pl. 355, and Miller; and its imported product has become a well-known condiment, used also medicinally (Lindl.); was observed by Rouyer in the drug shops of Egypt.

Zea mays of Tropical America. The cultivation of *maize* or *Indian corn* introduced into Mexico by the Toltecs — (Humb.): the grain was used in the religious rites of both Mexicans and Peruvians (A. Dec. 951), and sugar procured by them from it, also a vinous liquor called "chicha," drunkenness having already become frequent under the Aztec dynasty (Ovied., and Humb. iv. 9): spikes of maize were observed by myself in the ancient Peruvian cemetery at Pachacamac: bread made of "maiz" or "mahiz" was seen by Columbus in the West Indies (F. Columb. 28), also by Oviedo nat. hyst. f. 5. Farther North, Thorwald in 1003 found in Vinland a wooden "kornhjalmr" corn-shed, and *Z. mays* is known to have been cultivated by the native tribes of Northeast America as far as the Bay of St. Lawrence. Transported to Europe, was seen by Oviedo before 1525 under cultivation in Spain; according to Rhamnusius, "was first seen in Italy in his own time;" and according to tradition and the current names, from Turkey and Syria reached Egypt and the mountains of Yemen (Forsk., and Del.); also directly or indirectly by European colonists was carried to Hindustan, observed by Roxburgh, and Graham, "commonly cultivated" and called "muk jowaree-boota," and according to Drury "next to rice it forms the most important crop in the east" especially "in Behar and Upper India;" to Ceylon, called there "muwa" (Moon): to Burmah, called there "pyoung-boo" (Mason); to the Malayan archipelago, called throughout "jagung" (Crawf.), observed by myself under cultivation on Mindanao, by Blanco, valued and well known on the other Philippine Islands: to China, mentioned by Li-chitchin in 1552 to 1578 (A. Dec.); to Japan, brought perhaps from China, cultivated near Nagasaki and called "sjo kuso" or usually "too kibbi" (Kaempf. v. 834. and Thunb.); and to most parts of the world having a suitable climate, the Tropical islands of the Pacific forming at present the only considerable exception.

"668, May 18th" (Pauth. 301), a comet. Regarded with much alarm by the Chinese emperor Kao-tsoung. "Oct. 22d," submission of the king of Corea, after the capture of his chief city by the Chinese.*

"The same year" (Sm. b. d.), Constans succeeded by Constantinus IV. Pogonatus, eighteenth Byzantine emperor.

"669 A. D." (Pauth. 302), in the region of Lake Kokonoor, the Chinese army defeated by the Thibetians. Ioulun-Tieghin chief of the Ouigours is known to have warred against the Chinese under the Thang (see Klapr. mem. ii. 333).

"670 A. D." (Cockayne iii. 451), the abbey in Thanet founded by Eormenburh, daughter of Eormered king of Kent, with the wergild she had exacted for her murdered brothers.

"672 A. D." (Plate in Sm. b. d.), after the capture of Smyrna and most of the Greek islands, the blockade of Constantinople begun by the Muslim fleet. In the defence, *Greek fire*, newly invented by Callinicus, employed with success: — A "kind of fire" was seen by Brocquière at Baruth, that was "launched into the air very high and to a great distance" (evidently after the manner of rockets).

"The same year" (Clint.), in Rome, Vitalianus succeeded by Adeodatus, twelfth archbishop.

"The same year" (Beda. h. e. iv. 18, and Cockayne iii. 449), Ætheldrith, daughter of Anna king of the East Angles, appointed abbess of Ely; the monastery containing both men and women, as was the way in Ireland.

"The same year" (ann. Jap., and art de-verif.), Tent-sii succeeded by his brother Tenmu or Tenbou, now "fortieth" daïro of Japan.

Gelidium corneum of Japan. A seaweed† called "tengusa;" affording "kanten or vegetable

* *Urtica Japonica* of Japan. White cloth made by the Coreans of the fibres of the "tchu" as early probably as this date: — this kind of cloth is enumerated among the articles sent as tribute to the Chinese emperor (geogr. Chin. transl. Klapr. 167). *U. Japonica* was observed in Japan by Thunberg, its fibres used for cords.

Malus baccata of Eastern Asia. Called "men-tsu-fou" by the Coreans, and "lin-khin" by the Chinese — (vocab. Klapr.). Known to grow also in Daouria along the river Schilka, and in Siberia (Pall. i. pl. 10, and Pers.).

† *Chondrus* sp. of Japan. A seaweed called "fu," resembling carrageen, and from early times "much used for industrial purposes," as "for instance, the sizing of the warp of silk goods" — (Jap. c. c. 109).

Quercus serrata of Japan. An oak known from early times, its branches placed in the sea to promote the growth of seaweed, by furnishing a basis for attachment — (Jap. c. c. 109): *Q. serrata* was observed in Japan by Thunberg.

isinglass, employed from early times for cooking purposes, making moulds, and "as a substitute for all kinds of gelatines." — Imported into Europe, it is sold under the name of *agar-agar* (Jap. centen. comm. 108).

673 A. D. (= "2d year of Tenmu," art de verif.), in Japan, building of the celebrated temple of Midera.

674 A. D. (= "3d year of Tenmu," art de verif.), *silver* mines opened by the Coreans on the island of Tsussima, and the metal brought to Japan.

675 A. D. (= "4th year of Tenmu," art de verif.), celebration of the first Matsuri; a noted religious festival of the Japanese.

"676 A. D." (Alst., and Nicol.), at Rome, Adeodatus succeeded by Donus or Domnus, thirteenth archbishop.

"678 A. D." (Pauth. 302), near Lake Kokonoor, a Chinese army of "one hundred and eighty thousand" men defeated by the Thibetians.

"The same year" (Alst.) at Rome, Domnus succeeded by Agatho, fourteenth archbishop.

"679 A. D." (Beda, and Cockayne p. xxvi.), in Britain, a surgical operation performed by the leech Cynifrid or Cyneferth; who opened a tumour for Aetheldryth queen and abbess, without saving her life.

"In this year" (Sm. b. d.), after the destruction of many ships by *Greek fire*, the fleet of the Muslims compelled to retire from Constantinople, and wrecked in a storm: their retreating land army also overtaken and defeated by the Greeks, and a treaty of peace signed by khalif Mu'awiyah. The Bulgarians however obtained from the Greek emperor a cession of that country South of the Danube which is still called Bulgaria.

The treatise De aliment. is dedicated to Constantinus IV. Pogonatus.

Portulaca oleracea of Tropical or Subtropical America. Called in Britain *purslane*, by Turner "purcellaine," by Treveris "porcelayne," in Germany "portzel kraut" from "porcellus" according to Fuchsius p. 111, in France "porcellaine" (Prior), in Italy "porcellana" (Lenz), in Greece "glustritha" (Sibth.), in Egypt "baqlæ" or "ridjle" (Forsk.), and the ΧΟΙΡΟΒΟΤΑΝΟΝ of the treatise De aliment., — and Psellus 296, is referred here by E. A. Sophocles: *P. oleracea* is termed "p. angustifolia sive sylvestris" by Tournefort inst. 236; was observed by Munby in Algeria; is known to occur in Italy and throughout middle Europe, cultivated and growing as a weed (A. Dec., and Lenz); was observed by Forskal, Sibthorp, and Fraas, frequent in waste and cultivated ground from the Peloponnesus to the Greek islands and Asia Minor, and eaten crude; is known to occur also in the Tauro-Caspian countries (Ledeb.). Farther South, the "baklat elhamaka" of Ebn Masawia, Maserjawia, Hobaisch, Rhazes, Mosih, and Avicenna, is identified by Ebn Baitar with the "ridjlat;" the "ridjlet" is mentioned also by Rabbinical writers (Schwarz); mingling its seeds in medicines, by Mesue trocisc., and Abd-allatif i. 6; seeds of *P. oleracea* were found by Forskal mat. med. sold for this purpose in Egypt, and the living plant was observed by him, and Delile, in gardens as well as growing spontaneously: is called "segettemam" in Nubia (Del.); is known to occur also in Abyssinia (A. Rich.); was observed by Forskal under cultivation on the plains and mountains of Yemen, and called "ridjlet el farras" or "dænnel el farras" or "brabra" or "chamile;" by myself, sold in bundles at Mocha, and growing in the streets of Muscat. Eastward from Arabia, was observed by Rheede x. pl. 36, Roxburgh, and Wight, in Hindustan, according to Graham "common in moist places;" by Mason v. p. 473, a common weed in Burmah, "used by the natives for a pot-herb" and called "myæ-byet;" by Zoll., and Blume, on Java; by Blanco, on the Philippines and called in Tagalo "colasiman" or "olasiman," in Camarines "ausiman;" by Bunge, in Northern China; by Kaempfer, and Thunberg, in waste and cultivated ground everywhere in Japan, and called "bakin," or usually "uma biju" or "siberi fiju;" by myself, among the islands of the Pacific only on Tongataboo, Tahiti, and the Hawaiian Islands, clearly introduced (though perhaps not aboriginally by Polynesians). Farther East, was observed by E. James at the sources of the Arkansas and Platte along the Rocky mountains, by Nuttall on the Upper Missouri, and may have thence accompanied aboriginal agriculture to the Atlantic, for "purselin" was found by Strachey along James river in 1610, "purselane" by W. Wood in New England in 1629, and "wild purcelane" by Josselyn before 1670: *P. oleracea* having no flowering-season seems essentially a Tropical plant, and "verdolagas o portulaca" is enumerated by Oviedo nat. hyst. 80 and gen. xi. 2 as one of three plants common to Spain and the West Indies, the "portulaca" by Lerijs in 1556 among the three plants common to Europe and Brazil, and "purslane" was observed by Richard Hawkins in 1593 on the St. Anne's Islands in S. Lat. 22° 30' off the Brazilian coast. By European colonists, *P. oleracea* may have been carried to the Azores (Wats.); to Austral Africa (Thunb.); to the Mauritius Islands (Boj., and A. Dec.); and as intimated above, to the Polynesian islands.

Ribes uva-crispa of Northern Europe and mountains farther South. Called in Britain *gooseberry*, in the Eastern counties *thape* or *fape* or *feabe* or *fæa-berry*, in Germany "kräusel-beere" or by

Matthioli "creutzbeer," in France "groseille" (Prior) or by Dodoens "groisseletz" (A. Dec.), in Brittany "spezad" (Legonid.), in Greece "lagökérasia" (Sibth.): the ΒΟΥΤΖΗΝΑ Ο ΔΕ ΤΗΣ ΛΑΓΙΝΙΑΔΟΣ ΚΑΡΠΟΣ of De alim. 13 — may be compared: also the "ribes" growing according to Serapion on the cold snowy mountains of Syria and bearing berries sweet to the taste with some acidity (Isaac, and Ort. San. 392): *R. uva-crispa* was observed by Sibthorp, and Chaubard, on the mountains of the Peloponnesus; and by Forskal, in its cultivated form in the gardens of Constantinople. Westward, is described by Ruellius p. 283, and Dodoens p. 748; is termed "*grossularia simplicis acino vel spinosa sylvestris*" by Tournefort inst. 639; is known to grow wild in France and throughout Northern Europe (Schmidel pl. 1, Pers., Dec. fl. fr., and Ledeb. fl. ross.); and was already cultivated in the days of Matthioli p. 135. By European colonists, its cultivated form "*R. grossularia*" was carried to Northeast America, where it continues in gardens, lingering and producing only inferior fruit.

"680 A. D." (art de verif.), Mu'awiyah succeeded by Yezid, second Ommiad khalif.

"Oct. 10th" (Badger edit. Salil-ibn-Razik p. 311), Husein, son of Ali, slain in battle at Kerbela in Babylonian Irak.

"Nov. 7th" (Alst., and Nicol.). Sixth general ecclesiastical Council. Convened at Constantinople, against the Monothelites. Marriage among the clergy was sanctioned. — The authority of this Council continues to be recognized by the Greek church (E. A. Soph.).

"681, Jan. 9th" (Nicol.), in a synod at Toledo, king Wamba's renunciation of the throne confirmed.

The same year (= "tenth year of Tenmu," art de verif., see also Jap. centen. comm. 49), *copper* discovered in Japan; *silver* money prohibited, and putjes of *copper* and *bronze* substituted. The empire about the same time divided into sixty-six provinces.*

"683 A. D." (art de verif.), Yezid succeeded by Mu'awiyah II., third Ommiad khalif.

"The same year" (Alst.), at Rome, Agatho succeeded by Leo the younger, fifteenth archbishop.

"Towards the close of the Seventh century" (quart. rev. for 1870), Anglo-Saxon version of Scriptural narratives by Caedmon, a monk residing "in the convent of Streaneshalch (Whitby)," and, regarded as the "father of English poetry."

"684 A. D. = 'sse-tching,' 1st year of Tchoung-tsong; " his mother Wou-heou being the real ruler — (Chinese chron. table).

"The same year" (art de verif.), Mu'awiyah II. succeeded by Merwan, fourth Ommiad khalif.

"The same year" (Alst., and Nicol.), at Rome, Leo the younger succeeded by Benedict the younger, sixteenth archbishop.

"685 A. D." (art de verif.). Merwan succeeded by Abd-el-Melek, fifth Ommiad khalif. In the reign of Abd-el Melek (Wilk. theb. and eg. p. 541), a *nilometer* constructed at Helwan (near the present city of Cairò).

Oman, hitherto nominally under the authority of the khalifs, its subjection undertaken by Hajjaj governor of Irak. — After various futile attempts by his generals, he succeeded; the defeated brothers Suleiman and Said, descendants of the Azdite Julanda, taking refuge in Zanj. The earliest emigration on record of Oman Arabs to the East coast of Africa (Badger edit. Salil-ibn-Razik p. xiii and 5).

The Greek physician Theodocus or Tiaduk in the service of Hajaj Ibn Yusuf — (Ebn Osaib'ah vii. 5, Abu-l-Faraj, and Sm. b. d.).

The "burak" considered Armenian by Tiaduk (Theodocus), — mentioned also by Ishak Ben Amran, Mahmed Ben Hasan, Jisch Ben Hasan, Mosih, Avicenna, Edrisi, Ebn Wafid, Serapion, Madschul, and Ebn Baitar, or "borad" of the Persians, is referred by J. de Sousa to *borax* or borate of soda. Farther East, this salt is mentioned by the Sanscrit medical writer Susruta (F. Adams); and was ascertained by Saunders and Turner to be procured from a lake in Thibet. More recently, borax is said to be artificially manufactured in the Mediterranean countries; and has been procured in large quantities from a lake in California.

Gnaphalium leontopodium of Switzerland and the Pyrenees. The "komes elbahri" of Tiaduk, — and Ebn Baitar, is referred here by Sontheimer: *G. leontopodium* is described by Matthioli p. 828 (Spreng.); is termed "filago stellata" by Lamarck fl. fr.; and is known to grow on the alpine portion of Switzerland and the Pyrenees (Pers., and Steud.)

"The same year" (Alst., and Nicol.), at Rome, Benedictus the younger succeeded by Joannes the fifth, seventeenth archbishop.

* *Erythronium "grandiflorum"* of Japan. From early times, a kind of starch called "kata-kuri" made there "of the root of a kind of dog's-tooth violet" — (see Jap. centen. comm. 34 and 110).

"In this year (= 10th year of the Gothic king Ricisvintus" of the addit. to chron. Isidor., see Clint. v. p. 399), Ildefonsus appointed bishop of Toledo.

"September" (Alst., and Sm. b. d.), Constantinus IV. succeeded by Justinianus II., nineteenth Byzantine emperor.

Arculf visiting Jerusalem, found on the site of the temple a square Muslim house of prayer; of beams and planks erected in a rough manner upon some remains of old ruins: while at Damascus, a large mosque had been built by the Muslims (said to be a Christian church on the foundations of a Roman temple to Juno, Leps. eg. and sin. p. 343). Proceeding to Egypt, Arculf speaks of Alexandria as a very large city, in a manner the emporium of the whole world; the *pharos* being a large tower lighted up at night with torches, lest mariners might mistake their way and be dashed against the rocks in seeking the entrance to the harbour. Arculf also visited Constantinople, and the church of St. Sophia there, of which he gives a detailed description (T. Wright early trav. in Palest.).

"687 A. D." (Alst.), at Rome, Joannes the fifth succeeded by Conon, eighteenth archbishop.

"The same year" (ann. Jap. transl., and art de verif.), Tenmu succeeded by his widow and niece Dsito or Si-to, now forty-first dairo of Japan. — Under her reign, sakki or *rice-beer* was first brewed.

"688 A. D." (Alst.), at Rome, Conon succeeded by Sergius, nineteenth archbishop.

"692 A. D." (Nicol.), a synod convened in Britain by king Ina. "For the union of the Britons with the Saxons."

About this time (quart. rev 1870), the "Psalms" translated into Anglo-Saxon by Guthlac or Gurthlake, the first Saxon anchorite.

"693, May 2d" (Nicol.), in a synod at Toledo, the book of "Gothic law, or the code of Alaric," confirmed.

"694 A. D." (Nicol.), in a synod at Beaconsfield in England, promise of Vitred king of Kent, "to preserve the liberties and immunities of the churches and monasteries."

"695 A. D." (Elph. iv. 1), Manik Rai, eighth Hindu king of Ajmir, reigning.

"In this year" (Sm. b. d.), revolt at Constantinople and Justinianus II. dethroned, his nose cut off but his life spared by Leontius. — Nine years later "in 704," he recovered his authority.

"697 A. D." (= 1357th of Synmu," art de verif.), Dsito succeeded by Monmu, grandson of Tenmu, and now "forty-second" dairo of Japan.

"The same year" (Nicol.), a synod at Berkhamsted, the king and clergy being present. Twenty-eight canons were made, awarding temporal as well as spiritual punishment.

Manuscripts of the "Seventh or Eighth century" (De Wailly pl. iv. 4) presenting the following form of the letter R.

"698 A. D." = "79th year of the Hejra," inscribed on a coin issued by Abd-el-Melek, and figured by Marcel p. 34. By some writers, this is regarded as the earliest *Muslim coin*: but according to Marcel, *copper* only had been coined by the Muslims until the reign of Abd-el-Melek; who first coined *silver*, to the exclusion of Greek and Persian money.

Owing to the persecutions of khalif Abd-el-Melek, Hashimid Arabs emigrated to Ceylon, and found a refuge there in eight different cities * — (trans. Asiat. i. 538, and Gildem. p. 53).

"From this year" in Britain, Eadfrith bishop of Lindisfarne — twenty-three years. A piece of ornamental writing by Eadfrith, continues extant in the Durham book (Cockayne anglo-sax. ii. p. xxi).

"698 or 700 A. D." (Gildemeist. 6, and Wilson note to Vishnu purana iv. 24), the Muslims engaged in hostilities against Ratbal or Ratibal prince of Cabul; — the Hindu Ratanpal or Ratnapal.

"At the end of the Seventh century" (Pouchet. moyen âge), Iceland discovered. — In "795" (according to Dicuilus) some Irish devotees retired into this island. Relics of hermits, as "books and staffs," were found by the first Scandinavian visitors (see Rafn).

One hundred and fiftieth generation. Jan. 1st, 701, onward mostly beyond youth; Marcellinus presbyter, Andreas of Crete; Anthelmus, Bonifacius or Venofridus of Mayence, the monk Othmarus.

"702 A. D." (Alst.), at Rome, Sergius succeeded by Joannes the sixth, twentieth archbishop.

"704 A. D." (Beda, and Cockayne iii. p. 452), accession of Offa as king of Essex.

* *Taberna montana dichotoma* of Ceylon and Southern Hindustan. Regarded as the forbidden fruit by the natives of Ceylon; who allege the fragrance of the flower, and that the beautiful tempting fruit changed from delicious to poisonous on the occasion of the transgression, and continues to bear the marks of Eve's teeth — (geogr. plant. lond. tract soc.). A small tree called "titul" or "doodee-ka-jhar" in the environs of Bombay, is regarded by Graham as probably identical, growing on the Parr Ghaut and the hills* at Jooner, the flowers white and fragrant, and a decoction of the leaves found by Twemlow "used for curing sores on cattle;" described also by Roxburgh ii. p. 21.

The same year (= "8th year of Monmu," art de verif.), a coat of arms, toiap, assigned by Monmu to each province of Japan.

705 A. D. (= "9th year of Monmu," art de verif.), a square wooden measure called "sio" and "maas," sent as a standard by Monmu to the different provinces throughout Japan.

"The same year = 'chin-loung,' the real commencement of the reign of Tchoung-tsong," on the death of his mother Wou-heou — (Chinese chron. table, and Pauth. 306).

"The same year" (Alst., and Nicol.), at Rome, Joannes the sixth succeeded by Joannes the seventh, twenty-first archbishop.

"The same year" (art. de verif.). Abd-el-Melek succeeded by Walid, sixth Ommiad khalif. Coins were issued by Walid (see Marcel 34): and during his reign, the mosque El-Djame el-Atyk commenced (near the present city of Cairo).

The "man" of Chuz or Alkanzi, — Maserjawia, Hobaisch, Ebn Masah, Rhazes, and Ebn Baitar, is referred by Ehrenberg, and Royle (Kitt. cycl. bibl.) to the *mannu* produced by *Coccus manniparus*; an insect chiefly or altogether confined to the Sinai Peninsula, and feeding on *Tamarix Gallica*: the substance is also described by Seetzen, as seen by him on the spot.

Convolvulus (Ipomoea) turpethum of Tropical shores, from Hindustan throughout the East Indies and islands of the Pacific to the Taheitian Group. The "turbud" of Chuz, — Ebn Masawia, Maserjawia, Hobaisch, Rhazes, Haly Abbas, Mesue, Avicenna, Serapion, and Ebn Baitar, is referred by writers to this plant, and its imported product: the medicinal use in Egypt of "turbetum from India" or *turbith* is mentioned by Alpinus, and Forskal mat. med.; and *I. turpethum* is termed "turpethum repens fol. althaeae vel indicum" by C. Bauhin pin. 149. Eastward from Egypt, the "torbit" of "Melibar" is mentioned by Marco Polo 183; and *I. turpethum* is called in Bengalee "teoree" or "dood-kulmi." in Telinga "tellatagada;" was observed in Hindustan by Roxburgh, and Wight; by Graham, and Gibson, growing from Goozerat to beyond Bombay in the Concans or low country, and "the bark of the roots" used "by native doctors as a cathartic;" was observed on Ceylon by Hermann cat. lugd. 178. Farther East, was observed by Mason in Burmah; is known to grow throughout the East Indies as far as Timor and the neighbouring portion of Australia, also on the Marianne, Tongan, and Taheitian Islands (Lindl.); and was observed by myself throughout the Tropical Polynesian groups, from the Feejee Islands to Metia.

Lablab vulgaris of Tropical Eastern Asia. Called in Egypt "leblab," in which we recognize the "lebleb" of Alkanzi, — Ebn Masawia, Ebn Amran, Haly Abbas, Elgafaki, Serapion, and Ebn Baitar: *L. vulgaris* was observed by Alpinus pl. 75, Forskal, Delile, and Clot-Bey, in the gardens of Egypt, cultivated to form arbours, and in Nubia called "ougoudky." Eastward, has a Sanscrit name (Roxb., Pidd., and A. Dec.); was observed in Hindustan by Roxburgh, Wight, Drury, and according to Graham, is called "saim ka puttee" and "several varieties" are "commonly cultivated:" is enumerated by Mason v. p. 466 among esculents, "exotic" in Burmah, called "pai," and "several varieties of one or two species" cultivated by the Karens and Burmese. Farther East, an unobtrusive white flowered variety was observed by myself aboriginally introduced around dwellings on the Feejeean Islands, and on the Hawaiian Islands decidedly naturalized. By European colonists, the ornamental purple-flowered variety was carried to the Hawaiian Islands; also to Northeast America, where it continues to be cultivated in gardens.

Rhododendron lepidotum of the Himalaya mountains. The "thalisfar" of Elmadschusi, — Honain, Elhuri, Ebn Amran, Ebn Joljol, Avicenna, Elgafaki, and Ebn Baitar, is referred by Royle to the imported leaves, described as "highly aromatic." The living shrub was observed by him on the Himalaya mountains.

"In or about 706 A. D." (quart. rev. for 1870), the "Psalter" translated into Anglo-Saxon by Aldhelm or Ealdhelm, bishop of Sherborn, and "among the first of the Saxon ecclesiastics who was distinguished for learning."

"708 A. D." (ann. Jap., and art de verif.), in Japan, and Monmu succeeded as daïro by Genonei or Ghenmio, daughter of the "thirty-ninth" emperor Tent-sii. In the first year of her reign, Genonei coined gold and silver money: — but the latter was prohibited in the following year.

"In this year" (Humb. atl. pict.), and "in the reign of Ixtlicuechahuac," second Toltec king of Mexico, the *Teo-amoxtli* containing the history, mythology, laws, and the remarkable and singularly exact *calendar* of the Mexicans, composed by the astrologer Huematzin. (The accession of Ixtlicuechahuac is placed "667 + cycle of 52 yrs" = 11 years later by Clavigero ii).

The *turkey*, *Meleagris gallipavo*, domesticated in Central America as early possibly as this date. The bird was brought, perhaps by the way of Mexico from Northeast America; where it is indigenous, — but in no instance on record has been tamed by the aboriginal tribes. Honduras was first visited by Europeans in 1502, when "hens of that country which are better than ours" were brought by the natives to Columbus (F. Columb. 90; or in the words of Gomara) "gallipauos que son mejores que pauos y gallinas." In New Spain, according to Oviedo nat. hyst. 37, there are "otros pauos

mayores y mijores de sabor y mas hermosas," many of which birds have been imported into the islands and into Spain. Some years later, the turkey became generally known in Europe; and after the visit of Alpinus, was introduced into Egypt, where one of its names "Maltese fowl" indicates the route of transmission.

The *musk duck*, *Anas moschata*, domesticated in Central America as early possibly as this date: — "geese like ours" were observed by Columbus in 1493 in the houses of the natives on Guadalupe; and were afterwards met with in Honduras (F. Columb. 47 and 90). *A. moschata* is known to occur in the wild state in Guayana (Schomburgk edit. Raleigh), and I have seen specimens from Surinam. As transported to Europe, the domesticated bird is figured by Belon, and has since become well known; its presence in Egypt, may be inferred from a remark of Clot-Bey. The bird is kept with other poultry in our Middle and Southern States, straying in some instances and reverting to secondary wildness. By European colonists also, the bird was carried to the Hawaiian Islands.

Lycopersicum esculentum of Central America or the neighbouring portion of South America. The *tomato* was called "tomatl" and sown among maize by the ancient Mexicans — (Humb. iv. 9). Transported to Europe, is described by Gesner, termed "tumatle americanorum" by Guilandinus, "mala peruviana" by Eyst. (Bauhin hist. iii. 621); is also described by Anguillara, Lobel, and Camerarius; was observed by Chaubard under cultivation in Greece; by Delile, and Clot-Bey, abundantly cultivated in Egypt and called "bydingan toumaten." Also by Europeans was carried Westward across the Pacific to the Philippines, where it has become a favourite with the natives and is called in Tagalo "tomates" or "camatis" (Blanco); to the neighbouring islands, called by the Malays "tomatte" (Rumph. v. 416); to Anam (Loureir.); to Burmah, called there "kha-yan-myæ-phung" (Mason); to Hindustan, observed there by Roxburgh, by Nimmo thriving luxuriantly at Surat, by Gibson, and Graham, naturalized "in many parts of the Deccan," and called "wall wangee;" to the Mauritius Islands (A. Dec.). In Northern climates, its cultivation is increasing in importance, was introduced into Barbadoes only in the middle of the Eighteenth century (Hughes 148), was unknown within my memory in Eastern New England, but I found it extended in 1841 to the Kookoosky mission-station in Oregon.

"The same year" (Alst., and Nicol.), at Rome, Joannes the seventh succeeded by Sisinnius or Zosimus; and before the close of the year, by Constantinus, twenty-third archbishop.

"709 A. D. About this time" (Blair), the "Laws of the Saxons" published by Ina king of Wessex.

"The same year" (Beda, and Cockayne iii. 452), Offa having abandoned his wife and country to become a monk in Rome, succeeded as king of Essex by Selred.

710 A. D. (= "3d year of Genonei," art de verif.), in Japan, building of the temple of Koobokusi, to contain the idol of Naco, made of gold and bronze by the celebrated sculptor Taisoquan.

"The same year = 'king-yan,' 1st year of Joui-tsoung, of the Thang" or Fifteenth dynasty — (Chinese chron. table).

"The same year" (art de verif.), by permission of khalif Walid, entrance of the Muslims into Spain. — After three years (Blair), they obtained possession.

"The same year" (Alst.), a synod at London. Confirming the use of image-symbols and the celibacy of the priesthood.

"711 A. D." (Biogr. Univ.), accession of Dagobert II., king of the Franks.

"In this year" (Alst.), Justinian II. succeeded by Philippicus, twentieth Byzantine emperor.

"In this year (= 4th of Ghen-mio," ann. Jap. transl. Tits.), Foudo-no Yasou maro (Taï Ngan ma liu) publishing the Ko-si-ki or history of Japan, from the earliest times down to "597 A. D."

"In this year (= 92 A. H." of Ferisht., Elph.), Second Muslim invasion of Hindustan. Leaving Shiraz, Mohammed Casim with "six thousand" men reached Dewal or Dival, the seaport of Sind (near or within the delta of the Indus), captured the temple and town and circumcised the bramins. Next proceeding to the head of the delta and up the Indus, he defeated the Hindu king Dahir, and obtained possession of his capital Alor (near Bakkar on the Indus) and of all Sind.

"713 A. D. = 'kai-youan,' 1st year of Ming-hoang-ti" or Hiouan-tsoung, of the Thang or Fifteenth dynasty (Chinese chron. table). Arrival in this year (Gaubil, and Pauth. 311) of an embassy from the king of Kia-che-mi-lo (Cashmere), a country inimical to Thibet, surrounded by very high mountains, and not easily invaded: from king Chin-tho-lo-pi-li, in Sanscrit Chandrapida, for aid against the Arabs (Gildemeist. 13, and Wilson note to Vishnu purana iv. 24).

"The same year" (Alst.), Philippicus succeeded by Anastasius II., twenty-first Byzantine emperor.

"In this year (= 6th of Ghen-mio," ann. Jap. transl. Tits.), the Foo-to-ki (Fung-thou-ki) completed, containing a description of all the provinces, cities, mountains, plants, birds, and quadrupeds of Japan.

"714 A. D. (= 96 A. H. comm. Sept. 15th," Ebn Khallikan, and Gildem. 12), expedition of the Muslim general Kutaiba ben Muslim against Kashgar; and a treaty made with Chinese legates, the first ever sent to the Arabs.

"715 A. D. (= 1375th of Synmu," art de verif.), Genonei succeeded by Gensioo, granddaughter of Tenmu, and now at the age of fourteen daïro of Japan.

"The same year" (Alst.), Anastasius II. succeeded by Theodosius III., twenty-second Byzantine emperor.

"In this year" (Biograph. univers.), end of the reign of Dagobert II., king of the Franks.

"The same year" (Alst., and Nicol.), at Rome, Constantinus succeeded by Gregorius the younger, twenty-fourth archbishop. At this time (= "720" of Beda), the practice in England among nobles and others, men and women, to make visits or pilgrimages to Rome.

"The same year" (art de verif.), Walid succeeded by Soliman, seventh Ommiad khalif. "In the reign of Soliman," building of the *nilometer* on Rhoda islet (not far from the present city of Cairo); round arches continuing in vogue.

"716 A. D. (= 94 A. H.," Elph. v. 1), date of an inscription in *Persian* in the country between the Oxus and Jaxartes, — seen by Burnes ii. 269 to 356.

"In this year" (Alst.), Theodosius III. succeeded by Leo III. Isaurus, twenty-third Byzantine emperor.

"In or about this year" (Abulfeda in Kitt. cycl. bibl.), the city of Ramleh, "twenty-four" miles Northwestward from Jerusalem, founded by khalif Soliman. The great caravan-road from Constantinople, Smyrna, and Damascus, passes through Ramleh to Egypt. — The city is mentioned about 154 years after its foundation, by the monk Bernard; and in the time of Edrisi, was next after Jerusalem the principal city of Palestine.

"In this year" (Jap. mann. 383), two Japanese students visiting China: one of whom returning became under the designation of Kibino Daisi the most celebrated learned man produced in Japan: the other remaining behind, was so honoured in China that he held the appointment of Archive keeper "sixty-one years."

"717 A. D." (art de verif.), Soliman succeeded by Omar II., eighth Ommiad khalif.

"718 A. D." (Gaubil, and Pauth. 314), a Sanscrit treatise on *Astronomy* translated into Chinese by Y-hang. Who further constructed instruments, and sent mathematicians North and South a long distance, to triangulate and ascertain the length of the degrees of Latitude, and the position of places on the Earth's surface. Y-hang maintained, That the planet Jupiter completes its revolutions in less than twelve years; having in "eighty-four years" made "seven revolutions and traversed in addition one twelfth part of the zodiac."

The Vetala panchavinsati, a series of twenty-five Sanscrit Tales, written as early perhaps as this date.*

"720 A. D." (art de verif.), Omar II. succeeded by Yezid II., ninth Ommiad khalif.

"In or about this year" (hist. Cashm., and H. H. Wils. hind. dram. ii. 4), Yasovarman reigning at Kanoj. He patronized the Sanscrit dramatist Bhavabhuti. Bhrigu, Vi-wamitra, Jamadagnya (Parasurama son of Jamadagni), also the sage Agastya, Vasishtha, the poetess Sakuntala, and Valmiki author of the Ramayana, are mentioned by Bhavabhuti.†

* *Erythrina Indica* of Tropical Hindustan and Burmah. A species of *coral tree* called in Malabar "moolloo-moorikah," in Tamil "muruka-marum," in Telinga "bad'de-chettu," in Bengalee "palitamar," in Hindustanee "furrud" (Drur.), in the environs of Bombay "pangara" (Graham), in Burmah "ka-theet" (Mason): in which we recognize the "muruca" tree of the Vetala panchavinsati, — referred here by B. G. Labington (lond. Or. transl.): E. Indica was observed by Rheede vi. pl. 7 in Malabar; by Graham, "common throughout the Concans," a "middle sized tree, trunk and branches armed with black prickles," in the Deccan "generally used as a prop for vines;" by Roxburgh and Wight, in other parts of Hindustan as far as Coromandel and Bengal, yielding the *mootchie wood*, light and easily worked, much used for boxes, sword-scabbers, toys, idols, and even rafts and canoes (B. G. Bab., and Drur.); by Mason v. 531, indigenous in Burmah, furnishing soft white wood "as easily worked as the pine."

† *Eleocharis ganitrus* of Tropical Hindustan. A tree called in the environs of Bombay "oodrach" (Graham); and the sacred rosary around the wrist of the military student mentioned by Bhavabhuti uttar. iv. — (transl. H. H. Wils.), the circlet of grains of "aksha" of Kalidasa ragh. xi. 56. and the "aksha" prescribed by Susrutas, are referred here by writers: E. ganitrus is described by Rumphius iii. pl. 101; was observed by Nimmo in the Southern Concan, the nuts "worn as necklaces by Brahmins and Faqueers" (Graham); by Roxburgh, and Wight, in other parts of Hindustan: and by Burmann pl. 20. on Ceylon. By European colonists, was carried to the Mauritius Islands, where it continues in gardens (Boj.).

Cedrela (Soyimida) febrifuga of Tropical Hindustan. A large tree called in Sanscrit "rohuna," in Mahratti "rohuñi" (J. F. Wats.), in Hindustanee "rohana," in Bengalee "rohun," in Telinga

Minusops elengi of Tropical Hindustan. An ornamental tree called in Sanscrit "bakula" or "vukoola" (J. F. Wats.), in Bengalee "bukul," in Hindustanee "mulsari," in Malabar "elengee," in Telinga "poghada," in Tamil "maghadam" (Drur.), in Mahratta "bugool" or "buckoollee," in the environs of Bombay "vowlee" (Graham); in which we recognize the "bakula" flowers of Bhavabhuti mal. ii, — Jayadeva, and the "vakula" tree and flowers of Kalidasa ragh. viii. 63 to ix. 33, Susrutas, and the Avadana purna: *M. elengi* was observed by Rheede i. pl. 20 in Malabar; by Graham, "in gardens Bombay," and "wild in the ravines at Kandalla," the "Mussulmen had the good taste to plant it round their mausoleums;" by Roxburgh, wild only "on the mountains of the Rajahmundry

"soimida," in Tamil "shem-marum" or "woond-marum" (Drur.) in the environs of Bombay "rouen" or "ruhim" (Graham); in which we recognize the "rohin" of Bhavabhuti mal. 9, against whose hollow trunk an elephant is leaning: — *S. febrifuga* was observed by Gibson, Auld, and Nimmo, "in considerable abundance in various parts of Goozerat, also in the Adjunta jungles," at "the Sindwah ghaut," and the "Jowar jungles" (Graham); by Roxburgh cor. i. pl. 17, and Wight, in other parts of the peninsula, its wood remarkably hard and heavy, greatly used by the natives for wood-work in their temples (Drur.). The bark according to Duncan, Ainslie, and others, is a good tonic in intermittent fevers (Lindl.).

Dalbergia Oujeinensis of Eastern Hindustan. A tree called in Sanscrit "tinisha" (Pidd.); and the "tinisa" of Bhavabhuti mal. 9, — prescribed medicinally by Susrutas chik. 19 to kalp. 7, is referred here by Hessler. *B. Oujeinensis* was observed by Roxburgh, Wight pl. 391, and Beddome, from the Godavery forests and Nagpore to Oude and Dheyra Dhoon, its timber useful and valuable, employed for making furniture and for house-building, and a *kino* extracted from the bark (Drur.).

Pentaptera arjuna of Tropical Hindustan. A tree called in Sanscrit "arjuna" (J. F. Wats.), in Bengalee "arjoon," in Hindustanee "cahua" (Drur.), in the environs of Bombay "arjuna" or "urjoon sadra" (Graham); in which we recognize the "arjuna" of Bhavabhuti 9, — Kalidasa ragh. xvi. 51, and Susrutas: *P. arjuna* was observed by Law "common in the jungles to the southeast of Surat," and Gibson found its bark "in great repute among the natives as a tonic internally, and a vulnerary applied externally" (Graham); was observed by Roxburgh, Wight, and Powell, as far as the Punjaub and Bengal (Drur.). A species possessing similar medicinal properties and possibly not distinct, is known to grow in Burmah (Mason v. 533).

Fasminum auriculatum of Tropical Hindustan? A shrub called in Sanscrit "yoothika" (Pidd.), in the environs of Bombay "jai" (Graham); in which we recognize the "yuthika" of Bhavabhuti mal. 9, — and Susrutas sutr. 36 to chik. 8 and 17: *J. auriculatum* from the gardens of the Hindus of Malabar is described by Vahl symb. iii. 1; was observed by Graham in the environs of Bombay, "in gardens scarce;" by Roxburgh, and others, as far as Bengal.

Convolvulus (Argyria) cuneata of Tropical Hindustan. A shrub, twining when near support (Graham); and the cloud spreading over the peak of the mountain, dark as the "tapincha" blossom when full grown and opening at top, mentioned by Bhavabhuti mah. 5, — may be compared: *A. cuneata* was observed by Graham "common in the Mawul districts above the Ghauts," the flowers "pretty large" and "exceedingly beautiful," of a "deep bright purple colour;" by Roxburgh, in other parts of Hindustan. Transported to Europe, is termed "*ipomea atrosanguinea*" in the Botanical magazine pl. 2170.

Salix tetrasperma of Hindustan. The *Indian willow* is a small elegant looking tree (Graham); and willows overhanging Godaveri river are mentioned in Bagabhuti uttar. 2 — (transl. H. H. Wils.): *S. tetrasperma* was observed by Law, and Graham, in "the vale of the Yena and other moist places, Mahableschwur," and "various parts of the Southern Mahratta country;" by Roxburgh cor. i. pl. 97, and Wight, as far as the Khasia hills and Oude (Drur.).

Gloriosa superba of Tropical Hindustan and Burmah. A gaudy and beautiful climber called in Malabar "mendoni," in Tamil "caateejan," in Hindustanee "cariari" (Drur.) in the environs of Bombay "karianag" or "indoi" or "kalawee" or "buchnag" (Graham), in Hindustanee "ulatchandul" (J. F. Wats.), in Burmah "hsee-mee-touk" (Mason); and the lily winding on its slender stalk, mentioned by Bhavabhuti — (transl. H. H. Wils.), may be compared: *G. superba* was observed by Rheede vii. pl. 57 in Malabar; by Murray, and Graham, "common in Guzerat and Concans, Mahableschwur," springing up "only during the rains," its root tuberous; by Roxburgh, Wight, and Drury, as far as Travancore and Bengal, its root said by the natives to possess nearly the same properties as that of *Aconitum ferox* and hence termed "wild aconite," applied in paste to the hands and feet in difficult parturition, and a salt procured from it by repeated washing and grinding; by Mason, indigenous in Burmah. Westward, was observed by Bojer on Mombas island, near the African coast; but by European colonists, was carried to the Mauritius Islands (Boj.). As transported to Europe, is described by Hermann lugd. pl. 689 Plukenet alm. pl. 116, and Darwin loves of plants.

district;" by him, and Wight, planted in other parts of Hindustan as far as Bengal and Silhet, its fruit edible, seeds yielding oil, and an odoriferous water distilled by the natives from the flowers; by Mason, "exotic" in Burmah, its "small delicate sweet-scented blossoms" strung by maidens for garlands. Westward, its dried fruit has been found in ancient tombs in Egypt (Champoll.-Fig. 157). By European colonists, was carried to the Mauritius Islands, where it continues in gardens (Boj.).

"722 A. D." (T. Wright early trav. Palest.). on reaching Palestine, Willebald found the inhabitants of Cyprus "not in arms, for there was great peace and friendship between the Greeks and" Muslims. A *lion* was seen by him on the farthest border of Samaria; illustrating the description in Jerem. xlix. 19, and l. 44.

"As early as this year" (according to the chronicle, Talvi iii. 1), a clerk or writer employed by Libussa, traditional princess of Bohemia. *Bohemian poems* are extant that seem earlier than the conversion to Christianity.

"The same year" (Pauth. 315), by a census in China, the number of persons found to be "45,431,265; not including princes, nobles, mandarins, persons attached to their service, the army, literati, bonzes, nor slaves."

Illicium anisatum of Southwestern China. The fruit used as a spice in cookery by the Chinese as early probably as this date: — the living shrub seen and described by Loureiro p. 353; the whole plant, especially the fruit having a pleasant aromatic flavour of anise (Lindl.). Westward, the fruit brought from China and called "habb cloué," was found by Rouyer in the drug-shops of Egypt: farther West, the imported fruit is described by Gärtner i. pl. 69; and according to Lindley, is called *star anise*, "by distillation yields an oil which has most of the properties of oil of anise, for which it is often substituted; it is chiefly used in the fabrication of liqueurs."*

"Under the Thang dynasty" (topog. Cant., and Pauth. 473), a regular market opened at Canton, attended by an officer to receive the tax or *duties* belonging to government.

"723 A. D. (= 1st of the nengo ten-pe-foo-zi = cyclique kiatzu," inscript., and Klapr.), the city of Ta-ka-seki in Oziou, opposite to the island of Yeso, founded by O-no-no Assa-yemi, general in charge of the forts.

"724 A. D." (ann. Jap., and art de verif.), Gensioo succeeded by her nephew Siommu, now forty-fifth dairo of Japan.

"In this year" (Jap. centen. comm. 60 to 90), the *potter's wheel* introduced into Japan by the priest Giyoki; and "samples of earthenware made at that time" are extant. Giyoki proposed the erection of a colossal *bronze* statue of Budha: and the plan was carried out by Shomu.

"The same year = 12th year of the 'kai-youan' of Ming-hoang-ti" (Chinese chron. table), beginning of the Fifty-seventh cycle.

"During the khai-youan of Youan-tsoung or Ming-hoang-ti (= 713 to 741," Rem. mel. iii. 85), Cambodia divided into two States, the Northern mountainous portion, and the Southern lowland.

"The same year" (T. Wright), by Yezid II. "instigated by the Jews," an edict issued "at the end of his reign" against the paintings in Christian churches within his dominions. The measure led to the re-commencement of hostilities between the Greeks and Muslims.

"Before the close of the year" (art de verif.), Yezid II. succeeded by Heschem, tenth Omriad khalif. Coins issued by Heschem, are figured by Marcel p. 38.

"726 A. D." (Sm. b. d.), edict by Leo III. Isaurus abolishing image-symbols in Christian worship. — Followed by the refusal of Rome and Western Europe to acknowledge any longer the authority of the Byzantine emperors, in taxes or otherwise.

Rumex scutatus of Europe and the adjoining portion of Asia. Called in Italy "acetosa romana" or "tonda" (Lenz); and the ΠΕΤΡΟΛΑΠΑΘΟΥ whose root is prescribed in the treatise Euporist. ii. 47 — (Spreng.), may be compared: *R. scutatus* was observed by D'Urville on the island of Milo (Bory). Westward, is described by Miller (Steud.); is known to grow wild in Switzerland "inter acervos lapidum" (Pers.) and as far North as Hesse Lat. 51° in Germany (Koch, and A. Dec.); occurs also "on walls" in Holland and the neighbouring portion of France (fl. Bat., and Breb.), and naturalized in Britain (Wats.); was once cultivated as far North as Sweden (Fries).

"727 A. D." (Blair), the tax called "Peter pence," instituted by Ina king of Wessex; to support a college in Rome.

"730 A. D." (Sm. b. d.), the revolt at Constantinople quelled by Leo III. Isaurus, who deposed and banished the patriarch Germanus, and appointed in his place the iconoclast Anastasius. In the course of the disturbances, the *library* of "thirty-six thousand" volumes in the church of St. Sophia was destroyed by fire.

* *Illicium religiosum* of China and Japan. Called "skimi" in Japan, and chiefly employed as a perfume by the priests of Japan and China — (Kaempf., Siebold, and Lindl.).

The *nigrogemmeus* of Britain, described by Beda hist. eccles. i. 1 as when rubbed detaining light substances like amber, also inflammable, — is doubtless *jct.*

The *musculæ* of Britain, described by Beda as of various colours, reddish, purple, violet, greenish, but especially white, sometimes containing pearls, — are clearly fresh-water mussels, *Unio margaritaceus*.

The *auca* for cooking hanging against the wall, mentioned by Beda vit. Cuthb. 36, — may be compared with the *great auk*, *Alca impennis*. This bird formerly frequent along the Northern shores of the Atlantic from Denmark to Newfoundland and Massachusetts Bay on the American side, is at the present day nearly extinct.

"731, June 10th" (Bed. hist. eccles. v. 23), end of the chronicle of Beda; who (according to his own statement) was now "fifty-nine" years old. — He died in "735" (chron. contin. anon., Smith, and Pouchet).

"In this year" (Alst., and Nicol.), at Rome, Gregorius the younger succeeded by Gregorius the third, twenty-fifth archbishop.

"732 A. D." (art de verif.), the Muslims after overrunning a large portion of France, as far as the Loire, finally defeated at Tours by Charles Martel. Soon afterwards, they were compelled to retire into Spain.

One hundred and fifty-first generation. May 1st, 734, onward mostly beyond youth: the Chinese poets Thou-fou, and Li-tai-pe: the Arab writers, the traveller and botanist Abu Saher, Madain (dead 768, Gildem.), Ebn El-Ala the grammarian (Lane dict.): Isidorus Pacensis, Clemens Antisiodorensis, Joannes Mailrosius, the monk Antonius Melissa, Fredegair (Blair); Joannes Damascenus who first composed a system of Divinity from the Greek fathers (Blair), Cosmas of Jerusalem, Joannes patriarch of Jerusalem; Rupertus bishop of Worms.

"In this year" (Sm. b. d.), unsuccessful attempt by Leo III. Isaurus to recover his authority at Ravenna. His expedition failed, and the city was captured by Lombards. Leo now detached Illyria, Greece, and Macedonia from the spiritual authority of Rome to that of the patriarchs of Constantinople, completing the separation of the Greek and Latin churches.

"736 A. D." (Mason ii. 21), in Burmah, Pungnareka anointed king of Pegu. He governed in accordance with the divine law, studied the Buddhist scriptures, and attended constantly with his queens, concubines, and courtiers on the preaching of learned teachers and holy priests.

"741 A. D." (Alst.), Leo III. Isaurus succeeded by Constantinus VI. Copronymus, twenty-fourth Byzantine emperor.

"742 A. D." (Alst.), at Rome, Gregorius the third succeeded by Zacharias, twenty-sixth archbishop.

"The same year" (Alst., and Nicol.), the first synod dated by the Christian era: a computation now beginning to be used in history.

"743 A. D." (art de verif.), Hescham succeeded by Walid II., eleventh Ommiad khalif.

"In this year" (Jap. centen. comm. 90), commencement of a second *bronze* statue of Budha "about fifty feet in height." — The statue has been "greatly damaged by an earthquake" and by fire, but "still exists in Nara."

"744 A. D." (art de verif.), Walid II. succeeded by Yezid III.; shortly afterwards, by Ibrahim; and before the close of the year, by Merwan II., fourteenth Ommiad khalif.

"In this year" (Gildem. p. 11), Bukhara captured by the Muslims. — Held by them six years.

"745 A. D." (Mar Gabriel, Wisscher, and Coq.-Montbret in rec. voy. et mem. 33), the number of Christians in Southern Hindustan having been reduced to "sixty-four" families, a large accession from Jerusalem and the Euphrates sent out by the patriarch of Babylon under the charge of a merchant named Thomas. The new colonists of both sexes and all ages obtained permission of the king of Cranganor to settle there, and built several churches, their houses numbering "four hundred and seventy-two."

"In this year" (Pauth. auth. 79, and Yule cath. i. p. xcii), decree of the emperor Hiouan-tsoung stating, That as the religion of the sacred books known as "Persian" (Christianity) originally came from Tathsin (the Byzantine Empire), the name "Persian temples" should be changed to "Tathsin temples."

"746 A. D." (Blair), *pestilence* desolating Europe and Asia. — It continued three years.

"The same year" (Chron. and Cockayne iii. p. 453), Selred king of Essex slain.

"In this year" (= 802 Vicram., Vansav., and Wilf. as. res. ix. 185), Narwaleh built by Vana-raja, now "fifty years" old and head of the last dynasty of balharas or kings of Guzerat: or according to Elphinstone iv. 1, the Chauras dynasty of kings of Guzerat establishing their capital at Anhalwara, — now called Pattan.

"749 A. D. (in the seventh month of 1409th year of Synmu," art de verif.), Siomu succeeded by his daughter Kooken, now dairo of Japan. In the first year of her reign, *gold*, hitherto imported from

Corea or China, discovered in the province of Osio in Japan (the event is placed two years earlier in Jap. centen. comm. 96).

"750 A. D." (art de verif.), Merwan II. succeeded by Abu'l Abbas, of the Abbas family and now khalif. The seat of government was removed from Damascus to a town on the Euphrates: a change accompanied with the loss of Spain, which became an independent Muslim kingdom.

"In this year also (= 132 A. H." of Ferisht., Elph.), the Muslims expelled from Sind, — which remained in the possession of the Hindus nearly "five hundred" years.

Janah-bin-Abbada, appointed by Abu'l Abbas governor of Oman, building the mosque of Janah or Jamah. He secretly countenanced the doctrines of the el-Ibadhiyah, — and this sect, taking the government into their own hands, established Julanda-bin-Mas'ud as the first rightful imam of Oman. He was slain in battle after maintaining a successful opposition against Abu'l Abbas "two years and one month."

"About this year" (Steinsch. ii. 8), origin of the Karaite sect among the Jews, and *Karaite literature* commenced by Anan ben David.

"751 A. D." (Alst., and Blair), through the influence of Zacharias archbishop of Rome, Childeric III. of France forced into a monastery; and succeeded by Pepin son of Charles Martel. The Merovingian or First French dynasty, giving place to the Carolingian. In return, Pepin ceded the Exarchate of Ravenna with other territory to the archbishop of Rome.

Papyri of this date (= "133 hej.," De Sacy chrest. ii. p. 531) written in a character nearly identical with the Neskhi Arabic, have been discovered in Egypt.

"752 A. D." (Alst., and Nicol.) at Rome, Zacharias succeeded by Stephanus the younger; and before the close of the year, by Stephanus the third, twenty-eighth archbishop.

"The same year" (Talvi iii. 1), the Czechs or Bohemians under duke Nezamysl, "said to have first distributed the lands in fee, and to have given to the whole community a constitutional form."

"754 A. D." (art de verif.), Abu'l Abbas succeeded by El-Mansur, second Abbassid khalif. Coins issued by El-Mansur, are figured by Marcel p. 44.

"The same year" (Pauth. 315), by a census, the population of China found to consist of "52,884,818 persons, not including princes, nobles, mandarins, nor those in their service, nor the military, literati, bonzes, nor slaves."*

"755 A. D." (Remusat, and Pauth. 382), end of the Thoung-tian; an encyclopedic statistical work by the Chinese archæologist Thou-yeou.

"The same year" (Alst.) a synod at Constantinople (by some ranked as a general Council), consisting of "three hundred and thirty-eight" bishops. The exclusion of images of saints from churches was sanctioned.

"756 A. D. = 'tchi-te,' 1st year of Sou-tsoung, of the Thang" or Fifteenth dynasty (Chinese chron. table). He continued to favour Christianity (inscript. Singanfu).

Not later than this year (= 701 an. jav. + "20 years" of Nata Kasuma, Raffles x), Kasuma Wichitra succeeded by his son Ra'en Aji Nirmala, fifth lineal descendant from Jaya Misana and now king of Java.

"In this year" (Sm. b. d.), the Lombard king Aistulph compelled by Pepin of France to cede the city and district of Ravenna to the Roman archbishop Stephanus the third. The beginning of the "temporal power" of the church of Rome.

Humulus lupulus of Northern climates. Called in Britain *hop*, in Anglo-Saxon "hymele," in mediæval Latin "hupa," in German "hopfe," in Dutch "hoppen," in Tartar "kumalak," in Hungarian "comlo," in Slavonian "chmel," in Esthonian and Finnish "humala," in Swedish "humle," in Danish "homle," and in French "houblon" (A. Dec., and Prior), and mentioned by king Pepin in a letter of dotation, — and by Adelard (Beckm.): *H. lupulus* is termed "*lupulus mas et fœmina*" by Tournefort inst. 535, and is known to grow wild throughout middle Europe (Pers., and A. Dec.). Eastward, was observed by Belon, Forskal, and Sibthorp, in hedges around Constantinople and in Asia Minor; and according to Clot-Bey, was introduced by Delile into Egypt; is known to grow wild around Caucasus, throughout Siberia to the Aldan branch of the Lena and Lat. 62° (Gmel.); and was seen by Thunberg on the mountains of Southern Japan, indigenous and nowhere cultivated. Farther East, was observed by E. James along the Rocky Mountains at the head waters of the Arkansas; lower down along the Arkansas, and along the Mississippi and Missouri, by Nuttall; at Lat. 49° on

* *Begonia* sp. of China. The autumnal "hai-tang" from sea rocks, celebrated by poets under the Thang dynasty, from its flowers having "two large and two small petals" — (Cibot in mem. Chin. iii. p. 443), would seem to be a species of *Begonia*. The "hai-tang" is further described by Cibot as of a fine red, fragrant, bearing peach-coloured flowers, and perennial in the South and more flourishing than at Pekin; not noticed by medical writers, but for the last two centuries planted in the grounds around the palace. *B. grandis* was seen in Japan by Kämpfer pl. 20.

Red river of Lake Winnipeg, by Say; is known to grow wild along the Ohio and its tributaries; and along our Atlantic streams, appeared to me wild on tributaries of the Delaware. The cultivated hop was however brought from Europe by colonists.

"757 A. D." (Alst., and Nicol.), at Rome, Stephanus III. succeeded by his brother Paulus, twenty-ninth archbishop.

"758 A. D." (Pauth 316), disturbances excited at Canton by the Arab and Persian traders; who after plundering the warehouses, retired by sea.

"759 A. D. (= 1419th of Synmu," art de verif.), Kooken succeeded by Fai-tai, great grandson of Tenmu, and now dairo of Japan.

"760 A. D." (Jap. c. c. 96), "a more elaborate money system" established in Japan, "consisting of gold, silver, and copper *coins*" (attributed however to "the emperor Sunnin").

"762 A. D." (Marcel), Bagdad, near ancient Babylon, founded by khalif El-Mansur for the new seat of government. — Also, Mansura on the west bank of the Indus for the seat of government of his prefect (Kaswini, and Gildem.).

"The same year = 6th of the nengo zin-ki = cyclique jin-yn," date of an inscription by Fousi-wara-no Ye-mi-no, general in charge of the forts, placed by him before the gate of the city of Ta-kaseki, not far from the island of Yeso. — A copy of the inscription is given in the San-kokf (transl. Klapr. p. 216).

"763 A. D. = 'kouang-te,' 1st year of Tai-tsoung II., of the Thang" or Fifteenth dynasty — (Chinese chron. table). He continued to favour Christianity (inscript. Singanfu).

"The same year = beginning of the Fourteenth manwantara" among the Hindus — (Graha Munjari tables, and Bentl.).

In ascending the Nile, the "barns of Joseph" (pyramids) described by Fidelis as looking in the "distance like mountains." On landing, he found near "the group of three" a *lion* and eight men and women all lying dead; "the lion had slain them by its strength," and they had slain the lion with their spears and swords. Fidelis afterwards sailed through the canal to the Red Sea, on his way to Palestine (T. Wright early trav. Palest.).

"765 A. D." (ann. Jap., and art de verif.), Fai-tai deposed, and the government resumed by Ko-ken, now under the name of Sio-tok as forty-eighth dairo of Japan.

"766 or 767 A. D." (Nicol.), a synod at Jerusalem. In favour of image-symbols in Christian worship.

One hundred and fifty-second generation. Sept. 1st, 767, onward mostly beyond youth: the Jewish writers, Ishak ben-Jakub el Isfahani: the Arab writers, Sibawaih, El-Khaleel, Ebn Seiyar El-Khurasanee, Yoonus, El-Kisa-ee (Lane dict.): Paulinus Aquileiensis: the Greek writers, Tarasius, and Theognostus.

"In this year" (Dionys. of Telmahre, and Gildem.), the Byzantine territories invaded by Muslims, including Sindian troops.

"The same year" (T. Wright), Mohammed ben Abdallah having revolted at Medina (Leps.) the canal leading from the Nile to the Red Sea blocked up by khalif El-Mansur (see Ramessu II.).

"768 A. D." (Alst., and Nicol.), at Rome, Paulus succeeded by Stephanus IV., thirtieth archbishop.

"The same year" (Alst.), Pepin succeeded by his son Carolus Magnus (Charlemagne) as king of France. Where his preceptor Alcuinus of England, became the "restorer of learning" (Blair).

"770 A. D." (Blair), by the Byzantine emperor Constantinus VI., the monasteries in the East dissolved, and the monks and nuns compelled to marry.

"The same year" (ann. Jap., and art de verif.), Ko-ken or Sio-tok succeeded by Koonin or Kwonin, grandson of Tent-sii, and now forty-ninth dairo of Japan.

Of woods from early times used in Japan, specimens of "hiba" (*Thuyopsis dolabrata*),* nedzuko (*Thuyopsis laetevirens*), "wabyakudan" (*Thuya* . . .), "larch tree" (*Larix* . . .), "inugaya" (*Cephalotaxus drupacea*), "tsuga" (*Abies thuga*), "tohi" (*Abies alkokiana*), shirabe (*Abies Veitchii*). "walnut tree" (*Juglans* . . .), "sawa-kurumi" (*Pterocarya sorbifolia*), "evergreen oak in two

* *Abies bifida* of Japan, as far as Yeso. A *spruce* called by the Ainos "sunk," in Japan "momi" (Sieb., and Jap. c. c. 30): known from early times, — and its wood enumerated by Siebold among the kinds especially fit for shipbuilding and supplying masts.

Quercus dentata of Japan, as far as Yeso. Called by the Ainos "gomuni" (Sieb.), in Japan "kashiwa" (Jap. c. c.); and its wood from early times used by the Ainos "for oars and other instruments" — (Sieb. 41 and 170).

Sophora japonica of Japan, as far as Yeso. A tall tree called by the Ainos "tokbeni" or "tsikbe," in Japan "jendsju" (Sieb.) or "yenji" (Jap. c. c. 31); and its wood used from early times. — From transported specimens, described by Linnæus (Pers.).

kinds," "ubamegashi (*Quercus phillyroides*)," "nara (*Quercus crispula*)," "chestnut tree" (*Castanea* . . .), "minebari (*Alnus firma*), alder" (*Alnus* . . .), "midzume (*Betula ulmifolia*), shirakanba (*Betula alba*)," "kurokaba (*Rhamnea*" . . .), "beech" (*Fagus* . . .), "keyaki (*Planera Japonica*)," "mukuno-ki (*Celtis aspera*), yenoki (*Celtis Sinensis*), harunire (*Ulmus campestris*), yamagiri (*Elacococca cordata*)," "box tree" (*Buxus* . . .), "inu-tsuge (*Ilex crenata*)," "katsura (*Cercidiphyllum Japonicum*)," "nurude, (*Rhus semialata*), utsugi (*Deutzia scabra*)," "sumomo, (kind of plum tree), pear tree" (*Pyrus* . . .), "kwarin (*Pyrus Chinensis*)," "horse chestnut" (*Aesculus* . . .), "mukurogi, (*Sapindus mukurosi*), momiji, (*Acer polymorphum*)," "shirakuchi (*Ictinidia arguta*), kenponashi (*Hovenia dulcis*)," "toneriko (*Fraxinus longicuspis*)," "chan-chin" (. . .), "sendan (*Melia Japonica*)," "yego (*Styrax* . . .)," "saru-suberi (*Lagers troemia* . . .)," "isu (*Distylium racemosum*)," "mayumi (*Euonymus Sieboldianus*)," "soro (*Carpinus sp.* . . .)," "aodako" (. . .), "shio-ji (*Kalopanax ricinifolia*)," "koyosan (*Cunninghamia Sinensis*), yamanashi" (. . .), "midzuki (*Cornus brachypoda*)," "shiotsuga" (. . .), "sogeki (*Myrsine neriifolia*)," "midsukusa" (. . .), "zumi (*Pyrus sp.*" . . .), and "kuromoji (*Lindera sericea*)"—were exhibited at our Centennial exposition (Jap. c. c. 30). Also, wood of

Camellia Japonica of Japan. A large and lofty tree called "tsubaki" (Jap. c. c. 31), and known from early times:—observed by Kaempfer, and Thunberg, abounding in the forest, frequent also in gardens. Transported to Europe and North America is called *Camelia*, and has become a favourite in greenhouses, where numerous and much admired variations have been produced in the flower.

"771 A. D." (= 719 + cycle of 52 yrs., Clavig. ii.), accession of Huetzin, third Toltec king of Mexico.

Datura stramonium of Eastern Asia. The *thornapple* called in Mexico "tlapatl" (Hernand. 278), and known there from early times; *—attributed to Mexico by Columna phytob. pl. 12: in Northeast America is sometimes called *Jamestown-weed* from being found by the first English colonists on James river; is known to occur in waste places throughout our Atlantic States from Florida to Canada; was observed by Nuttall along the Missouri to its source; by Sloane i. 159, in the West Indies; by Humboldt, near Caraccas (Kunth); by Martius, and myself, in Brazil; by C. Gay, and myself, in Chili; by myself, in Peru, and perhaps aboriginally introduced on the Hawaiian Islands. Farther West, was observed by Thunberg near Nagasaki in Japan; is known to occur in Tartary and Southern Siberia from the Altaian to the Talysch mountains (Gmel., and Georgi), also in waste places along the Taurian mountains (Bieb.); is termed "tatula Turcorum" by Bauhin hist. iii. 624, and at this time was regularly cultivated in Europe (Zannichelli 253), but soon became a weed, as appears from Gerarde, Ray, and Zanoni; is termed "stramonium" by Alpinus 42, "stramonium fructu spinoso oblongo flore albo" by Tournefort inst. 119; was observed by Sibthorp, Chaubard, and Fraas, from Smyrna to the Peloponnesus, and called "tatoula;" but in Italy according to A. Decandolle "stramonio" or "strimonio." Clearly by European colonists, was carried to Madeira (Lemann); and to the Mauritius Islands (Boj.).

Datura ferox,—used in China by thieves to deprive their victims of the power of resistance (Crawf. ind. arch. i, and Graham), is regarded by A. Decandolle as possibly not distinct.

"772 A. D." (Alst., Blair, and Nicol), at Rome, Stephanus IV. succeeded by Hadrianus, thirty-first archbishop.

"774 A. D." (Leo Marsic. i. 15, and Fabric. bibl.), the kingdom of the Longobardi or Lombards overthrown by Charlenagne, and Paulus Diaconus, secretary to the last king Desiderius, taken prisoner.—After being exiled, Paulus Diaconus was received into favour and honoured by Charlemagne.

"775 A. D." (Alst.), Constantinus VI. succeeded by his son Leo IV., twenty-fifth Byzantine emperor.

"The same year" (art de verif.), El-Mansur succeeded by El-Mahadi, third Abbassid khalif. Coins issued by El-Mahadi, are figured by Marcel p. 45.

776 A. D. = "701 an. jav." (Nata Kasuma, and Raffles ix. and x.), the Javan poem of the Brata Yudha or war of the Pandus composed by the Pandita Puseda, or "by order of Dewa Batara Guru."

* *Rhizophora mangle* of muddy Tropical shores, in the Atlantic and throughout the islands of the Pacific. A *mangrove* known from early times:—observed by Catesby ii. pl. 63 in the Bahamas; by Jacquin pl. 89 in the West Indies; and known to grow from Lat. 29° (twenty miles below St. Augustine according to N. A. Ware), and from the mouths of the Mississippi, throughout the islands and along the shore of the continent as far as Brazil (Kunth, and Dec.): also along the opposing shore of Equatorial Africa (fl. Nigr. p. 341). Westward, is known to grow from "Lat. 24° 38'" along the Pacific shore of America to the border of Peru (A. Dec.); also at the Galapagos Islands (J. D. Hook.); was observed by myself at the Samoan, Tongan, and Feejeean islands; by Rich, at the Tarawan coral-islands; and is known to grow as far as the New Hebrides and New Caledonia (Endl.).

Bisura Champaca (son of king Raden Aji Nirmala and father of Ang'ling Derma) leaving Milawa Pati proceeded to Mendang Kamulan possibly not earlier than this date. Mendang Kamulan became the new seat of government;—and its ruins continue to be pointed out, consisting of “heaps of stones and bricks” and “walls and excavations of an extensive tank” in an extensive forest in the district of Wirasaba.

“779 A. D. (= 14th year ta-li of Sou-tsong,” Remus. mel. iii. 86), Pho-mi viceroy of Cambodia, accompanied by his wife, visiting the court of China.

“780 A. D. = ‘kien-tchoung,’ 1st year of Te-tsong, of the Thang” or Fifteenth dynasty (Chinese chron. table). He continued to favour Christianity (inscript. Singanfu).

At this time (= “980 — about two hundred years” of Velasco, Markh. edit. G. de la Vega ii. 347), the Caras tribe under the rule of a scyri dwelling on coast of the Pacific opposite Quito.

“The same year” (Alst.), Leo IV. succeeded by Constantine VII., twenty-sixth Byzantine emperor. Ruling jointly with his mother Irene, — the succeeding “ten” years.

“781 A. D.” (= “2d year Kienchung = 1092 of the Greeks”), date of the Singanfu inscription, “Hanan Ishu’a” being Nestorian patriarch (news of his death “in 778” not having reached this remote station).

“781 to 782 A. D.” (De Wailly pl. iv. 10), a manuscript of this date, presenting the following form of the letter *g*.

“782 A. D.” (ann. Jap., and art de verif.), Koonin succeeded by his son Kouan-mu, now fiftieth daïro of Japan.

“784 A. D. = 1st year of the ‘hing-youan’ of Te-tsong” (Chinese chron. table), beginning of the Fifty-eighth cycle.

A Tibetan work on medicine, derived like the whole of Tibetan Literature from Sanscrit in the Eighth century (Csoma de Koros, and Royle antiq. hind. med. 48).

“The same year” (art de verif.), El-Mahadi succeeded by El-Hadi, fourth Abbassid khalif.

“786 A. D.” (art de verif.), El-Hadi succeeded by Harun-el-Rashid, fifth Abbassid khalif. Literature and science were protected and encouraged by Harun-el-Rashid; and his memory has also been cherished for benevolent acts. Coins issued by him are figured by Marcel p. 48.

A Sanscrit treatise on poisons translated into Persian by Manka, a Hindu at the court of Harun-el-Rashid (Royle antiq. hind. med. p. 184).

Sindbad after according to his own account visiting Kela (the river Calung in Malacca) where were “mines of tin, plantations of sugar-cane and excellent camphor,” sent on his seventh and last voyage by Harun-el-Rashid as ambassador to Ceylon.

Dryobalanops? camphora of the Equatorial portion of Sumatra and Borneo. A large tree affording *precious camphor*; clearly the “excellent camphor” seen by Sindbad at Kela, — and “excellent sort of camphor” from the island of Ramni seen by Ebn Wahab: precious camphor is mentioned also by Ebn Amran, Edrisi, Abulfeda, and Bakui (see Spreng.); “canfara sold for its weight in gold” was seen by Marco Polo 169 on Java; and camphor, by Nicolo Conti on Sumatra: D. camphora is known to be rare and confined to a narrow belt of territory along the Equator only on Sumatra and Borneo (Houttuyn xxi pl. 8, Colebr. as. res. xii. pl. . . , and Jack comp. bot. mag. i. 264); the drug according to Blume is procured from fissures in the bark and wood, also by incisions, is much firmer than common camphor and is not volatilised by exposure to the air, does not find its way to Europe, but is chiefly exported to China and Japan where it is highly valued for its stimulant tonic properties (Lindl.).

787 A. D. (= “6th year of Kouan-mu,” art de verif., see also San-kokf transl. Klapp. p. 218), Japan invaded by the Ainos, — who continued their ravages “nine” years until defeated by the Japanese general Tamamar or Tamoura-maro near the city of Ta-ka-seki. Tamoura-maro now pushed Northward, and extended the frontier beyond Oma and the districts of Nambu and Tsougar; being the “Second” establishment of a boundary between the Ainos and Japanese.

“Sept. 24th” (Nicol., see also Alst.), Seventh general ecclesiastical Council. Convened at Nice. In favour of image-symbols, and the intercession of saints. — The authority of this and the Six anterior general Councils, continues to be recognized by the Greek church (E. A. Soph.).

Under the direction of Charlemagne, a volume written against image-symbols and errors of the Romish church — (Alst. p. 370).

Hardly earlier than this date (Graham Munjari tables, Puranas, and Bentr.). Uru reigning in Hindustan.

“790 A. D.” (Talvi i.). The Slavonian tribes subdued by Charlemagne, enumerated by his secretary and annalist Eginhard as the Veletabæ, Sorabæ, Obotrites, and Bohemians, all speaking not the same, but very similar languages.

Carlina vulgaris of Europe and the adjoining portion of Asia. Called in Britain *carline thistle*, in medieval Latin “carolina” (Prior), and named after Charlemagne — (according to a legend in

Tabernæmontan ii. p. 391): *C. vulgaris* is described by Fuchsius p. 121, and Tragus f. 322 (Spreng.); is termed "*c. sylvestris vulgaris*" by Tournefort inst. 500; and is known to grow in woods and mountainous situations throughout middle Europe as far as Denmark (fl. Dan. pl. 1174, Engl. bot. pl. 1144, and Pers.). Eastward, was observed by Sibthorp on mount Athos and around Constantinople; and is described by Pallas (Steud.). Its dried calyx according to Persoon is hygrometric, expanding in fine weather, and closing when the atmosphere becomes moist.*

"796 A. D." (Alst.), at Rome, Hadrianus succeeded by Leo III., thirty-second archbishop.

"797 A. D." (Alst.), Irene now sole ruler of the Byzantine empire.

"798 A. D." (Gaubil, and Pauth. p. 322), arrival in China of "three ambassadors" from Harun-el-Rashid to the emperor Te-tsoung. And the ceremony of "ko-teou" or prostration, regarded as a mere form, after some scruples complied with.

"At this time" (Talvi i.), the Slavonian inhabitants of Pannonia already converted to Christianity, through "German priests."

"At the end of the Eighth century" (Mem. de l'Institut. v. p. 430), an embassy from Harun-el-Rashid to Charlemagne, bearing the keys of Jerusalem. Charlemagne proceeded to erect in that city a large building for the use of pilgrims from his dominions.

"800, Dec. 25th" (Alst.), in opposition to the Byzantine Empire, Charlemagne declared "Emperor of the West" by archbishop Leo III. In return, Charlemagne confirmed the grant of his father Pepin, and added more territory to the church of Rome, conveying political authority or "temporal power."

At this time, "796 to 804 A. D." (Lubke and Lutrow), building by Charlemagne of the Kaiser kapelle at Aix-la-Chapelle.

One hundred and fifty-third generation. Jan. 1st, 801, onward mostly beyond youth: the Jewish writers, Isaac of France, Mashalla el-Andrusger, and Sahl et Thaberi: the Arab writers, El-Kindi, Asmai or Ben Coraib, El-Yezedee, Ebn Shumeyl, Kutrub, El-Farra, Abu Obeideh Esch-Sheybantee, Abu Zeyd (Lane dict.), Jahia-Ebn-Serapion (Spreng. hist. med.): the Greek writers, Theodorus Studites, Joseph Studites, Isaaci Theophanes; the chronologer Georgius Syncellus, Dionysius of Telmahre: the theologians, the monk Usuardus, Ludgerus the first monastic bishop, Paschasius Ratbertus, Ansgarius, Claudius Scotus, Jonas Aurelianensis, and Halitgarius; Theodulphus, Leidrade: the Irish geographer Dicuil, the traveller Hetton (Voyag. Belg.).

"802 A. D." (Alst.), Irene dethroned; and the accession of Nicephorus, twenty-eighth Byzantine emperor.

"In the beginning of the Ninth century" (R. H. Major in soc. Hakl., see Ebn Wahab), arrival of Soliman the merchant at "Canfu" or Canton. He found there a Muslim judge, presiding over those of his own religion, under appointment from the Chinese emperor.

Ocimum basilicum of Tropical Asia. Called in Britain *basil* (Prior), in Yemen "hæbak" or usually as in Egypt "rihan;" in which we recognize the "rihan Soliman" — known "at Ispahan" according to Ebn Masawia, and Avicenna mentioned also by Ebn Baitar (the name in common with the Greek "ōrganōn" is derived from the Hebrew "ryh" meaning odour): *O. basilicum* is known to be cultivated in Persia (Pers.); was observed by Forskal under cultivation in Yemen; by him, and Belon, in the gardens of Egypt; again by Forskal in gardens at Constantinople; and is well known in the gardens of Europe (Bauh., and Blackwell pl. 104). Eastward, has been long cultivated in Hindustan, is called in Bengalee "babooitulse," in Hindustanee "kala tulsee" or "pashana

* *Gossypium religiosum* of Tropical America? A shrub, small-flowered, and called in the environs of Bombay "deo kapoos" or "ek sheng kapoos" (Graham) on the Feejee Islands "ngalingali" (Hale); and possibly the "plant yielding fibre resembling cotton" that was "introduced by a native of India" in "799 A. D.," — and cultivated for "some thirty years" in Southern Japan (Jap. c. c. 74): cotton according to Schouw 149 has been cultivated in China only from the Ninth century (A. Dec.), referring perhaps to *nankin cotton*, yielded according to Royle by this species; a variety bearing nankin-coloured wool was observed by Forster on Taheiti (Royle him. 99), and cotton-wool of this colour was seen by Peale on the Feejee Islands: cotton was seen on the Marquesas in 1793 by capt. J. Roberts (hist. coll. Mass. iv. 245): *G. religiosum*, frequent about the dwellings of the natives on the Hawaiian, Taheitian, Samoan, Tongan, and Feejeean Islands, so far as observed by myself had uniformly white wool, and the only use made of it was for lamp-wicks among the Taheitians. Westward, *G. religiosum* according to Roxburgh has only recently been introduced into Hindustan; was observed by Graham "at a temple in Giergaum road Bombay," and by Elphinstone at Rutnagiree. Transported to Europe, is described by Linnaeus, and Cavanilles vi pl. 164. "*G. Barbadiense*," by some writers regarded as not distinct, is described by Plukenet alm. pl. 188 (Pers.), and was observed by Swartz under cultivation in the West Indies (A. Dec.).

cheddee," in Tamil "tirnoot-patchie," in Telinga "vepoodipatsa" (Drur.); was observed by Rheede x. pl. 87 in Malabar, and called "soladi tirtava;" by Graham, "in gardens" at Bombay, "used in seasoning dishes;" by Roxburgh, Wight, and Drury, from Travancore to Oude and Bengal; and according to Ainslee, the pilose variety is employed to assuage the pains of childbirth. Farther East, is enumerated by Mason as "exotic" in Burmah. By European colonists, was carried to Northeast America, where it continues to be abundantly cultivated.

"804 A. D." (mel. Remusat iii. 278), arrival in China of a Japanese ambassador accompanied by Kobou-daisi. Who now made the acquaintance of Hindu priests, and obtained from them books on religious subjects, especially one that had been translated from the Sanscrit. — Returning "in 806," and having invented the Dosia powder, Kobou-daisi contributed largely to the extension of Buddhism in Japan.

"805 A. D. = 'young-tching,' 1st year of Chun-tsoung, of the Thang" or Fifteenth dynasty — (Chinese chron. table).

One of the capitularia by Charlemagne respecting villas or country-seats is dated in this year (Spreng. p. 223).

Sium angustifolium of Northern climates. Called in Greece "nērōsēlinōn" (Sibth.): the *SILUM* of the capitularia of Charlemagne — is referred here by Antony, and Sprengel: *S. angustifolium* is known to make good fodder for cattle: is termed "s. sive apium palustre foliis oblongis" by Tournefort inst. 308; and is known to grow in watery places throughout middle Europe as far as Denmark (fl. Dan. pl. 247, Gouan, Jacq. austr. pl. 67, and Pers.). Eastward, was observed by Sibthorp in watery places in the Peloponnesus; is known to be widely extended (A. Dec.); as far East according to A. Gray as "Michigan" in America.

Tragopogon porrifolius of the Uralian plains. Called in English gardens *salsify*, in France "salsifis," in medieval Latin "solsequium" (Prior), in Germany "haberwurzel" (Grieb), in Greece "tribōura" (Fraas); in which we recognize the *SOLSEQUIUM* of the capitularia of Charlemagne: — *T. porrifolius* is regarded by A. Decandolle as introduced into Britain after the departure of the Romans, but escaping from cultivation had become naturalized before the days of Gerarde; is naturalized also on the neighbouring portion of the continent (Koch, Wats., and Lecl.); was observed by Forskal in cultivated ground near Marseilles; and is termed "t. purpureo-cæruleum porri folio quod artificum vulgo" by Tournefort inst. 477. Eastward, was observed by Sestini (Sibth.), Chaubard, and Fraas, from Constantinople to the Peloponnesus; is regarded as indigenous in Dalmatia (Vis. fl. ii. 108, and A. Dec.); and was seen by Soujef clearly indigenous on the Lower Yaik (Pall. trav. iv.). By European colonists, was carried to Northeast America, where it continues abundantly cultivated. (See *T. crocifolius*.)

Arctium tomentosum of Western Europe. The *parduna* of the capitularia of Charlemagne — may be compared with the medieval "bardana," referred here by Willdenow: *A. tomentosum* was observed by Allioni in Southern France (Steud.), and is known to grow as far as Denmark (fl. Dan. pl. 642, and Pers.).

Rumex acutus of Western Europe. The "parduna" of the capitularia of Charlemagne — is however referred here by Antony, and Sprengel: *R. acutus* is described by Linnæus; and is known to grow in Italy and France (Pollin. veron., Lenz, Lam. fl. fr., and Pers.).

"806 A. D. (= 1466th of Synmu," art de verif.), Kouan-mu succeeded by his son Fei-dsio, now "fifty-first" daïro of Japan.

"This year = 'youan-ho,' 1st year of Hien-tsoung, of the Thang" or Fifteenth dynasty — (Chinese chron. table).

"During the youan-ho of Hien-tsoung (= 806 to 820," Remus. mel. iii. 86), tribute sent by the Lower or watery portion of Cambodia to China.

"807, Jan. 31st, three hours after midnight" (Blair, *occultation* of Jupiter by the moon "in 2° 27' of Libra." Observed in France by the monk Aimoin.

Oxalis acetosella of Northern Europe and Asia. Called in Britain *gowk-meal* or *wood-sowr* or *wood-sorrel*, also in English, German, French, Spanish, and Italian *alleluia* (from flowering between Easter and Whitsuntide when Psalms 113 to 117 ending with this word are sung, Prior): the *ALLELUIA* is enumerated among the ingredients of a compound medicine used in the time of Charlemagne — (Eckhard, and Sprengel): the "geaces sure" is mentioned in the Anglo-Saxon Leechbook i. 2. 13, and the "panis cuculi" in the *Ortus Sanitatis* 16: *O. acetosella* is termed "oxys flore albo" by Tournefort inst. 88; was observed by Desfontaines on mount Atlas; by Savi, in Etruria; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 980, Lam. fl. fr., and Pers.). Eastward, was observed by Sibthorp in the Peloponnesus, also near Constantinople; by Bieberstein, on Caucasus; by Thunberg, on mount Fakon in Japan, and called "katabami." The plant according to Pereira is "refrigerant," a "good scorbutic," and infused in milk or water "forms a grateful drink in fevers and inflammatory cases" (Lindl.).

Geum rivale of Northern climates. Called in Britain *water-avens* (Prior): the *benedictum* of the same compound medicine — is referred here by Sprengel: *G. rivale* is described by . . . ; is termed “caryophyllata aquatica nutante flore” by Tournefort inst. 295: was observed on the Apennines by Savi; and is known to grow throughout middle and Northern Europe as far as Lapland and Iceland (fl. Dan. pl. 722, Hook., and Wats.). Eastward, was observed by Sibthorp, and Chaubard, in wet places in the Peloponnesus and Asia Minor; by Bieberstein, on Caucasus; and by Gmelin, throughout Siberia. Farther East, is known to grow on the Rocky mountains and throughout Canada and Newfoundland (Mx., and Hook.); and along the Atlantic, as observed by myself, to about Lat. 41°. The plant according to Lindley is “stomachic, and said to be useful” in diarrhoea.

Pimpinella saxifraga of Europe and the adjoining portion of Asia. Called in Britain *pimpinell* (Lyte) or *burnet saxifrage*, in mediæval Latin “bipenella” (Prior), in France “boucage saxifrage” (Fée), in Germany “bibernell,” in Greece with seven other potherbs “kaukalithra” (Fraas); in which we recognize the *pimpinellam* of a medical formula of the time of Charlemagne, — “pimpinella” of a proverb quoted by Matthæus Sylvaticus pand. 573, and of *Ortus Sanitatis* 364: *P. saxifraga* is described by Brunfels i. 188, Tragus f. 177, Dodoens, and Cæsalpinus (Spreng.): was observed by Lenz in Italy: and is known to grow along roadsides in rocky places as far as Denmark (fl. Dan. pl. 669, Lam. fl. fr., and Pers.). Eastward, was observed by Fraas frequent on the hills of Attica and Bœotia, the young leaves eaten as greens; is known to grow also in the Crimea and Persia (Lindl.); and “pimpinella” is enumerated by Forskal mat. med. as sold in the drug-shops of Egypt. Its root is “astringent,” used according to Burnett as a masticatory to release toothache, and in decoction to remove freckles (Lindl.)

“809 A. D.” (art de verif.), Harun-el-Raschid succeeded by El-Amin, sixth Abbassid khalif.

“810 A. D.” (Alst. p. 370), Claudius bishop of Turin writing against image-symbols, relics, invocation of saints, and precedence of the archbishop of Rome.

The same year = “735 an. jav.” (Raffles ix.), date of an inscription in the Kawi or ancient Javan character “very beautifully executed” on copper.

“The same year” (art de verif.), Fei-dsio succeeded by his brother Sa-ga, now “fifty-second” dairo of Japan. — In his reign, magnificent temples were erected in various parts of Japan.

“811 A. D.” (Alst.), Nicephorus succeeded by Michael Curopalata, twenty-ninth Byzantine emperor.

“In this year” (palm-leaf ann. Jag., and W. W. Hunter), Kamal Kesari succeeded by Kundal Kesari, now king of Orissa. — He built the temple of Markandeswar in Puri, and reigned “eighteen years”

“812 A. D.” = “2d year of Michael” (Clint. iv. p. 327), end of the chronicle of Theophanes.

“Nov. 1st” (Nicol.), a synod at Constantinople. “Concerning overtures of peace made by the Bulgarians to the emperor Michael.”

“813 A. D.” (Alst.), Michael Curopalata succeeded by Leo V. Armenius, thirtieth Byzantine emperor.

“The same year” (art de verif.), El-Amin succeeded by El-Mamun, seventh Abbassid khalif. El-Mamun was an astronomer; and protected and encouraged literature and science. Coins issued by him are figured by Marcel p. 51.

“814 A. D.” (Alst., and Nicol.), Charlemagne succeeded by his son Louis (Ludovicus Pius) as emperor of France and Germany.

Hardly earlier than this date (Graha Munjari tables, Puranas, and Bentl.), Gambhira reigning in Hindustan.

“816 A. D.” (Alst., and Nicol.), at Rome, Leo III. succeeded by Stephanus V., thirty-third archbishop.

“In or about this year” (Blair), the sun’s greatest declination observed by khalif El-Mamun to be “23° 34’.”

“817 A. D.” (Alst., and Nicol.), at Rome, Stephanus V. succeeded by Paschalis, thirty-fourth archbishop.

“In the reign of Hien-tsoung” (. . .), a map of China and the countries around constructed by the geographer Kia-tan.

“819 A. D.” (Blair), under the direction of khalif El-Mamun, a degree of Latitude measured in the district around Babylon; and found to be “56½ Arabian miles.”

Trichilia emetica of Tropical Africa and Arabia. A large tree called in Yemen “roka,” in which we recognize the “jawz elruka” of Ebn Elhaitham, — Abd Elrahman, Abu Hanifa, Rhazes, Ebn Samhun, and Ebn Baitar: *T. emetica* was observed by Forskal p. 127 frequent on the mountains of Yemen, the fruit sold in market and mixed with odoriferous substances by women for washing the head, the ripe seeds with sesamum oil made into an ointment against psora. Westward, is known to grow in Senegal (A. de Juss., and Lindl.). The “djouz elkai” of the Scharh elmoudjiz is referred here by

Forskal ; and the "jawz elkai" of Ebn Elhatm, Hobaish, Rhazes, and Ebn Baitar, described by Edrisi as a tree growing throughout middle Yemen, may therefore be compared.

"820 A. D." (Alst. p. 370), the haughtiness of the clergy opposed by the emperor Ludovicus Pius ; and by his direction, the Scriptures translated into German.

Erica (Calluna) vulgaris of middle Europe and the adjoining portion of Asia. Called in Britain *ling* or *heath* or *hather*, in Anglo-Saxon "hæth," in German "heide" in Danish "lyng" (Prior), in French "bruyère" (Nugent), by the Turks "funda" (Sibth.), and mentioned in the Niebelungen-Lied, — also by Braunsweig distill. f. 68 (Spreng.), and termed "e. vulgaris glabra" by Tournefort inst. 602 : known to grow from Denmark throughout middle Europe (fl. dan. pl. 627, and Pers.) ; was observed by Sibthorp around Constantinople. By European colonists was carried to Northeast America, where it has been found in certain limited spots, in Newfoundland, and in Tewksbury on the Merrimac.

In this year (= 543 B. C. — "year 1362" in Mahavams. liv.), accession of Matwalesen, a poet, and now king of Ceylon.

"821 A. D. = 'tchang-tsing' 1st year of Mou-tsoung, of the Thang" or Fifteenth dynasty (Chinese chron. table). A treaty of peace between Mou-tsoung and the king of Thibet is extant, inscribed on marble at Lassa—(Pauth. p. 325).

"The same year" (Alst.), Leo V. succeeded by Michael II. Balbus, thirty-first Byzantine emperor.

"822 A. D." (rec. voy. et mem. iv. 15), founding of the city of Colam or Coylang on the coast of Southern Hindustan ; marking an *Era* which continues in use among the inhabitants of Malabar.

"823 A. D." (Blair), Crete captured by the Muslims of Spain, and by them called "Candia."

"The same year" (= 771 + cycle of 52 yrs., Clavig. ii.), accession of Totépeub, fourth Toltec king of Mexico.

Psidium guayava of Mexico and Central America. The *guava* tree indigenous in Mexico — according to Hernandez thes 85 ; was observed by Cieza de Leon xxvii to lxvi from the Cauca to Lower Peru ; by myself, exotic in Peru. The "guayaba" is mentioned by Oviedo nat. hyst. 64, and according to J. Acosta was introduced into Hayti "after the arrival of the Spaniards," and became naturalized there ; according to Monardes iii. 5, was "brought from Tierra Firme ;" and is regarded by Marcgraf 104 as introduced by Europeans into Brazil, a point confirmed by my own observation. By European colonists also, was carried Westward across the Pacific to the Philippines, where it has become abundant throughout, and is called in Tagalo "guyabas" or "bayabas" (Blanco) ; to the Moluccas, termed "cujavus" and "gujavus agrestis" by Rumphius i. pl. 40, observed both cultivated and springing up spontaneously ; to China before 1636, observed by Boymius fl. sin. (Spreng.) ; to Anam (Lour.) ; to Java (Blume) ; to Burmah (Mason) ; to Hindustan, observed by Rheede iii. pl. 35 in Malabar, according to Drury called there "malacka pela," in Bengalee "lal-peyara," in Hindustanee "lal sufrian," and var. pyrifera, in Malabar "pela," in Bengalee "peyara," in Hindustanee "soopæriam ;" by Graham, "in gardens every where" in the environs of Bombay, by myself under cultivation there, and naturalized on Zanzibar ; to the Mauritius Islands, cultivated and nearly naturalized (Boj., and A. Dec.) ; to Western Equatorial Africa (Benth. fl. nigr.) ; and subsequent to the visit of Forster to Tahiti, where it has overrun the more fertile portion of the island, to the Hawaiian and Feejeean Islands, found under cultivation by our Expedition. According to Clot-Bey, *P. guayava* has been recently introduced and successfully cultivated in Egypt.

In this year (= 820 + "3 years reign" of the Mahavams. liv.), Matwalesen succeeded by Mahayensan, now king of Ceylon.

"824 A. D." (Alst., and Nicol), at Rome, Paschalis succeeded by Eugenius II., thirty-fifth archbishop.

"The same year" (= 1484th of Synmu," art de verif.), Sa-ga succeeded by his younger brother Siunwa, now dairo of Japan.

"825 A. D. = 'pao-li,' 1st year of King-tsoung, of the Thang" or Fifteenth dynasty — (Chinese chron. table).

"The same year" (Paul. a St. Barthol., Vischer, and Gildem.), eras of Calicut and "Kaulam" (Coolau). Said to mark the date of privileges granted to those cities by Charuman Perumal, the last of the Keralian kings and a convert to Mohammedanism.

Cucumis chate of Equatorial Africa. "In or about this year" the "abdallawi" introduced into Egypt — (Abu'lkasem Magrebi, quoted by Ebn Khilcan, and Ebn Ayyas), and a well-known fact : the unripe fruit is called "adjur," in which we recognize the "aggōuria" of Simeon Sethus, and Agap. Cretensis ; but the cultivation seems chiefly confined to Egypt, and is mentioned by Abd-allatif, Alpinus pl. 116, Forskal p. 168, Delile, and Lane. The fruit is like a cucumber, but is pointed at each end, and might be termed *cucumber-melon*.

"826, June 1st" (Nicol.), a synod at Ingelheim. Ambassadors were received from the archbishop of Rome, "announcing the conversion of Harold prince of Denmark."

"827 A. D. = 'tai-ho,' 1st year of Wen-tsoung, of the Thang" or Fifteenth dynasty — (Chinese chron. table).

"The same year" (Alst., and Nicol.), at Rome, Eugenius II. succeeded by Valentinus, thirty-sixth archbishop.

"The same year" (Nicol.), the Heptarchy or seven Anglo-Saxon kingdoms united and conquered by the king of Wessex, Ecgbryht or Egbert; now sole monarch of England.

"828 A. D." (Alst., and Nicol.), at Rome, Valentinus succeeded by Gregorius IV., thirty-seventh archbishop.

"829 A. D." (Alst.), Michael Balbus succeeded by his son Theophilus, thirty-second Byzantine emperor.

"The same year" (Nicol.), a synod at Lyons. Against the Jews

"In or about 830 A. D. (Lubke and Lutrow), building of the convent church at S. Gallen in France; the plan furnished "by an architect at the court of Louis the Pious."

831 A. D. = "756 an. jav." (Nata Kasuma, and Raffles x.), Aji Jaya Baya after a reign celebrated for its prosperity succeeded by his son Salapar Wata, now king of Java.

Iahia Ben Masawia physician to khalif El-Mamun. — He died 857-8 (Greenh.).

Cassia tora of Tropical Eastern Asia. Called in Yemen "didjer el akbar" or "kolkol," in which we recognize the "kilkil" of Ebn Masawia, — Maserjawia, Abu Hanifa, Abu Nasr, Rhazes, Avicenna, Mosih, and Ebn Baitar: *C. tora* was observed in Yemen by Forskal. Eastward, is called in Sanscrit "prusni-purni," in Bengalee "chakunda," in Telinga "tantim" (Lindl.); was observed in Hindustan by Rheede ii. pl. 53, Roxburgh, Graham, and by myself, naturalized in the environs of Bombay; the seeds are described by Ainslie as used medicinally by the natives, and according to Lindley, the leaves are intermingled to adulterate the blunt-leaved senna. Farther East, *C. tora* is described by Mason v. 490 as "one of the most abundant weeds" in Burmah, called "dan-kywai," and the leaves "used to adulterate" senna; according to Blanco, is common in the Philippines, and called "manimanihan" or "mongomongohan" in Tagalo; and was observed by Thunberg around Nagasaki in Southern Japan. By European colonists, was unintentionally carried to Tropical America (Plum. xviii. pl. 72, Lam., and Pers.); and to Tahiti, as observed by myself.

Crotalaria retusa of Equatorial Africa. Called in Yemen "kalakel" or "kolkol" (Forsk.), and possibly the plant in question: — *C. retusa* was observed by Forskal p. 134 at Mor and Hadie, along the base and on the lower portion of the mountains of Yemen; and by Bojer p. 86, seemingly indigenous on the mountains of the Mauritius Islands. Eastward, was observed by Rheede ix. pl. 23 in Malabar; by Graham, common on the "Bombay esplanade during the cold season;" by Roxburgh, in other parts of Hindustan, but having no Sanscrit name; by Mason, in Burmah; and by Rumphius v. pl. 96, in the Malayan archipelago. By European colonists, was carried to the West Indies, where it has become naturalized on Dominica, Jamaica, Barbadoes, and Saint-Thomas (A. Dec.).

Crotagus azarolus of the Mediterranean countries. Called in Italy "azzarolo" or "lazzarolo" (Lenz), in Greece "mēmētzulēa" (Fraas): the "zurur" of Ebn Masawia, — I. Ben Amran, Avicenna, Serapion, and Ebn Baitar, is referred here by Sprengel, and Sontheimer: bushes of a species of "hawthorn" were seen by Pococke, Shaw, and Bové (Kitt. bibl. cycl.) on the Sinai mountains, and the "zurur" was observed there by Robinson. Farther North, *C. azarolus* was observed by Sibthorp, and Fraas, from Crete to Constantinople. Westward, is described by Matthioli i. pl. 229, and Cæsalpinus iii. 14; is termed "m. apii folio laciniato" by Tournefort inst. 641; and is known to grow in Carniolia, Italy, and Southern France (Scop., Pers., and Spreng.).

Ipomoea (Pharbitis) nil of Hindustan and Burmah. The blue-flowered *morning-glory* is called in Italy "campana azurea" (Graham), in Egypt "senbak" (Forsk.), in Bengalee "neel kalmee" (Drur.); and the "habb-el-nil" of Ebn Masawia, — Hobaisch, Ishak ben Amran, Ebn Baitar, or "granum indicum," is referred here by Royle antiq. hind. med. 9, seeds being sold at Calcutta as purgative under the name of "kala dana" black seed (Lindl., and Drur.): *P. nil* was observed by Graham "common in Bombay and throughout the Concan, flowers towards the close of the rains;" by myself, to all appearance wild on the Deccan; by Roxburgh, in Bengal; and is given by Mason with a mark of doubt as growing in Burmah. Transported to the Mediterranean countries, was observed by Forskal in gardens at Cairo; is described by Gesner hort. f. 255 (Spreng.), Lobel hist. 340, and Jacquin rar. pl. 36. Clearly by European colonists, was carried to the Philippines, observed by Blanco in Manila; to the "South Sea Islands" (Lindl.); to Australia (Choisy); to the Mauritius Islands where it has become naturalized, and to Austral Africa (Boj.); to Western Equatorial Africa (fl. nigr. 445); to Northeast America, planted for ornament and occurs besides on "banks and near dwellings from Maryland southward" (A. Gray), in "cultivated ground Florida" (Chapm.), was observed by Nuttall even on the Arkansas. "*P. hederacea*" observed in Tropical America is regarded as not distinct.

Piper cubeba of Java and Prince of Wales Island. The "kababat" of Ebn Masawia — (Haller), Honain, Elbathrik, I. E. Amran, Rhazes, Cafeki, M. E. Elkakam, and Ebn Baitar, and the "hhobebe" of Avicenna, and Serapion, are referred here by writers: "cubeba" is enumerated by Forskal mat. med. as used medicinally in Egypt; and farther North, *cubebs* is mentioned by Leoniceus, Fösius, Stapel, Cæsalpinus, and dried specimens of the plant are described by the younger Linnæus suppl. 90. Eastward, cubebs is imported into Hindustan, and is called in both Bengalee and Hindustanee "kabab chini" or "sital chini" (D'rozar.). Farther East, "cubebe" of the Greater Java is mentioned by Marco Polo 163, and cubebs was seen by Jordanus on Sumatra; but is regarded by Crawford as exotic there, and according to H. Yule, is the "only one of the spices" produced in Java. The specimens sent by Wallich 6646 from Singapur and Penang, were therefore probably cultivated: Lindley was unable to distinguish the dried fruit from the cubebs of druggists; but according to Blume, the fruit of *P. cubeba* although of good quality is not sent to Europe.

Piper caninum of Java and Prince of Wales Island. — Observed in the East Indies by Rumphius v. pl. 28; and (from transported specimens) described by Roxburgh i. 161 (Lindl.). According to Blume act. bat. xi. pl. 26, the *cubebs* of commerce is probably furnished chiefly by this species, having the fruit smaller and shorter stalked, with a distinct anise flavour and less pungent than in the preceding.

"832 A. D." (Blair), by the emperor Theophilus, painters and sculptors banished from the Byzantine Empire, "from his hatred against images." He however built the Hebdomon; a saloon or palace extant at Constantinople (Salzenberg, and Lubke and Lutrow).

"The same year" (Marcel), arrival in Egypt of khalif El-Mamun. He opened the Great pyramid (according to Alhokm, see Greaves pyramidogr.).

By his order, the nilometer at Rhoda repaired, and *Kufic inscriptions* sculptured on the walls; — noticed by Marcel. Among the Kufic inscriptions at Assuan, some (according to Wilkinson theb. and eg. 455) are very nearly as ancient.

"833 A. D." (art de verif.), El-Mamun succeeded by Motassem, eighth Abbassid khalif. Coins issued by Motassem are figured in Marcel 53.

"In or about this year" (), Sicily conquered by the Muslims. — Who held possession more than two centuries.

"834 A. D." (ann. Jap. transl. Tits., and art de verif.), Siunwa or Zioun-wa succeeded by his nephew Nin-mio, son of Sa-ga and now fifty-fourth dairo of Japan.*

One hundred and fifty-fourth generation. May 1st, 834, onward mostly beyond youth: the Jewish writers, the Karaites Ismael el Okbari, and Al-Tifisi: the Arab writers, Abraham ben Aun, Thaleba the grammarian, Thabet, the astronomer Albumasar (Blair): the Greek writers, Theophanes o graptos d. 842, Joannes of Sicily, Antonius Rhetor; the biographer Anastasius: Strabus Fuldensis, Bertramus, Eulogius, Angelomus, Christianus Druthmarus, Nithardus, Freculphus, Hilduinus: the botanists, Plinius Valerianus, and Placidus Actor.

"836 A. D." (Nicol.), Egbert succeeded by Ethelwulf, second Anglo-Saxon king of England.

"837 A. D." (J. R. Hind, and Humb. cosm. i. 1), a comet whose orbit is known from Chinese observations. Passing within "two millions of miles" of the Earth, and terrifying Louis emperor of France and Germany into building churches and founding monastic establishments.

Hardly earlier than this date (Graha Munjari tables, Puranas, and Benti), Bradhna reigning in Hindustan.

"Towards the middle of the Ninth century" (Pouchet), weight substituted for the action of water and *clocks* first made with wheels by Pacificus. — "Clocks with weights" were found by Ebn Wahab in use in China.

"838 A. D." (Blair), the Picts defeated and extirpated by Kenneth II. king of Scotland.

"Sept. 6th" (Nicol.), a synod at Quiercy on Oise. The liturgical writings of Amalarius were condemned.

"839 A. D." (Sm. b. d.), Amorium in Phrygia captured and destroyed by khalif Motassem. From a Greek captive Motassem heard of the varied acquirements of Leo of Thessalonica, and by letter invited him to Bagdad. The invitation was not accepted, but proved the means of making Leo known to the Greek emperor Theophilus. — Leo was living "in 869," and is generally designated as "philosophus" by Byzantine writers.

The medical compendium by "Leo philosophus" is dedicated to Georgius (compare "Georgius praefectus militarium tabularum" under Theophilus).

* *Volkameria Japonica* of Corea. A large and lofty tree introduced thence into Japan, where it is called "fi giri" or "go too" (Thunb.); in which we recognize the "go to" or tree of the phoenix, representations of which were visited by Nin-mio at the commencement of his reign: — *V. Japonica* was also seen in Japan by Kämpfer v. p. 861.

Senecio jacobæa of Europe and the adjoining portion of Asia. The ΙΑΚΩΒΙΑ commended as a cooling application by Leo philosophus med. v. i and vii. i, — is referred here by writers: *S. jacobæa* was observed by Forskal, and Sibthorp, on mounts Athos and Sipylus, and around Constantinople. Westward, is termed "*jacobæa vulgaris laciniata*" by Tournefort inst. 485; and is known to grow in moist places in France and middle Europe (Engl. bot. pl. 1130, Pers., fl. Wett., and Steud.).

In this year (= 823 + "16 years reign" of the Mahavams. liv.), Mahayensan succeeded by Salamewan, now king of Ceylon. — He collected an army of Malabars.

"841 A. D. = 'hoei-tchang,' 1st year of Wou-tsoung, of the Thang" or Fifteenth dynasty — (Chinese chron. table).

"842 A. D." (Alst.), Theophilus succeeded by his son Michael III., thirty-third Byzantine emperor. Ruling jointly with his mother Theodora — for thirteen years.

"The same year" (art de verif.), Motassem succeeded by Wathek, ninth Abbassid khalif.

"The same year" (Alst.), end of the chronicle of Nicephorus of Constantinople.

"843, March 16th" (Blair, and Nicol.), by the French peers assembled at Thionville, "a new partition of the French dominions among the three brothers:" France being assigned to Charles II. le Chauve, and Germany to Louis II.

In or about this year (see Renaudot), arrival of Ebn Wahab at Canfu (Canton), "the port for all ships and goods of Arabs who trade to China." A *duty* of "thirty per cent" was exacted on merchandise imported by sea. The houses were "built of nothing but wood and split cane" (*bamboo*). He found the Chinese "fond of gaming and all manner of diversions," dressing in *silk*, possessing *gold, silver, pearls*, and "rich stuffs in great abundance;" receiving from foreign parts *ivory, frankincense, copper* in pigs, *tortoise-shell*, unicorn's (*rhinoceros*) horns; making "ware of equal fineness with glass" (*porcelain*); knowing no other kind of wine except that "made of rice" (*arrack*): subject to a poll tax only, there being "no impost on lands;" and in times of dearth, the emperor's store-houses were opened. Thiet, as in India, was always punished with death; and "both poor and rich learn to read and write." Proceeding a long distance inland to the seat of government, he found the emperor regarding himself as one of the "four" great kings: the others being, the king of the Arabs, the king of the Greeks, and the balhara (Indian king). The emperor also held, "That principalities cannot subsist but by force, and that the people know not what justice is."

Sagus laevis of the Eastern portion of the Malayan Archipelago. Frequent in Sumatra and Malacca, and called in Malay "rambiya" (Lindl.): Ebn Wahab found the Chinese acquainted with "trees which bear meal;" — large trees full of meal beneath the bark, were found by Marco Polo 170 on Java; and Mandeville 18 learned that on a large isle near "grow trees that bear meal, of which men make good bread:" according to Jack, and Lindley, some of the finest *sago* of Malacca is prepared from the soft cellular substance of the trunk of *S. laevis*, and it forms the principal part of the food of the natives of the Pogy Islands, along the West coast of Sumatra. A lofty *sago palm*, the trunk smooth, was observed by myself planted near Singapore.*

"844 A. D. = 4th year of the 'hoei-tchang' of Wou-tsoung" (Chinese chron. table), beginning of the Fifty-ninth cycle.

"The same year" (Alst., and Nicol.), at Rome, Gregorius IV. succeeded by Sergius II., thirty-eighth archbishop. Against whom, Drogo son of Charlemagne and bishop of Metz was sent by Louis II. with an army, to recall him to obeying the empire.

"845 A. D." (Pauth. 327), in China, the number of priests and priestesses of Fo (Budha) ascertained to be "260,000;" and those of the Ta-thsin (Christian and Magian religions) to be about "three thousand." The destruction of the temples of all foreign religions and dispersion of the priesthood among the people, now ordered by the emperor Wou-tsoung.

"The same year" (Talvi iii. 1), at Ratisbon on the Danube, baptism of fourteen Bohemian princes. — Forty-nine years afterwards, the head of the nation duke Borzivog received baptism: but Christianity did not become "firmly established in these regions until the second half of the Tenth century."

Walafridus Strabo at this time writing. — He died in 849 (Spreng.).

Salvia pratensis of Europe and the adjoining portion of Asia. Called in Britain *meadow clary* (Prior), in Germany "wild salbey" or by some "ambrosiam" (Trag.); in which we recognize the "wild salbeyen" *ambrosiam* of Walafridus Strabo, — and "*salvia agrestis*" of Hieronymus apodix. (Braunsweig): *S. pratensis* was observed by Tragus i. pl. 4 and litt. Brunf. in Germany, fragrant and used medicinally; is termed "*sclarea pratensis foliis serratis flore cæruleo*" by Tournefort inst. 179; is known to grow from Britain throughout middle Europe (Engl. bot. pl. 153, Bull.

* *Sagus farinifera* of the Malayan Archipelago. — Also found to yield *sago*, but of a very indifferent quality (Roxb., and Lindl.).

herb. pl. 357, and Vill.) ; was observed by Sibthorp, and Chaubard, from the Peloponnesus throughout the Greek islands to Smyrna in Asia Minor.

"In this year (= 231 A. H. comm. Sept. 6th," Gildem. p. 124), the Arab traveller Salam journeying in Northern Asia (Ebn Khordabah).

"847 A. D. = 'ta-tchoung,' 1st year of Hiouan-tsoung" or Siouan-tsoung, of the Thang or Fifteenth dynasty (Chinese chron. table, and Pauth.). He permitted the rebuilding of temples and monasteries.

"The same year" (Alst., and Nicol.), at Rome, Sergius II. succeeded by Leo IV., thirty-ninth archbishop.

"The same year" (art de verif.), Wathek succeeded by Motawakkel, tenth Abbassid khalif. Coins issued by Motawakkel, are figured in Marcel p. 56.

Honain-ebn-Izhak, a pupil of Ebn Masawia, received the appointment of physician to Motawakkel — (Abulfarag., Spreng. hist. med., and Greenh.). He died in 873 (Ebn Kallikan).

Croton tiglium of Ceylon and Southern Hindustan. The "dend" of Honain, — A. C. Elrahib, Hobaisch, Rhazes, Serapion, I. B. Ali, and Ebn Baitar, is referred by Sontheimer, and Royle, to its imported seeds: "abelmeluk" or "hab el-molouk" Molucca seeds, are enumerated by Alpinus i. p. 178 to 181, and Delile, as used medicinally in Egypt; and according to Lindley, much of the *croton oil* sold in Europe is made from seeds of *C. tiglium*. Eastward, this plant is called in Sanscrit "jayapala," in Hindustanee "jalgata" (Lindl.); was observed in Hindustan by Rheede ii. pl. 33, Roxburgh iii. p. 682, and is described by Graham as "a small tree" growing in the Southern Concan "not common," but "in abundance in Travancore;" was observed in Ceylon by Burmann pl. 90, and specimens were received from Ceylon by Lindley. Farther East, is described by Mason v. p. 492 as "exotic" in Burmah, called "khan-na-kho," and "frequently seen under cultivation," the seeds being used medicinally by the natives.

Croton pavana of Ava and the Eastern border of Hindustan. An allied species, — regarded by Hamilton linn. trans. xiv. 259 as having probably furnished the original "grana tilli" or "grana dilla." According to Lindley, "in all probability others equally allied to it will yield an oil of similar quality."

"848 A. D." (Blair), the Venetian fleet in the Bay of Crotona totally defeated by the Muslims.

"October" (Alst., and Nicol.), a synod at Mayence. The opinions of Godescalcus (Gotheschalc) on predestination and free-will, opposed by Rabanus Maurus and condemned.

"The same year" (Irish annals, quoted by Wilde journ. Ulst. 27 for July 1859, Troyon p. 219), the crannoge of Lagore in Meath county sacked and burned by mercenaries under Cinaedh: — and "in 933," the islet demolished by Aulav O'Hivair during the incursions of the Scandinavians. "In 1246," Turlough escaped from the crannoge of Lough-Leisi. "In 1368," Teige was made prisoner by treachery in his crannoge of Ard-an-choillin. "In 1436," the crannoge of Loch-Laoghaire was captured by the sons of Brian O'Neill: and similar notices occur from 1455 to 1560. In Monaghan county "in 1591," as shown by a map made by Francis Jobson, the dwellings of the chiefs are all on islets. "In 1603," mention is made of the crannoge of Nan-Duini. The last notice of a crannoge is "in 1610," of one in Galway county.

Greek inscriptions of about this date (Sylvestre), present the following form of the letter ρ.

"851 A. D. (= 1511th of Synmu," art de verif.), Ninmio succeeded by his eldest son Montoku or Bontoku, now dairo of Japan. The *gardens* of his imperial palace were laid out by his prime minister — (hist., and Jap. c. c. 116).

The following plants cultivated in Japanese gardens as early perhaps as this year: of "ever-green trees and shrubs," * the "sawara" (*Chamaecyparis pisifera*), "ibuki" (*Juniperus Japonica*),

* *Citrus Japonica* of Japan. A shrub called in Japan "kinkan," and from early times cultivated in gardens — (Jap. c. c. 35): observed in Japan by Thunberg 292, its fruit not larger than a cherry (Pers.).

Pittosporum tobira of Southern Japan. An ornamental shrub called "tobera," from early times planted in gardens — (Jap. c. c. 35): observed in Japan by Thunberg (Pers.).

Ilex latifolia of Japan. Called there "tarayo," and from early times planted in gardens — (Jap. c. c. 35): observed in Japan by Thunberg (Pers.).

Podocarpus maki of Japan, as far as Yeso. Called by the Ainos "tsikuni," in Japan "maki" (Sieb.), and from early times planted there in gardens — (Jap. c. c. 35): known to grow on Yeso (Sieb.).

koyamatsu (*Sciadopitys verticillata*), "nagi (*Podocarpus nageia*), species of sugi (*Cryptomeria Japonica*)," "yudzurira (*Daphniphyllum Roxburgii*), kaya (*Torreya nucifera*)," "saka-ki (*Cleyera Japonica*)," "hiragi (*Olea aquifolia*), masaki (*Euonymus Japonica*), yatzude (*Fatia Japonica*)," "shuro-chiku (*Rhamnus flabelliformis*) various species of," "shuro (*Chamaerops excelsa*)" "mokoku (*Ternstroemia Japonica*)," "zuiko (*Daphne odorata*)," "sazanka (*Camelia sasangua*), mube (*Stauntonia hexaphylla*), binan-kadzura (*Kadsura Japonica*), nanten (*Nandina domestica*) two species of, hiraginanten (*Berberis Japonica*), shiromoji (*Lindera triloba*)," and "teikakadzura (*Parechites Thunbergii*)."

Of plants with "ornamental foliage," the "kiri (*Paulownia imperialis*), aogiri (*Firmiana platanifolia*), mokuran (*Talauma Sieboldii*), oyama-enge (*Magnolia pariflora*)," "ajisai (*Hydrangea ajisai*), momiji (*Acer sp.*), mansaku (*Hamamelis Japonica*), ro-bai (*Chimonanthus fragrans*), mume (*Prunus mume*), nishiki-gi (*Euonymus alatus*)," and "tzuru-mume-modoki (*Celastrus articulata*):

Of "herbaceous perennial plants," the "hana-shobu (*Iris tectorum*),* shaku-yaku (*Paeonia officinalis*). And of ferns, shinobu (*Davallia sp.*): — all enumerated in Jap. centen. comm. 35.

"The same year (= 237 Hej." of Abu Zaid, Yule cath. i. p. cii.), date of the first part of the compilation of Arab Voyages to Hindustan, Ceylon, and China.

"852 A. D." (Nicol.), a synod at Cordova. Against voluntary martyrs, and worshipping them.

"853 A. D." (Blair), some cities in France acquired by the Normans.

"855 A. D." (Alst. p. 282 and 450), at Rome, Leo IV succeeded by Joannes VIII. (Joanna). — Mention is made of Joanna by Marianus Scotus, Siebertus, and Martinus Polus.

"November" (Nicol.), a synod at Winchester, three of the provincial kings being present. A tenth part of the kingdom of Wessex was granted to the church as "compensation for the ravages of the Normans."

"The same year" (Assem. iii. 2. 440. and Gildem. 51 to 53), era of the Christians of Malabar. Who also had received privileges from king Charuman Perumal.

"About the Ninth century" (John as. res. vii. p. 345), the Tamil female philosopher Aviyar living in the time of three famous kings, Sholen, Sheron, and Pandien.

Poinciana pulcherrima of Tropical Eastern Asia. A flowering shrub called in the environs of Bombay "gool mohur" (Graham), in Bengalee and Sanscrit "krishna-choora," in Tamil "komri" (Lindl.): the "konnei" flower of Aviyar — is referred here by John: *P. pulcherrima* is described by Rumphius iv. pl. 20; was observed in Hindustan by Rheede vi. pl. 1, sometimes growing spontaneously (A. Dec.), but by Roxburgh, Graham, and myself, only under cultivation; was observed by Moon cat. p. 34 on Ceylon. Farther East, is enumerated by Mason v. 412 as "exotic" in Burmah, "much cultivated" by the natives, and called "doug-souk;" was observed by Zoll. verz. p. 2 on Java; is called "hoa phung" in Cochinchina (Taberd dict.); is known to occur in China (Hook., and Arn.); was observed by Blanco frequent throughout the Philippines, called by the natives "rosas caballero" or "flores," the flowers inducing abortion; was not met with by myself on the Feejeean Islands, but introduced by Polynesian tribes throughout the Tongan, Samoan, and Tahitian groups. By European colonists, was carried to the Hawaiian Islands, where I found it only in the gardens of resident Whites; to the Mauritius Islands (Aublet); to the Cape Verd Islands, and thence according to Ligon to the West Indies, where it was found by Sloane ii. p. 49 seemingly naturalized, by Browne, and Descourtilz, clearly exotic; to Brazil, where it was observed under cultivation by myself; and recently to Egypt, where according to Clot-Bey it is now successfully cultivated.

Bauhinia tomentosa of Tropical Arabia and Hindustan. Called in Malabar "chanscheha," in Tamil "triviat-putrum" or "caat-atie" (Drur.); and the "ati" flower of Aviyar — is referred here by John: *B. tomentosa* was observed in Hindustan by Rheede i. pl. 35. Roxburgh, Wight; by Graham, "a shrub" in "gardens," and found by Nimmo "wild in the Concans;" is known to grow on the "Coromandel mountains," the "dried buds and young flowers, prescribed in dysentery" (Lindl.); and was observed by Burman pl. 18 on Ceylon. Farther East, is enumerated by Mason as "exotic" in Burmah and cultivated for its "large sulphur-coloured flowers;" was observed by Blanco on the Philippines, called in Tagalo and Pampango "alibanban," in Iisaya "alibanban" or "balibanban" or "alibihil" or "alamlihior" or "alihiro" or "diis" or "livas," and the leaves eaten by the natives as a substitute for vinegar. Westward from Hindustan, was observed by Forskal p. 85 frequent near mount Melhan in Yemen and called "athbir" or "tummar" or "henn el bagar" or "henn embas."

* *Azalea Indica* of Eastern Asia. Possibly the "azaleas" cultivated in Japan for its flowers, — mentioned in Jap. c. c. 115: *A. Indica* is described by Kaempfer reliq. pl. 55. And as transported to Europe, by Hermann lugd. pl. 163 (Pers.).

"857 A. D." (Alst.), at Rome, Benedictus III. elected fortieth archbishop.

"The same year" (Nicol.), Ethelwulf succeeded by Ethelbald II., third Anglo-Saxon king of England.

Oxa and Dun, whose prescriptions are quoted in the Anglo-Saxon leechbook i. 47 and ii. 65 (Cockayne), as early possibly as this date.

"858 A. D." (Alst., and Nicol.), at Rome, Benedictus III. succeeded by Nicolaus, forty-first archbishop.

Conium maculatum of Northern Asia. Called in Britain *hemlock*, by Gerarde "homlock" (Prior), in France "ciguë" (Nugent), in Germany "gefleckter schierling," in Italy "cicuta" (Lenz), in Albanian "kirkōuta," in Wallachian "maggōutha" (Fraas), in Greece "vrōmōhōrtōn" (Sibth.); and probably the *CICUTAE* of Macer Floridus 65, — and "hemlice" or "hymlican" of the Anglo-Saxon leechbook i. 1 to 58, and Lacnunga: *C. maculatum* is termed "conium maculatum" by Hildegarde ii. 85, "cicuta major" by Tournefort inst. 306; was observed by Gussone near Naples, by Lenz frequent in Italy; and is known to occur in waste places throughout middle Europe as far as Britain (Jacq. austr. pl. 156, Curt. lond. i. pl. 17, and Pers.). Eastward, was observed by Sibthorp, Chaubard, and Fraas, frequent among rubbish from the Peloponnesus to Constantinople; by Pallas trav. . . , wild in East Siberia. Farther East, possibly carried from Asia to America, as it was found by R. Brown the younger used medicinally by the tribes of Northwest America, the infusion in diarrhœa: continues springing up around dwellings, in Northeast America, and in Austral America was observed by A. Saint-Hilaire in the streets of Porto Alegre (A. Dec.). Clearly by European colonists was carried to the Mauritius Islands, observed under cultivation by Bojer. The plant seems to have been retained in medicinal use partly on account of its supposed identity with the Greek "kōnēiōn." (See *Oenanthe prolifera*.)

Sedum acre of Europe and the adjoining portion of Asia. Called in Britain *stone-crop* or *wall-pepper* (Prior), in Germany "mauerpfeffer," in Italy "borracino" or "semprevivo minimo" (Lenz); and the lesser *ΔΙCΙDΥΛΑΜ* called *SEMPERVIVAM* of Macer Floridus 18 — may be compared: *S. acre* is termed "s. parvum acre flore luteo" by Tournefort inst. 263; was observed by Sibthorp on rocks in Crete; by Lenz, frequent in Italy; is known to grow also in France and throughout middle Europe as far as Britain (Pers., Lam. fl. fr., and Curt. lond. i. pl. 32). By European colonists, was carried to Northeast America, where it is "cultivated for edgings," and "has become spontaneous in a few places near Boston" (A. Gray). Is enumerated by Lindley among plants in medicinal use, the "leaves acrid."

Veronica chamædrys of Europe and the adjoining portion of Asia. Called in Britain *speedwell* from its blossoms flying away as soon as it is gathered, or originally *forget-me-not*, in Denmark "forglemn-mig-icke," mentioned by Macer . . . , — and in the *Ortus Sanitatis* . . . , and a flower called "soveigne vous de moy" woven in collars of knights was the subject of a famous joust between France and England "in 1465" (Prior): *V. chamædrys* is described also by Brunfels i. 125, Gesner, and C. Bauhin pin. . . . (Spreng.); is termed "v. minor foliis imis rotundioribus" by Tournefort inst. 144; is known to grow from Denmark throughout middle Europe (fl. Dan. 448, and Pers.); and was observed by Sibthorp from the Peloponnesus to Constantinople.

Hyssopus officinalis of middle Asia. Called in Britain *hyssop* (Lindl.), in Italy "isopo" (Lenz), in which we recognize the *hyssopum* of Macer Floridus 45, — referred here by Baudet, and the "ysopum" whose leaves and flowers are prescribed in the Anglo-Saxon leechbook i. 1. 17: *H. officinalis* is described by Tragus pl. 18, Cæsalpinus xi. 50 (Spreng.), Stapel pl. 727, and Tournefort; is known to occur under cultivation in Italy (Lenz), also cultivated and naturalized throughout middle Europe (Jacq. austr. pl. 254, and Pers.), and naturalized in a single long-known locality in Britain (Bromf., and A. Dec.). Eastward, is known to grow in the Tauro-Caspian countries (Bieb.), and as far as Central Asia (Lindl.); but according to Clot-Bey, has only recently been introduced into Egypt. By European colonists, was carried to Northeast America, where it continues under cultivation, and according to A. Gray has "escaped from gardens" to "roadsides, Michigan etc.;" was also carried to the Mauritius Islands, where it rarely flowers (Boj.). The plant according to Lindley is "a stimulating stomachic."

Costus speciosus of Tropical Hindustan and Burmah. A very elegant Scitamineous plant with velvety leaves and large pure-white flowers, in Hindustanee and Bengalee called "keco," in Telinga "bomma kachica" (Drur.), in the environs of Bombay "keoo" or "koot" or "kemooka" or "vang-chowrah" (Graham); and one of the two kinds of imported *COSTUS* enumerated by Macer Floridus 74 — is referred here by Baudet. Eastward, the "kemuka" or "kusht'ha" is prescribed medicinally by Susrutas sutr. 46 and nid. 13 to chik. 25; and the conspicuous "bhasouras" of Harivansa 220 is referred here by Langlois: *C. speciosus* is termed "herba spiralis hirsuta" by Rumphius vi. pl. 64; was observed by Rheede xi. pl. 8 in Malabar; by Graham, common "throughout the hilly wooded parts of the Concan;" by Ainslie, Retz, Roxburgh, and Drury, as far as Coromandel and Bengal, the

roots "insipid," but a kind of preserve made from them deemed by the natives "very wholesome;" was observed by Mason indigenous in Burmah. Transported to Europe, is termed "*costus arabicus*" by Linnæus, "*amomum hirsutum*" by Lamarck. (See *Aucklandia costus*)

"859 A. D." (ann. Jap., and art de verif.), Montoku or Bon-toku succeeded by his fourth son Seiwa, now fifty-sixth daïro of Japan.

Rhus vernicifera of Japan. The *lacquer tree*: "the art of lacquering is already more than a thousand years old, and pieces made in those ancient times—are still extant:" "very fine specimens of lacquer over two hundred years old may be seen in the temple" in Tokio, "also in the Philadelphia Exhibition" (Jap. centen. comm. 72): *R. vernicifera* is known to grow in Japan (Pers.).

"860 A. D. = 'hian-thoung,' 1st year of Y-tsoung, of the Thang" or Fifteenth dynasty—(Chinese chron. table).

"The same year" (Nicol.), Ethelbald II. succeeded by Ethelbryht II. or Ethelbert II., fourth Anglo-Saxon king of England.

Lepidium ruderale of Europe and the adjoining portion of Asia. Called in Britain *Bowyer's mustard*, and cultivated species *town-cress* (Prior); the *TVNCERSAN* growing of itself and not sown of the Anglo-Saxon leechbook i. 1. 14—may be compared: *L. ruderale* is described by Linnæus; was observed by Scopoli in Carniolia; and is known to occur in waste places in France and throughout middle Europe as far as Denmark (fl. Dan. pl. 184, Crantz, Lam. fl. fr., Engl. bot. pl. 1595, and Pers.). Eastward, was observed by Sibthorp around Constantinople. By European colonists, was carried to Northeast America, where in our Northern and Middle States, according to A. Gray, it continues along "roadsides, near towns, sparingly."

Erysimum alliaria of Europe and the adjoining portion of Asia. Called in Britain *sauce-alone*, by Turner "garlic-wort," being eaten with meat and having a strong odour of garlic, in Germany "sasskraut" (W. Coles, and Prior): the *LEACERSE* of the Anglo-Saxon leechbook iii. 15—is referred here by Cockayne: *E. alliaria* is described by Gerarde; is termed "*hesperis allium redolens*" by Tournefort inst. 222; was observed by Brotero 578 in Portugal; and is known to grow in France and throughout middle Europe as far as Denmark (fl. Dan. pl. 435, and Pers.). Eastward, was observed by Sibthorp on mount Athos.*

* *Cardamine pratensis* of Arctic and Subarctic climates. Called in Britain *cuckoo flower* or *lady's smock* (Prior): and the *LVSFMOCÉ* of the Anglo-Saxon leechbook i. 30 to 38—is referred here by Cockayne: the "lady-smocke" is mentioned by Drayton ecl. 4. and "lady-smocks all silver white" by Shakspeare l. l. 1. 2 (Prior p. 103): *C. pratensis* is described by Gerarde p. 203; was observed by Brotero in Portugal; by Savi, in Italy; and is known to grow in wet grassy meads throughout middle and Northern Europe as far as Lapland and Iceland (fl. Dan. pl. 1039, Pers., Hook., and Wats.). Eastward, was observed by Gmelin throughout Siberia; by Chamisso, on St. Lawrence Island towards Behring Straits; is known to grow throughout Arctic America (Hook.), as far even as Igloodik (Parry), and Southward from Hudson's Bay (Pursh) to Wisconsin and Vermont (A. Gray). The flowers according to Lindley are "pale lilac or almost white," and when dried "have been a popular remedy for epilepsy in children."

Drosera longifolia of Northern climates. With other species called in Britain *sundew*, in Germany "sindau" (Prior): the *SMALAN MORVVYFT* of the Anglo-Saxon leechbook i. 58. 1—may be compared: *D. longifolia* is described by Morison xv. pl. 4 f. 2; was observed by Brotero in Portugal; by Allioni, in Piedmont; and is known to grow throughout middle and Northern Europe as far as Lapland and Iceland (Pers., Hook., and Wats.). Eastward, was observed by Gmelin throughout Siberia; is known to grow in Kamtschatka (Ledeb., and A. Dec.). Farther East, in Canada (Torr. and Gray); was observed by Short in Kentucky; by myself, along the Atlantic from Lat. 45° to 38° in the Delaware Peninsula; and by Elliott, and Chapman, as far as Florida.

Drosera Anglica of Northern climates. The Anglo-Saxon *MORVVYFT*—is referred here by Gerard, Somner, and Cotgrave (Cockayne): *D. Anglica* is described by Morison xv. pl. 4. f. 1; and is known to grow throughout middle Europe from Switzerland to Sweden and Russia (Hayne, Pers., and Wats.). Eastward, was observed by Menzies along the Pacific in North America, and is known to grow in the central portion of the Continent at Cumberland House in Lat. 54° (Hook., and A. Dec. geogr. b. p. 566).

Rubus corylifolius of Northern Europe. Possibly the *THEFAN THORN* of the Anglo-Saxon leechbook iii. 8,—or "thefe-thorn" of Wycliffe's translation of Judg. ix. 14, the context implying a humble and worthless brier (see Prior): *R. corylifolius* is described by Villars, and Smith brit. ii. p. 542; and is known to grow in woods and hedges throughout Northern Europe (Pers., Hayne, and Steud.).

Spiræa ulmaria of Northern Europe and Asia. Called in Britain *medewort* or *meadowort* or

Ulex Europæus of middle Europe. Called in Britain *furze* or *gorse* (Prior), in which we recognize the *GORST* of the Anglo-Saxon leechbook i. 31. 3, — and transl. Diosc. 142: "gorassorum non portantium fructus comestibiles" are mentioned in Stat. Montis reg. p. 236 (Prior): *U. Europæus*, occurring at Gibraltar (Boj.) and rare in Italy (Daub.), is known to grow throughout middle Europe,

mead-sweet or *meadow-sweet*, in Denmark "miød-urt," in Sweden "miød-ort" (Prior), in Germany "wiesenkonigen" giving rise to the mediæval "regina prati" (Cockayne); in all which we recognize the *medovvyrT* of the Anglo-Saxon leechbook i. 30 and 38. 10, — or "regina medwurt" of gloss. Harl. in 1240: the older names according to Hill p. 23 derived from mixing the flowers "with mead to give it the flavour of the Greek wines," an account confirmed by Nennith (Prior): *S. ulmaria* is described by Linnæus; and is known to grow on the Pyren. es (Brot.) and mountains of Switzerland, and throughout middle and Northern Europe as far as Lapland and Iceland (fl. Dan. pl. 547, Pers., and Hook.). Eastward, is known to grow on Caucasus (Bieb.), and in Siberia (Wats.). By European colonists, was carried to Northeast America, where it continues in gardens. According to Lindley, "a fragrant water, forming an agreeable aromatic beverage, may be distilled from the flowers."

Sedum villosum of middle and Northern Europe. Included in the *vvyrmvvyrT* of the Anglo-Saxon leechbook i. 39 and 57 — according to Lyte, and Cockayne: *S. villosum* is described by C. Bauhin pin. p. 283; and is known to grow in marshy meads throughout middle Europe as far as Denmark (fl. Dan. pl. 24, Engl. bot. pl. 394, and Pers.).

Hieracium pulmonarium of Britain. Called there *golden lungwort*, and the *lvngenvvyrT* yellow upwards of the Anglo-Saxon leechbook i. 38. 4 — is referred here by Cockayne: *H. pulmonarium* is described by Smith (Steud.).

Gentiana pneumonanthe of Northern Europe and Asia. Called in Germany "lungen blume" (Val. Cord.), in Britain *lung-flower* or *calathian violet* (Prior) having been mistaken by Ruel ii. 129 for the "calathiana" of Pliny (Dod.): the *mersc meær gæallæn* of the Anglo-Saxon leechbook i. 39. 2 and ii. 50. 2, — and Lacnunga, is referred here by Cockayne: *G. pneumonanthe* is termed "pneumonanthe" by Valerius Cordus (Dod. pempt. ii. 1. pl. 12); is described by Linnæus; and is known to grow from Switzerland and France as far as Sweden (fl. Dan. pl. 209, Lam. fl. fr., and Wats.). Eastward, is known to grow on Caucasus (Bieb.); and in Siberia as far as the Yenisei (Pall.).

Primula elatior of middle and Northern Europe. Called in Britain *oxlip* (Prior), in which we recognize the *OXæn Slyppæn* of the Anglo-Saxon leechbook i. 2. 15: — *P. elatior* is termed "p. Columnæ" by Tenore; is described by Miller, and Linnæus; is known to grow in France and throughout middle and Northern Europe (fl. Dan. pl. 434, and Pers.), its leaves according to Lindley not so "finely downy and soft" as in *P. veris*.

Lamium album of middle Europe. Called in Britain *blind nettle* or *white dead-nettle* (Prior), in which we recognize the *blinde nettle* of the Anglo-Saxon leechbook i. 23: — *L. album* is described by Linnæus; and is known as a weed in cultivated ground throughout middle Europe (Crantz, and Pers.).

Melampyrum vulgatum of Northern Europe. Called in Britain *horse flower*, in Flemish "peerts-bloem" (Prior); and the *ferd vvyrT* of the Anglo-Saxon leechbook i. 87 — may be compared: *M. vulgatum* is mentioned by Lyte ii. 14; is described by Lobel adv. p. 11, Dalechamp, and Gerard (Spreng.); and is known to abound in woods in France and Britain (Ray, Engl. bot. pl. 113, and Pers.).

Rumex palustris of Northern Europe. Included in the "fealwan doccan" of the Anglo-Saxon leechbook — by Cockayne: *R. palustris* is described by Petiver pl. 2. f. 7, and Boccone mus. pl. 104; and is known to grow in wet places in France and Britain (Thuil., Dec. fl. fr., Curt. lond. iii. pl. 23, Pers., and Steud.).

Myrica gale of Northern climates. A shrub called in Britain *bog myrtle* or *gale* or *sweet gale*, by Turner "gall" and in his time in Somersetshire "goul" or "golle," by Galfridus pr. pm. "gawl" or "gavl" or "gawyl," in Dutch "gagel" (Prior); in which we recognize the *gæ gæl* of the Anglo-Saxon leechbook i. 36, — and Lacnunga, referred here by Cockayne: *M. gale* is described by Gerarde; was observed by Brotero at S. Martinho in Portugal; is known to grow from Switzerland throughout middle and Northern Europe as far as Lapland (fl. Dan. pl. 327, Lam. fl. fr., Dec., and Wats.). Eastward, is known to grow in Northern Asia (Wats.). Westward from Europe, was observed by Lapilaye in Newfoundland; by Michaux, in northern Canada; by myself, throughout New England, ceasing at about Lat. 41° (Eat.) except on the mountains of Pennsylvania and Virginia, and continuing inland as far as Wisconsin (Pursh, and A. Gray). An infusion according to Lindley has been employed medicinally, and "the leaves are used in Sweden as a substitute for hops in brewing."

abounding especially in Britain (Linn., fl. Dan. pl. 608, and Pers.). Eastward, was observed by Chaubard around Calamata in the Peloponnesus. By European colonists, was carried to St. Helena and the Mauritius Islands, and in both localities has become naturalized (A. Dec., and Boj.).

Potentilla argentea of Europe and the adjoining portion of Asia. One or more species is called in Iceland "mara" (Olaf Olafsens urtag.); and the *māre* of the Anglo-Saxon leechbook i. 31. 7— is referred here in part by Cockayne: *P. argentea* is termed "pentaphyllum exiguum" by Tragus (Spreng.), "quinquefolium folio argenteo" by Tournefort inst. 297; and is known to occur in waste places throughout middle and Northern Europe (Crantz, Pers., Genersich, and Wahl.). Eastward, was observed by Sibthorp around Constantinople and on the Bithynian Olympus. By European colonists, was carried to Northeast America, where it has become naturalized, occurring not only in waste ground but in wild sunny situations.

Potentilla anserina of cool climates. Called in Britain *goose-grass* or *goose-tansy* or *silver-weed*, in mediæval Latin "argentina" (Prior), in France "argentine" (Nugent); the *gelodvvyrt* of the Anglo-Saxon leechbook i. 32. 3, and the "mare" in part,—are referred here by Cockayne: *P. anserina* is described by Brunfels (Spreng.); was observed by Bertoloni in Italy; is known to grow on the Azores (Wats.), and throughout middle and Northern Europe as far as Lapland and Iceland (Lam. fl. fr., fl. Dan. pl. 544. Fries, and Hook.). Eastward, is known to grow throughout Northern Asia as far as Armenia, Talusch, Cashmere (Thomson, and A. Dec.), Pekin (Bunge), Daouria, and Kamtschatka (Ledeb.). Farther East, on the seashore of Unalascha and at Norfolk Sound and Kotzebue Sound (Mert., and Hook.); was observed by myself around the interior salines of Oregon; is known to grow as far as Cumberland house in Lat. 54° (Drumm.); lake Huron (Hook.), lake Champlain (Mx.), Pennsylvania (A. Gray), Labrador (Pursh), Greenland (Dec.), Newfoundland (Lapil), along the Atlantic so far as observed by myself, exclusively maritime and ceasing at about Lat. 42°. In the Southern Hemisphere, was observed by R. Brown p. 60 in Australia; by J. D. Hooker p. 54 in New Zealand; and by C. Gay ii. p. 303, in Chili.

Circaea lutetiana of Northern climates. Called in Britain *enchanter's nightshade* (Prior), in Old Dutch "alfrancke," and the *ælfþhone* of the Anglo-Saxon leechbook i. 32. 4—is referred here conjecturally by Cockayne: *C. lutetiana* is described by Lobel obs. p. 137, F. Columna ecphr. ii. p. 80 (Spreng), and Tournefort inst. 301; was observed by Savi on the Appenines; and is known to grow throughout middle and Northern Europe as far as Sweden and Finland (Ledeb., Wats., and A. Dec.). Eastward, was observed by Forskal, and Sibthorp, in cultivated ground around Constantinople and in woods on the Bithynian Olympus, rarely in Greece; is known to grow on Caucasus (Bieb.), and throughout Siberia as far as the Yenisei (Pall.). Farther East, was observed by Beck on the Mississippi at St. Louis; and is known to grow from lake Huron and Montreal (Hook.) throughout our Northern and middle States, and along the Alleghanies as far as Georgia (Ell., and Chapm.); observed by myself, sometimes in waste ground, but more frequently in the forest and to all appearance indigenous.

Callitriche aquatica of Temperate climates. Called in Britain *water-starwort* (Prior): the *ælfifer* of the Anglo-Saxon leechbook i. 22. 2 and ii. 24—is referred here in gloss. Dun., and the "waterwyr" of transl. Apul. 48, is referred here by Lyte and Nemnich (Cockayne): *C. aquatica* is described by Vaillant pl. 32, Linnæus, and Smith; was observed by Gussone in Sicily; by Desfontaines, in Algeria; and is known to grow on the Azores and throughout middle and Northern Europe as far as Lapland and Iceland (Hook., and Wats.). Eastward, was observed by Sibthorp in pools on the Bithynian Olympus; is known to grow on Caucasus (Ledeb.), in Abyssinia (Rich.), in Hindustan even to within the Tropic (J. D. Hook.), throughout Siberia to the Yenisei (Pall.), Daouria (Ledeb.), and Japan (Thunberg.). Farther East, was observed by Chamisso on Unalascha; and is known to grow from the mouth of the Columbia and Eschscholtz Bay to Bear Lake and Lat. 66°, and throughout Canada (Wats., and Hook.) to Arkansas (Nutt.), Kentucky (Short), and our Atlantic States as far as Carolina and Florida (Ell., and Chapm.). In the Southern Hemisphere, is known to grow in Chili (C. Gay), on the Falkland Islands (D'urv.), Terra del Fuego, New Zealand, Campbell's Isle, Auckland's Isle, Tasmania, and Kerguelen (J. D. Hook., and A. Dec.).

Sanicula Europæa of Europe and the adjoining portion of Asia. Called in Britain *selfheal* or *sanicle* (Prior), in France "sanicle" (Nugent), in Germany "sanikel" (Grieb); the *vyydv merce* of the Anglo-Saxon leechbook i. 15 and 39. 2—is identified with the "sanicula" in a gloss in Lacnunga (Cockayne): the "sanicle" is mentioned as curative in old proverbs, French and English; and the "diapensiam" of *Ortus Sanitatis* (edit. Lubec) is referred here by Sprengel: *S. Europæa* is described by F. Columna phyt. pl. 16; is termed "s. officinarum" by Tournefort inst. 326, "astrantia diapensia" by Scopoli; is known to grow in woods in Carniolia, France, and throughout middle Europe as far as Denmark (fl. Dan. pl. 283, Crantz, Lam. fl. fr., and Pers.). Eastward, was observed by Sibthorp on mount Athos.

Galium mollugo of Europe and the adjoining portion of Asia. Called in Britain *whip-tongue*,

and an allied species in Cotgrave *harrewort* (Prior); the little *hærre vvyrt* that according to the Anglo-Saxon leechbook i. 61 oftenest groweth in gardens and hath white flowers, — may be compared: *G. mollugo* is described by Brunfels (Spreng.); is termed “*g. album vulgare*” by Tournefort inst. 115; is known to grow in France and throughout middle Europe as far as Denmark (fl. Dan. pl. 455, Schrad., Lam. fl. fr., and Pers.). Eastward, was observed by Sibthorp around Constantinople.

Galium cruciatum of Europe and the adjoining portion of Asia. Called in Britain *cross-wort* (Prior); the *vvræte* of the Anglo-Saxon leechbook iii. 1. 8, — and “crosswort” of ms. Bodl. 536, are referred here by Cockayne: *G. cruciatum* is termed “*crucialis*” by Hermolaus Barbarus (Spreng.), “*cruciata hirsuta*” by Tournefort inst. 115; was observed by Scopoli in Carniola; and is known to grow in France and throughout middle Europe (fl. Wett., Engl. bot. pl. 143, and Pers.). Eastward, was observed by Sibthorp in the Peloponnesus.

Campanula trachelium of Europe and the adjoining portion of Asia. Called in Britain *throat-wort* (Prior), in Holland “*halskruid*,” in Germany “*halskraut*” or “*halswurz*,” in Denmark “*halsurt*” (Cockayne), in which we recognize the *hæls vvyrt* of the Anglo-Saxon leechbook: — *C. trachelium* is termed “*uvularia major*” by Tragus (Spreng.), “*c. vulgarior foliis urticæ vel major et asperior*” by Tournefort inst. 109; is known to grow in France and throughout middle Europe (fl. Dan. pl. 1026, Engl. bot. pl. 12, and Pers.). Eastward, was observed by Sibthorp on mount Athos.

Primula veris of Europe and the adjoining portion of Asia. Called in Britain *cowslip* or *cow-slop*, in Old English “*petty mullein*,” in medieval Latin “*verbasculum*” (Prior), in Turkish “*taus-chian kulaghe*” (Sibth.), in which we recognize the *CVSLYPPAN* of the Anglo-Saxon leechbook iii. 30, — *Lacnunga*, and the “*cusloppe*” of Ælfric’s glossary: the “*herbam paralysis*” is mentioned by Hermolaus Barbarus, Brunschwygk ii. 8, and Brunfels p. 190; *P. veris* is described by Matthioli p. 883, and Gerarde; is termed “*p. veris odorata flore luteo simplici*” by Tournefort inst. 124; is known to grow in France and throughout middle and Northern Europe (fl. Dan. pl. 433, Jacq., and Pers.). Eastward, was observed by Sibthorp around Constantinople and on the Bithynian Olympus. Its flowers according to Lindley “make a pleasant soporific wine.”

Scrophularia nodosa of Northern Climates. Called in Britain *figwort* or *brownwort*, in Germany “*braunwurz*,” but by Brunfels and old writers “*brunnwurz*” apparently from growing around “*brunnen*” or public fountains (Prior), in which we recognize the *brvne vvyrt* of the Anglo-Saxon leechbook i. 38. 4, — and transl. Apul. 57: *S. nodosa* is described by Gesner hort. germ. f. 254 (Spreng.); is termed “*s. nodosa fetida*” by Tournefort inst. 166; is known to grow in moist situations from Italy and Spain throughout middle and Northern Europe as far as Lapland (Pers., Colm., Bertol., and Fries). Eastward, was observed by Sibthorp in the Peloponnesus; and is known to grow about Caucasus and in Siberia (A. Dec.). Farther East, is known to grow in Oregon (Dougl., Scouler, and Hook. fl.), and California (A. Dec.); was observed by E. James at the sources of the Platte in the Rocky mountains; by Nuttall, and Pitcher, along the Arkansas; by Short, in Kentucky; by Percival, in Canada; by Clayton 71 in Virginia (Linn. sp. pl.); is known to occur throughout our Atlantic States (Pursh, Ell., and A. Gray) and “from Florida to Mississippi” (Chapm.), but so far as observed by myself having the aspect of an introduced plant, chiefly met with where roads cross streams. According to Burnett, and Lindley, the leaves and roots are “said to be purgative and emetic,” and “a decoction of the leaves is used by farmers to cure the scab in swine.” “*S. Marylandica*” observed by Banister in Virginia (Ray suppl. 396), is regarded as not distinct.

Scrophularia aquatica of Europe and the adjoining portion of Asia. Included in Britain under the name *brownwort*, called besides *water-betony* or *bishop’s leaves*, in France “*herbe du siège*” understood as of a bishop’s see (Prior), but according to Burnett, from its roots eaten by the garrison of Rochelle during the siege in 1628 by cardinal Richelieu: possibly included in the above Anglo-Saxon “*brune wyrt*”: — *S. aquatica* is termed “*s. aquatica major*” by Tournefort inst. 166; and is known to grow in watery places from Switzerland throughout middle Europe as far as Denmark (fl. Dan. pl. 507, and Pers.). Farther East, was observed by Sibthorp at the lake of Nicæa in Greece. Its properties according to Lindley “much as in the last species.”

Euphrasia officinalis of Northern Climates. Called in Britain *eyebright* (Prior), in France “*eufraise*” (Nugent): the *eaðgvvyrt* of the Anglo-Saxon leechbook iii. 30 — is referred here by Cockayne: *E. officinalis* is mentioned by Brunschwygk, and W. Coles (Prior); is termed “*e. officinarum*” by Tournefort inst. 174; is known to grow on the mountains of the Azores and Southern Spain, and from France throughout Northern Europe as far as North Cape in Lapland, the Feroe Islands, and Iceland (Hook., Wats., Wahl, Boiss., and Trevel.). Eastward, was observed by Sibthorp on the mountains of the Peloponnesus and the Bithynian Olympus: is known to grow also on Taurus (Bieb.), in Cabul, Cashmere, and on the Himalaya mountains (A. Dec., and Lindl.), and in

Siberia (Gmel.). Farther East, was observed by Chamisso on Unalascha; is known to grow on the Rocky mountains (Drummond), in Canada from "Lat. 64°" (Hook.), at York factory (Rich.), in Labrador from Lat. 57° (E. Meyer), in Greenland (Gieseck), Newfoundland (Lapil.); was observed by Michaux, and myself, on the Lower St. Lawrence; and ceases at about Lat. 45° in New England (Muhl., and A. Gray). The plant according to Lindley is "slightly bitter and aromatic," and "has had much reputation in diseases of the eye."

Rumex sanguineus of Europe and the adjoining portion of Asia. Called in Britain *blood-wort* or *bloody dock* (Prior), and the *ƿeaðan doccan* of the Anglo-Saxon leechbook i. 49 — is referred here by Cockayne: *R. sanguineus* is described by Valerius Cordus (Spreng. præf.); is termed "lapathum folio acuto rubente" by Tournefort inst. 504; was observed by Schrader in Germany; and is known to occur in other parts of middle Europe as far as Britain (Blackw. pl. 492, Engl. bot. pl. 1533, and Kit.). Eastward, was observed by Sibthorp, and Chaubard, in the Peloponnesus. By European colonists, was carried to Northeast America, where it continues in Virginia and around Newbern and Charleston (Pers., Ell., Croom, and Chapm.).

Rumex maritimus of the seashore of the Mediterranean and North Atlantic. The *ƿealƿan doccan fūllow dock* of the Anglo-Saxon leechbook i. 49 — is referred here in part by Cockayne: *R. maritimus* is described by Petiver brit. pl. 2. f. 8; was observed by Pollini veron. (Lenz) along the Adriatic; and is known to grow along the Atlantic in the salt marshes of France and Britain (Smith brit. i. 253, Lam. fl. fr., and Pers.). Farther West, across the Atlantic, is enumerated by A. Gray as growing on the "sea-shore, Virginia to Massachusetts, and in saline soil in the interior;" by Chapman, on the seashore of North Carolina. "*R. persicarioides*" regarded as not distinct, was observed by Pursh, and Elliott, from Virginia to Carolina; by Short, in Kentucky; and by Nuttall, on the Arkansas.

Cynosurus cristatus of Europe and the adjoining portion of Asia. Called in Britain *dog's-tail grass* from its spike fringed on one side only, or *windle-straw* from its stem used for platting (Prior); and the *micle gƿeate vvindel streavv* two-edged and growing in highways according to the Anglo-Saxon leechbook i. 4. 3, — is referred here by Cockayne: *C. cristatus* is described by Barrelier pl. 27: is termed "gramen spicatum glumis cristatis" by Tournefort inst. 519; and is known to grow in grassy places throughout middle Europe (Engl. bot. pl. 316, and Pers.). Eastward, the "kunōsūra" of Eustathius may be compared: *C. cristatus* was observed by Sibthorp, and Gittard, from the Peloponnesus to Constantinople.

Agrostis spica-venti of Europe and the adjoining portion of Asia. Also called in Britain *windle-straw* (Prior, Mylne, and Cockayne), and agreeing with the implied smaller "windel streaw:" — *A. spica-venti* is described by Lobel pl. 1. 3 (Spreng.), and Parkinson; is known to occur in cultivated ground throughout middle Europe (Leers pl. 4, and Pers.). Eastward, was observed by Chaubard in the Peloponnesus.

Aira cæspitosa of Northern Climates. A grass growing in tufts that in Britain are called *hassocks* (Nemnich, and Prior); the *Cæssvc* of the Anglo-Saxon leechbook i. 63 and iii. 62 — is referred here by Cockayne, confirmation being found in Lacnunga: *A. cæspitosa* is termed "gramen pratense paniculatum altissimum locustis parvis splendentibus non aristatis" by Tournefort inst. 524; and is known to grow throughout middle and Northern Europe as far as Lapland and Iceland (Hook., Pers., and Wats.). Eastward, was observed by Sibthorp frequent in grassy tracts on the Greek islands; is known to grow on Caucasus (Bieb.), and in Siberia (Wats., and Kunth). Farther East, across the Pacific, is known to grow on Unalascha (Kunth); in Canada, and as far South as Lat. 40° in central Pennsylvania (Muhl., Darl., Wats., and A. Gray).

Avena pratensis of middle and Northern Europe. The *SELFÆTE* of the Anglo-Saxon leechbook iii. 8, referred by Cockayne to the *wild oat*, may be compared: *A. pratensis* is termed "gramen avenaceum panicula purpuro-argentea splendente" by Tournefort inst. 525; and is known to grow in meads throughout middle Europe as far as Scotland (Engl. bot. pl. 1204, Pers., and A. Dec.). Eastward, was observed by Sibthorp near Constantinople.

"The same year" (Alst. p. 371), Otfriidus Wissenburgensis writing on religious subjects in the *vernacular language* of Franconia.

"860 to 863 A. D." (Rafn), rediscovery of Iceland by the Scandinavian navigator Gardar.

The nilometer at Rhoda having been accidentally injured, was rebuilt by khalif Motawakkel (Kufic inscript., Marcel, and Wilk. Theb. and eg. p. 312). Its "*pointed arches*" may therefore prove the earliest instances of this style of art (see below, Tooloon).

"861 A. D." (art de verif.), Motawakkel succeeded by Montaser, eleventh Abbassid khalif.

Strychnos nux-vomica of Tropical Hindustan and Burmah. The imported seeds are mentioned by Abram — (Serap. 164, F. Adams), and Haly Abbas. The tree is called in Telinga "musadi," in Bengalee "kuchila" (Lindl.), in the environs of Bombay "kajra" (Graham); is mentioned by a commentator on the Amara-cosha (W. Jones in as. res. iv. p. 128); was observed in Hindustan by

Rheede i. pl. 37, Roxburgh, and Royle; by Graham, in the "hilly parts of the Concans," the bitter wood of the roots "used by the natives in the cure of intermittent fevers;" is known to grow also on Ceylon (Linn. fl. zeyl. 91). Farther East, is enumerated by Mason v. 488 as indigenous in Burmah and called "kha-boung," growing "as far South as Maulmain," the pulp of the fruit "a favourite repast with native children," and the bark "used by the Karens in fevers;" the *lignum colubrinum* of commerce is regarded by Blume as consisting in great part of wood of this species, more than of any other (Lindl.). Westward from Hindustan, the imported seeds are called in Egypt "kydjle" or "chobz el ghorab" or "æjsch el ghorab" (Forsk. mat. med., and Del.), and according to Clot-Bey the living tree has recently been introduced; "nucis vomice" is mentioned by Nicolaus Præpositus 122, and continues well known in Europe as exceedingly poisonous seeds affording as in other species the principle called *strychnia*; the bark is besides imported under the name of *false Angustura* (Lindl.).

"862 A. D." (art de verif.), Montaser succeeded by Mostain, twelfth Abbassid khalif.

"The same year" (Talvi, and others), at Novgorod, dissensions among the Slavonians in electing their "posadnik" (mayor), the choice falling upon Rurik chief of the Varegians; an encroaching Scandinavian tribe (by the Finns called "Ruotzi" or "strangers"). The election leading to a more warlike policy, is regarded as the *beginning of the Russian empire*. The encroaching Scandinavians being comparatively few, soon becoming amalgamated and merged in the general Slavonian population.

"863 A. D." (Talvi). Some Slavonian tribes (according to Kopitar) already in possession of the *Glagolitic alphabet*. But "about this time," the *Greek* alphabet with some additional letters applied to the Slavonic language by Constantine usually called Cyril; sent to Moravia with his brother Methodius as missionaries; and the Gospels translated by them into Slavonic.

The same year (= "5th year of Seiya," art de verif.), the writings of Confucius brought to the court of Japan, and read with approval.

"865 A. D." (Alst. p. 371), Huldericus bishop of Augsburg writing against the celibacy of the clergy: and against encroachment on the religious liberty enjoyed by the German priesthood.

"The same year" (Nicol.), Ethelbert II. succeeded by Ethelred or Ethered, fifth Anglo-Saxon king of England.

"866 A. D." (art de verif.), Mostain succeeded by Motaz, thirteenth Abbassid khalif.

Hardly earlier than this date (Graham Munjari tables, Puranas, and Bentr.), Agnivahu reigning in Hindustan.

"867 A. D." (Blair), the Danes under Ivar brought into England by Earl Bruern, and Northumberland conquered by them.

"The same year" (Alst.), Michael III. succeeded by Basilus Macedo, thirty-fourth Byzantine emperor. Writings by the emperor Basilus are extant; and in his reign, Christianity was finally adopted by the Greeks of Maina in the Peloponnesus (Porphyrog. adm. 224, and E. A. Soph.).

One hundred and fifty-fifth generation. Sept. 1st, 867, onward mostly beyond youth: the Jewish writer Nachshon: the Arab writers, Ebn Kotaiba, Alfraganus, Kotha ben Luca, Beladsor d. 892 (Gildem.): Nicetas Paphlago, Joannes diaconus and rhetor, Simeon Metaphrastes, Joseph the hymnographer d. 883, Metrophanes of Smyrna: Hincmarus; John Scotus; Ambrosius Ansbertus, Remigius Antisiodorensis.

"The same year" (T. Wright early trav. Palest.), sailing of Bernard from Tarentum, provided with letters of safe conduct from the Muslim prince of Southern Italy, and in company with three thousand Christian captives in two ships. Landing at Alexandria and proceeding up the Nile, Bernard describes "such a peace" between Christians and Muslims that a traveller's baggage might be safely left on the road: but any one found journeying "without a letter or some mark of a king or prince of that land" is imprisoned, until he can give an account of himself, "whether he be a spy or not." After reaching the village of Babylon, Bernard returned Northward, proceeding to Damiatta, thence to Farama and across the Desert by the nearest route to Palestine.

"868 A. D." (Alst., and Nicol.), at Rome, Nicolaus succeeded by Hadrianus II., forty-second archbishop.

"869 A. D." (art de verif.), Motaz succeeded by Mohtadi, fourteenth Abbassid khalif.

Hobaisch, a nephew of Honain (Spreng. hist. med. vi. 5), may have been at this time writing.

Liquidambar altingia of mountainous districts in the East Indies. The "miat" described by Hobaisch as flowing from the bark of a lofty tree in the East Indies, — mentioned also by Ishak Ebn Amran, Rhazes, Serapion 46, Avicenna, Abu Khoraij, and Ebn Baitar, is referred here by Sprengel: the "storacis liquide" is mentioned by Franciscus de Pedemontium f. 133; and *liquid storax* continues to be largely imported into Europe. Eastward, *L. altingia* growing at the elevation of from two to three thousand feet on Java, was ascertained by Noronha, and Blume fl. jav. pl., to yield the "ras-sa-ma-la" of the Malays or true liquid storax: and farther North, according to Mason v. p. 486 (and

journ. asiat. for 1848), the tree is "indigenous on the Tenasserim coast, and in some sections is quite abundant." According to Lindley, liquid storax is "a fragrant honey-like balsam," a "stimulating expectorant substance acting in the same way as solid storax, that is to say influencing the mucous membranes, especially that which lines the air passages."

Aconitum ferox of the Himalaya mountains. The acrid root of an *Aconitum* found by Belon imported into Egypt and called "bish;" in which we recognize the "bish" of Hobaisch, — Rhazes, Ebn Samhum, Avicenna, I. ben-Ali, and Ebn Baitar, referred by Royle (in Kitt. bibl. cycl.) to *A. ferox*, the name derived from the Sanscrit "visha" signifying poison, and the drug long celebrated among the Hindus: the plant is also attributed to Hindustan by Kaswini (De Sacy chrest., and Gildem.), and may prove the source of genuine *aconite*.

Cucumis sativus of Tropical Eastern Asia. Called in Egypt "khyar," in which we recognize the "khiar" of — Hobaisch, I. ben Masah, Amineddulat, I. ben Soliman, Rhazes, Avicenna, Elgafaki, Abd-allatif, and Ebn Baitar: *C. sativus* was observed in Egypt by Forskal, Delile, and myself; and farther North, is called in Persian "kyar" (Roxb. iii. p. 720); was observed by Forskal in gardens at Constantinople; and according to Chaubard, is abundantly cultivated in Greece. Westward, is called in Esthonian "ukkuritz" or "uritz" in Polish "ogorek," in Bohemian "agurka," in German "gurke" or "kukummer" (A. Dec.), in Italian "cocomero," in Spanish "cogombro," in French "concombre," and in English *cucumber* or the young fruit for pickling *gherkin*; is described by Matthioli p. 367, Dalechamp p. 620, and Lobel pl. 638, and is cultivated throughout Middle Europe. Southward from Egypt, is known to be cultivated in Abyssinia (A. Rich.); and was observed by myself at Muscat. Eastward, is called in Sanscrit "sookasa" (Pidd.), in Bengalee "sasha" or "khyira" or "kankur," in Hindustanee "khira" or "kakri" (D'rozar); was observed in Hindustan by Rheede viii. pl. 6, Roxburgh, Wight, myself, and according to Graham is "cultivated to a considerable extent as an article of food among the natives." Farther East, is enumerated by Mason v. p. 471 as "exotic" in Burmah, the Burmans and Karens seeming to prefer the fruit "when large and yellow;" was observed by Blume p. 930 under cultivation in Java; in Cochinchina and China, by Loureiro p. 726; and by Kämpfer, and Thunberg, cultivated in Japan and called "akwa," or usually "karas uri" or "ki uri." From Europe, was carried by Columbus to the West Indies (F. Columb. 53); and at the present day, is abundantly cultivated throughout Northeast America.

"Oct. 5th" (Nicol., see also Alst.), "Eighth" general ecclesiastical Council. Convened at Constantinople by the emperor Basilius: who "for parricide" had been excluded from the church. The patriarch Photius was deposed, and Ignatius reinstated; and on an appeal being made to Rome, some writings of Photius against the encroachments of the Roman archbishop, subscribed by many provincial bishops, were publicly burned by Hadrianus II.

"870 A. D." (art de verif.), Mohtadi succeeded by Motmed, fifteenth Abbassid khalif.

The authority of Motamed was acknowledged by Tooloon; who, under the appointment of governor of Egypt, had rendered himself really independent. Coins issued in Egypt by Tooloon, are figured in Marcel p. 66.

Fagara Avicennæ of China. Called in Arabic "faghara" (Mowafik): and the "fagirat" of Ebn Masah, — Ishak ben Amran, Mesue, Serapion 200, Ebn Baitar, supposed by Avicenna to come "from Sofala," is referred here by Jussieu: *F. Avicennæ* is described from imported specimens by Lobel ic. ii. pl. 133. Eastward, was observed in China by Incarville (who sent specimens to Jussieu, Spreng.); and according to Lindley, is "used in China as an antidote against all poisons; undoubtedly a powerful stimulant."

"In or about this year" (Nicol), by a synod at Spalatro, the use of the Slavonian language in religious services prohibited.

"872 A. D." (Nicol.), Ethelred succeeded by Alfred, sixth Anglo-Saxon king of England. Alfred's coins are of inferior workmanship: his jewel, "a beautiful work of art" bearing an inscription in Anglo-Saxon capital letters, — is now in the museum at Oxford (Pauli vi).

"873 A. D." (Alst., and Nicol.), at Rome, Hadrianus II. succeeded by Joannes IX., forty-third archbishop.

"874 A. D. = 'kian-fou,' 1st year of Hi-tsoung, of the Thang" or Fifteenth dynasty — (Chinese chron. table).

Hardly later than this date (Yule cath. i. p. cvii), Ebn Wahab, an acquaintance of Abu Zaid, visiting Khumdan (Singanfu) in China.

"The same year" (Rafn), colonization of Iceland by Scandinavians under Ingolf.

"875 A. D." (Pauth. 329), in China, beginning of the revolt led by Hoang-tchao (called "Ban-choa" by Abu Zaid).

"The same year" (= 823 + cycle of 52 yrs., Clavig. ii), accession of Nacaxoc, fifth Toltec king of Mexico.

Acer (Negundo) Americanum of the Mississippi and its tributaries. A pinnate-leaved maple

called *ash-leaved maple* or *box-elder*, and sugar procured from it by the Crees,* perhaps from early times — (R. Brown jun.): grows according to A. Gray on "river-banks, Pennsylvania to Wisconsin, and southward," a "small but handsome tree;" was observed by F. A. Michaux in the Southern and Western States; by Elliot, in the upper district of Carolina and Georgia; by Chapman, "Florida and northward;" by Darby, near New Orleans; by E. James, from the Missouri to within the Rocky mountains; by Nuttall, along the Missouri to the mountains; and by Richardson, as far as 53° on the Saskatchewan (see also Hook.). Transported to Europe, is described by Plukenet pl. 123 (Spreng.), Linnæus, and Duhamel i. pl. 11; was observed by Clot Bey in the gardens of Egypt.

"876 to 877 A. D." (Rafn), beyond Iceland, "islands" discovered by Gunbjorn: the coast of Greenland, — as subsequently ascertained.

"877 A. D." (Abu Zeid, see also Pauth.), the city of Kan-fou (Canton) captured by Hoang-tchao, and all the inhabitants put to death; including "twenty-six thousand Muslims, Jews, Christians, and Parsees, residing there for the purposes of commerce."

"The same year" (ann. Jap., and art de verif.), abdication of Seiwa, in favour of his eldest son Josei or Yo-zei, now fifty-seventh daïro of Japan.

"The same year" (Nicol.), Charles II. le Chauve succeeded by his son Louis II., as king of France.

"878, Aug. 11th" (Nicol.), a synod at Troyes. An ordinance was adopted, that the bodies of excommunicated persons, instead of being buried, "should be exposed to beasts of prey."

"Under the administration of Tooloon" (Marcel p. 61 and 68), construction of the *subterranean aqueducts* that supply the city of Alexandria with water. Tradition among the Copts ascribes the work to Sanutious or Shenouda, at this time Coptic patriarch.

"879 A. D." (according to two Kufic inscriptions), and on the site selected ninety years afterwards for the city of Cairo, the mosque of Tooloon completed. With the possible exception of the nilometer of Motawakkel, it presents the earliest *pointed arches* (Wilk. theb. and eg. p. 302 and 457, and Marcel p. 75, see also Lepsius eg. and sin. p. 73). — The new style soon became universal in Egypt; and very little change has since taken place in *Muslim architecture*; recognized throughout the East by the dome and pointed arch. In the West also, the origin and extension of the so-called "Gothic" architecture, is clearly connected with the Muslim occupancy of Sicily and Spain.

Serratula behen of Syria and Cyprus. The "bahman" of Ishak ben Amran, — Rhazes, Avicenna 141, Mosih, Serapion, and Ebn Baitar, is referred here by writers: "bahman" roots from Greece, are enumerated by Forskal mat. med. as used medicinally in Egypt. Farther North, S.

* *Phaca aboriginorum* of the Saskatchewan and Mackenzie river. From early times, eaten by the Crees and Stone Indians East of the Rocky mountains — (R. Brown jun.): described by Hooker, and as growing from Lake Winnipeg to the Rocky mountains, and Bear Lake at 66°.

Heracleum lanatum of Subarctic America. The *American cow-parsnip*, from early times used as a potherb by the Crees, and its roots and young stems eaten by the tribes along the Pacific — (R. Brown jun.): observed by Michaux in Canada; by Lapilaye, in Newfoundland; by myself, from the Subalpine portion of the White mountains to 40° along the Atlantic; by Muhlenberg, and Chapman, "mountains of North Carolina;" by Short, in Kentucky; and according to Hooker, grows throughout Canada to 58° on the Mackenzie river, also in Northwest America as far as Unalascha.

Urtica gracilis of North America. A tall *nettle*, very slightly stinging; and from early times, fibre obtained from its stem by the Northwestern tribes — (R. Brown jun.): received from Hudson Bay by Aiton (Pers.); termed "u. procera" by Muhlenberg (Steud.); observed by Pursh from Canada to Pennsylvania; by A. Gray, "common, especially northward" from Central New York; by myself, from 43° to 40° along the Atlantic; by Schweinitz, at 36° in Upper Carolina; by Elliot, in the Upper district of Carolina and Georgia; by Short, in Kentucky; by Nuttall, on the Arkansas; and by Long's Expedition ii., on the Upper Mississippi.

Lilium Canadense of Northeast America. The *Canadian yellow lily*, its root from early times eaten by the natives of Northwest America — (R. Brown jun.): "mountain-lilies bearing many yellow flowers, turning up their leaves like the martigon, or Turk's-cap, spotted with small spots as deep as saffron," were seen by Josselyn rav. 54 in New England: *L. Canadense* was observed by Michaux in Canada and on the Alleghanies of Virginia and Carolina; by myself, on the border of marshes from 47° 30' on the Lower St Lawrence to 42° along the Atlantic; by Torrey, to 41° on the Hudson; by Schweinitz, at 36° in Upper Carolina; by Catesby pl. 11 (Pers.), and Elliot, on the Alleghanies of Carolina; by Chapman, in "mountain-meadows, Georgia, and northward;" by Beck, as far as the Mississippi near St Louis. Transported to Europe, is described by Io Robin (Spreng.), Morison iv. pl. 20, and Barrelier.

behen was observed by Rauwolf pl. 288 in Syria; is termed "*jacea orientalis patula carthami facie flore luteo magno*" by Tournefort cor. 32; and was observed by Sibthorp on Cyprus.

Rheum ribes of the mountains of Syria and Persia. The "*ribas*" of Ishak ben Amran, — Elbasri, Avicenna, Edrisi, Sandhasar, Mesue electuar., and Abd-allatif, mentioned by Ebn Baitar as growing in Syria, is referred here by Sontheimer, and Royle: "*rob ribas* from Greece and Syria," is enumerated by Forskal *mat. med.* as imported into Egypt. *R. ribes* is described from imported specimens by Gronovius, Dillenius *elth.* pl. 158, and Desfontaines *ann. mus.* i. pl. 49; but according to Lindley, is not medicinal (see *Ribes uva-crispa*).

Nauclea ovalifolia of Eastern Hindustan. Called in Bengalee "*shal*" or "*shala*;" in which we recognize the "*schal*" of Ishak ben Amran, — Elminhadsch, Ebn Dschezla, and Avicenna, described as an Indian quince by Ebn Baitar: *N. ovalifolia* is described in the *Hortus Bengalensis* 14, and by Roxburgh ii. 125, and Piddington 206 (J. F. Wats. index).

Garcinia mangostana of the Equatorial portion of the Malayan archipelago. The "*jawz jandum*" of Ishak ben Amran, — Rhazes, Ebn Joljol, Avicenna, Ali ben Razn, and Ebn Baitar, is referred here by Sontheimer. Eastward, *G. mangostana* is enumerated by Mason v. p. 447 as "*exotic*" in Burmah, called "*men-gu*," and "*cultivated to a considerable extent in Mergui*" or to N. Lat. 13°: *mangosteen* fruit was seen by myself only under the Equator at Singapore. *G. mangostana* was observed in the wild state by Rumphius i. p. 133 on Saleya. By European colonists, was carried to Hindustan, where Roxburgh was unable to obtain fruit beyond N. Lat. 23° 30'; to the environs of Bombay more recently (Graham, and Nimmo); and to Jamaica, where the fruit is decidedly inferior (Macfad., and A. Dec.).

"The same year" (Nicol.), Louis II. succeeded by his two sons, Louis III. and Carloman, as kings of France.

"The same year" (Alst.), end of the chronicle of Ado Viennensis.

"880 A. D." (Pauth. 329, see also Abu Zeid), the title of "emperor" assumed by Hoang-tchao, now in possession of the greater portion of China. He was soon afterwards defeated, through the "aid of the king of Tagazgaz," and put himself to death.

About this time ("a little after 264 A. H. comm. Sept. 12th 877," Gildem. 75), compilation of Arab voyages to India and China by Abu Zaid Alhakim of Siraf. He speaks of a "great multitude of Jews" in Sarandib (Ceylon), and many other sects, even Tanwis or Manichees, the king permitting the free exercise of every religion. Gaming was the most usual occupation of the inhabitants, as draughts, and the fighting of *cocks*, whose spurs they armed with iron. The favourite drink was "*of palm-honey* boiled and prepared with the '*tari*' or juice which runs from the tree" (clearly *toddy*, the crude sap procured from different kinds of palms). — "*Vin*" obtained in Java from growing trees, is mentioned by Marco Polo 167.

The island of Socotra chiefly inhabited by Christians: derived (according to Abu Zeid) from a Greek colony founded "by Alexander," and subsequently converted to Christianity; in which faith they have persevered, "as well as all the inhabitants of other isles." — Marco Polo 189 describes the population of "Scotra" and some islands halfway between it and Hindustan, as Christian, recognizing as their head the "arcevesque" of Bagdad. On the arrival of the Portuguese, the Socotrans exhibited crosses, but according to Barbosa, there was nothing left but the name. By other Portuguese, they are termed "Jacobites subject to Alexandria."

The "lead called al-qala'i" (*tin* of Banca) is enumerated by Abu Zaid as sold at Kalah — in or near the Malay Peninsula (Yule *cath.* i. p. cxc.).

Cassalpinia sappan of the Siamese countries. An arborescent shrub furnishing the *sappan wood* of commerce, called in Tagalo "*sapang*" or "*sibucac*" (Blanco), in Burmah "*teing-nyet*" (Mason), in Tamil "*patungha*," in Telinga "*bukkapu*," in Bengali and Hindustanee "*bukkm*," in Malabar "*tsiapangum*" (Drury), and enumerated by Abu Zaid as sold at Kalah; — by Musir ben Muhallil, as growing at Kulam (on the Indian Sea); mentioned also by Abu'fadli (Cels. i. 176), Edrisi, Abulfeda, and according to Bakui imported "from the Malayan archipelago and from Zingitana:" the wood called "*presillum*" was known in Europe to Matthæus Sylvaticus; "*brazilium*" is mentioned by Rabbinical writers of the Twelfth century (Spreng.); and the "*berzi*" shrub was seen by Marco Polo 169 under cultivation on Java. *C. sappan* was observed by Blanco abundant on the Philippines; by myself, naturalized there and on Zanzibar, and under cultivation at Bombay; by Mason v. 511, indigenous and confined to Tavoy, but according to the Karens having "a much wider range" on "the Meinan side of the mountains in Siam;" by Roxburgh, Wight, and Drury, cultivated and growing freely without care from Bengal to Ceylon, its wood used by Telinga dyers for a cheap red; was observed by Rheede vi. pl. 2 in Malabar; by Graham, "in gardens Bombay and the Deccan."

"882, Sept. 19th, one hour and fifteen minutes after midnight" (Blair, and Clint. iii. p. 369), the *Autumnal equinox* observed by Albategni at Aractus.

"The same year" (F. Mason ii. 23), in Burmah, offerings made by the governor of Thatung to the pagoda at Rangoon. — One of the largest in the country, as appears from the ruins.

"883 A. D." (Alst., and Nicol.), at Rome, Joannes IX. succeeded by Marinus or Martinus, forty-fourth archbishop.

"In or about this year" (Blair), the first star of Aries observed by Albategni to be "18° 2' from the Equinoctial point."

"884 A. D." (Alst., and Nicol.), at Rome, Marinus succeeded by Hadrianus III., forty-fifth archbishop.

"Under khalif Motamed" (Yule cath. i. p. cix), the Arab geographer Ebn Khordadbeh director of the posts in Jibal or ancient Media. — He died about 912 (= "300 Hej," comm. Aug. 17th, Gildem. 75).

"Ghorraib" (a kind of plant) enumerated by Ebn Khordadbeh among the exports of China — (Yule).

Pterocarpus marsupium of Tropical Hindustan, as far as Assam. The *red sanders* is a very large Leguminous tree called in Bengalee "peet-sal," in Telinga "yeanga-sha" (Lindl.) or "yegi," in Hindustanee "peet-shola," in Tamil "vengay" (Drur.), in the environs of Bombay "bia" or "bewba" or "beebla" (Graham); its timber used from early times, and its gum-resin *kino* mentioned by Ebn Khordadbeh — (Yule) : *P. marsupium* was observed by Rheede vi. pl. 25 in Malabar, whence according to Gibson kino continues to be exported in considerable quantities; by Graham, "common in some parts of Concans" as far as Bombay, and found by Lush in the "Rajpeepla jungles;" by Ainslie, Roxburgh, Wight, and Cleghorn, from the Neilgherries and Travancore to the Eastern ghauts and Circar mountains, but plentiful only in the forests of Cuddapah and North Arcot (Drur.); is known to grow also in Assam (Mason v. 485). Kino according to Roxburgh is strongly but simply astringent. (See *P. erinaceus*, and *Butea frondosa*).

Pterocarpus Wallichii of Burmah. Possibly affording the *kino* enumerated by Ebn Khordadbeh among the exports of China. Its wood has been long valued in Burmah, — being according to Roxburgh "not unlike mahogany, but more heavy, red, coarse in grain;" only within a few years, has its gum-resin kino been exported (Mason v. 485, and Journ. as. 1848).

"The same year" (Nicol.), Charles le Simple being a minor, the government of France assumed by the German emperor Charles le Gros.

"In this year," the Welsh monk Asser, according to his own account, guided by some of the Saxon nation through many wide-intervening ways in the country of "Suthseaxum" (Sussex) to the royal vill called Dene (Dean), to meet by invitation king Alfred.

"885 A. D. (= 1545th of Synmu," art de verif.), Josei succeeded by Kooko, younger son of Ninmio and brother of Montoku, and now dairo of Japan.

"The same year" (Alst., and Nicol.), at Rome, Hadrianus III. succeeded by Stephanus VI., forty-sixth archbishop.

"Nov. 11th (= St. Martin's day" of Asser), king Alfréd commencing his literary pursuits, assisted by the monk Asser.

As early perhaps as this year, voyage of Ohthere around the Northern cape and thence "four days" eastward into the White Sea, up which he sailed "five days" due south, meeting with the inhabitants: "Finnas" who were all fishermen, fowlers, and hunters, and "Beormas" speaking nearly the same language but who had well cultivated their country. Ohthere further informed king Alfred that he dwelt in "Halgoland" northmost of all the Northmen, had not more than twenty horned cattle, twenty sheep, and twenty swine, and the little that he ploughed he ploughed with horses; had however six hundred "hranas" *rein-deer*, including six "stæl-hranas" decoy deer, highly valued among the Finns for catching wild rein-deer; but wealth in that country consists chiefly of rent paid by the Finns in skins of animals, birds' feathers, whalebone, and ship-ropes of whale or seal hide.

He with five assistants had killed *whales* fifty ells long; but his voyage North, besides seeing the country, was chiefly on account of "hors-hwælum" *walrus*, a kind of whale not more than seven ells long having noble tusks or teeth and a hide good for ship-ropes; some of the tusks were brought to the king. (Walrus tusks from their costliness were at this time employed for the handle of the sword of the kings of Norway, Schöning p. 37, Noel, and Pouchet p. 289).

Wulfstan, another navigator, had sailed to the mouth of the Vistula among the "Estum" Esthoni-ans: who have many towns and in every town a king; drink mares' milk, or the poor and slaves "medo" mead; burn their dead, after keeping the corpse a month or more, feasting and expending all the property (Alfr. transl. oros.).

"886 A. D." (Alst.), Basilus Macedo succeeded by his son Leo VI. Sapiens, thirty-fifth Byzantine emperor. Orations and a letter on the truth of Christianity, were written by Leo VI.

"887 A. D." (Blair), Paris besieged by the Normans.

"888, Jan. 13th" (Blair), death of the emperor Charles le Gros. As guardian of Charles le

Simple and regent of France, he was succeeded by count Odo. The Charlemagne dominions now forming five kingdoms, France, Burgundy, Germany, Italy, and . . .

Hardly earlier than this date (Graha Munjari tables, Puranas, and Bentr.), Suchi reigning in Hindustan.

"The same year" (ann. Jap. and art de verif.), Kooko succeeded by his third son Uda or Ouda, now fifty-ninth daïro of Japan. In whose reign, the princess Isse distinguished herself for her knowledge, and composed a book which continues to be highly esteemed in Japan.

"88," A. D. = 'Ioung-ki,' 1st year of Tchao-tsoung, of the Thang" or Fifteenth dynasty — (Chinese chron. table).

"In or about 890 A. D." (Blair), a "Body of Laws" composed by king Alfred of England.

"891 A. D." (Alst., and Nicol.), at Rome, Stephanus VI. succeeded by Formosus, forty-seventh archbishop.

"892 A. D." (art de verif.), Motamed succeeded by Motadhed, sixteenth Abbassid khalif.

894 A. D., the Arab botanist Abu Hanifah writing. — He died in the following year (= "282 Hej." of Abulfed., Casiri giving "290").

Oxalis corniculata of Subtropical Eastern Asia. Called in Yemen "homadmad" or "hæmæmadah" or "hæmda," in which we recognize the "hamdhidh" mentioned as a sour vegetable by Abu Hanifa — (Ebn Bait.): *O. corniculata* was observed by Forskal among the mountains of Yemen; is known to grow in Abyssinia (A. Rich.); and was observed by Forskal, and Delile, occurring as a weed at Cairo. Farther North, was observed by Forskal, Sibthorp, and Chaubard, in shaded situations in Crete and the Peloponnesus and in cultivated ground around Constantinople and called "mōshōphilō;" is known to occur also around Caucasus and in the adjoining portion of Siberia (Ledeb., and Bieb.). Westward, is described by Ruel ii. 144. Matthioli, and Lobel; was observed in 1576 by Clusius pl. 476 in Spain and in a garden at Montpellier; is termed "*oxys lutea*" by Tournefort inst. 88; and is known to occur in waste and cultivated ground in Algeria and throughout middle Europe as far as Britain (Munby, Wats., Bromf., and A. Dec.). Eastward from Arabia, has Sanscrit names (Pidd.); was observed by Graham in the environs of Bombay "in gardens and pasture grounds during the rains;" by Roxburgh, in other parts of Hindustan; by Mason, in Burmah; by Zoll. p. 14, in Java; by Kaempfer, and Thunberg, in Japan, called there "sunsjo" or "sasjo," or usually "sikambo" or "katabami" or "simmoguso;" and is known to occur on the Loo Choo Islands (Hook., and Arn.). By European colonists, was carried to Madeira, the Azores, West Indies, Chili, and Austral Africa (Dec., C. Gay, Wats., and Wight and Arn.).

Melilotus coerulea of Central or Eastern Asia? The "dsark elthair" of Abu Hanifa, — growing in Irak and identified by Ebn Baitar with the "handakuka" of the Nabatheans, or the "handakuka" of Serapion, is referred here by Sontheimer and others: *M. coerulea* or *blue melilot* is said to grow in Lybia (Pers.), but according to Clot-Bey has only recently been introduced into Egypt. Farther North, was observed by Forskal at Smyrna: and Westward, has been long cultivated in middle Europe; is described in the *Ortus Sanitatis*? by Cordus, Gesner, Fuchsius 815, Turner, Anguillara, Matthioli, Dodoens, and C. Bauhin; and according to Sprengel, an oil prepared from it is used in Belgium and Spain for removing spots on the face.

Citrus acida of Hindustan. Called in Britain *lemon*, in Egypt and Yemen "lim" or "limun" (Forsk.), in Hindustanee "limu" or "nibu," in Bengalee "lebu" or "jamir" or "jambir" (D'roz.), in Sanscrit "nimbooka" (Royle), in which we recognize the "limun" frequent in Arabia according to Abu Hanifa but only in the cultivated state — (Ebn Bait., and De Sacy), mentioned also by Ebn Djami, and Ebn Ayas: *C. acida* in the days of Forskal had become sparingly naturalized in Yemen, fruit was seen there by Barthema in 1503, by myself in market at Mocha, and by Alvarez in 1520 in Abyssinia; *C. acida* was observed by Makrizi under cultivation in Nubia; by Abd-allatif, Forskal, and Delile, in Egypt; by Jacques de Vitry in the "thirteenth century" in Palestine; is mentioned by Persian medical writers; was observed by Bory cultivated abundantly on the Greek islands, especially on Naxos; is known also under cultivation throughout the Mediterranean countries. Eastward from Arabia, the "jambiru" is mentioned by the Sanscrit writer Susruta (Hessl.); *C. acida* seems known under cultivation in Hindustan (Royle, and D'roz.), and a tree called "biharee" observed by Royle apparently wild along the base of the Himalayas may prove its original state. Farther East, the "large lime" is enumerated by Mason v. p. 453 and 760 as "exotic" in Burmah and in different varieties "diffused all over the country;" and *C. acida* was observed by Loureiro p. 568 in Cochinchina. By European colonists, was carried to the West Indies, where it has become naturalized (Macfad., and A. Dec.); to the Tahitian and Samoan groups in the Pacific, verified by myself; and to the Feejeean group, its introduction claimed by Capt. Vanderford of our Expedition, in accordance with the absence of a native name ("moli" including the shaddock, Hale).

Santolina fragrantissima of the Egyptian and Syrian Desert. Called in Egypt "keisum gebeli" or "babouneg" or "ba'yteran," in which we recognize the "abitheran" of Abu Hanifa, — Avicenna,

A. H. Ellahabali, Elkara, and Ebn Baitar: *S. fragrantissima* was observed by Lippi, Forskal, and Delile pl. 42, in the Desert from Cairo to Suez, the juice applied in affections of the eyes, and the dried flowers also used medicinally, having the odour of chamomile but much more powerful. According to Lindley, the plant occurs also in Palestine and between Aleppo and Bagdad.

Lavandula vera of the West Mediterranean countries. The flowers imported from Venice into Egypt and called "chozame" (Forsk.), in which we recognize the "chuzama" of Abu Hanifa, — Elzaharawi, Elgafaki, and Ebn Baitar: "spiritus lavandulæ" is also enumerated by Forskal mat. med. as well known in Egypt. Northward and Westward, *L. vera* is called in medieval Latin "lavedula," in Italian "lavandola," in Dutch and German "lavendel," and in English *lavender*, names derived from "being used to scent newly washed linen, or according to Diez, in washing the body" (Prior); is known to grow wild in Southern France (Villars, and A. Dec.) and across the Mediterranean (Lindl.), and is besides cultivated in gardens throughout middle Europe. By European colonists, was carried prior to 1670 (Jossel.) to Northeast America, where it continues frequent in gardens. According to Lindley, the flowers are chiefly employed in perfumery, but with the leaves and oil are sometimes administered medicinally. (See *L. spica*.)

Rumex nervosus of the mountains of Yemen. A shrubby species called there "öthrob," in which we recognize the "uthrub" of Abu Hanifa, — Elgafaki, and Ebn Baitar: *R. nervosus* was observed by Forskal p. 76 on the mountains around Hadie.

Suaeda monoica of the seashore and inland salines of Egypt and Arabia. A shrub called in Yemen "asal" (Forsk.); and the "asal" of Abu Hanifa, — and Ebn Baitar, may be compared: *S. monoica* was observed by Forskal p. 70 at Alexandria, also on the plains inland and along the sea in Yemen, where "hötam" or "doluk" (barilla) is obtained from its ashes and used in washing clothes. *S. fruticosa*, observed by Forskal at Djidda, by Delile near Rosetta, by Sibthorp, and Bory, on the seashore of Greece, and known to grow from Persia to the shores of Spain and Portugal (Brot. 403, and Pers.), is by some writers regarded as not distinct.

Commelyna communis of Tropical Africa and Asia. Called in Yemen "djalif" (Forsk.), in which we recognize the "jalif" of Abu Hanifa, — and Ebn Baitar: *C. communis* was observed by Forskal among the mountains of Yemen: and Westward, is known to grow in Guinea (A. Dec.). Eastward from Arabia, was observed by Roxburgh, and Graham, in Hindustan; and by Kaempfer v. pl. 889, in Japan.

"895 A. D." (Alst.), at Rome, Formosus succeeded by Bonifacius VI.; soon afterwards by Stephanus VII.; and before the close of the year, by Theodorus II., fiftieth archbishop.

"898 A. D." (Nicol.), in France, the government assumed by Charles III. le Simple.

"The same year" (ann. Jap., and art de verif.), Uda succeeded by his eldest son Dai-go, now sixtieth dairo of Japan.

"899 A. D." (Csomadekeros, and F. Mason ii. 23), the Budhist religion abolished in Thibet.

"900 A. D." (Pauth. 330), in China, the emperor Tchao-tsoung confined to prison limits by the eunuchs; who were now numerous, and during a long series of years had acquired official positions and great political influence.

One hundred and fifty-sixth generation. Jan. 1st, 901, onward mostly beyond youth: the Jewish writers, Chiwi al Balki, Joseph ben Jacob (abu J.) el Kirkissani el Bassir, Saadja, Salman ben Jerucham, Menahem, Jehudah Ibn Koreish, and Eldad Hadani: the Arab writers, Ebn-al djezzar, Ebn Wahshiyyeh, Ebn el Batrik, Ishak ebn Honain d. 910: the Greek writers, Arethas of Cæsarea, Joannes Cameniatas d. 904: the theologians, Marcus eremita, and Radulphus Flaviacensis: the optician Vitello.

"The same year" (Alst.), at Rome, Theodorus II. succeeded by Joannes X., fifty-first archbishop.

"Oct. 28th" (Nicol. p. 355), Alfred succeeded by Edward, seventh Anglo-Saxon king of England.

Leucanthemum vulgare of Europe and the adjoining portion of Asia. Called in Britain *great daisy* or *moon daisy* or *maud.in wort* (Prior), in ms. Laud. 553 f. 9 "bow wort" or "bris wort;" in which we recognize the *bryse vvyrte* of an Anglo-Saxon leechdom, — referred here by Cockayne i. 375: the "white bothen" is also identified with the "great daisie" by Gerarde: *L. vulgare* is described by Fuchsius 148 (Spreng.), and Matthioli p. 653; is termed "*L. vulgare*" by Tournefort inst. 492; was observed by Scopoli in Carniolia; and is known to grow in woods and cultivated ground in France and throughout middle Europe as far as Denmark (fl. Dan. pl. 994. Lam. fl. fr., and Pers.). Eastward, was observed by Sibthorp in mountain pastures on the Greek islands; but is unknown in Eastern Asia (Ledeb., and A. Dec.). By European colonists, was carried to Northeast America, where it has become naturalized throughout our Northern, Middle, and even in our Southern States (Chapm.), multiplying in old clearings, and in New England termed *whiteweed*, in the distance whitening fields with its flowers.

"902 A. D." (art de verif.). Motadhed succeeded by Moktafi, seventeenth Abbassid khalif.

As early perhaps as this date (. . .), Geber writing on Chemistry, mentioning among other preparations *corrosive sublimate* — (Pouchet).

Salsola sativa of the seashore of Southern Spain. Carbonate of soda, effloresced on the soil of Northwestern Hindustan and procured besides from ashes of Salsolaceous plants, is called in Sanscrit "sajika," in Hindee "sajji muttee" or "sajji loon;" in which we recognize the "sagimen vitri" of Geber, — so named from its use in glass-making (Royle ant. hind. 41), the barilla in question being possibly manufactured in the Mediterranean countries: *S. sativa*, annual and herbaceous, was observed by Löfving trav. 132, and Cavanilles iii. pl. 291, in Spain, and is enumerated by Guibourt among the four species yielding the best *barilla* or soda of commerce, containing twenty-five to forty per cent of Carbonate of soda (Lindl.). The plant from transported specimens is described by Linnæus.

Salsola soda of the shores of the Mediterranean as far as the Crimea. Annual and herbaceous: — enumerated by Guibourt among the four species furnishing the best soda of commerce. *S. soda* is known to grow on the seashore of Southern Europe (Linn., and Jacq. hort. pl. 68); was observed by Forskal near Marseilles; by Desfontaines i. 216, in Barbary; by Bory, in the Peloponnesus; by Forskal, near Smyrna; and is known to grow on the "salt-plains" of the Crimea (Lindl.).

Salsola tragus of the shores of the Mediterranean, Black, and Caspian seas. Annual and herbaceous, with spinescent leaves: — enumerated by Guibourt among the four species furnishing the best soda of commerce. Described by Matthioli p. 731, and Lobel pl. 797; termed "*kali spinosum foliis longioribus et angustioribus*" by Tournefort inst. 247; and known to grow on the seashore of Southern Europe (Linn., and Pers.). Eastward, observed by Sibthorp frequent in the maritime sands of the Greek islands; by Delile, on the Mediterranean border of Egypt; and known to grow on the shores of the Black Sea and Caspian (Pall. ii. pl. 29, and Lindl.).

Salsola kali of the shores of the North Atlantic and Mediterranean, as far as the Caspian and salines of Selenga. Annual with rigid spinescent leaves: — enumerated by Guibourt as the fourth species furnishing the best soda of commerce (Lindl.). *S. kali* is called in Britain *prickly glasswort* (Prior); is described by Morison v. pl. 33; is termed "*kali spinosum foliis crassioribus et brevioribus*" by Tournefort inst. 247; is known to grow on the sandy portions of the seashore from Sweden to the Mediterranean (fl. Dan. pl. 313, and Wats.); and was observed by Desfontaines in Barbary. Eastward, observed by Forskal, and Sibthorp, frequent on the seashore of Greece and Asia Minor; by Forskal, and Delile, on the Mediterranean border of Egypt; by Bieberstein, on salines around Taurus and Caucasus; and by Pallas, along the Volga, the Caspian, and as far as the salines of Selenga. Westward from Europe, known to grow along the Atlantic shore of North America from Lat. 43° to 31° in Florida (Pursh, Walt., Ell., Baldw., and myself).

As early probably as this year, by Abulkasim of Balkh and Hasan ben Musa of Naubakht, accounts of the Hindu sects and ordinances, and of the tortures self-imposed by devotees (extract Masudi edit. Gildem.).

"903 A. D." (Pauth. 331), decree of the emperor Tchao-tsoung depriving the eunuchs of official position; followed by a general massacre of them throughout China.

"904 A. D. = 1st year of the 'thian-yeou' of Tchao-tsoung" (Chinese chron. table), beginning of the Sixtieth cycle.

"The same year" (Marcel), Egypt recovered from the descendants of Tooloon, by the army of khalif Moktafi.

Corchorus olitorius of the Southern border of the Sahara. Called in Yemen and Egypt "*melochia*" or "*meloukhyeh*," in which we recognize the "*meloukhia*" of the Blacks seen in Egypt by Ishak Israeli, and identified by him with the "*schouschandibé*" of Irak — (Abd-allat. i. 2), mentioned also in the treatise Elrudschlat, and by Ebn Baitar: *C. olitorius* is enumerated by Alpinus, Forskal, and Clot-Bey, as a favourite esculent in Egypt; was observed by Forskal in Yemen both wild and cultivated; and is known to be cultivated by the Negro tribes of West Africa (J. D. Hook. and Benth. fl. nigr.). Eastward from Arabia and Persia, is called in Sanscrit "*putta*," in Bengalee "*put*" (Royle fibr. plant.); was observed in Hindustan by Roxburgh, Wight, and by Graham "common in Bombay, springing up in gardens and cultivated ground;" is described by Royle as a potherb, and one of the species yielding *jute* fibre; and by Mason v. p. 521, as manufactured by the Bengalees into "coarse paper," occurring also as a weed throughout Burmah "though not very abundant." As transported to European gardens, is termed by old writers "*olus judaicum*" (Royle) equivalent to the English *Jew's mallow*; and is described by Commelyn hort. pl. 12, and Plukenet v. pl. 127. By European colonists, was carried to the Mauritius Islands, where it occurs only in the cultivated state (Boj.); and to the West Indies (Macfad., and A. Dec.).

"The same year" (Blair), Italy ravaged by the Hungarians.

"905 A. D. = 2d year of the 'thian-yeou,' accession of Tchao-hiouan-ti" or Tchao-siouan-ti, of the Thang or Fifteenth dynasty — (Chinese chron. table, and Pauth. p. 331).

"In this year" (ann. Jap., and Klajpr.), the Ko-kin, a Japanese poem, composed: — followed by

the Go-sen in 950, Sif-i in 986, Go-sif-i in 1086, Kin-yo in 1128, Zi-kwa in 1144, Zin-zai in 1187, Sin-ko-kin in 1205, all ancient; and after these, the Šin-tsokf-sen in 1223, Zokf-go-sen in 1250, Zokf-ko-kin in 1267, Zokf-sif-i in 1280, Sin-go-sen in 1304, Giokf-ye-ziou in 1313, Zokf-zen-zai in 1318, Zokf-go-sif-i in 1327, Fo-ga-ziou in 1346, Sin-zen-zai in 1360, Sin-sif-i in 1364, Sin-go-sif-i in 1382, and Sin-zokf-ko-kin in 1438; in all "twenty-one" collections.

"The same year" (Alst.), at Rome, Joannes X. succeeded by Benedictus IV., fifty-second archbishop.

"The same year" (Alst.), end of the chronicle of Rhegino Abbas.

Aspidium (Cibotium) baromez of the country between Caucasus and the Volga. A fern from its mode of growth called *lamb-plant* or *Tartar lamb*; and in the annals of the Thang dynasty "vegetative lambs" are mentioned as growing in the country formerly called Tathsin but in later days Fulin — ("pōlin" or Constantinople, Yule i. p. lvii): The Tartar lamb is also mentioned by Odoric 43, and J. C. Scaliger exot. 1537 f. 248; and is identified with *C. baromez* in the English cycl. nat. hist.

"907 A. D. = 'kai-ping,' 1st year of Tai-tso" or Tchou-san, head of the new dynasty of the "later Liang" (Chinese chron. table, and Pauth.). The beginning of the Ou-tai or Five short dynasties.

"The same year" (Alst.), at Rome, Benedictus IV. succeeded by Leo V., fifty-third archbishop.

"908 A. D." (Alst.), at Rome, Leo V. succeeded by Christophorus; and before the close of the year, by Sergius III., fifty-fifth archbishop.

"The same year" (art de verif.), Moktafi succeeded by Moktader, eighteenth Abbassid khalif. A coin issued by Moktader, is figured in Marcel p. 90.

"910 A. D." (Alst., and Nicol.), at Rome, Sergius III. succeeded by Anastasius III., fifty-sixth archbishop.

"911 A. D. = 1st year of the 'kian-hoa' of Tai-tso" — (Chinese chron. table).

"The same year" (Alst.), Leo VI. succeeded by his son Constantinus VIII. or Alexander Constantinus, thirty-sixth Byzantine emperor.

Hardly earlier than this date (Graha Munjari tables, Puranas, and Bentl.), Sucra reigning in Hindustan.

"912 A. D." (Alst., and Nicol.), at Rome, Anastasius III. succeeded by Lando; and before the close of the year, by Joannes XI., fifty-eighth archbishop.

"913 A. D. = 'kian-hoa,' 1st year of Tchou-tching, of the later Liang" or Sixteenth dynasty — (Chinese chron. table).

About this time ("900 to 925," Gildem. p. 76), Isthakhri writing his geographical work. He mentions Moulton (situated near the confluence of the five branches of the Indus) and an idol there venerated by the Hindus and receiving costly gifts from pilgrims (suffered to remain, notwithstanding that the city had been long held by Muslims). He describes the "Rous" or Russians as burning their dead, and having a rule not to shave one another's beards.

Abutilon Indicum of Tropical Africa and Arabia. Called in Yemen "ren," and the crude flowers eaten (Forsk. p. xciii): a flower in Persia, eaten green like leaves of "chukender" beet, is mentioned by Isthakhri: — *A. Indicum* was observed by Forskal p. 124 in moist places in Tropical Arabia; and is known to occur in Tropical Africa as far as the Atlantic (Benth. fl. Nigr., and A. Dec.). Eastward, is described by Rumphius iv. pl. 11; was observed in Hindustan by Rheede vi. pl. 45, Roxburgh, Wight; by Graham, "a tall herbaceous plant three or four feet" high, "common in waste places about villages;" and according to Lindley, with "other allied species" is substituted for "marsh-mallow as an emollient." Farther East, is enumerated by Mason v. p. 503 as called in Burmah "tha-ma-khyoke," cultivated by the natives, and "considered all over India a very good substitute for marsh-mallows:" was observed by Blanco on the Philippines, used by the natives medicinally, and called in Tagalo "cuacuacohan" or "guilig-guiligan," in Bisaya "malis" or "palis" or "tabing" or "dalupang." As transported to Europe, is termed "abutilon" by Camerarius hort. pl. 1 (Linn., and Spreng.).

Pancratium Illyricum of Southern Persia. Called in Egypt "susann," in which we recognize the "susen nergus" lily-narcissus growing in the territory around Shiraz, according to Isthakhri: — *P. Illyricum* was observed by Forskal in gardens at Alexandria, the flower in whiteness surpassing the lily and all artificial dyes.

"915 A. D. = 'tching-ming,' 1st year of Tching, of the later Liang" or Sixteenth dynasty — (Chinese chron. table).

"In or about this year" (Gildem. p. 73), China visited by Abu Yazid Muhammed ben Yazid of Siraf. — Masudi obtained information from him at Basra.

As early at least as this date (Colebrooke as. res. viii. p. 467), Sucra expounding the Vedas. — He is described in the Sancara vijeya as the instructor of Gaudapada.

920 A. D. = "845 an. jav." (Raffles ix. and x.), date of an inscription in the Kawi or ancient

Javan character on a stone discovered near the site of Jang'gala. The founding of Jang'gala on the accession of king Dewa Kasuma son of Kandiawan, is assigned (by Adi Mang'gala) to "about 846 an. jav." — The country around the site in the division of Surabaya "is strewn with antiquities."

"923 A. D. = 'thoung-kouang,' 1st year of Tchouang-tsoung, of the later Thang" (Chinese chron. table) : the new name arising from the desire of this emperor to continue the Thang dynasty (Pauth.).

"The same year" (Blair), in France, *fiefs* or manor-jurisdictions begin to be established.

"The same year" (Cockayne note to Leechb. i. 40), date of the treatise by Rhazes on the *small pox*.

Cleome pentaphylla of Equatorial Africa. Called in Nubia "arareg" (Del.), in Dongola "tama-lak" (Cailliaud), in which we recognize the "tumluk" or "kunnabari" of Rhazes, — and Avicenna, described by Ebn Elawam as a sort of wild greens growing in gardens and on the strand of rivers, and identified by Ebn Baitar with the "elbargascht" of the Persians : *C. pentaphylla* was observed by Alpinus, and Delile, as far North as Cairo; is enumerated by Clot-Bey among the plants employed in Egypt for feeding cattle; and is a well-known esculent on the Upper Nile and throughout Equatorial Africa as far as Congo (Oudney, R. Brown, and A. Dec.). Eastward, the "karavella" or "suryavalli" of Susrutas sutr. 19 to 46 is referred here by Hessler; *C. pentaphylla* has Sanscrit names (Pidd.); was observed in Hindustan by Rheede ix. pl. 24, and Wight; by Graham, in the environs of Bombay "common in gardens and cultivated grounds." Farther East, is enumerated by Blanco as called "araña" at Manila. By European colonists, was carried prior to 1707 (Sloane i. 94) to Tropical America, where the names "sambo" at Jamaica, "mosambe" or "acaia" at Cayenne, and "coyers" at Barbadoes, imply African origin; was also carried to Taheiti, as verified by myself.

Glauclium citrinum of Northern Hindustan. Called at Lahore "mameeran" (Honigb. 280), in which we recognize the "mamiran" of Rhazes. The "ma-mee-ran" is however defined in the Ulfaz Udwyeh 1351 as a species of yellow wood (J. F. Wats. index).

Suæda vera of Arabia and Egypt. Called in Egypt "suæd" or "soud," in which we recognize the "suad" of Rhazes, — Ebn Redhwan, Mosih ben Elhakam, Avicenna, and Ebn Baitar : *S. vera* was observed by Forskal, and Delile, on the Mediterranean border of Egypt near Alexandria; and farther South, by Forskal in the maritime portion of Yemen.

Spinacia oleracea of Central Asia. Called in Egypt "esbanach," in which we recognize the "isfanaj" of Rhazes, — Avicenna, Serapion, Edrisi, and Ebn Baitar : *S. oleracea* was observed in Egypt by Alpinus, Forskal, Delile, and Clot-Bey. Farther North, is called in Persian "ispanaj" or "ispanj" (Roxb.); seeds were collected in the plains of Persia by Olivier (Bosc. dict. agr.); and the plant was found by C. Koch apparently indigenous around Caucasus (A. Dec.). Westward, is described by Brunfels p. 16, Fuchs p. 668, Tragus, Matthioli, Cotgrave, Dodoens v. 1, and C. Bauhin; continues to be cultivated throughout Europe, and is called in Italian "spinace," in English *spinach* (Prior). Eastward from Persia, has no Sanscrit name (A. Dec.); but is called in Hindustanee "isfanaj" or "palak" or "bathua" (D'rozar), was observed in Hindustan by Roxburgh, and by Graham "cultivated in gardens." Farther East, was observed by Loureiro cultivated around Canton. By European colonists, was carried to Northeast America, where it continues to be abundantly cultivated.

Zygophyllum fabago of the Northern portion of the Desert, from Barbary to Syria and the border of Siberia. The "andarian" of Rhazes 24 — is referred here by Sprengel : *Z. fabago* was observed by Rauwolf p. 113 in Syria; and according to Lindley, is esteemed there "as a vermifuge;" is known to grow also on the border of Siberia, in the Crimea, and in Barbary (Lam. ill. pl. 345, Pers., and Lindl.).

Acacia tortilis of Yemen. Called there "hares;" the "yellow and red vars" described by Rhazes as "brought from Yemen and collected upon trees like pounded saffron," — may be compared : Forskal is silent respecting any use made of *A. tortilis*; but the tree is enumerated by Lindley among the species of *Acacia* "yielding a gum like gum arabic."

Guilandina bonduc of Tropical shores, from the West Indies and Brazil to the Eastward to the Malayan Archipelago and the Samoan and Hawaiian islands. The "bunduk hindi" of Rhazes, — Masudi, Avicenna, and Ebn Baitar, may be compared : *G. bonduc* was observed by Forskal p. 135 in the interior towns of Yemen, brought from Hindustan and planted by the Banians under the name of "sirs," but unknown to the Arabs around. Eastward, has Sanscrit names (Pidd.); is called in Bengalee "nata," in Hindustanee "katkarunja" or "katkulija" (Lindl.); was observed by Rheede ii. pl. 22 in Malabar; by Graham, "a scandent well armed shrub" called "sagur-gota," common "in hedges and jungly tracts;" was observed by myself near Bombay; and according to Roxburgh, Wight, and Lindley p. 156 and 263, the seeds in powder are a powerful bitter and tonic, and an excellent febrifuge. Farther East, is enumerated by Mason as indigenous in Burmah and called "ka-leing;" was observed by Wallich 5806 on Penang; is known to grow on Timor (Decsne fl. p. 134); was observed

by Rumphius v. pl. 48 on Amboyna and called "sehit;" by Blanco, on the Philippines, called in Tagalo "bayag cambing" or "calambibit," in Bisaya "dalugdug," and the seeds used medicinally by the natives; observed by myself on Mindanao, and on the Feejeean and Samoan Islands; and by Beechey (Hook.), and Mann, on the Hawaiian Islands. Westward from Ceylon, was carried according to Bojer p. 116 to the Comoro Islands and to Madagascar, where it has become naturalized; was observed by Drège at the Cape of Good Hope (E. Mey.); is known to grow along the West African coast in Congo, Guinea, and Senegambia (R. Brown, Thoning, and Perr.); was observed by myself in Southern Brazil; by Aublet, in Guyana; by Sloane, Plumier, and others, in the West Indies as far as the point of Florida, and seeds drifted by the Gulf stream have preserved their vitality after reaching the Irish coast (J. Banks, and A. Dec.).

Cucumis djyzer hendi of Scind and the adjoining portion of Hindustan. Called in Yemen "djyzer hendi" Indian carrot, and the "bathikh elhindi" of Rhazes, — Eltamimi, and Ebn Baitar, is referred here by Sontheimer: *C. djyzer hendi* was observed by Forskal in a few gardens in Yemen, brought from India and called by the Indians (Banians) "gadjer" or "schekarkand," the root edible. (See *C. pseudo-colocynthis*).

"925 A. D." (Nicol.), Edward succeeded by Athelstan or Ethestan, eighth Anglo-Saxon king of England.

In this year (= 839 + "10th + 48 + 12th + 3 + 1 + 4 + 2d + 6 = 86 years" of Malabar domination, Mahavams. liv to lix), the Malabars defeated by Mahaloo Wijayaba, who now became king of Ceylon. — He reinstated the Buddhist religion by sending to his friend king Anoorudda, and importing "twenty priests" together with "several books" (from Aramaradeese on the coast of Coromandel, note by transl.).

"926 A. D. = 'thian-tching,' 1st year of Ming-tsoung, of the later Thang" or Seventeenth dynasty — (Chinese chron. table).

"In the reign of Ming-tsoung" (Pauth. 333), the art of *printing* from wooden blocks, invented in China. The printing of the first four books of Confucius is referred by Humboldt cosm. ii. to "890-925."

Toltecs under their "fifth" chief Nimaquiché retiring to Guatemala, founded the city of Quiché on lake Atitan; and Nimaquiché dying on the route, his son Acxopil became in effect the first king of Guatemala (art de verif. contin.).

Agave Americana of the Western slope of the Peruvian Andes. The *century plant*, called in Peru "chuchau," and its fibre "chahuar," and this fibre twisted into mantles by the wild tribes of the cold portion of the Andes — (G. de la Vega i. 14 to viii. 13); also gave the name "Chahuarhuay" (June) to the second month established by Yupanqui; and furnished the slings given to youths of Inca descent in the seventh month Ccapac Raymi (C. de Molin. 38). Numerous uses of the plant are mentioned by G. de la Vega, and Ruiz and Pavon iii. 66; and the plant itself was observed by myself clearly indigenous and a striking feature in the vegetation on the basal portion of the Peruvian Andes. In Mexico, the "maguey" or "metl" was cultivated as far South as the Aztec language extended for making cordage and the kind of paper on which hieroglyphics were painted, and its sap fermented into "pulké," a beverage not used by the Otomite, Totonac, nor Mistic tribes (Humb. iv. 9): *A. Americana* is described by Lopez de Gomara (Spreng.). By European colonists was carried Westward across the Pacific to the Philippines, where it is used by the natives medicinally and for making fine cloth, and is called "magui" (Blanco); to the neighbouring islands, termed "aloe americana" by Rumphius v. pl. 94; to Hindustan, called in Bengalee "bilatipat" or "jungli-ananash," in Tamil "anaik-katrashai," in Telinga "rakashi-mattalu," in Hindustanee "bakas-pattah" or "halhi-sengar" or "bara-kanvar" or "jungli-kanvar" (Drur.), and "now common" throughout (Royle, Wight, and Drur.). Transported to Europe "in 1586" (Camer. hort. 11, and Clus. hisp. 444), continues to be cultivated, especially for hedges, in Southern Spain, Algeria, Sicily, Italy, and Dalmatia, has become seemingly naturalized but does not ripen seed (A. Dec.); was observed by Siebold, and Chaubard, in Greece, a few stocks derived apparently from former cultivation: by European colonists also, was carried to Northeast America, where it continues in greenhouses. Its roots according to Lindley are diuretic, and are brought to Europe mixed with sarsaparilla.

"927 A. D." (= 875 + cycle of 52 years, Clavig. ii.), accession of Mitl, sixth Toltec king of Mexico.

Ipomaea jalapa of the Mexican table-land. Called by the Spanish colonists "jalapa macho" or "purga macho" (Schiede), and the "mechoacan" of the ancient Mexicans * — (Humb. iv. 10) may

* *Inga unguisati* of Mexico and the West Indies. A large shrub called in Mexico "quamo-chitl" (Hernand. 94), and known from early times: — observed by Plumier pl. 4, Descourtilz i. pl. 11, and Macfadyen, frequent in the West Indies. By European colonists, was carried Westward

be compared: I. jalapa is attributed to Mexico by Linnæus (Pers., and Steud.); was observed by Orbegozo in the temperate parts of Oaxaca, its root considered by the traders extremely similar in quality to jalap, and being "the more abundant and larger of the two, at least in some districts," is regarded by Lindley as probably furnishing a portion of the imported drug.

Ipomæa purga of the mountains of Eastern Mexico. Called at Jalapa "purga," but in Mexican "laschachne" or "tetonpacte" — (Lindl.), and furnishing the true jalap of commerce: observed by Schiede, and Orbegozo, on the mountains near Orizaba, on Coffre de Perote at the elevation of "six thousand" feet, and on the Eastern declivity of the mountains near Chiconquiaco. "Sufsub jalaba" was found by Forskal mat med. imported by the way of Greece into Egypt.

"928 A. D." (Alst., and Nicol.), at Rome, Joannes XI. succeeded by Leo VI., fifty-ninth archbishop.

"929 A. D." (Alst., and Nicol.), at Rome, Leo VI. succeeded by Stephanus VIII., sixtieth archbishop.

"The same year" (Munk), the pilgrimage to Mecca interrupted by the sect of Karmatians. Lines of impending partition now beginning in the Khalifate or Muslim Empire.

"931 A. D." (Alst., and Nicol.), at Rome, Stephanus VIII. succeeded by Joannes XII., sixty-first archbishop.

"The same year" (ann. Jap., and art de verif.), Dai-go succeeded by his son Siusaku or Zusiak, now sixty-first dairo of Japan.

"In this year" (Elph. iv. 1), the king of Guzerat, dying without male issue, succeeded by his son-in-law as head of a new dynasty, the Salonka or Chalukya dynasty.

"932 A. D." (art de verif.), Moktader succeeded by K iher, nineteenth Abbassid khalif.

"934 A. D. = 'yng-chun,' 1st year of Min-ti; and after a brief interval, 'tching-tai,' 1st year of Lou wang: "emperors "of the later Thang" or Seventeenth dynasty — (Chinese chron. table, and Pauth.).

One hundred and fifty-seventh generation. May 1st, 934. onward mostly beyond youth: the Jewish writers, Japhet (Abu Ali Hassan el Basri) Halevi, Sabbatai Donolo ben Abraham: the Syrian bishop Moses Barkepha: the Arab writers, the astronomers Azophi and Alfarabi d. 950 (Pouchet), the grammarian Faresi, Ebn Said, Said ben Batrik (Eutychius) wr. 932 to 953 (Leps.): the Greek writers, Georgius Monachus d. 948, Theodosius acroaseis d. 961, Pollux the chronographer: Oecumenius d. about 950, Genesius d. about 95; the theologians, Hadamarius, and Giselbertus: Luitprand, Witichind, Frodoard, Eudes de Cluni.

"The same year" (art de verif.), Kaher deposed, and the accession of Radi, twentieth Abbassid khalif. A coin issued by Radi, is figured in Marcel p. 93.

"936 A. D. = 'thian-fou,' 1st year of Kao-tsou III., "head of the new dynasty of the later Tsin — (Chinese chron. table).

"The same year" (Alst., and Nicol.), at Rome, Joannes XII. succeeded by Leo VII., sixty-second archbishop.

"The same year" (Nicol, see Alst.), Henricus Auceps succeeded by his son Otto or Otho, as

across the Pacific to the Philippines, where it is called in Tagalo "camochiles" or "camachiles" or "camonsiles," and the pulp around its seeds eaten by the natives (Blanco). Its bark in decoction is "very astringent," and is employed medicinally (Lindl.).

Inga saman of Central America. An immense tree, the "genisaro" of Mexico (Drur.), and probably long known there: — described by Jacquin (Steud.); and observed by Squier in Central America, "ninety feet high," with branches "five feet in diameter" extending quite horizontal "ninety-two feet." By European colonists was recently introduced into Ceylon, and thence to the Cuddapah and Codoor plantations in Hindustan, supposed "to be a tree of great value for railway fuel" (Beddome, and Drur.).

Inga dulcis of Mexico. A large tree probably known to the natives of Mexico and Central America as early as this date. — By European colonists, was carried across the Pacific to the Philippines (Pers.), and thence reached Hindustan, where it is called in Telugu "sima chinta," in Tamul "coorookoo-pally" (Drury); was observed in Hindustan by Roxburgh cor. pl. 99; by Graham, "common about Bombay," its "pods curiously twisted, filled with a sweet firm pulp which forms a very nourishing food."

Tigridia pavonia of Mexico. The *tiger-flower* called "cacomite" and its farinaceous root eaten by the ancient Mexicans — (Humb. iv. 9): observed by Hernandez viii. 23 in Mexico: and a drawing of "flos tygridis" sent by Brancion to Dodoens (Lobel hist. 59, and Dalech.). By European colonists, was carried to Northeast America, where it continues a favourite flower in gardens; and by Nimmo to the environs of Bombay.

"king" of Germany. An impression of the seal of Otto, — attached to a parchment written "in 956," is extant.

Hardly earlier than this date (Graha Munjari tables, Puranas, and Benti.), Abhijit reigning in Hindustan.

938 A. D. = "863 an. jav." (Raffles x.), date of an inscription in the Kawi in ancient Javan character on a stone discovered near Jang'gala.

940 A. D. = "865 an. jav." (Raffles x.), date of an inscription in the ancient Javan character "very beautifully executed" on copper. Also of an inscription in the same character on a stone discovered on the Kedang hills.

"In this year" (Alst., and Nicol.), at Rome, Leo VII. succeeded by Stephanus IX., sixty-third archbishop.

"The same year" (art de verif.), Radi succeeded by Motaki, twenty-first Abbassid khalif.

Motaki was acknowledged by Ikhschid; who, from being appointed governor of Egypt, had rendered himself really independent, and had even extended his authority over Palestine and Syria. Coins issued by Ikhschid, are figured in Marcel p. 95.

About this time (tradit., and Colebrooke as. res. viii. 258 to 467), Gaudapada, "stated to have been" the instructor of Govindanath, expounding the Vedas. Some of his writings — are extant.

"941 A. D." (palm-leaf ann. Jag., and W. W. Hunter), Jana Kesari succeeded by Nripa Kesari, now king of Orissa; a warlike and ambitious prince, — who founded the city of Cattack at the commencement of the delta of the Mahanadi, and reigned "twelve years."

"The same year" (= 331 A. H. comm. Sept. 14th," Gildem. 77), Musir ben Muhalhil accompanying the Chinese ambassadors back to their own country.

"Oct. 27th" (Nicol.), Athelstan succeeded by Edmund, ninth Anglo-Saxon king of England.

"In this year" (Sm. b. d.), sudden appearance of a Russian fleet of "ten thousand boats" under Ingor, ravaging the country around the entrance of the Bosphorus. The Russians were repelled, and most of their boats destroyed, — and "in 945," Olga widow of Ingor came to Constantinople and received baptism under the name of "Helena."

"942 A. D." (J. Nicholson in Kitt. cycl. bibl.), death of Rabli Saadjah Haggaoon or Saadja Gaon, born in the Faijum, rector of the academy at Sora, and author of an Arabic version of the Pentateuch, Isaiah, Job, and a portion of Hosea. The version "often follows the Septuagint;" — and was published in the Hebrew character in the Tetraglott of "Constantinople in the year 1546."

"The same year" (= 331 A. H. comm. Sept. 14th," Ebn Batut., and Gildem. p. 54), death of Abu Abdallah ben khalif; who first opened to Muslims the pilgrimage to the mountain in Ceylon containing the alleged imprint of Budha's foot.

Returning from Sindabil in China part of the way by sea, Musir ben Muhahil visited the "pepper country" (Malabar?), and mount Kafur on which among other great cities Kamrun is situated, that exports "the green wood called mandal kamruni" (. . .). "There is also the city called Sanf, which gives its name to the Sanfi aloes-wood" (. . .). "At another foot of the mountain towards the north is the city of Saimur" (not far from Sind) containing mosques, churches for Christians, synagogues, and even a temple for fire-worshippers (Parsees); the Hindu population not slaying animals, nor eating fish, eggs nor meat, except that some among them would eat animals beaten to death or thrown from a precipice, but not animals dying naturally. The "saimuri wood" is named from this city though it is only brought thither for sale. — Much of the narrative of Musir ben Muhahil has been preserved by Yakuti, and Kazwini (Gildem., and Yule).

"943 A. D. = 8th year of the 'thian-fou,' accession of Tchou-tchoung-kouei, of the later Tsin" or Seventeenth dynasty (Chinese chron. table).

"The same year" (Alst., and Nicol.), at Rome, Stephanus IX. succeeded by Marinus II. or Martinus II., sixty-fourth archbishop.

In this year (= "332 A. H., comm. Sept. 3d," Gildem.), Masudi, according to his own account, writing his "Meadows of gold." He speaks of the burning of widows with their deceased husbands in Hindustan (Wilford as. res. ix. 181), having visited Sind "in 912" while quite a youth, and afterwards Zanzibar and the Island of Kanbalu (Comoro?), Champa, China, and the country of Zabaj (Java?), besides travelling in Turkestan — (Yule cath. i. p. cx.). He died "in 957" (Pouchet).

Hernandia sonora of wooded Tropical shores from the Malayan archipelago to the Samoan Islands. The *jack-in-a-box* is a large tree called in Tagalo "colongcolong" (Blanco); and the tree bearing men and women on the island of Wak-wak in the Southern Ocean, mentioned by Masudi, — and Bakui (Yule 79), may be compared: Al Biruni denies that the island is named from a fruit shaped like a human head which cries "wak wak:" *H. sonora* was observed by myself frequent along the seashore of the Samoan Tongan and Feejeean Islands; by Rich, under cultivation at Otatu coral-island from a drifted seed; by Blanco, frequent along the seashore of the Philippines; by Rumphius ii. pl. 85, on the Moluccas, its fibrous roots chewed and applied to wounds caused by the Macassar poison form

an effectual cure (Lindl.) ; is known to grow also on Timor (Decsne) and as far as Java (Hassk., and A. Dec.). Eastward, was observed in the West Indies by Plumier, Browne, Jacquin amer. 245, and Descourtilz, but no Carib name is given, and from what is above stated, may have been carried there by Polynesians. From transported specimens, is described by Plukenet alm. pl. 208. The juice of the leaves according to Lindley "is a powerful depilatory," destroying "hair wherever it is applied, without pain."

"944 A. D." (art de verif.), Motaki deposed; and the accession of Mostakfi, twenty-second Abbassid khalif.

"Dec. 20th" (Sm. b. d.), at Constantinople, the throne recovered from his usurping guardian and colleague Romanus Lecapinus by Constantinus VII. Porphyrogenitus. By whose direction, Theophanes Nonnus compiled his medical compendium.

The earliest notice of *distilled rose-water* $\rho\omicron\lambda\omicron\sigma\tau\alpha\gamma\mu\alpha\tau\omicron\varsigma$ is by Theophanes Nonnus 97 — (Spreng., and Sm. b. d.).

"945 A. D." A *Coptic inscription* dated in the "six hundred and sixty-second year of the Diocletian era, and three hundred and thirty-fourth of the Hejra" (the two reckonings agreeing with each other and with the above year) — is mentioned by Champollion-Figeac eg. anc. p. 228.

"In this year (= 2d of the khai-yun," geogr. Chin. transl. Klapr. p. 35), Kian succeeded by his son Wou, now king of Corea.

"In this year (= 8th year of the 'ten-kei' of Zu-siak," ann. Jap. transl. Tits.), Fousiwara-no Naka fira dying, received the posthumous title of Biwa-no Sadaisin.*

"946 A. D." (Alst., and Nicol.), at Rome, Martinus II. succeeded by Agapetus II., sixty-fifth archbishop.

"May 26th" (Nicol.), Edmund succeeded by Edred, tenth Anglo-Saxon king of England.

"The same year" (art de verif.), Mostakfi deposed, and the accession of Mothi, twenty-third Abbassid khalif. A coin issued by Mothi, is figured in Marcel p. 94.

Mothi was acknowledged by the eunuch Kafur, who governed Egypt in the name of the children of Ikhschid — (Marcel p. 97).

"947 A. D. = 12th year of the 'tching-tsin-thian-fou' of Kao-tsou IV.," now head of the new dynasty of the later Han — (Chinese chron. table).

"The same year" (ann. Jap., and art de verif.), Siusaki succeeded by his brother Murakami, fourteenth son of Dai-go, and now sixty-second daïro of Japan.

Greek manuscripts of about this date (Sylvestre) presenting the following forms of letters, $\delta, \gamma, \lambda, \mu, \sigma, \nu$.

Under Constantinus VII. Porphyrogenitus (. . . .), the Geoponica, Greek agricultural writings, collected by Cassianus Bassus.

Pinus cembra of Europe and Northern Asia. Its cones called in France "ceinbrots," in Italy "zermi," in Germany "zirbelnusse," and the $\sigma\tau\rho\beta\iota\lambda\omicron\nu$ of the Geoponica xi. i. 11 — is referred here by Sprengel: *P. cembra* is described also by Avicenna 179 (Spreng.), and is known to grow on the mountains of Switzerland (Lam. fl. fr., and Pers.). Eastward, is known to be frequent throughout Northern Asia as far as the Kurile Islands (Endl., and A. Dec.). Is "said to yield *Carpathian balsam*" (Lindl.).

"948 A. D. = 'kien-you,' 1st year of Yn-ti, of the later Han" or Nineteenth dynasty — (Chinese chron. table).

"The same year (= 337 A. H. comm. July 10th," Gildem. p. 54), date of an Arabic sepulchral inscription in the city of Colombo in Ceylon (trans. Asiat. i. 540).

The same year = "5th year of Mostakfi," in an inscription at the gold mines of Gebel Ellaka in the Ababdeh Desert. The earliest inscription in the current *Arabic letters* hitherto discovered (Wilk. theb. and eg. p. 416 and 545).

About this time ("909 to 951" Krapf trav.), Mukdishu on the coast of East Africa founded by Arabs.

"950 A. D." (Munk), the pilgrimage to Mecca again opened.

* *Eriobotrya Japonica* of Japan. The first part of the above title is derived from this tree — (Klapr.), called "biwa" to the present day: *E. Japonica* was seen in Japan by Kaempfer v. p. 800; and is described by Thunberg as large and lofty, bearing esculent fruit. Westward, was observed by Loureiro in China or Cochinchina. But by European colonists may have been carried to Burmah, where it is enumerated by Mason as "exotic" and called *loquat*; and to Hindustan, where it was observed by Roxburgh, and Graham in gardens, and called *loquat* or *whampee*. Clearly by European colonists, carried to the Mauritius Islands, where it is cultivated in elevated situations, and called "bibassier" (Boj.); to Europe, in the days of Plukenet alm. pl. 371; and to Northeast America, where it has become frequent in greenhouses.

Haly Abbas about this time writing.

"951 A. D. = 'kouang-chun,' 1st year of Tai-tsou II." or Ko-wei, head of the new dynasty of the later Tcheou (Chinese chron. table, and Pauth.).

"954 A. D. = 'hien-te,' 1st year of Chi-tsoung, of the later Tcheou" or Twentieth dynasty (Chinese chron. table).

"955, Nov. 23d" (Nicol.), Edred succeeded by Edwy or Edwyn, eleventh Anglo-Saxon king of England.

Nigella damascena of the Mediterranean countries. Called in Britain *fennel-flower* or *devil-in-the-bush* or *bishop's-wort* (Prior), in Greece "mavrökōkō" or "pōrthōhōrtōn" (Sibth.); in which we recognize the **biscopvvyrt** of the Anglo-Saxon transl. Apul. 1,*—and a glossary at Epinal: *N. damascena* has been long cultivated in Britain (Curt. mag. pl. 22); is termed "n. angustifolia flore majore simpliciter cœruleo" by Tournefort inst. 258; was observed by Forskal near Marseilles; and is known to occur in cultivated ground in Southern France and Spain (Pers., and Boj.). Eastward, was observed by Sibthorp, and Chaubard frequent in cultivated ground in Greece and on the Greek islands; and is enumerated by Clot-Bey and Figari as long known in Egypt. By European colonists, was carried to Northeast America, where it continues under cultivation, and has been observed by A. Gray "nearly spontaneously around gardens;" to the Mauritius Islands, where it was observed by Bojer under cultivation as a garden flower. (Compare *bishop's-weed*, *Ammi majus*.)

* *Ranunculus acris* of Europe and Northern Asia. Called in Britain with other species *butter-cup* or *king-cup* or *king-cob* (Prior), its many-petaled form in France "bouton d'or" (Pers.): the **clvfvvyrt** of the Anglo-Saxon transl. Apul. 10—is referred here by Cockayne: *R. acris* is termed "*r. hortensis*" by Fuchsius 157 (Spreng.); and is known to grow abundantly throughout middle and Northern Europe (Thuil, Dec. fl. fr., and Pers.). Eastward, is known to grow on Caucasus (Bieb.), and in Northern Asia (Wats.): and thence may have been carried by Russian colonists across the Pacific to Norfolk Sound, where it was observed by Mertens. Clearly by European colonists, was carried to Iceland and Greenland (Hook., and Wats.); to Northeast America, where it has become naturalized, multiplying especially in clearings that have become grass-grown in our Northern States and Canada, as far even as the central portion of the continent in "Lat. 58°" (Drumm., and Hook.). From its superior height over two allied species, is termed *tall butter-cup* by A. Gray.

Ranunculus gramineus of middle Europe. The **refnes fot** raven's foot of the Anglo-Saxon transl. Apul. 28—is referred here by Cockayne: *R. gramineus* is described by Linnæus; and is known to grow in mountain meads in France and Britain (Gouan, Smith brit. ii. p. 588, Pers., and Steud.).

Saxifraga granulata of Europe and Northern Asia. Called in Germany "weiss steinbrech" (Trag.), and the **sundcorn** of the Anglo-Saxon transl. Apul. 99—from the figure in manuscript *ϑ*, is referred here by Cockayne: *S. granulata* is described by Platearius, Brunfels 185, Tragus i. pl. 180, and Dodoens 316 (Spreng.); is termed "*s. rotundifolia alba*" by Tournefort inst. 252; and is known to grow throughout middle Europe (fl. Dan. pl. 514, Curt. lond. i. pl. 30, and Pers.). Eastward, was observed by Sibthorp, and Chaubard, frequent in grassy places in the Peloponnesus.

Eupatorium cannabinum of Europe and the adjoining portion of Asia. Called in Britain *hemp-agrimony* (Prior); the **henep** of the Anglo-Saxon transl. Apul. 116—may be compared, the figure in manuscript *ϑ* agreeing according to Harley and Cockayne: *E. cannabinum* is classed under "hepatorium" by Gerarde; is known to grow in marshy ground throughout middle Europe as far as Denmark (Tourn. inst. 456, fl. Dan. pl. 745, Engl. bot. pl. 428, and Pers.). Eastward, was observed by Forskal, Sibthorp, and Chaubard, frequent in shady wet situations from the Peloponnesus to Constantinople.

Cirsium acaule of middle and Northern Europe. The **vvdv thistel** of the Anglo-Saxon transl. Apul. 111—may be compared with its caulescent form when growing in woods, the figure in manuscript *ϑ* resembling according to Cockayne *C. lanceolatum*: *C. acaule* is described by Linnæus; and is known to grow in France and throughout middle Europe as far as Denmark (fl. Dan. pl. 1114, Vill., and Pers.).

Gentiana amarella of Northern Europe, and farther South on mountains. One or more species called in Britain *felwort* (Prior); the **felpvvyrt** of the Anglo-Saxon transl. Apul. 17,—may be compared: *G. amarella* is termed "*g. pratensis flore lanuginoso*" by Tournefort inst. 81; and is known to be frequent in Britain, France, and Northern Europe (flor. Dan. pl. 328, Engl. bot. pl. 236, and Pers.); Eastward, was observed by Sibthorp in grassy situations on the Bithynian Olympus. The plant according to Lindley is "one of the British substitutes for the gentian of the shops."

Pinguicula vulgaris of Northern Climates. Called in Britain *butterwort* (Prior): the

Medicago maculata of Europe and the adjoining portion of Asia. Called in Britain *heart-clover* (Prior p. 50). in Greece "triphullōmmatēn" (Ang.), in which we recognize the *HEORT CLAEFRE* of the Anglo Saxon transl. Apul. 25, — and gloss. Laud. 567, referred here by Cockayne: *M. maculata* is described by Anguillara p. 285 (Spreng.), and Morison ii pl. 15; is termed "*medica echinata glabra cum maculis nigricantibus*" by Tournefort inst. 410; and is known to grow from the Mediterranean to Britain (All., Curt. lond. iii. pl. 47, and Pers.). Eastward, was observed by Sibthorp, and Chaubard, frequent from the Peloponnesus throughout the Greek islands to mount Athos; and is described by Pallas (Steud.). By European colonists, was carried to Northeast America, where it was observed by A. Gray "introduced with wool into waste grounds in some places."

Trifolium procumbens of Europe and the adjoining portion of Asia. A yellow-flowered species called in Britain *hop-clover*; and the *hymele* of the Anglo Saxon transl. Apul. 52, — figured with trefoil leaves in manuscript G. is referred here by Cockayne: *T. procumbens* is termed "*t. lupulinum*" by Rivinus tetrapl. pl. 10, "*t. pratense luteum capitulo lupuli vel agrarium*" by Tournefort inst. 404; and is known to grow in grassy situations throughout middle Europe as far as Denmark (Vaill. par. pl. 22, fl. Dan. pl. 945, and Pers.). Eastward, was observed by Sibthorp, and Chaubard, frequent in cultivated ground from the Peloponnesus to Asia Minor and Cyprus; by Hasselquist, around Damietta on the Mediterranean border of Egypt. By European colonists, was carried to Northeast America, where it continues in waste and cultivated ground as far inland as Kentucky (A. Gray); also to Austral Africa (Drege, and A. Dec.).

Asperula odorata of Europe and the adjoining portion of Asia. Called in Britain *wood-rose* or *wood-ruff* or *wood-row* or *wood-rowel* from its whorled leaves resembling rowels of ancient spurs (Prior), in which we recognize the *VVVVV ROFE* of the Anglo-Saxon transl. Apul. 33 and 53, — and the "*woderoue*" termed "*herba muscata herba citrina*" in gloss. Harl. 3388 (an instance according to Prior of the adoption of a French word into Anglo-Saxon): *A. odorata* is figured in manuscript V of the Anglo-Saxon transl. Diosc. 174 (Harley and Cockayne); is termed "*aparine latifolia humilior montana*" by Tournefort inst. 114; was observed by Scopoli in Carniolia (Steud.); and is known to grow throughout middle Europe as far as Britain (Curt. lond. iv. pl. 15, and Pers.). Eastward, was observed by Sibthorp in shady situations on the Bithynian Olympus and around Constantinople. According to Smith, and Lindley, "the herb while drying has the scent of new hay," and "passes for a diuretic."

Digitalis purpurea of middle Europe. Called in Britain *foxglove*, in Norway "*rev-bielde*" fox-bell, in France "*gantes de notre dame*," in Germany "*fingerhut*" (Prior), in which we recognize the *FOXES GLOFA* of the Anglo-Saxon transl. Diosc. 144, — and a manuscript glossary of Ælfric: *D. purpurea* is termed "*digitalis*" by Fuchsius, who remarked the absence of Greek and Latin names; is described also by Tragus 339 (Spreng.), and F. Columna (Mentzel.); and is known to grow wild throughout middle Europe as far as Norway (fl. Dan. pl. 74, Ehrhard, and A. Dec.). By European colonists, was carried to Northeast America, where it continues under cultivation; to the Mauritius Islands, where according to Bojer it seldom flowers. The leaves and seeds according to Lindley "afford one of the most valuable of known medicines, for the purpose of reducing the action of the heart, promoting the action of the absorbents, as a diuretic, and for producing a specific action over the cerebro-spinal system."

Calamintha acinos of Europe and the adjoining portion of Asia. Called in Britain *basil-thyme* (Prior), and the *MISTEL* of the Anglo-Saxon transl. Apul. 119, — identified by Cockayne with the *basil*, may be compared: *C. acinos* is described by Fuchsius p. 896, Anguillara p. 218, Lobel, and Clusius (Spreng.), and Parkinson th. p. 10; is termed "*clinopodium arvense ocymi facie*" by Tournefort inst. 195; was observed by Forskal near Marseilles; is known to grow wild in Italy (Lenz), and throughout middle Europe as far as Britain (Lam. fl. fr., Pers., and Curt. lond. i. pl. 43). Eastward, was observed by Sibthorp, Chaubard, and Fraas, in the Peloponnesus; and is described by Pallas.

Calamintha clinopodium of Europe and the adjoining portion of Asia. Called in North America

SMEROVVYRT of the Anglo-Saxon transl. Apul. 20 — is referred here by Cockayne p. lvi: *P. vulgaris* is described by W. Coles (Prior): is known to grow in wet situations in Switzerland and throughout middle and Northern Europe as far as Lapland and Iceland (Oed. dan. pl. 93, Pers., Hook, and Wats.). Eastward, is known to grow in Siberia (Wats.). Farther East, a *Pinguicula* was observed by Chamisso on St. Lawrence Island; and *P. vulgaris* is known to grow on wet rocks from Lake Superior to Western New York (A. Gray).

Satyrion viride of middle Europe. The *HRÆFNES LEAC* raven's leek of the Anglo-Saxon transl. Apul. 16 — may be compared (the figure according to Cockayne being that of *Satyrion* of Linnæus and not a *Habenaria*): *S. viride* is known to grow in mountain meads from Britain throughout middle Europe (Engl. bot. pl. 94, and Pers.); was observed by Haller pl. 20 in Switzerland.

basil (A. Gray), in Greece “köpsöhörtön” (Sibth.), and the “mistel” in question, — although the figure does not well agree, is referred here by Cockayne: *C. clinopodium* is described by Valerius Cordus, Gesner, Matthioli, and Clusius (Spreng.); is termed “*c. origano simile elatius majore folio*” by Tournefort inst. 195; is known to grow in Algeria (Benth.), Italy (Lenz), and throughout middle Europe as far as Sweden and Kasan (fl. Dan. pl. 933, Fries, and Ledeb.). Eastward, was observed by Sibthorp, and Chaubard, in mountainous stony places in the Peloponnesus and Crete; is known to grow on Caucasus, and throughout middle Asia as far as Cashmere and Lake Baikal (Ledeb., and Benth.). By European colonists, was carried to the Azores (Wats.); to Northeast America, where it has become naturalized in open situations from Newfoundland and Canada to South Carolina and Missouri (Hook., Beck, and A. Dec.).

Lysimachia nummularia of Europe and the adjoining portion of Asia. Called in Britain *moneywort* (Prior): the *CENTIMORBLA* of the Anglo-Saxon transl. Diosc. 162 — is referred here by Lovell, Lyte, and Nemnich (Cockayne): *L. nummularia* is termed “*l. humifusa folio rotundiore flore luteo*” by Tournefort inst. 141; and is known to grow in wet soil throughout middle Europe as far as Denmark (fl. Dan. pl. 493, Curtis lond. iii. pl. 14, and Pers.). Eastward, was observed by Forskal, and Sibthorp, in the environs of Constantinople.

Holcus lanatus of Europe and the adjoining portion of Asia. The *CYVICE* of the Anglo-Saxon transl. Apul. 79 — may be compared with the “weich” of Hildegard ii. 165, referred here by Sprengel: *H. lanatus* is termed “*gramen pratense paniculatum molle*” by Tournefort inst. 522; and is known to grow in meads in France and throughout middle Europe (Vill., Curt. lond. iv. pl. 11, and Pers.). Eastward, was observed by Sibthorp around Constantinople. By European colonists (according to Josselyn) *couch-grass* was carried to New England, and *H. lanatus* has been observed by myself sparingly naturalized in the environs of Salem.

“956 A. D.” (Alst., and Nicol.), at Rome, Agapetus II. succeeded by Joannes XIII., sixty-sixth archbishop.

“957, Oct. 1st” (Nicol. p. 356), Edwyn succeeded by Edgar, twelfth Anglo-Saxon king of England. Dunstan in this year made bishop of Worcester (Cockayne iii. 435).

“959 A. D.” (Blair), in England, the power of the monks very high. Dunstan and Ethelwold, with king Edgar, expelling the secular and married clergy from the great ecclesiastical foundations and substituting Benedictines (Cockayne iii. p. 406).

“Nov. 15” (Sm. b. d.), Constantinus VII. Porphyrogenitus succeeded by his son Romanus, thirty-seventh Byzantine emperor.

“960 A. D. = ‘kian-loung,’ 1st year of Tai-tsou III.,” head of the new dynasty of the Soung (Chinese chron. table). A decree was issued or renewed by Tai-tsou III., making the emperor’s signature indispensable to the execution of death-sentences — (Pauth. p. 337).

Hardly earlier than this date (Graham Munjari tables, Puranas, and Bentr.), Siva Swasa reigning in Hindustan.

“961 A. D.” (Blair, and Sm. b. d.), Crete recaptured from the Muslims by Nicephorus Phocas.

“In this year (= 350 A. H.,” Elph. v. 2), Abdulmelek succeeded by Mansur, now sixth Samani king of Bactria. Alptegin, having given his vote against Mansur, deprived of the government of Khorasan, but with a body of adherents found safety at Ghazni in the heart of the mountains of Soliman. The position, near the Indus, is important, as — subsequently the point of departure of Muslim invasions of Hindustan.

“963 A. D.” (Alst., and Sm. b. d.), Romanus succeeded by Nicephorus Phocas, now Nicephorus II., thirty-eighth Byzantine emperor. Writings by the emperor Nicephorus Phocas are extant.

About this time (tradit., and Colebrooke as. res. viii. 467), Govindanath, “instructor of Sancara,” expounding the Vedas.

“964 A. D. = 2d year of the ‘kian-te’ of Tai-tsou III.” (Chinese chron. table), beginning of the Sixty-first cycle.

“The same year” (Blair), Italy conquered and united with Germany by king Otto or Otho: who now assumed the title of “emperor.” And deposing Joannes XIII., Leo VIII. was elected sixty-seventh archbishop.

“965 A. D.” (Alst., and Nicol.), at Rome, Leo VIII. succeeded by Benedictus V., sixty-eighth archbishop.

“966 A. D.” (Alst., and Nicol.), at Rome, Benedictus V. succeeded by Joannes XIV., sixty-ninth archbishop.

“967 A. D.” (Blair), the city of Antioch recovered from the Muslims by Nicephorus II. Phocas. One hundred and fifty-eighth generation. Sept. 1st, 967, onward mostly beyond youth: the Jewish writers, Joseph Ibn Santas: the Arab writers, Ebn Samhun, Caboudi, Harib, Ibn al-Gezzar, Temimi, Salmana: the Greek writers Suidas d. about 974. Symeon Magister d. after 975, Leo diaconus d. about 987: Abbo, the historian Armoine: the naturalist Alfredus.

Solanum insanum of Equatorial Africa. Mentioned by Abu'lfaḍli — (Celsius hierobot., and Spreng.) : and as transported to Europe, figured in manuscript V of the Anglo-Saxon herb. Diosc. 144 (Harley and Cockayne) ; described by Morison xiii. pl. 2, and Plukenet alm. pl. 226, and in English greenhouses called *egg-plant* (Prior) from seeming to bear hen's eggs. Eastward, has been observed under cultivation in Ceylon (Rumph. v. pl. 85, and Scop. insubr. i. pl. 1). By European colonists, was carried across the Atlantic to the West Indies (Pers.) ; and to Northeast America, where it continues to be occasionally seen in greenhouses. "*S. ovigerum*" of Tournefort inst. 151, and Lam. enc. p. 294, differing in the absence of prickles, is regarded by Persoon as perhaps only a variety.

Thymbra spicata of the East Mediterranean countries. — Termed "t. Abulfali" by Adanson, and known to grow in Macedonia and on Lebanon (Pers.) ; observed by Sibthorp pl. 546 on dry hills from Crete and the Peloponnesus to Asia Minor. From transported specimens, described by Plukenet alm. pl. 116.

"968 A. D." (ann. Jap., and art de verif.), Murakami succeeded by his second son Ren-sei or Rei-zen, now sixty-third daïro of Japan.

"The same year" (Marcel p. 97), death of the eunuch Kafur ; Abul Fawaris, a grandson of Ikhschid aged "eleven years," becoming governor of Egypt.

"Dec. 22d, about ten a. m." (Blair), *eclipse of the sun*. Observed at Constantinople.

The Khalifat or United Muslim Empire now virtually at an end : though the spiritual authority of Mothi continued to be very extensively acknowledged.

"969 A. D." (art de verif.), entrance into Egypt of an army from the West ; sent by Moez hereditary ruler of Barbary, claiming by his descent from Fatimah to be the real khalif. He obtained possession of the government ; and his authority was soon acknowledged in Palestine, Syria, and even in Arabia. A coin issued by Moez, is figured in Marcel p. 102.

"The same year" (Alst.), Nicephorus II. Phocas succeeded by Joannes Zemiscas, thirty-ninth Byzantine emperor.

"The same year" (Nicol.), a Conference at Constantinople between the Catholics and Jacobites.

"970 A. D." (Marcel), El-Kahira or Cairo founded by Djauhar Kaid, the general of Moez, for the new seat of government. He also founded the mosque and college of El Ezher — (Wilk. theb. and eg.).

"The same year" (ann. Jap., and art de verif.), Rai-zen succeeded by Jen-wo or Jin-jo or Yen-wou, fifth son of Murakami, and now sixty-fourth daïro of Japan.

"971 A. D." (Blair), the Bulgarians "three hundred thousand" in number defeated in battle and subjugated by Bardas, minister of Joannes Zemiscas. This emperor also recovered "the whole of Judea" from the Muslims — (T. Wright early trav. Palest.).

"972 A. D." (Marcel p. 102), the great mosque and *college* of El-Azhar commenced by Djauhar Kaid in the Northeast quarter of Cairo. — This continues to be the principal Arab university ; and students from Morocco, Astrakan, and Hindustan, were found there by Marcel.

"The same year" (Munk, and Marcel), removal of Moez into Egypt.

"The same year" (Alst.), at Rome, Joannes XIV. succeeded by Donus or Domnus II., seventy-tieth archbishop.

"973 A. D." (Alst., and Nicol.), Otto succeeded by Otto II. or Otho II., second emperor of Germany and Italy.

"The same year" (Alst., and Nicol.), at Rome, Domnus II. succeeded by Benedictus VI., seventy-first archbishop.

"974 A. D." (Alst., and Nicol.), at Rome, Benedictus VI. succeeded by Benedictus VII., seventy-second archbishop.

975 A. D. (= "973 complete years" of text), end of the chronicle of Ethelwerd, with the reign of Edgar.

"July 18th" (Nicol.), Edgar succeeded by Edward II. the Martyr, thirteenth Anglo-Saxon king of England. The fleet of Edward II. was commanded by Brithric — (Blair).

"The same year" (Alst.), death of Joannes Zemiscas ; leading to the loss of Palestine, which returned to the dominion of Egypt. He was succeeded by the brothers Basilus II. and Constantinus IX., joint rulers of the Byzantine empire.

"The same year" (art de verif.), Moez succeeded by Aziz, of the Fatimite dynasty, second sultan of Egypt. A coin issued by Aziz — is figured in Marcel 103.

Citrus aurantium of Tropical Eastern Asia. Called in Britain *orange*, in Egypt "narindj," in Yemen "chommæsch" (Forsk.), in which we recognize the "narunj" whose bitter juice has been prescribed "from the tenth century" by Arab physicians — (Gallesio p. 122 and 247), and "naranj"

of Edrisi, Abd-allatif, and Ebn Baitar: the bitter variety was already cultivated "in Sicily in 1002," and was observed by the Crusaders in Palestine (A. Dec.); both the sweet and bitter varieties were observed by Forskal, and Delile, in Egypt; by Chaubard, in Greece; and are known to be abundantly cultivated throughout the Mediterranean countries. Farther South, *C. aurantium* was observed by Forskal under cultivation among the mountains of Yemen; but the fruit seen by Barthema in Yemen may have been imported from Egypt, as at the present day at Mocha: the oranges seen by Vasco de Gama in 1498 in Eastern Equatorial Africa were probably the same cultivated at present on Zanzibar, lemon-coloured and more acid than usual. Banians here being prohibited from eating oranges, the fact may help to explain the non-cultivation of *C. aurantium* in Hindustan, where I found only the imported fruit from Zanzibar. Farther East, *C. aurantium* is enumerated by Mason v. p. 452 as "exotic" in Burmah and called "lieng-mau," its fruit "quite abundant" but of inferior quality; is probably the species with petioles almost always winged and fruit "acido-dulcis" observed by Loureiro "cultu inculaque" in Cochinchina and China, for *C. aurantium* I was assured by Mr. Williams grows wild in Southern China: throughout the Malayan archipelago, was observed by myself only at Manila, a small quantity of the fruit in market, clearly the species described by Blanco as having the flesh adhering to the rind and pleasantly acid. By European colonists, was carried to Madeira, where it was observed by Cadamosto in 1454; to the West Indies, where it became naturalized in the lifetime of Oviedo, and has extended throughout Florida; to Brazil, where I met with both the bitter and sweet varieties; and to the Tahitian, Hawaiian, Samoan, and Feejeean groups, the sweet variety only as verified by myself. (See *C. Sinensis*.)

In this year (= 925 + "50 years reign" of the Mahavams. LX.), Mahaloo Wijayaba succeeded by Wickramabahoo, now king of Ceylon.

"In this year (= 365 A. H. of Ferisht., Elph.), Alptegin succeeded by his son Isakh; who, proceeding with Sebektegin to Bokhara, was appointed by Mansur governor of Ghazni, and Sebektegin his deputy.

"976 A. D. = 'tai-ping-hing-koue,' 1st year of Tai-tsoung III., of the Soung" or Twenty-first dynasty — (Chinese chron. table).

Hunahpu, third king of Guatemala, may have been at this time reigning — (art de verif. contin.).

Theobroma cacao of Eastern Equatorial America. The *chocolate* tree wild in the forest along the Oronoco and Amazons, and the use of its nuts discovered in the reign of Hunahpu* — (art de verif. contin.): under the Mexican emperors the "cacari" was much cultivated and "chocolatl" made from its nuts, which were used besides for money (Hernand. iii. 46, and Humb. iv. 10): on the coast of Honduras, nuts in the hands of natives in a canoe were found by Columbus to be highly prized (F. Columb. 89). The living tree, described by Lopez de Gomara (Spreng), was quickly introduced by the colonists into the West Indies, where it was observed by Sloane ii. pl. 160. and Catesby iii. pl. 6: by Pedro Bravo de Lagunas, was carried in 1670 from Acapulco to the Philippines, a single stock from which most of the trees now so abundant have been derived (Blanco); thence to Burmah (Mason); to Hindustan (Wight, and Graham), where according to Drury it "has been long introduced."

Vanilla aromatica of Central America. A climbing Orchideous epiphyte called in Mexican "tlilxochitl" (), and its product *vanilla* used perhaps from the beginning in making chocolate: — "vinelloes" with which chocolate is perfumed, were seen by Dampier on the coast of Honduras. By European colonists, was carried to the West Indies, observed there by Catesby iii. pl. 7, and Swartz; to Burmah (Mason); to Egypt, where according to Clot-Bey it is successfully cultivated. Transported to Europe, is described by Plukenet, and is termed "v. mexicana" by Miller (Steud.).

"The same year" (Lubke and Lutrow), at Venice, the church of San Marco injured or destroyed by fire. — The walls of the present edifice were completed "in 1043;" and the building consecrated "in 1085;" but "the decorations of the round hills, with Gothic flowers," and "the finials of the tabernacle," were added in the "Fourteenth century."

"In or about this year (= 366 A. H. comm. Aug. 29th," Gildem.), Ebn Haukal writing his geographical work. He mentions Heathen tribes continuing in Sind; Bodhites, the Mund a pastoral

* *Gossypium Jamaicense*, *G. purpurascens*, and *G. oligospermum* of the West Indies and neighbouring portion of Tropical America. The use of *cotton* for spinning and weaving also discovered in the reign of Hunahpu — (art de verif. contin.): Columbus landing on Cuba found cotton spun and woven by the natives, from plants that "are not set, but grow naturally about the fields like roses" (F. Columb. 28 to 47); the wild cotton of Hayti is described by Oviedo as very abundant, forming an article of export to Spain; cotton growing wild in Northern Mexico is mentioned by Vasquez (Sloane ii. 69); and the above three species were observed by Macfadyen i. 72 wild on Jamaica and not cultivated (A. Dec.).

tribe, and the Hindu people called Zuth. The Muslims now having mosques throughout Guzerat as far as Cambay; a Muslim prefect, appointed over them by Balhara; and at Cambay, Camuhul, Sindan and Saimur, Muslim courts of justice.

"977 A. D." (Blair), the Bohemians subdued by the emperor Otho II.

"In this year (= 367 A. H." of Ferisht., Elph.), Isakh succeeded by Sebektegin, now third sultan of Ghazni. He was attacked by Jeipal Hindu king of Lahore, — who was twice defeated at Laghman, and the Ghazni dominions were extended to the main river Indus at Peshawer. Hamid Khan Lodi, Muslim ruler of Laghman and Multan, tending his submission (Elph. v. 3).

"978, March 18th" (Nicol), Edward II. succeeded by Ethelred II., fourteenth Anglo-Saxon king of England.

About this time ("960 to 1000" Krapf trav.), Keelwah on the coast of East Africa founded by Arabs.

Eltamimi at this time writing. — He died in 980 (= "370 Hej" of Ebn Abi Osaib., Soyout., and Sonth.).

Cheiranthus cheiri of the cliffs of the Mediterranean. The "khiri" of Eltamimi i. p. 443. — Elgafaki, and Ebn Baitar, is referred here by Stapel and others: *C. cheiri* was observed by Sibthorp, Chaubard, and Fraas, on rocks and walls in Southern Greece and on the Greek islands. Westward, is known to grow on walls in Spain (Pers.); and according to Prior, was "introduced from Spain" into England "as a 'wall stock-gillifer,' which became successively *wall gilliflower* and *wall-flower*;" is described by Brunswyck (Spreng.), Dodoens, and Gerarde; is termed "*leucoium luteum vulgare*" by Tournefort inst. 221; and in journeying through Europe, was observed by myself chiefly abounding in England, and clearly a genuine cliff plant that originated in some country containing mural precipices. By European colonists, was carried to Northeast America, where it continues to be cultivated for ornament; and to Hindustan, where it was observed by Graham "in gardens" around Bombay.

Balanites Aegyptiaca of the Southern border of the Sahara from the Atlantic to Hindustan. The "zakkum el achar" described by Eltamimi as a tree growing in ravines of the mountains of Persia and supposed there to be the *myrobalanus chebula*, transported into Syria and cultivated, the nuts yielding an oil of wonderful properties, — and by Ebn Baitar as a thorny tree, may be compared: *B. Aegyptiaca* was observed by Alpinus p. 20 and 205 in a garden at Cairo, a single tree described by Vesling as "*myrobalanus el-chabul*," named to Delile "sagar el-kably," but which according to Figari, and Lloyd, has since disappeared. Farther up the Nile, was observed by Delile at Siout; by Vansleb at Esneh; by Lepsius eg. and sin. p. 217, in Upper Nubia; by Cailliaud, from Sennaar to Fazoglo; and Westward, by Lippi in the Oasis El-wah, and by Adanson fam. plant. ii. p. 508 in Senegal. Eastward, the trees seen by Browne within the city of Cobbe in Dar Fur came from Arabia, and the "halelj" of Southern Arabia is described by Forskal p. xcvi. and 197 as having sweet edible fruit, the wood tough and hard, much used for household utensils: *B. Aegyptiaca* is known to grow also in the more arid portion of Hindustan, in Goozerat, the "Deccan plains and Candesh," being "one of the few trees which flourishes on black soil," and is called "hingenbet" (Roxb., Royle, Gibs., and Graham). By European colonists, probably through the medium of transported negroes, was carried to the West Indies, where trees were seen by Poiteau on Hayti.

Colchicum Illyricum of . . . Called in Persian "us-abai-hoormuz" (Irvine mat. med. patn., and J. F. Wats. index), in which we recognize the "*asabia Hermes*" identified by Ebn Baitar with the "*schanbalid*" of the Persians and Eltamimi: — *C. Illyricum* is . . .

"979 A. D." (= 927 + cycle of 52 years, Clavig. ii.), accession of Xicotztlzin, Toltec queen of Mexico.

Opuntia ficus-Indica of the West Indies. The large *prickly-pear* or "tunas" known there from early times,* — mentioned by Oviedo nat. hist. 80 and gen. hist. viii. pl. 25, together with the peculiar

* *Comocladia dentata* of the West Indies. A Terebinthoid tree called on Cuba and Hayti "guao" (Lindl.); and from early times, death believed to be the penalty for sleeping in its shade: — observed by Jacquin am. xiii. pl. 173 in the West Indies, its milky juice on exposure turning black, and indelibly staining linen or the skin (Lindl.).

Chrysobalanus icaco of the wooded shores of Tropical America. The *coco-plum* or "hicacos" long known in the West Indies; — observed there by Oviedo gen. hist. viii. 9, Plumier pl. 158, P. Browne, Catesby, and Jacquin am. pl. 94, by Marcgraf as far as Brazil; known to grow also along the seashore on the Pacific side of the Isthmus (Benth. bot. Sulph.). From being maritime may have reached the African shore without human intervention, but was probably carried there on account of its edible fruit, and occurs naturalized only from Senegal to the mouth of the Congo, is called by the French "*prune d'Amérique*" (Perrottet fl. Sen., and A. Dec.). By European colonists has recently been introduced into Hindustan (Graham).

effect produced by its edible fruit; was observed also in the West Indies by Sloane, by Jacquin, used to fortify a town (Pers.). Transported to Europe, was seen by Oviedo in a garden in Italy, and according to Matthioli was brought within his own recollection from the West Indies; was known to Dodoens, Lobel, and Bauhin, only under cultivation (A. Dec.), but has since become naturalized on the Canaries and throughout the Mediterranean countries, and in Egypt the Aitian name is retained in "tin Franj" fig of Europeans (Forsk., and Del.). Possibly by Polynesians, was carried Westward to the Hawaiian Islands, where it has been established long enough to be regarded by the natives as indigenous. Clearly by European colonists, was carried farther across the Pacific to the Philippines, where it is called in Tagalo "sandocsandoc" or "dilang baca" (Blanco); to Burmah, called there "ka-la-zoung" (Mason); to Hindustan, observed by Roxburgh, and Wight, by Graham "commonly used as a hedge plant" on the Deccan, by myself forming thickets there and completely naturalized.

Cephaelis ipecacuanha of the West Indies and neighbouring portion of South America. Coffeaceous and suffruticose, yielding the drug *ipecacuanha* (Lindl.): the "gioia" mingled by the Aitians with another herb as an emetic*—(Columb. and F. Roman Pane 16) may be compared: *C. ipecacuanha* was observed by Martius in the woods of Brazil, is known to grow on the mountains of New Granada (Lindl.), and was observed by Tussac in the West Indies (Steud.). The drug *ipecacuanha*, known in Europe from nearly the middle of the Seventeenth century (Spreng.), was found by Forskal mat. med. imported by the way of Europe into Egypt. (See *Ionidium ipecacuanha*.)

"980 A. D." (Blair), Apulia and Calabria recovered by the Byzantine emperors.

"In this year" (Velasco, and Markh. edit. G. de la Vega ii. p. 347), the Caras, ascending the river Esmaraldas in balsas,† defeat the Quitus and take possession of their country. Their religion was that of the Sun and Moon,—and "they built a temple of the Sun on a height near Quito, now called Panecillo."

981, "June (= 372 Hej.," Sylv. de Sacy, and Sonth.), Soliman Ben Hassam Ebn Joljol writing at Cordova.

Senecio squalidus of the Egyptian Desert. Called in Egypt "korræjr" or "korreis," in which

* *Geophila reniformis* of Tropical America. A small creeping Coffeaceous herb, possibly one of the plants in question:—observed by P. Browne 161, and Jacquin am. pl. 46, in moist shady places in the West Indies (Pers.); by Humboldt and Bonpland on the Oronoco, and known to grow in Brazil, "its root emetic, used as a substitute for *ipecacuanha*" (Lindl.). By Polynesians, was carried Westward to the islands of the Pacific, observed by myself completely naturalized on the Hawaiian Islands, seemingly wild in deep woods on Tahiti, naturalized on the Samoan Islands occurring on Savaii only in pathways leading to the Interior forest, naturalized also on the Feejeean Islands, and on the Philippines on mount Banajao. Farther West, was observed by Rheede pl. 21 in Malabar; by Roxburgh, and Wight, in other parts of Hindustan; and by Nimmo in the "S. Concan," nearly as far as Bombay (Graham).

Lucuma mammosa of the Upper Oronoco. Called by French and English colonists *mammei-sapote*, by Spanish "sapote" (A. Dec.), and its edible fruit known from early times:—observed by Sloane ii. 125 on Jamaica, apparently only under cultivation; by Jacquin am. 57 on other West India Islands and at Carthage, and termed by him "a sapota major;" by Maycock 146, on Barbadoes; but by Humboldt and Bonpland iii. 240, wild in the forest at the missions on the Oronoco. By European colonists, was carried Westward across the Pacific to the Philippines, where it is called in Tagalo "mamei" (Blanco 238).

Sapota achras of the West Indies and neighbouring portion of Tropical America. The *sapodilla*, called by French colonists "sapotier" or "sapodiller," by Spanish "zapota" or "zapotilla" (A. Dec.), long known in the West Indies:—observed by Sloane ii. 172 to all appearance wild on an island near Campeachy and on Jamaica; by P. Browne ii. pl. 19, also on Jamaica; by Jacquin am. 59, and Humboldt and Bonpland iii. 239, wild in the forests of Venezuela. By European colonists, was carried to the Mauritius Islands (Boj.); to Hindustan (Roxb., and Wall. 4148), called at Bombay "kowut" (Graham); to Burmah (Mason); and to Java (Hassk. 463).

Coccoloba uvifera of the shores of the West Indies and neighbouring portion of Tropical America. A small tree called *seaside-grape*, and its fruit known from early times: the "guiabara"—is described by Oviedo gen. hist. viii. pl. 13: *C. uvifera* was observed by Sloane ii. pl. 220, Catesby ii. pl. 96, and Jacquin am. pl. 73, in the West Indies, its fruit eatable and commonly sold in market, but not much esteemed (Lindl.). From transported specimens, described by Lobel ii. 195.

† *Arundinaria* sp. of Tropical America. These balsas were of course made of the "caña de Guayaquil," a *bamboo*—afterwards sent by order of the Incas to all the rivers and lakes of Peru for the purpose of making balsas, the best kind always coming "from the province of Quito" (G. de la Veg. iii. 16).

we recognize the "kurras" or "anjurat" of Ebn Joljol, — and the "korrais" or "anjurat" of Ebn Baitar. *S. squalidus* was observed by Forskal, and Delile, frequent in the Desert bordering Lower Egypt. Westward, is known to occur as a weed in Sicily and Southern Europe (Boccon. sic. pl. 41. Barrel. pl. 262, and Pers.); and though unknown in the intervening country, was already in Britain in the days of Dillenius, and has become naturalized there (A. Dec.).

"983 A. D." (Nicol., see also Alst.), Otto II. succeeded by his son Otto or Otho III., at the age of "ten" years third emperor of Germany and Italy.

"The same year" (Rafn), from Iceland sailing in search of the land seen a century previously by Gunnbjorn, Erikus Rufus found an extensive coast, which he named Greenland. After examining it, — and passing two winters there, in the third summer he returned to Iceland.

Chilian civilization as early probably as this date.

Acacia (Vachellia) Farnesiana of Chili. Arborescent and called in Chilian "caven" * — (Molina); observed by myself clearly indigenous, dotting the open country along and upon the basal portion of the Andes. Raised in Europe "in 1611" from seeds received from Hayti (Tob. Aldin. hort. farngs. 3), described also by Hyacinthus Ambrosinius, Parkinson, and Plukenet pl. 73; observed by Forskal, and Chaubard, in the gardens of the Peloponnesus and Rhodes, and by the Turks called "mis-setsjæ;" by Hasselquist, Forskal, and Delile, in the gardens of Egypt and called "fetneh;" was carried also to Western Equatorial Africa (Benth. fl. nigr.) ; and from Buenos Ayres to Louisiana (A. Dec.), continuing planted as far North as Charleston. By European colonists also, was carried to Tahiti (observed there by myself), and Westward across the Pacific to the Philippines, where it has become frequent and is called in Tagalo "aroma" (Blanco); to Timor (Descne); to Java (Hassk., and Zoll.); to Burmah, observed by Mason "exotic" and called "nan-lung-kyeing;" to Hindustan, called in Sanscrit "urimeda" or "vitkhira," in Bengalee "gooya-babula," in Telinga "kustoori" or "piktoome" (Roxb. and Lindl.) or "piyi-tumma" or "kampu-tumma" or "naga-tumma," in Tamil "piy-velam," in Malabar "pivelam" (Drur.), observed by Graham "very common in the Eastern parts of the Deccan," by myself both under cultivation and naturalized; yielding according to Wight, and Drury, "a considerable quantity of useful gum," and the flowers distilled "a delicious perfume."

Solanum tuberosum of Southern Chili. The *potato*, called in Peru "papas" (Ciez., Carate, Gomara, Barcia, and myself), growing wild in Southern Chili and collected for food by the natives (Cl. Gay): carried thence, becoming an object of cultivation † in Northern Chili — and Peru "in the

* *Dolichos funarius* of Chili. Climbing, called in Chilian "cogul" (Molin.), and doubtless from early times used for cordage, — as witnessed by Molina among the colonists.

Quillaia smegmadermos of Chili. A Rosaceous tree called in Chilian "quillai" from "quillcan" to wash (Molin.), its bark therefore from early times used as a substitute for soap: — observed by Frezier i. 206, and Molina; by myself, frequent from the coast throughout the basal portion of the Andes, and its bark exported in large quantities.

Cestrum parqui of Chili. A large many-stemmed shrub called in Chilian "parqui" or "palqui" (Molin.), and from early times its wood considered the best for procuring fire by turning a rod rapidly; also employed medicinally: — observed by Feuillée, and Molina; by myself, frequent at the outlet of valleys near the sea-level; described also by Ruiz and Pavon ii. pl. 32.

Ocimum? salinum of Chili. Its round articulate stem covered every morning with saline globules, doubtless from early times collected and used for salt, — as witnessed by Molina among the colonists.

Aristotelia macqui of Chili. A large shrub called in Chilian "maqui," its berries eaten and a drink prepared from them (Molin.) doubtless from early times: — observed by Molina; by myself, frequent in Lower Chili; described also in fl. peruv. 125 (Pers.).

† *Solanum cari* of Chili. A distinct species of *potato* from early times cultivated in Chili, — described by Molina, but according to Humboldt iv. 9 remaining unknown as far North as Quito, as well as in Mexico and Europe.

Heracleum tuberosum of Chili. Known from early times, — and enumerated by Molina among useful plants.

Luma sp. of Chili. Large Myrtaceous shrubs, one or more species called in Chilian "luma" (Molin.), and from early times a sort of wine made of the berries: — observed by Molina; by myself, several species some of them arborescent frequent in Lower Chili.

Lucuma Vulparadisica of Chili. One of the three wild species called in Chilian "lucuma" (Molin.), and probably from early times: — observed by Molina (Steud.); by myself in a steep mountain-ravine facing the sea about three miles South of Valparaiso.

Lucuma bifera, *turbinata*, and *spinosa*, all of Chili. Also called in Chilian "lucuma" (Molin.), known from early times and one of them cultivated: — observed by Molina (Steud.).

Adenostemum nitidum of Chili. A large Sapotaceous tree, its delicious fruit known from early

time of the Incas" (Garc. de la Vega): the "papa" is mentioned in a Quichua prayer (preserved by C. de Molina edit. Markh. 30); and was cultivated as far North as the Bogotan Andes, but to the time of the Montezumas had not reached Mexico (Hernand. iii. 15, and Humb. iv. 9). Transported to Europe, *S. tuberosum* is described by Lobel nov. stirp. 317, Gerarde, Clusius, and C. Bauhin, its

times:—termed "lucuma keale" by Molina 202 as observed by him wild in groves, "gomortega nitida" by Ruiz and Pavon 108 (Pers., and Steud.).

Peumus Dombeyi of Chili. A Lauraceous tree called in Chilean "peumo" (Molin.), and its fruit eaten from early times:—observed by Dombey (Steud.), and Molina; by myself, frequent from the coast to the Andes, and its fruit brought to market in large quantities.

Temus moschata of Chili. Called in Chilean "temo" (Mol.), and known from early times:—its seeds according to Molina may be used for coffee.

Sisyrinchium bulbosum of Chili. Violet-flowered, called in Chilean "illmu" (Molin.), and from early times its bulbs cooked and eaten,—exquisite in taste according to Molina; observed also by Feuillée iv. 8.

Alstroemeria ligtu of Chili and the mountains of Peru. Called in Peru "liutu" (Pers.), in Chili "utata" (Mol.), and from early times farina obtained from its bulbous root,—suitable for invalids according to Molina; observed also by Feuillée, and known to grow from Concepcion to the environs of Lima (Ruiz and Pav. 59, Tew obs. ii. pl. 4, and Pers.).

Alstroemeria haemantha of Chili or Peru. Known from early times and farina also obtained from its root — (Ruiz and Pav. 60, and Pers.).

Alstroemeria revoluta of Chili. Growing in the Chilean province of Rere, and from early times farina obtained from its root — (Ruiz and Pav. iii. 59, and Pers.).

Alstroemeria versicolor of Chili. Growing with the preceding, and from early times farina obtained from its root — (Ruiz and Pav., and Pers.).

Rubia Chilensis of Chili. Dyeing with indigenous plants practised from time immemorial in Chili, and this species of *madder* called "relbun" and used to dye red — (Molin.); observed also by Feuillée pl. 45; by myself, frequent in the environs of Valparaiso, its berries orange-coloured.

Sassia tinctoria of Chili. Called in Chilean "sassia" (Molin.), and from early times its flowers used to dye purple:—observed by Molina (Steud.).

Eupatorium Chilense of Chili. Annual, used from early times to dye yellow, — and by colonists called "contra yerba" (Molin.); observed also by Feuillée.

Santolina tinctoria of Chili. Called in Chilean "poquel" (Molin.), and from early times used to dye yellow:—observed also by Feuillée pl. 45.

Coriaria ruscifolia of Chili. A shrub called in Chilean "deu" (Molin.), and from early times its bark and leaves used to dye black:—observed by Molina; by Brackenridge, in the "sands of the seashore" within a few miles of Valparaiso; by Feuillée iii. pl. 12, as far as Peru (Pers.).

Lonicera? corymbosa of Chili. A shrub called in Chilean "uthiu" (Molin.), and from early times its bark and leaves used to dye black:—observed by Molina. From transported specimens, termed "loranthus corymbosus" by Lamarck (Steud.).

Baccharis? sp. of Chili. Called in Chilean "thilco" (Molin.), being the third shrub with leaves and bark used from early times to dye black:—observed by Molina.

Gunnera scabra of Chili. A large Rheum-leaved herb called in Chilean "panke" (Molin.), and from early times its root used to dye black:—observed by Feuillée ii. 742, and Molina; by myself, at the outlet of valleys near the sea-level.

Poinciana? spinosa of Chili. Called in Chilean "jaru," known from early times, — and its berries furnishing ink (Molin.); observed also by Feuillée.

Pseudocacia fol. mucr. of Chili. Called in Chilean "mayu," known from early times, — and its juice furnishing ink (Molin.); observed also by Feuillée.

Lithræa Chilensis of Chili. A large shrub called in Chilean "lithi" (Molin.), allied to and resembling *Rhus cotinus* and its contact causing pustules:—observed by Molina; by myself, frequent on the basal portion of the Andes.

Maytenus Chilensis of Chili. A small and graceful Celastroid tree called in Chilean "mayten" (Molin.), and from early times a decoction of its young branches used to wash swellings produced by the *Lithræa*:—observed by Feuillée iii. pl. 27, and Molina; by myself, here and there in the Interior.

Ionidium maytensillo of Chili. Violoid, and from early times highly esteemed as a purgative:—observed by Feuillée fl. chil. iii. pl. 28. "I. parviflorum" of Linnæus, and Ventenat 27, is referred here by Hooker (Lindl.).

Linum aquilinum of Chili. Yellow-flowered, called in Chilean "retamilla" (Molin.), and from

cultivation extending so slowly as only recently to have reached Greece (Chaub.) and Egypt (Clot-Bey); roots "imported from Hindustan" were seen by myself at Muscat, Mocha, and Zanzibar, and the plant under cultivation at the last-named locality; observed also by myself cultivated on New Zealand by the natives; and in Northwest America, forming the Commencement of Agriculture among the Chinooks.

"984 A. D." (Alst., and Nicol.), at Rome, Benedictus VII. succeeded by Joannes XV., seventy-third archbishop.

"985 A. D. (= 1645th of Synmu," art de verif.). Jen-wo succeeded by Quassan, eldest son of Ren-sei, and now daïro of Japan.

"The same year" (Alst., and Nicol.), at Rome, Joannes XV. succeeded by Joannes XVI., seventy-fourth archbishop.

"986 A. D." (Rafn), a colony from Iceland led into Greenland by Erikus Rufus, and a settlement formed on the "Southwestern shore." Later in the summer, Bjarnius sailing for Greenland, was driven by adverse winds far Westward, and saw land, covered with woods, and here and there low hills (Newfoundland). Leaving this to the larboard, at the end of "a day and night" he saw another land, "flat and covered with trees" (Labrador?). He continued thence "three" half days' sail to a high and mountainous land covered with glaciers; and "two days and two nights" afterwards, reached his destination in Greenland.

A portion of the constructions at Pachacamac ("pacha" world and "camac" creator), and many huacas or burial-mounds in Lower Peru, older according to "some old writers" than the time of the Incas: * — the oracle and temple were captured by the inca Pachacutec, and a considerable portion of the city was in ruins when visited by Hernando Pizarro (Ciez., and Markham edit. p. 255).

early times used medicinally: — observed by Feuillée ii. pl. 22, and Molina; by myself, frequent in the open country.

Polygala clinclin of Chili. Called in Chilian "clinclin" (Molin.), and from early times used medicinally: — termed "polygala coerulea ang." by Feuillée (Molin.).

Mimosa balsamica of Chili. Called in Chilian "jarilla" (Molin.), and from early times used medicinally: — observed by Molina.

Gnathaliun viravira of Chili. Called in Chilian "viravira" (Molin.), and from early times used medicinally: — observed by Frezier i. 205, and Molina.

Senecio nilgue of Chili. Called in Chilian "nilgue" (Molin.), and from early times used medicinally: — termed "jacobæa leucanthemi vulg. fol." by Feuillée (Molin.).

Solidago diuca of Chili. Called in Chilian "diuca-lahuen" (Molin.), and from early times used medicinally: — termed "virga aurea leucoe. fol." by Feuillée (Molin.); and possibly the species observed by myself from the coast to the middle mountain-region of the Andes.

Erythraea Chilensis of Chili. Annual, called in Chilian "cachanlahuen" (Molin.), and from early times used medicinally: — described in mem. Acad. 1707; observed also by Feuillée ii. pl. 35. and Molina.

Pleghorhiza guaicura of Chili. Called in Chilian "guaicura" (Molin.), and from early times its root used medicinally: — observed by Molina.

Verbena erinoides of Chili. Prostrate and multicaul, called in Chilian "sandia-lahuen" (Molin.), and from early times used medicinally: — termed "lichnidea verbenæ tenuifolia" by Feuillée iii. pl. 25 (Molin.); described also by Ruiz and Pavon i. pl. 33. From transported specimens, termed "erinus laciniatus" by Linnæus.

Quinchamalium Chilense of Chili. A small Thesioid plant called in Chilian "quinchamali" (Molin.), and from early times used medicinally: — observed by Frezier i. 135. and Molina; by myself, frequent throughout the open country to the middle mountain-region of the Andes. "Q. procumbens" of Ruiz and Pavon ii. pl. 107, probably not distinct, was observed by myself on the basal portion of the Peruvian Andes.

Herniaria payco of Chili. Called in Chilian "payco" (Molin.), and from early times used medicinally: — observed by Frezier i. 205. and Molina.

Collignaja ? of Chili. Called in Chilian "pichoa" (Molin.), and from early times used medicinally: — termed "tithymal. fol. trinerv." by Feuillée (Molin.).

Bromus ? *catharticus* of Chili. Called in Chilian "guilno" (Molin.), and from early times used medicinally: — termed "gramen bromoides cathart." by Feuillée, as seen at Lima (Pers.); but was observed by Molina in Chili; by myself, a Bromus-like grass with compressed spikelets in the environs of Valparaiso.

* *Lucuma obovata* of Western Peru. A Sapotoid tree called in Peru "lucuma" (C. P.); in which we recognize the luxurious "lucma" fruit of a legend of the Yuncas of the Lurin valley — (Avila 125): the "leucoma" is described in a letter to Monardes 3; was observed in Peru by J. Acosta, Feuillée,

"987, July 3d" (Blair, and Nicol.), Louis V. succeeded by Hugh Capet, head of the Capetian or Third dynasty of French kings.

"The same year" (ann. Jap., and art de verif.), abdication of Quassan, who retired to the monastery of Quamsi, adopted the costume of a bonze or priest, and took the name of Nigugakf. He was succeeded by his cousin Itsi-dsio or Yets-sio, now sixty-sixth daio of Japan:—and who patronized literature, and attracted many learned men to his court.

988 A. D. (= 975 + 13 years of twelve lunations) = "14th year of Aziz," in an Arabic inscription at the *gold* mines of Gebel Ellaka in the Ababdeh Desert (Wilk. theb. and eg. p. 416).

"The same year" (Nicol.), a synod at Llandaff. Arthmail king of Wales was "condemned to do penance for having slain his brother."

About this time (= "a little more than eight hundred years" before 1804. tradit., and Colebrooke as. res. viii. p. 467), Sancara or Sancar'acharya expounding the Vedas.

"990 A. D. = 1st year of the 'tchun-hoa' of Tai-tsoung III." (Chinese chron. table). "In the time of Chun-hoa" (topog. Cant., and Pauth. 473), the foreign agent at Canton receiving from the Chinese "*metals, silk, gold, etc.*," gave in return "*rhinoceros, horns, elephants' teeth, coral, pearls, precious stones, crystal, foreign stuffs or cloth, paper, red-wood, drugs, etc.*" At the capital, a tribunal of revenues established.

"In the Tenth century" (Storch, and Pouchet), the Russians had extended their commerce as far South as Constantinople.

"Towards the end of the century" (Talvi ii. 1), Christianity introduced into Russia through the influence of king Vladimir; who also founded the first schools there.

"993 A. D." (Nicol.), a synod at Latran in Rome. Udalric bishop of Augsburg declared a saint: the first act of *canonization* on record.

"In this year (= 383 A. H." of Ferisht., Elph.), Noah or Noh, seventh Samani king, driven from Bokhara across the Oxus by the Tartars under Bogra Khan; whose sickness retreat and death enabled Noah to recover his throne.

"994 A. D." (see Samuel Aniëns., and his editor), end of the chronicle of Stephanus Asolnichius of Armenia.

"995 A. D. = 1st year of the 'tchi-tao' of Tai-tsoung III." — (Chinese chron. table).

"The same year" (Alst.), at Rome, Joannes XVI. succeeded by Joannes XVII., seventy-fifth archbishop.

"996 A. D." (Alst., and Nicol.), at Rome, Joannes XVII. succeeded by Gregorius V., seventy-sixth archbishop.

and Ruiz and Pavon iii. pl. 239; its fruit by myself in market at Lima, solid in consistence, and so rich-flavoured and sweet that a small quantity suffices; the tree I was assured by Mr. Matthews is "native in ravines to the Northward." Is probably one of the two species cultivated according to Molina by the natives of Chili.

Prosopis dulcis of Peru. A Leguminous tree called "pacai:" its pods exhumed in the cemetery at Pachacamac,—great quantities observed also in the market at Lima, and the tree in gardens: the "pacay" was observed in Peru by J. Acosta, Feuillée ii. pl. 19, and is termed *P. dulcis* by Humboldt and Bonpland. By European colonists, was carried to the Tahitian Islands, a single young stock observed by myself on Aimeo.

Gossypium Peruvianum of Western Peru. The art of weaving *cotton* cloth known in Peru as early at least as this date: remnants of different degrees of fineness observed by myself in the ancient cemetery at Pachacamac, together with accompanying tufts of the wool, belonging to a free-seeded species:—a *Gossypium* was observed by myself about half-way to the Andes, a single small tree about fifteen feet high, its five-lobed leaves pubescent beneath. *G. Peruvianum* is described by Cavanilles vi. pl. 168 (Pers.).

Plumieria purpurea and *P. incarnata* of Lower Peru. Arborescent shrubs called "suchi" (Markh.), from early times cultivated for their flowers and fragrance:—observed by Ruiz and Pavon ii. pl. 137 and 138 in gardens in Peru; also by Markham p. xl.

Musa sapientum of Tropical America. The *plantain* called in Brazilian "paco" (Ler. 206), in Tamanaque "paruru," in Maypure "arata" (Humb. ii. 397), in Peru "arton" and cultivated there in the time of the Incas (Garcil. de la Vega i. 282); leaves also found in the huacas — (Stevenson. i. 320, and A. Dec.); and fruit offered to Pizarro on his arrival at Tumbez (early ms. quoted by Prescott): "plantans" were seen by De Soto in 1538 on Cuba: and the "plane" by J. Acosta in the neighbouring countries as far as Peru: plantains have been observed by myself only in Peru, much longer and of coarser substance than any varieties of the banana, but the plant producing them was not met with.

"The same year" (Blair), the succession to the German empire made elective by Otto III.

"The same year" (art de verif.), Aziz succeeded by Hakem of the Fatimite dynasty, third sultan of Egypt. A gold coin issued by Hakem is figured in Marcel 104.

"In this year" (= 975 + "21 years reign" of Mahavams. lxiii.), Wicramabahoo succeeded by his son Parackramabahoo, now king of Ceylon.

"997 A. D. (= 387 A. H." of Ferisht., Elph.), Noah or Noh succeeded by Mansur II., eighth Samani king of Bactria.

"Within a month" (Ferisht., and Elph.), death of Sebektegin, ally and friend of Noah. After contests for "seven months," Mahmud obtained the government of Ghazni.

"998 A. D. = 'hian-ping,' 1st year of Tchín-tsoung, of the Soung" or Twenty-first dynasty (Chinese chron. table). Reprinting of the ancient books for distribution throughout the Empire, was ordered by the emperor Tchín-tsoung — (Pauth.).

"999 A. D." (Alst., and Nicol.), at Rome, Gregorius V. succeeded by Gerbert, under the name of Sylvester II. seventy-seventh archbishop. Gerbert was one of the first among Europeans to direct attention to the writings of the Arabs.

"In this year" (= 389 A. H." of Ferisht., Elph.), Mansur II. dethroned and blinded at Bokhara, through intrigues at court. Mahmud of Ghazni now ordered the name Samani to be left out of the public prayers, declared himself an independent sovereign, and receiving investiture from the khalif assumed the title of "sultan" (an old Arabic word for king).

"1000 A. D." (Alst. p. 216), in Hungary, Stephanus ruling as duke, made king. Regarded by Hungarians as the beginning of the Third dynasty.

"The same year" (Nicol.), Garcia III. succeeded by Sancho III. the Great, as king of Spain.

"The same year" (Rafn, Major gives "1001"), from Greenland sailing Westward in search of the land seen by Bjarne fourteen years previously, Leif son of Erikus Rufus reached the described flat land covered with trees, and named it "Markland" (i. e. Woodland). He thence continued on a day and night with the wind Northeast, to an island near the coast (Anticosti?). Here or in the neighbourhood, he wintered and called the country Vinland; * finding abundance of *salmon*, and cutting down trees to load his vessel. The days and nights were more equal than in Greenland, the shortest day consisting of eight hours (as understood by Thormodus Torfæus, and Wormkiold, placing the locality "in N. Lat. 49°").

"In this year = 927 an. jav." (Madura trad., Nita Kasum., and Raffles x.), death of Panji, and accession of Maisa Lalean as king of Java. Abandoning Jang'gala, Maisa Lalean established his seat of government at Koripan.

His brother Chamara Gading sailing with a party established himself on Celebes; and is supposed to be identical with Sawira Gading, the first prince of whom the Bugis accounts make mention.

One hundred and fifty-ninth generation. Jan. 1st, 1001, onward mostly beyond youth: the Persian poet Ferdusi: the Arab writers, Ebn Jounis (Pauth. 313). Al Biruni (d. after 1038): the Greek writer Leo grammaticus d. about 1013: Fulbertus, Burchardus, Berno Augiensis; Aimoin of Fleury.

"In this year" (= 391 A. H." of Ferisht., Elph.), third Muslim invasion of Hindustan. "Nov. 27th," Jeipal of Lahore defeated near Peshawer and taken prisoner by Sultan Mahmud: who continued his march across the Panjab to Batinda, which he captured and plundered, and returned with the spoils to Ghazni.

"1002 A. D." (Alst., and Nicol.), Otto III., after an interregnum of "four months," succeeded by Henricus II. Cludus, fourth emperor of Germany and Italy.

"Nov. 13th. Sunday" (Blair). general massacre of the Danes in England.

"The same year" (Rafn), sailing from Greenland Westward. Thorwald brother of Leif reached the wintering-place in Vinland (mouth of the St. Lawrence). — The following summer, in proceeding "occidentale terræ latus circumire, around the West side of the land," Thorwald found the sea "valde insulosum," full of islands (the Mingan Isles); and on an island far Westward, met with a "wooden

* *Vitis cordifolia* of Northeast America. The *winter grape* probably the species found in the new country by Tyrker, a German companion of Leif; — Adamus Bremensis some seventy years later speaks of a country "by the Danes" called "Winland, eo quod ibi vites sponte nascantur" (grapes growing spontaneously being unknown in Europe): a large island below Quebec was named by Jacques Cartier "Bacchus Island" from abounding in wild grapes (Forst. discov. North), fruit of *V. cordifolia* was observed by myself in the Quebec market, but beyond this island I could not find any *Vitis* on the Lower St. Lawrence, nor in New Brunswick, nor even in Nova Scotia. *V. cordifolia* was observed by Beck near Castleton, Vermont; by myself, along the Pemigewasset as far South as 43° 40', and planted near a dwelling on the Androscoggin; was received by Hooker from Lake Winnipeg Lat. 52.°

kornhjalmr" (corn-shed? for *maize*), but saw no other signs of inhabitants, nor of wild beasts. The next summer, 1004 A. D., he followed the Eastern shore and passed over to the land in the North, where, seeing three canoes, each containing three persons, he captured two of them and killed those on board (*Iroquois*?). He was attacked soon afterwards by the natives in a large number of canoes, and mortally wounded with an *arrow*.

The civilization of the Aymaras,* around the Southern extreme of Lake Titicaca, more ancient than the time of the Incas. They divided their year into "ten months"—(Ciez.): and their language, still in use, differs from the Quichua though having the same grammatical construction. The gospel of St. Luke was translated into Aymara and published by Pasoscanki, a native; and an Aymara grammar by P. Ludovico Bertonio "was published at Rome in 1608" (Markh. edit. p. xxxvi).

By the Peruvians, two quadrupeds reduced to the domestic state: the *lama* (Auchenia) for a beast of burden, and the *Guinea-pig* (*Cavia*); also one bird, *Anas moschata*.

The rats called "ucucha" abounding from early times at Panama and in the coast towns of Peru—(G. de la Vega ix. 22) doubtless the *black rat*, *Mus rattus*. This species, introduced by returning ships, had become naturalized in Europe and is described by Gesner, but is regarded by Linnæus, and Pallas, as an American animal; and by Bartram, and Bachman, as indigenous in Northeast America, occurring not only in the settlements, but among "the rocks of the Blue mountains remote from all human dwellings" (Kalm trav. ii. 47).

"In this year" (Wilford as. res. ix. 157, and Elph.), suicide of Chaitra-pala or Gepal or Jeipal, unsuccessful in battle against the Muslims under sultan Mahmud. He was succeeded by his son Mahendra-pala or Anang Pal, now tributary Hindu king at Lahore.—The raja of Batia, on the Southern side of Multan, refusing to pay his share of the tribute, was defeated by sultan Mahmud, and also committed suicide.

"1003 A. D." (Alst., and Nicol.), at Rome, Sylvester II. succeeded Joannes XVIII.; and before the close of the year, by a cardinal, now Joannes XIX. seventy-ninth archbishop.

"The same year" (Kufic inscript., and Wilk. theb. and eg. 299 and 547), building at Cairo of the mosque of Hakem; the arches all *pointed*. In a Kufic inscription over the door, Hakem is "treated as a prophet:" besides persecuting Christians, he founded a new religion;—being the Druse prophet of the sect so-named, now confined to Lebanon.

"1004 A. D. (= 395 A. H.) of Ferisht, Elph.), Abul Fatteh Lodi, Muslim ruler of Multan, having revolted and in alliance with Anang Pal and mountain tribes raised an army, defeated near Peshawar by sultan Mahmud. Multan was soon besieged, but after "seven days" its submission was accepted by Mahmud, called away by news of a Tartar invasion.

"In this year" (quart. rev. for 1870), Ælfric appointed abbot of Peterborough, — and in "1023," archbishop of York.

Scirpus maritimus of the seashore and Interior salines of Temperate Climates. Called in Britain *spurt-grass*, and made into *spyrTān* baskets, employed as appears from Ælfric coll. for catching fish — (Prior): *S. maritimus* is described by Bauhin hist. ii. 495 (Spreng.), and Tournefort inst. 527; was observed by Desfontaines in Barbary; by Brotero, in Portugal; and is known to grow along the Mediterranean and Atlantic as far as Sweden, also in wet places more or less saline in the Interior (fl. Dan., Lam. fl. fr., Fries, and A. Dec.). Eastward, was observed by Sibthorp, and Chaubard, from the Peloponnesus to Cyprus and Constantinople; by Forskal, in Egypt and called "depsjæ" (Del); is known to grow in the Tauro-Caspian countries (Bieb.) and in Siberia (Kunth). Farther East, is known to grow along the Pacific shore of North America and throughout Canada (Hook. fl. bor. ii. p. 230); was observed by Baldwin along the Lower Missouri (Torr.); is known to grow at the Salina salt-springs in New York (A. Gray); and on the Atlantic seashore from Lat. 43° to Florida (Mx., Pursh, Muhl., Ell., and Chapm.). In the Southern Hemisphere, is known to grow from Senegambia (Kunth) to Austral Africa (E. Mey.), Australia (R. Brown), and New Zealand (Raoul). By European colonists, may have been carried with the salt manufacture to the Hawaiian Islands, where it was observed by Beechey voy. p. 98.

Potamogeton lucens of Northern climates. With other species called in Britain *pondweed* or *greeds*, and the Anglo-Saxon *græð* translated *u l v a* in Ælfric's glossary — is referred to this tribe by Prior: *P. lucens* is termed "p. foliis latis splendentibus" by Tournefort inst. 233; was observed by Desfontaines in Barbary; and is known to grow on the Azores (Wats., and A. Dec.), and

* *Buddleia coriacea* of the country around Lake Titicaca. A stunted crooked tree called "ccolli" (Markh.), and known from early times: — observed by Markham p. xxxv one of the two trees "few and far between" on the bleak Collao table-land containing Lake Titicaca.

Baccharis sp. of the country around Lake Titicaca. A low shrub, from early times furnishing fuel: — observed by Markham "in some places on the Collao table-land."

throughout middle and Northern Europe as far as Sweden and Iceland (Pers., Hook., and Wats.). Eastward, was observed by Sibthorp from the Peloponnesus to Constantinople. Farther East, was observed by Drummond at Cumberland House Lat. 54° in central North America; and by myself along the Atlantic as far South as Lat. 42°

"1005 A. D." (Nicol.), a synod in Brandenburg. Against "unlawful marriages, selling Christians to the Gentiles, and violating the laws of justice."

"In or about this year" (Blair), a new *style of architecture* in rebuilding old churches.

"1006 A. D." (Blair), *pestilence*. Extending over all Europe, — and continuing "three" years.

"1007 A. D." (Rafn ant. am.), from Greenland with three ships and carrying cattle, Thorfinn Karlsefni reached the wintering-place in Vinland. Where were "hvalir reythr" (*fin-back whales*. Physalus, observed by myself in the Lower St. Lawrence, in deep places approaching the shore regardless of spectators). — After the first winter, the natives came in numbers, though frightened "by the voice of the bull," bringing for traffic skins of "martium" or *sables*, and various other kinds of furs. A battle with the natives ensued in the second winter; and at the end of "three" years, finding the place constantly exposed to attacks, Karlsefni abandoned the country and returned to Greenland.

Triticum (Agropyrum) repens of America? Called in Britain *quitch grass* in Anglo-Saxon "cwice" from "cwic" vivacious (Prior), by Lobel "quych gras" (. . .), in Greece "aira" (Sibth., compare Lolium), in Mongol "kia" (Klapr.): the "agros triticeos sponte satos" seen by Karlsefni on an excursion Southward * — (Rafn), or "champs de blé sauviage" the spike like rye and seed like oats seen by Jacques Cartier on Bryon Island and around Chaleur Bay, may be compared: *A. repens* has been observed by myself abounding and to all appearance indigenous along the salt marshes of Eastern New England, and clearly indigenous as found by Oakes on the Subalpine portion of the White mountains in 1826; but in general occurs as a troublesome weed throughout our Northern and Middle States, sometimes regularly cultivated for feeding cattle. Westward, this or an allied species was observed by myself filling much of the unwooded country of Interior Oregon: *A. repens* according to Klaproth mem. i. ♀ gave its name to the Siberian town and stream of Kiakhta or Kiaktou, abounding there and affording excellent feed for cattle; was observed by Forskal, Sibthorp, and Chaubard, from Constantinople to the Peloponnesus, frequent along roadsides and in cultivated ground. Farther West, figures in Matthioli 999. and Dodoens 345. are referred by Lobel to the "quych gras;" *A. repens* is distinctly described by C. Baubin pin. 1 (Willd.); is termed "gramen loliaceum radice repente sive gramen officinarum" by Tournefort inst. 516; is known to occur in waste and cultivated ground from Algeria and the Canary Islands throughout middle and Northern Europe as far as Lapland (Pers., Munby, Webb, and Wats.); and was observed by Hooker on Iceland. In Austral America, was observed by myself at the mouth of the Rio Negro in Patagonia, and clearly indigenous in Terra del Fuego; is known to grow also on the Falkland Islands (Brog. 1st voy. Astrol. 56, and J. D. Hook.): but seems unknown in other parts of the Southern Hemisphere (A. Dec.).

"In this year (= 4th of the 'king-tê' of the Soung dynasty," hist. Cor., and Klapr. note to geogr. Chin.), near Tan-lo or Quelpaerts Island, by a submarine volcanic eruption a new mountain raised out of the sea, more than a thousand feet in height.

* *Elymus Virginicus* of Northeast America. Sometimes called *wild rye* (A. Gray); and possibly the grass in question: — "some cares of wheate," also "barly" (*Hordeum jubatum*), and "rie growing there wilde," were seen by visitors to St. Luke's Bay in Nova Scotia in 1623: *E. Virginicus* has been observed by myself from Lat. 45° at Mount Desert to our Middle States, often in little beds along the seashore; by Elliott, at Sister's ferry on the Savannah river; by N. A. Ware, and Chapman, as far as Florida; by Short, in Kentucky; and by Nuttall, along the Red river. From transported specimens, is described by Linnaeus.

Betula papyracea of Northeast America. The *canoe birch*, a large tree, doubtless furnished the brooms of "mausur," wood brought by Karlsefni from Vinland: — Jacques Cartier entering the Straits of Belleisle met with natives in birch-bark canoes who had come from the Southward; and in the days of Gookin coll. 3, such canoes were occasionally seen as far South as Massachusetts Bay, sewed "with a kind of bark, and then smearing the places with turpentine;" water-buckets were also "of birch barks, artificially doubled up, that it hath four corners and a handle in the midst," and "several sorts of baskets great and small." *B. papyracea* was observed by Lapilaye from Lat. 51° in Newfoundland; by myself, frequent on the Lower St. Lawrence and in New Brunswick and the neighbouring portion of New England, but ceasing along the Atlantic in about 42°, and a little farther South on the mountains; westward, is known to grow as far as Wisconsin (A. Gray) and Lake Winnipeg (Long's exp. ii. 81), was observed by Drummond at Cumberland House Lat. 54°, and nearly to the Rocky mountains.

"1008, in the spring (= 399 A. H." of Ferisht., Elph.), fourth Muslim invasion of Hindustan. Anang Pal of Lahore and the assembled forces of Gwalior, Ujen, Ajmir, Calinjer, Canouj, and Delhi, defeated near Peshawar by sultan Mahmud: who continued his march to the Eastern portion of the Panjab, plundered the fortified temple of Nagarcot on the lower portion of the Himalayas, and with immense booty returned to Ghazni.

"From this year" (G. de Tassy i. 519), Gwalior in the province of Agra — governed by rajas or princes.

"In this year" (C. Mackenzie as. res. ix. 270), birth of Ramanuja, reformer of the Saiva doctrine and "the famous author of the Sri-bhashya." — He is invoked in a Jain inscription at Belligola dated in "A. D. 1367."

"1009 A. D." (Alst., and Nicol.), at Rome Joannes XIX. succeeded by Sergius IV., eightieth archbishop.

In manuscripts of this date (De Wailly vi. 3), *capital letters* used for beginning sentences.

"1011 A. D." (Elph.), fifth Muslim invasion of Hindustan. Crossing the Indus, Mahmud proceeded nearly as far as the waters of the Ganges, captured and plundered the temple and town of Tanesar, and returned with a multitude of captives to Ghazni before the Hindu princes could assemble to oppose him.

In this year (= 996 + "16th year of his reign," Mahavams. lxxv to lxxvii), a commotion in and about Matura subdued by king Parackramabahoo. — Pursuing the dhamila forces of king Kulesekara Pandya he conquered Soly or Coromandel, and returning to Ceylon, assembled a Buddhist council under the great priest Causypa or Kaxapa.

"1012 A. D." (Alst., and Nicol.), at Rome, Sergius IV. succeeded by Benedictus VIII., eighty-first archbishop.

"The same year" (ann. Jap., and art de verif.), Itsi-dsio succeeded by Sandusio or San-zio, second son of Ren-sei, and now sixty-seventh dairo of Japan.

"1013 A. D." (Blair, and Nicol.), Ethelred II. abdicating, his brother Swegn or Sueno II. king of Denmark proclaimed king of England. The Danes in this manner gaining possession of England.

"The same year" (Pauth. 337), by census in China, the number of persons engaged in agriculture ascertained to be "21,976,965; not including women, youths under twenty, magistrates, literati, *eunuchs*, the military, bonzes, nor mariners."

"1014, Feb. 3d" (Nicol.), death of Sueno II., and election by the fleet of his son Cnut or Canute II. as king of England. The throne was however resumed by Ethelred II.

"1016, April 23d" (Nicol.), Ethelred II. succeeded by Edmund II. Ironsides, fifteenth Anglo-Saxon king of England; and "Nov. 30th," by Canute II.; who besides inherited and extended his dominion over Denmark, Norway, and Sweden.

"1017 A. D. (= 408 A. H." of Ferisht., Elph.), sixth Muslim invasion of Hindustan. With a large army Mahmud of Ghazni kept near the mountains until he had crossed the Jamna affluent of the Ganges, when turning South he reached the great city of Canouj so unexpectedly that the Hindu king could make no resistance, and gave himself up. The city was spared, and the king restored; but on his way back, Mahmud plundered Matta, Munj, and other places.

"In this year" (ann. Jap., and art de verif.), Sandusio succeeded by Itsi-dsio II. or Go-itsi-dsio, younger son of Itsi-dsio I., and now at the age of nine dairo of Japan.

"1018 A. D." (Blair), first entrance of a body of Normans into Italy.

"1021 A. D." (art de verif.), Hakem succeeded by Daher of the Fatimite dynasty, fourth sultan of Egypt. A gold coin issued at Cairo by Daher, is figured in Marcel 105.

The same year (= "5th year of Itsi-dsio II.," art de verif.), permission granted to Sai-sin, a Japanese noble, to ride in a "khuruma" or covered chariot drawn by bullocks: the invention was soon adopted by all the court.

"In or about this year" (= 1062 — "30 to 40 years reign," G. de la Vega, Girolamo Benzoni f. 167, addit. art de verif., and Tschudi trav.), the city of Cuzco founded by the first Inca Manco Capac, who came with his companions from an island in Lake Titicaca. Bringing "the arts of government and society," Manco Capac peacefully acquired influence over the surrounding population, for "eight leagues" West, "nine" South, and Eastward as far as the river Paucar-tampu. The site of the city on the ridge of the Andes, and the plan, manifest ambition: a central intersection of streets leading North, South, East, and West by continuous roads to the bounds of the dominion.

At Cuzco on the hill Colcampata, Manco Capac built a palace. — subsequently occupied by Paullu son of Huayna Capac, and "the ruins" of which according to Markham p. 224 "are still very perfect."

The Inca policy, on conquering a country, was To extend the limits of cultivable soil by means

of channels of irrigation; so that larger crops of *maize*, "papas" (*potatoes*), and other esculents,* could be raised — (G. de la Vega v. 1).

"1022 A. D." (Nicol.), by a synod at Orleans, "thirteen Manichæans" condemned to be burned.

"The same year" (Blair), *music* of a new kind, "under six notes," invented by Aretinus (Guy d'Arezzo).

"At the time the first Incas were founding the city of Cuzco" (Ciez. lxxiv), incursion of the Yuncas of the Chinchá valley Eastward into the mountains. They are said to have done "much mischief in Soras and Lucanas" and to have advanced as far as the Collao table-land, returning with "great spoils." — But were conquered in the time of Tupac Yupanqui.

The use of *guano* as manure in Lower Peru from Arequipa to Tarapaca known from early times. The sea-birds producing it on islets along the coast — protected by laws issued by the Incas (Ciez. lxxv, and Garc. de la Vega ii. 5. 3). Frezier 152 in 1713 found guano exported from Iquique and other places along the coast to Arica and Ilo.

Gen. Cucurbitac. of Western Peru. The "pepino" cultivated in the Chinchá valley as early probably as this date: † — described by Cieza de Leon lxi to lxxiv as "one of the most singular fruits I ever saw," fragrant, "not like those of Spain although they bear some resemblance," "yellow when the peel is taken off, and so delicious that it is necessary to eat many:" by Tschudi 192, as grown in great abundance, creeping on the ground, its fruit cylindrical, four to five inches long and somewhat pointed at both ends, the husk yellowish-green with long rose-coloured stripes, the edible part solid juicy and well-flavoured but very indigestible. "*Momordica pedata*" observed by Feuillée i. pl. 41 in Peru, the fruit striate (Pers.), may be compared. Transported to the Mediterranean, "*M. pedata*" was seen by Delile in gardens at Cairo.

"In this year (= 413 A. H." of Ferisht., Elph.), on his way to assist the Hindu king of Canouj, Mahmud opposed by Jeipal II. of Lahore. The city and territory were now annexed to Ghazni, and a permanent *Muslim garrison* for the first time established East of the Indus.

"1023 A. D. = 'thian-ching,' 1st year of Jin-tsoong, of the Soung" or Twenty-first dynasty — (Chinese chron. table).

"The same year" (art de verif.), the "jeki" or plague committing great ravages in Japan.

* *Oxalis tuberosa* of Chili. A species of *wood-sorrel* having potato-like roots, and called in Chilian "oca" (Molin.), in the Collao "apilla" (Markh.); in which we recognize the "ocas," one of the esculents in question — according to G. de la Vega v. 1: *O. tuberosa* was observed also by Markham edit. ii. p. 359 under cultivation in the cold region of the Collao. Farther South, is regarded by Molina iii. 24 as properly a Chilian plant.

Oxalis crenata of the Peruvian Andes. An allied species, perhaps the "añus" in question, having a root differing in taste and which can only be eaten cooked — (G. de la Vega v. 1): *O. crenata* was observed by Feuillée iii. pl. 24. Molina 109, and Humboldt iv. 9, under cultivation on the Peruvian Andes; by myself, near the extreme limit on the Western slope, planted in small patches, often alternating with those of the potato.

Chenopodium quinoa of the Bogotan? Andes. A species of *goosefoot* bearing esculent seeds, one of the crops in question; its seeds used also by the natives to make a beverage like that from maize, its flower employed medicinally, and its tender and wholesome leaves eaten — (G. de la Vega v. 1 to viii. 9): *C. quinoa* was observed by Feuillée med. pl. 10. Molina 101 (A. Dec.), Tschudi under cultivation on the Andes, according to Humboldt iv. 9 from Chili to Bogota; and seeds brought by Couthouy from Quito have been shown me. Transported to Europe, has been successfully cultivated in Germany (Markh. edit. ii. p. 357).

† *Baccharis scandens* of Lower Peru. Called there "chilca" (Markh.), and giving its name to the village of Chilca — (South of Lima): the Inca Huascar, when taken prisoner by the forces of Atahualpa, was insulted by the offer of "chilca" leaves instead of coca (Salcam. edit. Markh. 118): the "chilca" shrub is mentioned also by G. de la Vega i. 187: *B. scandens* was observed by Ruiz and Pavon in the arid portion of Peru (Pers.); by Markham edit. p. 307, thickets on the battle-field near Guamanga.

Prosopis horrida of the Western valleys facing the Pacific. A large tree called "guaranga" (Markh.), and known from early times: — the "algaroba" was observed by Cieza de Leon xxxvi to lxxvii in the mountain-valleys throughout Western Peru, its pods "somewhat long and narrow and not so thick as" those of beans, used in some places, to make bread "and it is considered good:" *P. horrida* was observed in Peru by Humboldt and Bonpland (Steud.); by Markham p. 239, bearing abundant "clusters of pods, which form excellent food for mules and cattle and for immense herds of goats," its timber "very hard."

"1024 A. D. = 2d year of the 'thian-ching' of Jin-tsoung" (Chinese chron. table), beginning of the Sixty-second cycle.

"The same year" (Alst., and Nicol.), Henricus II. succeeded by Conradus II. Salicus, fifth emperor of Germany and Italy.

"The same year" (Alst., and Nicol.), at Rome, Benedictus VIII. succeeded by Joannes XX., eighty-second archbishop.

"September (= 415 A. H." of Ferisht., Elph.), leaving Ghazni with an army Mahmud crossed the Indus and reached Multan in October. With "twenty thousand" camels crossing the Desert, he made his appearance before Anhalwara so unexpectedly that the king of Guzerat was constrained to abandon the city. Continuing his march, Mahmud after a great battle captured and plundered the great temple at Somnat, and destroyed the idol. — He remained more than a year in Guzerat, having visions of a fleet, the gems of Ceylon, and gold mines of Pegu, and on leaving set up a new Hindu king.

"1025 A. D." (Alst.), Constantinus IX. now sole ruler of the Byzantine Empire.

"1026 A. D. (= 1083 ann. Vicram," Wilford as. res. viii. p. 289 and ix. p. 74), the latest of the four mounds or "Meru-sringas" near Benares raised by two sons of Bhupala, king of Gaura.*

"1027 A. D." (Kalhana hist. Cash., and H. H. Wils. ind. dram. ii. 260), accession of Samgrama as king of Cashmere.

Mesue living at Cairo. He had been physician to "Alhaken" or Hakem (Leo Afric. med. arab. 273), quotes Avicenna, — and died "in 1028" (Spreng.).

Zygophyllum coccineum of the Desert, from Barbary to the border of Siberia. Called in Egypt "rotarajt" or "kamun karamani," in which we recognize the "cimini carmeni" of Mesue electuar. : — *Z. coccineum* was observed by Forskal p. 87, and Delile, in the Desert between Cairo and Suez, frequent but avoided by all cattle, even by the camel; the aromatic seeds however used medicinally, against colic by the Egyptians. The plant was also observed by Shaw f. 231 in Barbary, and is known to grow on the border of Siberia (Pers.).

Laserpitium glabrum of the mountains of middle and Eastern Europe. By the French called "turbith des montagnes" (Fee); the "turbith" of Mesue, — referred by Sprengel to a Thapsia, may be compared: *L. glabrum* is described by Morison ix. pl. 19; and was observed by Crantz iii. 54, and Jacquin pl. 146 in dry wooded situations on mountains within the Austrian dominions (Pers.). According to Lindley, "the root is gorged with a gum resinous juice, which is acrid, bitter and even somewhat caustic: it is reckoned a violent purgative."

Achillea ageratum of Europe. Called in Britain *mawdeleyn* or *maudeline* from Magdalen (Prior), in Languedoc "herba divæ Mariæ" (Lyte ii. 67): the "eupatorium" of Mesue — is referred here by Andr. Marinus ed. Mes. pl. 59; *A. ageratum* is described also by Tragus i. pl. 175, Matthioli (Spreng.), and Lobel pl. 489; is termed "ageratum" by Bauhin; is known to grow wild in Southern France (Lam. fl. fr., and Pers.); and was observed by Gittard in the Peloponnesus (Chaub.).

"1028 A. D." (Alst.), Constantinus IX. succeeded by Romanus II., forty-first Byzantine emperor.

"1029 A. D." (rudim. chron. Lond.), in England, the causeway connecting Peterborough with Ramsey built by Canute II.

"The same year" (Talvi iii. 1), the Moravian kingdom dissolved; and Moravia proper, inhabited by a Slavonian people, united with Bohemia.

In this year (996 + "after his 33d year," Mahavams. lxxviii.), Parackramabahoo succeeded by his nephew Pandita-wijeya-Chako, now king of Ceylon. — He composed poems in the Pali language.

"1030, Apr. 29th (= 421 A. H." of Ferisht., Elph.), death of Mahmud of Ghazni, the most renowned monarch of his time. "Within five months," he was succeeded by his son Masaud.

"1030-2 A. D." (Humb. cosm. ii.), Abul-Ryhan, or Albiruni of Byrun in the valley of the Indus, corresponding with Avicenna — who died "in 1036."

* *Zizyphus oenoplia* of Tropical Hindustan and Burmah. A thorny shrub (Graham), called in Bengal "sehaicul," and brought to W. Jones as the "ghonta" or "gopaphonta" of an ancient Sanscrit poet, a tree shaped like the "vadari" (*Z. jujuba*), growing only in forests and having very small fruit, — and "ghonta" of the Amara-cosha (as. res. iv. 264): the "ghonta" or "gopaphonta" is mentioned by Susrutas (Hessl.): *Z. oenoplia* was observed by Graham, in "the Concans;" by Burmann pl. 61, W. Jones, Roxburgh, and Wight, as far as Ceylon and Bengal, its fruit black and of the size of a pea, eaten by the natives, and the bark of the fresh root in decoction "said to promote the healing of fresh wounds;" was observed by Mason in Burmah.

Abutilon Avicennae of China and Mongolia. Mentioned by Avicenna — (according to Gaertner): from seeds sent from Pekin, ascertained by Roxburgh to be the “king ma” of China, occurring from “Lat. 32° to 39°” and cultivated for its fibre (Royle him. p. 116 and fibr. pl.); observed by Pallas trav. i. 503 as far West as the Yaik. Farther West, is described by Gesner, Anguillara, Matthioli, Dalechamp p. 592 (Spreng.), Dodoens, Camerarius, and C. Bauhin; is known to occur in Siberia and Switzerland (Pers.), and is regarded by A. Decandolle as “probably naturalized in Southern Europe.” Possibly by European colonists carried to Northeast America, where it continues in Carolina and Georgia “in waste places chiefly in the middle and upper districts” (Ell., and Chapm.); so far as observed by myself from Lat. 39° to 43° along the Atlantic, has more of the aspect of a weed brought by our aboriginal tribes.

Reseda Mediterranea of the East Mediterranean countries. Called in Egypt “romeikh” (Forsk., and Del.), and the “raamek” of Avicenna (Kirst.) may be compared: the “gselbehnak” of Avicenna — (Kirst.), and Ebn Baitar, is referred here by Sontheimer: *R. Mediterranea* is described by Linnæus; was observed by Sibthorp in grain-fields on the Greek islands; by Forskal p. 92 at Alexandria; by Delile, not far from Cairo growing in the Desert; is known to grow also in Palestine (Pers.).

Melia azedarach of Subtropical Japan and China. Called in Egypt “zænzalacht” (Forsk.), in Northern Hindustan “dek” (Royle): the “azedarach” of Avicenna — is referred here by writers, probability favouring according to Royle him. p. 141: the “mahanimba” of Susrutas . . . is referred here by Hessler: *M. azedarach* is known to occur on Ceylon (Pers.); was observed in Hindustan by Roxburgh, Royle, and Wight; by Graham, “a common tree, generally met with about villages both in the Concan and Deccan,” the name given me by the natives signifying “English tree,” but according to Royle var. *sempervirens* is distinguished in Hindustanee as “bukayun” or “bukain.” Farther East, *M. azedarach* is enumerated by Mason v. 411 and 479 as “exotic” in Burmah and called “ka-ma-kha,” cultivated for ornament and the root used as a vermifuge; was observed by Blanco on the Philippines, in one or more localities and called in Tagalo “malongain;” by Kaempfer, and Thunberg, frequent in Japan from Nagasaki to Jeddo, having several native names and furnishing oil for burning. Westward from Hindustan, was observed by Forskal under cultivation in Yemen: by him, and Delile, in the gardens of Egypt; by Rauwolf, and Hasselquist, in Palestine; by Chaubard, on the Greek islands; is termed “pseudo-sycamorus” by Matthioli pl. 232; and is known to occur under cultivation as far as Spain (Pers., and Blanco). By European colonists, was carried to the West Indies (Comm. hort. pl. 176, Swartz ii. p. 737); to our Southern States, where it is planted for ornament and called *China tree* (Chapm.); and as verified by myself, to Tahiti, and the Hawaiian Islands.

M. composita, enumerated as distinct, was observed in Hindustan by Roxburgh ii. p. 397, and Wight; by Graham, “a middle sized tree” called “neembarra” or “limbarra,” on the “hilly parts of the Concan, Parr Ghaut, not common.”

Canarium commune of the Malayan Archipelago. The *Java almond* or *elemi tree*, pinnate-leaved and called in Hindustanee “jungle-badam” (Drur.), in Tagalo “palsahingin,” in Ylocano “anten” (Blanco), was known to Avicenna as growing at Macassar — (Spreng.); was observed by Blanco on the Philippines, the liquid resin procured from the trunk much used by the natives; by Rumphius ii. pl. 47 to 48, under cultivation on the Moluccas, where according to Ainslie its exudation is burned as a lamp; by myself, under cultivation as far East as the Feejeean Islands. Westward, is known to occur on Java (Drur.); is termed “amyris Zeylanica” by Retz iv. 25, observed by him on Ceylon; was observed by Roxburgh, and Wight, in peninsular Hindustan, yielding according to Lindley “abundance of limpid oil, with a pungent turpentine smell, congealing in a buttery camphoraceous substance,” the “raw fruit eatable but apt to bring on diarrhoea.” By European colonists? was carried to the Mauritius Islands, where it is called “bois de colophane.” From transported specimens, is termed “colophonina Mauritianica” and “balsamodendron Zeylanicum” by Decandolle prodr. ii. 76 to 79, and “*bursera paniculata*” by Lamarck (Lindl.).

Mimosa abstergens of Hindustan. Called at Lahore “shekai” (Honigb.); and the “schekaaa” of Avicenna, — may be compared: *M. abstergens* is described by Honigberger 403, as observed in Hindustan (J. F. Wats.).

Lathyrus tuberosus of the Uralian plains. Called by the Calmucks “sohnok” (Pall.), in Germany “erdnuss” or “sewbrot” (Trag.); and the “harthanita” of Avicenna — is referred here by some writers: *L. tuberosus* was observed by Pallas trav. i. 513, cooked and eaten by the Calmucks; by Tragus ii. pl. 19 in cultivated ground in Germany, its tuberos roots sometimes eaten, and much sought for by swine; is known to occur also in France (Pers.).

Spiræa aruncus of Northern climates. Called in Germany “waldgeissbart” (Trag.), in Japan “sjoma” or “torino asikusa” (Sieb.); and the “barba hircina” described as astringent by Avicenna, — and Serapion, may be compared: *S. aruncus* was observed by Tragus i. pl. 95 in Germany; is known to grow also on the Pyrenees and Jura (Dec.), and on Caucasus (Bieb.); was observed by

Thunberg on mount Fakon in Japan; by Siebold, on the island of Yezo; by Gmelin, throughout Siberia to Kamtschatka. Farther East, is known to grow on Puget Sound and from the mouth of the Columbia to its source (Hook.); was observed by E. James on the Missouri; by Beck, near St. Louis; by Michaux, on the Alleghanies from Georgia to Virginia; by Schweinitz, at 36° in Upper Carolina; and by Eaton, as far as the Catskill mountains.

Manettia lanceolata of Tropical Arabia. Called in Yemen "laēja" (Forsk.), and the "laija" described by Avicenna as bitter and milky, or "laaijah" of Abu Khoraij, Elgafaki, and Ebn Baitar, may be compared: *M. lanceolata* was observed by Forskal p. 42 everywhere on the mountains of Yemen, the bruised root applied to ulcers.

Memecylon tinctorium of Tropical Hindustan and Burmah. A highly ornamental shrub called in Mahratta "anjun" or "anjuna" (J. F. Wats.), in the environs of Bombay "anjune" (Graham), in Telinga "alli chettu," in Tamil "kayampoovoocheddi" or "casau-cheddy" or "casha-marum" (Drur.), in Burmah "myen-khæ-ta-nyet" (Mason); and the plant growing according to Avicenna 165 in Yemen and India, and dyeing yellow, — mentioned also by Serapion c. 170, is referred here by Sprengel: *M. tinctorium* was observed by Rheede v. pl. 19 in Malabar; by Murray, Law, and Graham, "common at Mahableschwur" and "along the Ghauts;" by Roxburgh, and Wight, as far as Travancore and Coromandel, cultivated besides in gardens, its fruit eaten and leaves "affording a delicate yellow lake" (Drur.): by Mason v. 419 to 512, indigenous in Burmah, its leaves affording a bright yellow dye. Westward, if occurring in Yemen, doubtless only in gardens.

Strychnos ignatia of the Philippines. Imported *Ignatius beans* are called in Arabic "narmuschk" (Mowafik ii. 96), in Persian "fafita," in Hindustanee "papita" (J. F. Wats.); in which we recognize the "naarmesk" of Avicenna: — these beans are "used successfully in India as a remedy for cholera" (Lindl.). Farther East, the living tree is described by Loureiro i. 155; was observed by Blanco in the Bisayan portion of the Philippines, especially in Catbalogan, and called in Bisaya "pangaguason" or "aguason" or "canlara" or "mananaog" or "dancagai" or "igasud" or "cata-longa," in Pampango "pepita sa Catbalogan," in Tagalo "pepita" or "fruta," used in fevers and against the bite of poisonous reptiles. Described also by Kamel phil. trans. xxi. 88 and act. erud. 1700, and termed "caniram de St. Ignaco" by Petit Thouars (Steud.).

Pergularia tomentosa of Nubia and Arabia. A woody Asclepiaceous vine called in middle Egypt "leben el-homarrah" donkey's milk (Del.), in Yemen "dæmia" (Forsk.); the "lactuca asini" of Avicenna — may be compared: *P. tomentosa* was observed by Forskal, and Delile, not far from Cairo, growing in the Desert; by Forskal p. cviii and 49, among the mountains of Yemen near Taæs. Eastward, by Graham, "common in gardens Bombay," its "flowers yellow, very fragrant;" by Roxburgh, and Wight, in other parts of Hindustan; is described also by Rumphius vii. pl. 26; was observed by Mason v. 421 "exotic" in Burmah, cultivated for its fragrant flowers; is termed "cynanchum odoratissimum" by Loureiro, as observed by him in Anam.

Hyoscyamus pusillus of Persia. The yellow-flowered "bnj" of Avicenna 145, — and Serapion c. 340, is referred here by Sprengel: *H. pusillus* is known to grow in Persia (Pers.): transported to Europe, is described by Plukenet alm. pl. 37. f. 5.

Mentha piperita of Hindustan. Called in Egypt "lemmam" or "na'na" (Del., and Lindl.), in which we recognize the "nana" of Avicenna, — Edrisi, the treatise Erfahrungen, and Ebn Baitar: the Coptic or Egyptian "sôumanas" (Edw.) may also be compared: *M. piperita* was observed by Forskal, and Delile, in the gardens of Egypt. Farther North, has not been found in Greece, but is described by Linnæus, is well known in gardens throughout middle Europe, is called in Britain *pepper mint* (Prior), and had become naturalized there before the days of Persoon. Eastward from Egypt, the "nana" is identified by Persian writers with the "podeena," a "species of mint cultivated in the gardens of Northwestern India" (Royle in Kitt. bibl. cycl.); *M. piperita* is called in Bengalee and Hindustanee "pudina," also in Hindustanee "nana," and the liquor distilled from it "araq-i-nana" (D'rozar.); was observed by Law "on the banks of the Yena at Mahableschwur," but as occurring in gardens around Bombay is said by Nimmo to have been introduced from Europe (Graham): farther East, a species of mint "exotic" in Burmah and called "boo-dee-na" is enumerated by Mason; and *M. piperita* was observed by Thunberg in Japan, around Nagasaki and called "faki." By European colonists, was carried to Northeast America, where it continues to be cultivated, and to a limited extent has become naturalized (A. Gray, and Chapm.); also to South America (Lindl.). According to Pereira, is "an aromatic stimulant and the most pleasant of all the mints." (See *M. arvensis*.)

Salicornia Arabica of the shores of the Red Sea. Called by Arabs in Hindustan "ushnan" (J. F. Wats., U. U. 163, B. 69), in which we recognize the "aschnaanun" of Avicenna — (Kirst.), or "uschnan" of Ebn Baitar: *S. Arabica* was observed by Forskal p. 3 on the shore of the Red Sea from Ghomfude to Djidda; by Pallas trav. i. 745, on salines near the Caspian. From transported specimens, is described by Morison ii. 5. pl. 33.

Salix Babylonica of Eastern Asia. Called in Britain *weeping willow*, in the gardens of Egypt "safsaf roumy" willow of Constantinople (Del.), by the Arabs of Syria "garb" (Rauw.), in the gardens of Burmah "mo-ma-kha" (Mason); and the "ghrb" of Avicenna 279 — is referred here by Sprengel: the willows planted for shade according to Raschid-eddin along roads in China (Yule cath. 260) may also be compared: *S. Babylonica* was observed by Loureiro ii. 609 in Anam; by Mason, "exotic" in Burmah; by Graham, "in gardens" around Bombay (but no native name is given). Farther West, was observed by Rauwolf pl. 183 during his visit to Palestine, and was now first made known to Europeans (Spreng.); is termed "*s. orientalis flagellis deorsum pulchre pendentibus*" by Tournefort cor. 41; was observed by Forskal, and Delile, in gardens from Cyprus and Constantinople to Athens; and has become well known throughout Europe. By European colonists, was carried to Northeast America, where it continues to be planted for ornament; to the island of St. Helena, and thence in one instance to Hindustan (Graham). One sex only being known, the tree has been kept in cultivation by cuttings only, and is therefore regarded by A. Decandolle as perhaps a deviation from its undiscovered normal state.

Populus fastigiata of Central Asia. The "ghurb" of Arab writers — is referred here by Royle himal. 344: *P. fastigiata* was observed by him on the Himalayan mountains. Westward, is known to have been introduced in the Eighteenth century throughout Europe; was observed by Chaubard in Greece; is described by Aiton, Poiret, and Duroi; and its French name "peuplier d'Italie" and English *Lombardy poplar* seem derived from resembling the artificially-trimmed poplars of Lombardy. By European colonists, was carried to Northeast America, where trees planted for ornament were frequent within my remembrance, but they did not continue thriving, and one sex only being in the country, are rapidly disappearing; was also carried to Chili, where I have seen trees in flourishing condition. According to Lindley, the young leafbuds are used medicinally for the same purposes as those of *P. nigra*. (See *Salix Babylonica*.)

Gymnadenia conopsea of Europe and the adjoining portion of Asia. A palmate-rooted orchid called in Germany "kreutzblum," in drug shops "palma Christi," by the Arabs "bucheiden," and the "digiti citrini" distinguished by Avicenna as altogether yellow — is referred here by Fuchsius pl. 712: *G. conopsea* is described also by Brunfels i. 104, and Lobel obs. 90 (Spreng.); is termed "*o. palmata minor calcaribus oblongis*" by Tournefort inst. 435; and is known to grow in meads from Denmark throughout middle Europe (fl. Dan. pl. 224, Engl. bot. pl. 10, Vaill. pl. 30, Hall. helv. pl. 29, and Pers.); was observed by Sibthorp, and Chaubard, in the Peloponnesus.

Orchis maculata of Europe and the adjoining portion of Asia. Also called in Germany "kreutzblum," and the "digiti citrini" distinguished by Avicenna as yellow mixed with white — is referred here by Fuchsius pl. 713: *O. maculata* is described also by Lobel obs. 90; is termed "*o. palmata pratensis maculata*" by Tournefort inst. 435; is known to grow in meads from Denmark throughout middle Europe (fl. Dan. pl. 933, Engl. bot. pl. 632, Hall. helv. pl. 32, and Pers.); was observed by Sibthorp in meads in the Peloponnesus.

Narcissus jonquilla of the West Mediterranean countries. Called in Spain "junquillo" from its slender rush-like stem, in Britain *jonquill* (Prior), in France "jonquille" (Nugent); and the "nesryn" described by Avicenna as a kind of narcissus, — by Ebn Alwam i. 334 as growing in Spain and yielding an oil, is referred here by Sprengel: *N. jonquilla* is known to grow wild in Spain (Pers.), but has been long cultivated as a garden flower: is described by Dodoens; and was observed by Clot-Bey and Figari in the gardens of Egypt.

Fritillaria imperialis of Central Asia. Called in Britain *crown-imperial*, in Persia "tusac": the "corona regia" is mentioned by Avicenna — (according to Kirsten): roots of *F. imperialis* about the middle of the Sixteenth century were brought from Persia to Constantinople, thence some to Vienna and distributed throughout Europe (Clus. rar. ii. 1, and Beckm): the plant is described also by Dodoens, Lobel, and Tournefort 372. By European colonists was carried to Northeast America, where it continues a favourite garden flower.

Alectoria Arabum of Hindustan. The best and most fragrant kind of "oschnah," enumerated by Avicenna p. 128 as brought from India, — is referred to this tree lichen by Dillenius pl. 84 f. 10, and Acharius (Sj. reng.).

"1031 A. D." (Blair). Apulia in Southern Italy conquered from the Greeks by the Normans.

"The same year" (Alst., and Nicol.), Robert succeeded by his son Henri, as king of France.

"The same year" (= 979 + cycle of 52 years, Clavig. ii.), accession of Topiltzin, eighth Toltec king of Mexico.

Bixa Orillana of Tropical America. The *arnotto* tree called in the West Indies "bixa" (Ovied.) or "urucu" (Sloane), in Carib by the men "cochehuc" (Desc.); and from early times, the red pulp around its seeds used by the Caribs to paint themselves; its bark used also for cordage, and its wood to procure fire by friction — (Drur.): observed by Oviedo nat. hyst. f. 13 and c. 76, and Sloane ii. pl. 181, in the West Indies, mixed in chocolate by the Spanish colonists; by myself, under

cultivation in Peru and Southern Brazil. Possibly by Polynesians, was carried to the Hawaiian Islands, observed there by myself; and to Tongatabu, observed by Rich. Clearly by European colonists, was carried across the Pacific to the Philippines, where it has become frequent and is called "achote" (Blanco); to the neighbouring islands (Rumph. ii. pl. 19); to Burmah, observed by Mason v. 511 abundantly cultivated by the natives; to Hindustan, called in Telinga "jafra," in Tamil "kooragoomangjul," in Malabar "korungoomunga," in Hindustanee "gawpurgee" (Drur.), in the environs of Bombay "kisree" (Graham), cultivated as a dye, which however is not very durable, used also medicinally (Roxb., and Wight). Transported to Europe, is described by Clusius, and Commelyn hort. i. 65; the imported drug is used to tinge butter, cheese, oils, and varnish (Drur.).

Swietenia mahagoni of the West Indies and Central America. The *mahogany* tree, called in Carib "oubouheri" or by the women "liacaicachi" (Desc.), and known from early times*:—

* *Ochroma lagopus* of the West Indies. A large-leaved Bombaceous tree called in Carib "saamonna" or "zamacuna" or "comaka" (Desc.), and known from early times:—observed by Plumier, and Swartz fl. ii. 1144, in the West Indies; by Descourtilz, frequent there in the forest. (See *Eriodendron anfractuosum*.)

Humirium balsamiferum of Guayana. A lofty tree called in Carib "houmiri" or "touri" (Lindl.), and known from early times:—observed by Aublet pl. 225 in the Guayana forest, and its *balsam* compared to that of Peru; mentioned also by Schomburgk (annotat. Ralegh). From transported specimens, is termed "myrodendron amplexicaule" by Schreber 901.

Humirium floribundum of Eastern Equatorial America. A tree thirty feet high, called at Para "umiri" (Lindl.), known from early times,—and yielding the valuable *umiri balsam*; possessing the same medicinal properties as copaiva balsam, but regarded by Martius as superior and rivalling the Peruvian: the living tree observed by Martius ii. pl. 199 in various parts of Brazil.

Sauvagesia erecta of Tropical America. Suffrutescent, called in Guayana "adima" or "yaoba" (Lindl.), and from early times used medicinally:—in the West Indies, in slight inflammation of the bladder (Jacq. am. pl. 51); in Brazil, in complaints of the eyes (A. Saint-Hil. rem. pl. 3); in Peru, in disorders of the bowels, and called "yerba de St. Martin" (Ruiz and Pav. iii. 11); is known to grow also in Mexico (A. Saint-Hil.). Probably by European colonists was carried across the Atlantic to Senegal and Guinea (Willd., and fl. nigr.); to Madagascar (A. Saint-Hil., and A. Dec.); and to Java (Perrott.).

Spondias mombin of the West Indies. A large Terebinthoid tree called there "hobos" (Ovied.), in Carib "oubou" or by the women "monbea" (Desc.), and its plum-like fruit eaten from early times:—described by Petrus Martyr, and Oviedo nat. hyst. 72 and gen. hist. viii. 2; observed also in the West Indies by Sloane ii. pl. 219, Jacquin am. pl. 88, and Descourtilz. Transported to Europe, is termed "s. purpurea" by Miller (Steud.).

Spondias myrobalanus of Guayana. An allied species known also from early times:—observed by Sloane ii. pl. 219, and Jacquin 138; by Merian pl. 13, in Surinam. Transported to Europe, is termed "s. lutea" by Miller (Steud.).

Hedwigia balsamifera of the mountains of Hayti. An Amyroid tree, known from early times:—observed by Swartz fl. ii. 672. From transported specimens, is termed "*bursera balsamifera*" by Persoon i. 414 and 524.

Icica heptaphylla of Guayana. An Amyroid tree called there "hyawa" or "haiawa" (Hancock) or in Carib "arou aou" (Aubl.), and known from early times:—observed by Aublet pl. 130 in the Guayana forest, its trunk exuding a fragrant liquid that hardens into a whitish resin, according to Hancock a valuable remedy for coughs (Lindl.).

Icica aracouchini of Guayana. A small tree yielding *balsam of acouchi*, an aromatic terebinthinous liquid highly esteemed by the Caribs from early times as a vulnerary:—observed by Aublet pl. 133 in the Guayana forest, near the source of the Courou river (Pers., and Lindl.); mentioned also by Schomburgk (annotat. Ralegh).

Icica tacamahaca of the Oronoco. Known from early times,—and yielding one of the bitter resins called *tacamahaca*:—observed by Humboldt and Bonpland common near Calabozo on the plains of the Oronoco (Lindl.).

Icica carana of the Oronoco. Known from early times:—observed by Humboldt and Bonpland at the missions on the Oronoco, and supposed by most writers to yield the fragrant balsamic substance called *caranna*, but this is disputed by Hancock (Lindl.).

Cedrota longifolia of Guayana. A lofty tree, known from early times:—observed by Aublet i. pl. 126 in the depths of the Guayana forest, and termed by him "aniba guianensis;" according to Hancock yielding the balsamic substance called *caranna* (Lindl.).

Erythrina corallodendron of the West Indies. A coral tree called in Carib "aiphí tuinanti-iba"

observed by Catesby ii. pl. 81, and Jacquin am. 127. in the West Indies; known to grow also in Honduras, whence its ornamental wood is largely exported. By European colonists, was carried to Burmah, observed "exotic" there by Mason.

Ionidium ipecacuanha of Eastern Equatorial America. A Violoid plant called in Guayana "itoubu" (Aubl.), and from early times its roots taken as emetic:—observed by Aublet ii. pl. 318 in Guayana; by Vandelli, pl. 1, and Martius med. pl. 8, in the Brazilian forest, called "poaya branca" or "poaya da praja," and its roots collected as a substitute for true ipecacuanha (Lindl.).

Simaruba amara of Guayana. A large tree called in Carib "chipion" (Desc.), and known from early times:—"in 1713," the bark of its root was first imported into Europe (Desc.), where it continues to be employed medicinally: the living tree was observed by Aublet pl. 331 and 332 in sandy soil in Guayana, and a diœcious tree observed by Macfadyen on the mountains of Jamaica, is regarded by him as not distinct (Lindl.).

Mucuna pruriens of the West Indies. The *cowitch* is a twining bean called in Carib "mantia kaira" (Desc.), and known from early times:—observed by P. Browne pl. 31, Jacquin am. pl. 122, Macfadyen, and Descourtilz, in the West Indies, common in woods and along river courses, as well as in waste places. The hairs on its pods, constituting the exported drug, are according to Lindley "a mechanical anthelmintic."

Bromelia ananas of the West Indies and neighbouring portion of Tropical America. The *pine-apple*, called in Brazilian "nana" (Marcgr.), in the West Indies "yayama" (Ovied.), in Carib "yayonua" or "boniama" (Desc.), in Mexican "matzatli" (Hernand.), and its fruit eaten from early times:—"a sort of fruit which looked like our green pine-apples" (*Pinus pinea* cones) "but much bigger, and within full of solid meat like a melon, and much sweeter both in taste and smell, which grow on long stalks like lilies or aloe, wild about the fields, and are better than those brought up by art, as afterwards appeared," were seen by Columbus on Guadelupe in 1493, and on a subsequent voyage at Veragua (F. Columb. 47 to 96): *B. ananas* was observed in Tropical America by Oviedo hist. gen. pl. 13, three varieties cultivated by the natives; also by Thevet, J. Acosta, and Hughes; by Marcgraf 33, wild and bearing seeds in Brazil; by Martius, wild in the catingas of Bahia (A. Dec.); by Humboldt and Bonpland, wild with some seeds on the Upper Orinoco; by Hernandez 311, wild in the warm hilly region of Mexico. By European colonists, was carried Westward across the Pacific to the Philippines, where it continues abundantly cultivated and is called in Tagalo "piña" (Blanco): to China, cultivated according to Kircher 253 and supposed to have come from Peru; to Java before 1599 (C. Acosta, and Clus.), and observed by Rumphius v. 228 seemingly wild on Celebes; to Burmah, called there "na-nat" (Mason): to Bengal "in 1504 in the reign of Akbar" (hind. hist., and Royle ill. 376), is called in Sanscrit "anarush" (Pidd.), in Bengalee "anaras," in Hindustanee "anannas" (D'rozar.), was observed by Turner seemingly wild in jungles near Teshoo-Loomboo, occurs also seemingly wild on Ceylon (Royle), was observed by Rheede xi. 6 in Malabar and called "kapa-tsjakka," by Graham "in gardens" at Bombay, but I was told does not succeed; to Eastern Equatorial Africa, observed by myself naturalized on Zanzibar. Transported to Europe, fruit was shown to the emperor Charles V. (J. Acost.); the plant is described also by Monardes

(Desc.), and known from early times:—in the West Indies (Pers.); observed there by Descourtilz. Transported to Europe, is described by Commelyn hort. i. pl. 108, and is termed "e. spinosa" by Miller (Steud.). If the species observed by myself planted on Zanzibar, a magnificent flowering tree, probably the finest of its tribe.

Casalpinia coriaria of the Northern shore of South America. An unarmed Leguminous tree twenty-five or thirty feet high, its ripe pods called "libidibi" and used in preparing leather:—observed by Jacquin am. pl. 175 on the seashore from Carthagera to Curaçao (Pers.); and known to grow as far as Hayti (Drur.). By "Wallich twenty-five years ago" introduced into Hindustan, where according to Drury it has now become "extensively distributed," its pods being "considered superior to any other material used in the" country for tanning.

Dicypellium caryophyllatum of Eastern Equatorial America. A Lauraceous tree called by French colonists "bois de rose," in Carib "licari kanali" (Lindl.), and its hot peppery clove like bark known from early times,—having "powerful tonic properties:" observed by Aublet, pl. 121 in the Guayana forest; by Martius, extending into the Brazilian forest (Nees handb. ii. 435).

Euphorbia hirta of Tropical America. A weed called in Carib "araouebara, caatia" or "alaou-rou couli" (Desc.), and known from early times:—observed by Descourtilz troublesome in the West Indies. Probably by European colonists carried across the Pacific to the Malayan archipelago, termed "esula esculenta" by Rumphius vi. pl. 23; to Burmah, but enumerated as indigenous by Mason; to Hindustan, observed by Ainslie ii. 99, and Roxburgh, by Graham as far as Bombay, "a very common weed, springing up on garden walks etc.," by Burmann pl. 104 on Ceylon.

iii. 4, and continues in greenhouses, not succeeding in the open air even as far South as Egypt (Hasselq., and Clot-Bey). By European colonists also, was carried to Guinea (Clus., and R. Brown); and subsequent to the visit of Forster, to the islands of the Pacific, observed by myself on Tahiti naturalized, on the Samoan, and Feejeean Islands, and at Sydney in Australia.

"1033 A. D." (Nicol.), in Spain, Sancho III. the Great succeeded as king of Castile by Ferdinand. Who marrying Sanctia, daughter of the king of Asturias and Leon, added these provinces to his dominions.

"June 29th, about mid-day" (Blair), great *eclipse of the sun*. Observed in France.

"1034 A. D." (Alst.), Romanus II. succeeded by Michael IV. Paphlago, forty-second Byzantine emperor.

"The same year" (Alst.), at Rome, Joannes XX. succeeded by Benedictus IX., eighty-third archbishop.

One hundred and sixtieth generation. May 1st, 1034, onward mostly beyond youth: the Jewish writer Benjamin ben Serach: the Arab writers, Ebn Wafid, Alhazen: the Greek writers, Eugesippus, Georgius Cedrenus d. 1057, Symeon Sethus, Petrus Antiochenus d. after 1053, Michael Cerularius d. 1058, Nicon d. 1060: Merboldus; Campanus of Novarro; Glaber Radulphus; Franco; Humbertus Cardinalis, Adelmannus, Haymo of Canterbury.

"In this year" (palm-leaf ann. Jag., and W. W. Hunter), Kurma Kesari succeeded by Matsya Kesari, now king of Orissa. — He built the great bridge over the Atharanala at Puri (existing to this day), and reigned "sixteen years." (According to Stirling, the bridge was built by Kabir Narsinh who reigned 1282-1307.)

"The same year" (Nicol.), Malcolm II. succeeded by Duncan, as king of Scotland.

"1035 A. D." (Blair, and Nicol.), in Spain, the kingdom of Arragon established by Ramirez.

"1036 A. D." (Nicol.), Canute II. succeeded by his son Harold, seventeenth king of England.

"The same year" (art de verif.), Daher succeeded by Mostanser, of the Fatimite dynasty, fifth sultan of Egypt. Gold coins issued by Mostanser, are figured in Marcel p. 118.

Amomum grana-paradisi of Equatorial Africa. "Fulful elsudan" a kind of pepper from Aethiopia, is mentioned by Ebn Wafid, — and "shushamir" is further given by Ebn Baitar as the Persian name of *grains of paradise* (Sonth.): called according to Delile in the drug-shops of Egypt "tyn el-fyl." Farther North, "grana paradisi" are mentioned by Franciscus Pedemontium f. 133; but at the present day are imported direct from Western Equatorial Africa under the name of *malagueta pepper* or *Guinea grains*. According to Lindley, the plant grows near Sierra Leone, and the seeds are hot and acrid, "powerfully aromatic, stimulant, and cordial." I found the seeds exported also from Africa Eastward, across the Indian Ocean.

"1037 A. D." (ann. Jap., and art de verif.), Itsi-dsio II. succeeded by his younger brother Go-siu-saku or Go-ziu-ziak, sixty-ninth daio of Japan.*

"1039, March 17th" (Nicol.), Harold succeeded as king of England by the king of Denmark, Hardicnut or Hardicanute.

"The same year" (Alst., and Nicol.), Conradus II. succeeded by his son Henricus III. Niger, sixth emperor of Germany and Italy.

* *Hibiscus rosa-Sinensis* of the Philippines. The *shoe flower* or *rose Hibiscus*, a small ornamental tree, is called in Tamil "sapatoo cheddie," in Telinga "dasanie," in Bengalee "juva" (Drur.), in Burmah "khoung-yan" (Mason), in Tagalo and Pampango and Bisaya "cayanga" or "tarocanga" or "tacorangan" or "arogangan" or "tapolanga" or "antolanga," and the double-petaled var. "gomamila" (Blanco): the "fou-sang" from which Japan is said to have been named on account of its beauty, — described also by Li-chi-tchin, is referred here by Klaproth (introd. ann. Jap.): *H. rosa-Sinensis* is known to grow also in China, where garlands and festoons of its flowers are employed on festive occasions, and during funeral rites; also in Anam, where its leaves are used medicinally (Drur.): was observed by Blanco on the Philippines, in one locality producing simple flowers with perfect fruit, elsewhere very generally planted for ornament around native dwellings, its flowers staining leather black; by myself, on the Feejeean, Samoan, and Tahitian Islands, planted by the natives for ornament, remaining in abandoned clearings, and even met with in wild situations. Westward, wreaths of "djawa" flowers are mentioned by the Hindu poet Harivansa 122: *H. rosa-Sinensis* was seen on Java by Bontius in 1630 and termed "rosa batavico-indica" (Piso); by Mason v. 416 to 756 "exotic" in Burmah, several varieties cultivated, the flowers used for blacking shoes; by Rheede ii. pl. 17 and vi. pl. 43, in Malabar; by Ainslie, Roxburgh, Wight, Graham, and Drury, in gardens throughout Hindustan; by myself, a planted tree in front of the lesser cave-temples at Karli, and flowers among temple-offerings to the end of my journey. By European colonists, was carried to the Mauritius Islands, where it has become frequent in gardens (Boj.); and to Northeast America, where it continues in greenhouses.

"In this year (= 432 A. H." of Ferisht, Elph.), sultan Masaud defeated at Zendecan near Merv by Toghrul Beg and the Seljuks, the first horde of Tartars that acquired possessions South of the Oxus. Masaud retreated to Ghazni, and across the Indus, — where in the following year he was dethroned and put to death. His son Modud, having married a granddaughter of Toghrul-Beg, was enabled to recover Ghazni and maintain his authority.

"1040 A. D." (Nicol.), Duncan succeeded by Macbeth, as king of Scotland.

"In the Eleventh century" (Pouchet), the *whalebone* procured along the Atlantic coast of Europe appears to have been claimed and regarded as the special property of the feudal chiefs. — This is expressed in charters of the time of Edward II. The "nordhval" of the Norwegians and Icelanders of the Twelfth century is clearly the *right whale* *Balæna mysticetus*; the mystery as to its food, being of course due to filtration through the bands of whalebone in the mouth.

"1041, June 8th" (Nicol.), accession of Edward III. the Confessor, son of Ethelred II., and now nineteenth king of England.

"The same year" (Alst.), Michael IV. succeeded by Michael V. Calaphata, forty-third Byzantine emperor.

"The same year" (Nicol.), several synods in France. And in one, ordained that "from Wednesday evening until Monday morning, no one should take anything by force, nor revenge an injury.

"1041-8 A. D." (Humb. cosm. ii), printing with *moveable types* practised in China.

"1042 A. D." (Alst.), Michael V. succeeded by Constantinus X. Monomachus, forty-fourth Byzantine emperor.

"1043 A. D. (= 435 A. H." of Ferisht, Elph.), the Panjab overrun by the Hindu king of Delhi, who captured Nagarcot and laid siege to Lahore. This last Muslim stronghold was saved by the bravery of the garrison, and a false report of the approach of sultan Modud.

Carissa spinarum of Tropical Eastern Asia. An allied species called in Japan "sonoki," or by some persons "fira" or "virasi" (Thunb.); and (notwithstanding *C. carandas* was always brought to W. Jones) probably the "carcandhu" of the Amara-cosha, — and Jayadeva, lips compared with the red lustre of its fruit by Kalidasa sacont.: *C. spinarum* is described by Rumphius vii. pl. 19; was observed by Graham "in gardens" around Bombay, "very beautiful when covered with bright red fruit," which "makes good tarts." Farther East, was observed by Kaempfer, and Thunberg, in Japan, cultivated in vases, and in rare instances springing up spontaneously.

"1044 A. D." (Alst., and Nicol.), at Rome, Benedictus IX., the last archbishop who in his Bulls used the years of the German emperors, succeeded by Gregorius VI.

"1046 A. D." (ann. Jap., and art de verif.), Go-siu-saki succeeded by his eldest son Go-reisei or Rei-sei II., seventieth dairo of Japan.

"The same year" (Marcel 106), the mosque of Amru at Fostat near Cairo, repaired by order of sultan Mostanser.

"About Christmas" (Alst. p. 352, and Nicol.), a synod at Sutri near Rome. Gregorius VI. was deposed, Clemens II. elected his successor, and the law renewed, making the consent of the emperor indispensable to elections of the archbishops of Rome.

"1048 A. D." (Alst., and Nicol.), at Rome, Clemens II. succeeded by Damasus II., eighty-sixth archbishop.

"In the middle of the Eleventh century" (E. A. Soph.), first appearance of the English at Constantinople, as battle-axe men forming a part of the emperor's body-guard and called "Varaggōi;" they are termed Kelts by Cedrenus ii. 613; "barbarians from Thule," by Anna Comnena i. 120 (compare Burray in the Shetland Islands); and according to Curopalates 57. spoke "igklinisti," English.

"1049 A. D." (Alst., and Nicol.), at Rome, Damasus II. succeeded by Leo IX., eighty-seventh archbishop.

"In this year (= 441 A. H." of Ferisht, Elph.), Modud succeeded by his brother Abul Hasan, now sultan of Ghazni.

"1050, May 2d" (Alst., and Nicol.), a synod convened at Rome. The opinions of Berenger on transubstantiation were opposed by Lanfranc, archbishop of Canterbury (regarded as the earliest *scholastic theologian*).

"The same year" (Alst.), end of the chronicle of Hermannus Contractus.

"In this year" (= 1102 — "142 years" of Abul-Fazil, Wilford as. res. ix. 170), the city of Delhi on the Ganges founded by Raya-sena, head of the Tomara dynasty: or according to Elphinstone iv. conquered by Visal, Hindu king of Ajmir, and ancestor of Prithwi.

In this year (= "400 + 650 yrs." of Bigandet, Max Müll. p. xvi), the transcribed Buddhist scriptures and other writings of Budhaghosha carried from Ceylon to Pagan in Burmah.

"1051 A. D." (Humb. atl. pict.), pestilence and destruction among the Toltecs: who now push their migrations farther South.

Carica papaya of Panama. Called by Portuguese colonists, "papay" or "mamocira" (Marcgr.), in Carib "abapaye" or "aleulé" or "alélé" (Desc.), and from early times cultivated for its fruit * — (Humb. iv. 9): the "higos del mastuerzo" was known to Oviedo nat. hyst. 70 as growing on the Panama Isthmus; *C. papaya* was observed by Ximenes in Mexico (Marcgr. 104); by Beechey 425, at Realejo in Mexico; by Squier (as he informed me) to all appearance indigenous in Nicaragua; by Hernandez 99, seemingly indigenous on Hayti; by Sloane on Jamaica, according to Browne indigenous there; by Marcgraf "in 1648" in Brazil, the female plant chiefly in gardens and the male plant in the woods, but so far as observed by myself in Southern Brazil a decidedly introduced plant. Possibly by Polynesians, was carried to the islands of the Pacific, where it seems to have been distributed after the visit of Foster; was observed by myself very generally cultivated by the natives on Metia, Taheiti, the Hawaiian, Samoan, Tongan, and Feejeean Islands, and according to Hale is called in Feejeean, "walete." Clearly by European colonists, was carried across the Pacific to the Philippines, where it is called in Tagalo "papaya" (Blanco); to the neighbouring islands, introduced by the Portuguese (Rumph. i. 147); to Anam and Tropical China (Boymius, and Lour.); to Burmah, called there "them-bau-thee" (Mason); to Hindustan, called in Hindustanee and Bengallee "pepeya," in Tamil "pappali-marum," in Malabar "pappoia-umbalay-marum" (Drur.), observed in Malabar by Rheede i. pl. 15, by Graham, as far as Bombay, and now cultivated throughout, its milky juice a powerful vermifuge, possessing besides the peculiar property of rendering meat tender (Ainsl., Roxb., Drur., and Lindl.); to Yemen, called there "amba hindi" Indian mango (Forsk.); to Eastern Equatorial Africa, observed by myself on Zanzibar. From "Inde Orientale" brought to Europe by de Valle "in 1626," is described by Columna pl. (A. Dec.); and recently, according to Clot-Bey, has been successfully cultivated in Egypt; probably from America, was carried to Western Equatorial Africa (R. Brown cong.), and the Mauritius Islands (Boj.).

"In this year (= 443 A. H." of Ferisht., Elph.), Abul Hasan succeeded by Abul Rashid, now sultan of Ghazni. He recovered the Panjab, which had been seized by a Muslim chief.

"1052 A. D. (= 444 A. H." of Ferisht., Elph.), Abul Rashid succeeded by Farokhzad, now sultan of Ghazni. He gained advantages over the Seljuk Tartars until checked by Alp Arslan.

In this year (= "1027 + 25 yrs." of Kalhan. hist. Cash., H. H. Wils.), Samgrama succeeded by Harir, and after "twenty-two days" by Ananta as king of Cashmere.

"1053, June 18th" (Blair), archbishop Leo IX. defeated in the kingdom of Naples by the Normans, and taken prisoner.

"In or about this year" (Way pref. pr. pm.), the vocabulary called *Elementarium* compiled by Papias. — It appears to be the ground-work of the dictionary of Uguitio or Hugo.

"1055 A. D." (Alst., and Nicol.), at Rome, Leo IX. succeeded by Victor II., eighty-eighth archbishop.

"The same year" (Alst.), Constantinus X. succeeded by his widow Theodora Porphyrogenita, as ruler of the Byzantine Empire.

* *Mammca Americana* of the West Indies and neighbouring portion of Tropical America. A Calophylloid tree called by Spanish and English colonists *mammee* or *mamee*, by French "abricotier d'Amerique" (A. Dec.), and its fruit eaten from early times: the "mamei" — was observed by Columbus in 1502 on first visiting Veragua, growing upon very high trees, tasting "like a peach" and "as big as a large lemon, and every one" having "two, three, and some nine stones," known also in the West Indies (F. Columb. 96): the "mamey" is described and figured by Oviedo nat. hyst. 62 and gen. hist. viii. 20: *M. Americana* was observed by Sloane ii. pl. 217, and Macfadyen, wild in the West Indies; by Jacquin am. pl. 182, wild on the neighbouring portion of South America; is also cultivated, but does not appear to have been carried to other countries (A. Dec.). According to Lunan, and Lindley, its "bark abounds in a strong resinous gum, used by negroes for extracting chigoes from their feet."

Cereus pitayaya of the West Indies and neighbouring portion of Tropical America. An upright *cactus* bearing edible fruit, known from early times: the "pitahaya" — is described by Oviedo gen. hist. viii. pl. 23, and its fruit pronounced wholesome; was observed by Guzman on Puerto Rico (soc. Hackl.); and is known to grow in maritime thickets at the Northern extreme of South America, near Carthagera (Jacq., and Pers.).

Crescentia cujete of the West Indies and neighbouring portion of Tropical America. The *calabash tree* called in Mexico "tecomate" (Blanco), and known from early times: — the "higuero" is described by Oviedo nat. hyst. 73 as a tree bearing "calabaças redondas" used for drinking-vessels, the natives on the greater part of *Tierra firme* having no other kind: *C. cujete* was observed by Plumier 23, Swartz obs. 234, and Jacquin am. pl. 111, on the West Indies and neighbouring mainland.

Argania sideroxylon of Morocco. The "arjan" of Ebn Redwhan, — or "arjan of West Africa" of Ebn Baitar, is referred here by Sontheimer and others: *A. sideroxylon* was observed by Schousboe p. 89, a small tree frequent in woods in Southern Barbary between the rivers Tansif and Suz, and an oil-like olive oil obtained from the nuts (Pers.). From transported specimens, described by Commelyn hort. i. pl. 83.

"1056 A. D." (Alst.), Theodora succeeded by Michael VI. Strato, forty-sixth Byzantine emperor.

"The same year" (Alst.), Henricus III. succeeded by his son Henricus IV., seventh emperor of Germany and Italy.

"The same year" (Talvi i.), date of the manuscript Evangelium of Ostromir, posadnic or mayor of Novogorod; the earliest example known of *Slavonic writing*. Except that writings of about the same age occur in the Glagolitic character. — The next oldest Slavonic manuscripts are: one written "seventeen," and another "twenty" years later.

"The same year" (Pouchet), Greenland and Vinland (and of course North America) included in a Bull from pope Victor II.

"1057 A. D." (Alst., and Nicol.), Victor II. succeeded by Stephanus X., eighty-ninth archbishop of Rome.

"The same year" (Alst.), Michael VI. succeeded by Isaacus Comnena, forty-seventh Byzantine emperor.

"The same year" (Nicol.), Macbeth succeeded by Malcolm III., as king of Scotland.

"1058 A. D. (= 450 A. H." of Ferisht., Elph.), Farokzad succeeded by his brother Ibrahim, a religious devotee, and now sultan of Ghazni. He yielded to the Seljuks all their demands, — and had a long and peaceful reign.

"Dec. 28th" (Alst., and Nicol.), a synod at Sienna; and through the influence of the emperor Henricus IV., Nicolaus II. elected ninetieth archbishop.

"1060 A. D." (Alst. p. 372), Petrus Damiani bishop of Ostia, writing against the abuses and corrupt condition of the church.

"1061 A. D." (Alst., and Nicol.), at Rome, Nicolaus II. succeeded by Anselm da Baggio of Milan; now Alexander II., ninety-first archbishop.

"The same year" (Alst.), Isaacus Comnena succeeded by Constantinus XI. Ducas, forty-eighth Byzantine emperor.

"In or about 1062 A. D." (= 1091 — "supposed 30 years reign," G. de la Vega, and addit. art de verif.). Manco Capac succeeded by his son Sinchi-Roca, now second Inca of Peru. Who continued his father's laws and peaceful policy; * — and by these influences, added twenty leagues to his dominions on the South.

"1063 A. D." (Lubke and Lutrow), after a plan furnished by Rainaldus, the building of the church at Pisa commenced.

"In this year" (Grey transl. Angiolello 97), foundation of the city of Tiflis on the river Kur. — It is the present capital of Russian Trans-Caucasia.

"1064 A. D. = 'tchi-ping,' 1st year of Yng-tsoung, of the Soung" or twenty-first dynasty (Chinese chron. table).

"1065 A. D." (Marcel), while engaged in expelling the Muslims from Southern Italy, count Roger

* *Tropaeolum tuberosum* of Peru. From early times cultivated on the Peruvian Andes for its tuberous roots (Humb. iv. 9): observed by Ruiz and Pavon pl. 314; by myself, planted in small patches in company with the preceding.

Basella tuberosa of Peru. A fourth tuber cultivated from early times on the Peruvian Andes: — observed by Humboldt and Bonpland; by myself, with the others planted in small patches just below the Paramera or cold pastoral region.

Monina polystachia of the Peruvian Andes. A downy Polygaloid shrub growing in the cool region and called in Peruvian "yallhoy masca" (Lindl.), and from early times the bark of its root used as a substitute for soap, — and for cleansing and polishing wrought silver; preferred also to quassia as a remedy in dysentery and irritating diarrhoea (Ruiz and Pav. 171).

Monina salicifolia of the Peruvian Andes. An allied species growing in the middle mountain-region of the Western slope, and possessing the same properties (Ruiz and Pav. 172, and Lindl.).

Calceolaria irjida of Peru. Suffrutescent, called in Peruvian "tumpu" (Lindl.), and known from early times, — regarded as antiseptic, tonic, and febrifugal; observed by Ruiz and Pavon i. pl. 26 in the middle mountain-region, in shaded situations near water (Pers.).

Calceolaria cuneiformis of the Western slope of the Peruvian Andes. Its chewed leaves showing a yellow dye: — observed by Ruiz and Pavon pl. 27 near Canta and Tarma in the middle mountain-region (Pers.).

of Normandy hearing of civil war among the Muslim population of Sicily, crossed over and obtained the government. — Coins issued by the Norman kings of Sicily, and bearing bi-lingual inscriptions, Latin and Arabic, are figured in Marcel p. 120.

Serapion at this time writing. — He died "after 1068."

Geranium columbinum of Europe and the adjoining portion of Asia. Called in Britain *dove's foot* (Prior), and probably the "pede columbino" supposed by Serapion to be identical with the "amomum" — (*G. robertianum*; see J. Jacobi de Manliis): *G. columbinum* is termed "g. c. dissectis foliis pediculis florum longissimis" by Tournefort inst. 268; and is known to grow throughout middle Europe as far as Denmark (Cav. iv. pl. 82, Vaill. paris. pl. 15, fl. Dan. pl. 1222, and Pers.). Eastward, was observed by Sibthorp, and Chaubard, in the Peloponnesus. By European colonists, was carried to Chili, observed by Molina employed medicinally and called "corecore," by myself, seemingly wild throughout from the coast to the Andes, subsucculent with small purple flowers.

Centaurea (Amberboa) moschata of middle Asia. Called in the environs of Bombay "shah pusund" sweet sultan (Graham), in Egypt "ambar" (Forsk.) or "a'nbar" (Del.); and the "moschata" of Serapion — (Trag. i. 24) may be compared: *C. moschata* was observed by Forskal p. liii, and Delile, in the gardens of Egypt, fragrant and coronary; by Graham, "in gardens" at Bombay, flowering "chiefly during the cold season;" by Roxburgh, in Eastern Hindustan. Transported to Europe, is described by Morison vii. pl. 25.

Rumex alpinus of the mountains of middle and Southern Europe as far as the Crimea and Caucasus. Called in Britain *monks rhubarb* (Lindl.), in Germany "münch rhabarbarum," and described by Serapion — according to Fuchsius 460: *R. alpinus* was mistaken by the commentators on Mesue for a rhubarb, and hence according to Parkinson the European names, but a different reason is assigned by Tabernæmontanus 824 (Prior); is termed "lapathum foliis amplis" by Clusius hist. ii. 69, "l. folio rotundo alpinum" by Tournefort inst. 504; is known to grow wild on the Pyrenees and the mountains of Switzerland and North Germany (Koch, and A. Dec.); was observed by Sibthorp on mountains from the Peloponnesus to the Bithynian Olympus; is known to grow also in the Crimea and on Caucasus (Lindl.); was formerly cultivated in Britain and its root used medicinally, and has recently been found springing up spontaneously in seven different localities (Wats.); in Switzerland also, occasionally occurs around dwellings (A. Dec.). The root according to Lindley is "purgative like rhubarb, only in a much less degree."

Cakile maritima of the seashore of the Mediterranean and North Atlantic. An annual called in Britain *sea-rocket* (Prior), in Egypt "rechad el bahr" or "figl el-gemel" (Del.), and described by Serapion — (Gaertner, and Steud.): the "genus erucæ" of *Caesalpinus* viii. 63 growing in maritime sands, having thick fleshy leaves, and short angular pods used against renal calculus, clearly corresponds: *C. maritima* was observed by Forskal, and Delile, on the Mediterranean shore of Egypt; by Sibthorp, and Chaubard, on the seashore of Greece and the Greek islands; by Scopoli, along the Adriatic (Steud.); is termed "*c. maritima*" by Tournefort cor. 49; and is known to grow along the Atlantic as far as Denmark and Lapland (fl. Dan. pl. 1168, and Wats.). Westward, was observed by Hooker on Iceland; by Baldwin, on Bermuda; by myself, on our Atlantic seashore from 45° to 39°; by Pursh, as far as Virginia; by Eliot, and Chapman, as far as South Carolina; by Humboldt, on Cuba; and by Nuttall, on the shores of the Lakes of the St. Lawrence.

"The same year" (Nicol.), in a synod in London, full immunity granted to the Abbey of Westminster by Edward III.

Delphinium consolida of middle Asia. Called in Britain *larkspur*, in Germany "feld-rittersporn," in Italy "consolida regale" or "speronelle salvadeghe" or "fior capuccio selvatico" (Lenz), and figured in manuscript V of the Anglo-Saxon transl. Diosc. 160 — (according to Harley and Cockayne): *D. consolida* is described by Gesner hort. f. 265 (Spreng.); is termed "*d. segetum flore cæruleo*" by Tournefort inst. 426; and is known to occur as a weed in cultivated ground in Italy and throughout middle Europe as far as Denmark (Ray, fl. Dan. pl. 683, and Lam. fl. fr.). Eastward, was observed by Forskal at the Dardanelles; but occurring in wilder situations towards Caucasus (Griseb., and Bieb.), is regarded by A. Decandolle as probably derived originally from that quarter. By European colonists, was carried to Northeast America, where it continues a garden flower, and in Virginia and Carolina is becoming naturalized (A. Gray, and Chapm.); to the Mauritius Islands, observed in gardens by Bojer. "A tincture of the seed" has "been recommended in asthma," and "the leaves and stalks are said to enter into the composition of some cosmetics" found according to Burnett to be destructive to the skin (Lindl.).

"1066, Jan. 5th" (Blair, and Nicol.), death of Edward III., after naming Harold II. son of the earl of Kent, as his successor.

"Oct. 14th" (Blair, and Nicol.), Harold II. defeated and slain in battle at Hastings by invading Normans: their leader William becoming twenty-first king of England and the head of a new dynasty. That the country was conquered, — appears from the freedom granted by a synod some

ten years later to "such nuns as had assumed the veil as a security against the insults of the Normans."

"1067 A. D." (Alst.), Constantinus XI. succeeded by Michael VII. Ducas, forty-ninth Byzantine emperor.

One hundred and sixty-first generation. Sept. 1st, 1067, onward mostly beyond youth: the Chinese writers, the historians Sse-ma-kouang, and Lieou-yu: the Jewish writers, Jehuda Ibn Balam, R. Ishak Cordubensis, Jacob ben Reuben, and Isaac Ibn Gajjat: the Arab writers, Ebn Ssaïd, Ebn Jezla d. 1095: the Greek writers, Joannes Scylitzes d. after 1031, and Joannes Micrologus: Adamus Bremensis, Ado Trevirensis; William of Spire; Roscelinus the reviver of Nominalism; Anselmus of Lugo, Anselmus of Laon, Ingulphus; Nestor of Russia; Ivo Carnotiensis: the scholastic theologians, Guitmundus, and Anselm afterwards archbishop of Canterbury: the translators of Arabic, Hermannus comes Veringensis, Gerardus Cremonensis, and Daniel Morlaeus.

"1068 A. D. = 'hi-ning,' 1st year of Chin-tsoung, of the Soung" or Twenty-first dynasty (Chinese chron. table). By his minister Wang'an-chi, *minis*, coining and regulating the amount of money in the provinces, and other innovations in government, introduced.

A new philosophy, the "Philosophy of Nature," also founded by Wang'an-chi.

"1069 A. D." (ann. Jap., and art de verif.), Go-reisei succeeded by his younger brother Go-sansio, now seventy-first daïro of Japan.

By Karika, "a chief of an island to the westward called Manuka" (Manu'a in the Samoan Group), the Rarotongan or Hervey Islands found uninhabited and colonized in the "twenty-ninth generation" before — his lineal descendant Makea (the principal chief at the time of the visit of J. Williams miss. ent. 169). "Again putting to sea," Karika encountered Tangiia a fugitive Taheitian chief, and allowed him to settle on the East side of Rarotonga.* Communication with the Taheitian Group, from this time continued "very frequent" (Hale ethnogr. expl. exp. 136).

"In or about this year" (Nicol.), by a synod at Spalatro, the Dalmatians prohibited from using the Slavonic language in religious services.

"1070 A. D." (Blair), by Arzachel of Toledo, the *sun's declination* observed to be "29° 34'."

Four hundred and two "observations on the *apogee of the sun*" were left by Arzachel.

"The same year" (M. Russell pp. 150 and 250), the altars, fifty-five obelisks, with other ancient structures at Axum, mostly broken and destroyed by Goudit or Judith, coming from Amhara. She was of Hebrew lineage, and on the death of Dalnaad, usurped the government, and reigned "forty" years.

"1072 A. D." (Nicol.) in England by a synod, the primacy confirmed to Lanfranc archbishop of Canterbury.

"1073 A. D." (Alst., and Nicol.), at Rome, Alexander II. succeeded by Hildebrand of Tuscany, now Gregorius VII., ninety-second archbishop.

"October" (Alst., and Nicol.), a synod at Erford. *Tythes* were exacted from the Thuringians. Also, a proposal was received from Hildebrand, That priests should either abjure matrimony, or give up their office.

"The same year" (ann. Jap., and art de verif.), Go-sansio succeeded by his eldest son Surakawa or Ziro-kawa, now seventy-second daïro of Japan.

"1074, or thereabouts" (Nicol.), in a synod at Paris, the abbot of Pontoise abused and beaten, for defending the decree of Hildebrand, forbidding the hearing of mass "said by incontinent priests."

"1075 A. D." (Nicol.), a synod in London, of all England. "The ancient canons touching the rank of bishops" were renewed, and "superstitions, divinations, etc.," forbidden.

"June 9th" (Blair), at Neustadt in Thuringia, the Saxons defeated by the emperor Henricus IV.

* *Pachyrhizus angulatus* of the Malayan archipelago. — A common-looking bean under cultivation on Metia was said to produce a yam-like edible root, and I heard a similar account on Tongatabu. *P. angulatus* was observed by Rumphius v. pl. 132 in the Malayan archipelago, producing a large edible tuberous root; and the "hicamas" or "sincamas" of the Philippines is described by Blanco as well known there and its large root eaten crude by both natives and Europeans; *P. angulatus* was seen by Parish in Burmah, and Mason v. 466 to 889 speaks of "a variety of the Goa bean which produces esculent roots that are eaten like potatoes, and are a very tolerable vegetable." Farther West, *P. angulatus* was observed by Roxburgh, and Wight, in Hindustan; by Graham, as far as Bombay, but no native names are given. By European colonists, was carried to the Mauritius Islands, observed by Bojer under cultivation and growing spontaneously. Transported to Europe, is described by Plukenet alm. pl. 52. "*Dolichos tuberosus*" received by Lamarck from Martinique (Pers.), but according to Descourtilz "introduced" there, no Carib name being given, may also be compared.

"1076, Jan. 23d" (Alst., and Nicol.), a synod at Worms; "twenty-six" bishops being present, together with Henricus IV. The deposition of Hildebrand was declared; a sentence approved soon afterwards in the synod at Pavia by many French and Italian bishops. In return, Hildebrand in a synod at Rome adopted the novel measure of excommunicating the emperor, absolving his subjects from their allegiance.

Finding himself abandoned by both nobles and people and the succession being elective, Henricus IV. in the end yielded, and made a journey to Rome. The beginning of the *Papal Hierarchy* over the monarchs of Western Europe.

"October" (Nicol.), in a synod at Salona, Demetrius crowned king of Dalmatia.

"1077, March 13th" (Nicol.), a synod at Forcheim in Franconia. Henricus IV. was declared deposed, and Rodolph of Swabia elected emperor of Germany.

"The same year" (Alst.), end of the chronicle of Lambertus Schafnaburgensis. By whom also, many abuses in the church are enumerated.

"1078 A. D." (Nicol.), a synod in London. Ulstan or Wulstan bishop of Worcester was deposed, for not understanding the French language; and Bath, Lincoln, Exeter, and Chichester were made episcopal cities.

"The same year" (Alst.), Michael VII. succeeded by Nicephorus III. Botoniates, fiftieth Byzantine emperor.

"November" (Nicol.), in a synod at Rome, the Byzantine emperor excommunicated.

About this time (= "1392 — more than 300 years" of Dallet p. xiii), Ouang-kien, king of Kao-li, aided by China conquering the States of Pet-si and Sin-la, thus uniting all Corea under his rule. He is called the founder of the Kaoli or Korie dynasty.

"1080 A. D." (Nicol.), a synod at Rome. The investiture of laymen was forbidden; Rodolph of Swabia was declared emperor of Germany; and the session closed "March 7th."

"The same year" (Nicol.), by a synod at Burgos in Old Castile, the Roman ritual substituted in Spain for that of the Goths.

"The same year" (Alst., and others), the Carthusian Order of monks, founded by Bruno.

"The same year" (Nicol.), beginning of the compilation of "Dooms-day book," from a survey of all the estates in England. — The compilation was completed in "six" years.

"The same year" (Klapr. mem. i. 410), end of *Armenian history*. — The nation no longer having a government and territorial home, but consisting of dispersed individuals engaged in commerce.

"1081 A. D." (Alst.), Nicephorus III. succeeded by Alexius Comnenus, son of Isaacus, and now fifty-first Byzantine emperor. Writings of the emperor Alexius Comnenus are extant.

"The same year" (Alst.), Rome captured by Henricus IV. And in a synod assembled there, Guibertus or Clemens elected to the place of the escaped Hildebrand.

"1082 A. D." (Puranas, Bentr. as. res. viii. 243, and H. H. Wils. dram. Hind.), Munja succeeded by Raja Boja also called Vicrama as Hindu king. The last two names (according to Wilford as. res. ix.) belonging to one king.

The astronomer Varaha Mihiri, author of the *Surya Siddhanta*, enumerated among the "nine gems" in the council of king Vicrama; together with Cshapanaca, Sancu, Betalabhata, Ghatacarpura, and Bararuchi (Navaratna, and Bentr. p. 242).

"1083 A. D." (Alst.), end of the chronicle of Marianus Scotus.

Amera Sinha, ninth gem in the council of king Vicrama (Bentr. as. res. viii. p. 242, and Colebr. p. 499) mentions in his dictionary relating to animals the "gavaya" (gayal ox), the spotted axis (*Cervus axis*), the porcine deer (*Cervus* . . .), the black antelope (*Antilopa* . . .), and the painted or white-footed antelope (*Antilopa nilgau*).*

* *Hemidesmus Indicus* of Tropical Hindustan. A shrubby twining Asclepiaceous plant called in Sanscrit "shariva" or "ununta" (Pidd.), in Bengalee and Hindustanee "ununtamul" (J. F. Wats.), in Telinga "soogundapala," in Tamil "nunnari" (Drur.); in which we recognize the "sariva" of the Amara-cosha, — and "sariva" and "ananta" of *Susrutas chik.* 15 to 38: *H. Indicus* was observed by Rheede x. pl. 34 in Malabar; by Graham, "very common" in the environs of Bombay; by Burmann zeyl. pl. 83, Ainslie, Roxburgh, and Wight, as far as Travancore, Ceylon, and Bengal, its root used among the natives particularly for the thrush in children, and by Tamil physicians in cases of strangury and gravel (Drur.). According to Lindley, "a great deal of it is consumed in London now, as a very fine kind of sarsaparilla."

Villarsia Indica of Tropical Hindustan and Ceylon. An aquatic plant "with large reniform

"1084 A. D. = 7th year of the 'youan-foung' of Chin-tsoung" (Chinese chron. table), beginning of the Sixty-third cycle.

The poet Damodara* among the many writers patronized by the Hindu king Bhoja or Vicrama — (Bhoj.-Prab., and H. Wils. ind. dram. ii. 373).

"1085, January" (Nicol.), in a synod at Rome, the excommunication of Henricus IV. by Hildebrand declared null. "May 25th," death of Hildebrand.

Instructions for the use of oil in painting "accipe semen lini," given by the monk Teofilo, called Ruggiero. — An *oil-painting* by Filippo Tesauro dated "1309," is extant; also another, somewhat later, by Stefanone (Bryan dict. paint.).

"1086 A. D. = 'youan-yeou,' 1st year of Tchi-tsoung, of the Soung" or Twenty-first dynasty (Chinese chron. table). The "Ten precepts," each in two Chinese characters, were composed and presented to him by his minister Liu-koung-tchu.

"In this year" (Humb. cosm. ii.), the Chinese statesman See-ma-kuang writing his poem "The Garden."

"May 24th" (Alst., and Nicol.), cardinal Desiderio, under the name of Victor III., elected second pope.

In this year (Pouchet), Constantinus Afer writing on Medicine. — He died "in 1087."

Gentiana acaulis of the alpine portion of Switzerland. Called there "bitterwurz," by the Italians "gariofonaria," and the "cantabrica" of Constantinus, — and Zwinggerus, is referred here by Gesner ii. fig. 86: *G. acaulis* is termed by him "g. minima floribus maximis," and was observed by him on the higher portion of the Alps; by myself, on the crest of the St. Gothard Pass; is termed "g. alpina magno flore" by J. Bauhin iii. 523, "g. grandiflora" by Persoon. (See *Convolvulus cantabrica*).

Pastinaca secacul of the East Mediterranean countries. The *OCULCEA* of Constantinus 352 — is referred here by Sprengel: the "secacul" of the Arabs is mentioned by Christoph. de Honestis comm. Mesul: *P. sacacul* was observed by Rauwolf, and Russel, in Syria. From transported specimens is described by Miller, and Ventenat hort. c. pl. 78.

"1087 A. D." (ann. Jap., and art de verif.), Surakawa succeeded by his second son Foricawa, now seventy-third daïro of Japan.

"The same year" (Alst.), end of the chronicle of Leo Hostiensis.

"1088, March 12th" (Nicol.), Victor III. succeeded by Otho of France or Urbanus II., third pope. William II. Rufus ruling England; and Philip, France.

orbicular leaves" (Graham); and the "syadanantotpala," with which the "syama" is identified in the Amara-cosha, — is according to the commentator a name arising from the flowers of the "syama" (*Ichnocarpus*) resembling those of the "utpala," an aquatic plant: the "utpala" is mentioned also by Susrutas, and is referred to this tribe by W. Jones as. res. iv. 263: *V. Indica* was observed by Rheede xi. pl. 28 in Malabar; by Graham, in "tanks throughout the Concans;" by Roxburgh, in Eastern Hindustan; is known to grow also on Ceylon (Pers.). By European colonists, was carried to Austral Africa, and to Jamaica (Sloane pl. 352, and Pers.).

Hydrocolea Zeylanica of Tropical Hindustan and the Siamese countries. An annual herb called in Sanscrit "languli" (Pidd.), in Bengalee "kauchra ishalangulya" (Drur.) or "isholangolya" (W. Jones); in which we recognize the "langali" of the Amara-cosha, — and Susrutas sutr. 36 to chik. 8: *H. Zeylanica* was observed by Rheede x. pl. 28 in Malabar; by Graham, on "margins of tanks throughout the Concans;" by Burmann pl. 2, W. Jones as. res. iv. 270. Roxburgh, Wight, and Drury, in marshy places as far as Ceylon and Bengal, the leaves beaten into a pulp applied to ulcers; by Mason, in Burmah; and is known to grow as far as Java (Linn. mant. 54).

Piper chaba of the Malayan archipelago. Imported *island long pepper* is called in Sanscrit "chuveya" (Pidd.) or "chuvee" or "chuyung" or "chuvika" or "chuvikung" (Roxb.), in Bengalee and Hindustanee "choee" (Pidd.) or "chayi" or "chava" (W. Jones), in the Taleef Shereef "chaab" (J. F. Wats.); in which we recognize the "chavya" or "chavica" of the Amara-cosha — (W. Jones as. res. iv. 303), and Susrutas sutr. 44 to chik. 37: *P. chaba* or its fruit was seen by Jordanus in "India the Greater," by Nicolo Conti on "Sciamuthera" (Sumatra); the living plant is described by Rumphius v. pl. 116, and was observed in the Malayan archipelago by Blume. According to Lindley, "its properties appear to be the same as those of *Piper longum*."

* *Chonemorpha dichotoma* of Eastern Hindustan. A twining Apocynous plant called in Sanscrit "vishulya-krit" (Pidd.); and the "visalya" of Damodara hanum.-nat. 13, a drug from the mountains, — mentioned also by Susrutas sutr. 25 to chik. 15, may be compared: *C. dichotoma* is described by Roxburgh ii. 10 as observed by him in Bengal. "From Bengal," was introduced by Nimmo into the environs of Bombay (Graham).

"The same year" (Blair), the Northern division of Portugal wrested from the Muslims by Alphonso VI. of Castile, and bestowed by him on his son-in-law Henricus. The origin of the independent kingdom of Portugal.

"1089 A. D. (= 481 A. H." of Ferisht., Elph.), end of the reign of Ibrahim, sultan of Ghazni.

"1090 A. D." (Alst.), Samuel Marochianus, a convert from Judaism to Christianity, writing against the Jews.

"Towards the close of the Eleventh century" (Hyde relat. vet. Pers. 209, and Pouchet), the calendar not having been corrected in Persia for more than "four thousand" years, the astronomers were assembled by Melek Shah; and one of them, Omar Cheyam, found the length of the solar year "365d. 5h. 48m. 48s."

"1091 A. D." (Nicol.), a synod at Leon in Spain. *Gaulish writing* was "substituted for that of the Goths in the books of the church;" and the Liturgy of Isidorus, ordered to be "made conformable to that of Rome."

"In or about this year" (Garc. de la Vega, and addit. art de verif.), Sinchi-Roca succeeded by his son Lloque Yupanqui, now third Inca of Peru. Who changed the policy hitherto pursued, raised an army, and extended his dominion by military conquests.*—According to G. de la Vega i. 2. 18, he conquered and annexed the district of Canas, South of Cuzco.

"1092 A. D.," as appears from Karmatic inscriptions on the building (copied by Marcel p. 116), the nilometer at Rhoda repaired.

"The same year" (Nicol.), by a synod at Szabolchs in Hungary, a *code of laws*, civil and ecclesiastical, compiled.

"1093 A. D." (Nicol.), a synod at Rheims. Robert, earl of Flanders, was "compelled to resign the appointments of clerks;" and a bishop was promised to the clergy of Arras by pope Urbanus II.

"The same year" (Lubke and Lutrow), building of the church at Laach on the Rhine commenced.—"After many interruptions," the edifice was completed "in 1156."

"1094, March 11th and 12th" (Nicol.), decision by a synod at Rockingham castle, That "the archbishop of Canterbury should not promise obedience to, or request the pall" (mantle of state) "from pope Urbanus II. without the king's consent."

"The same year" (art de verif.), Mostanser succeeded by Mostaali, of the Fatimite dynasty, sixth sultan of Egypt.

"1095, March 1st to 7th" (Nicol.), a synod at Plaisance in Lombardy. Aid against the Muslims was requested by the Byzantine emperor: inaugurating the *Crusades*; the first one now beginning to be preached by Peter the hermit throughout Europe.

"The same year" (Nicol.), a synod in England. Against Anselm archbishop of Canterbury, who had received the "pall" from pope Urbanus II. "without the king's consent."

"1096, February" (Nicol.), a synod at Rouen in France. Among other canons instituted, was one prohibiting "the wearing of long hair."

"In this year" (Sm. b. d.), arrival before Constantinople of the first Crusaders; an undisciplined body of men under Peter the hermit; they were allowed to pass into Asia, where they were massacred by the inhabitants.

"1097 A. D." (Sm. b. d.), a powerful army of Crusaders under Godfrey of Bouillon advancing into Asia, enabling the Greek emperor Alexius Comnenus to extend his authority over all Asia Minor.

Malva Tournefortiana of the Mediterranean seashore. Called in Greece "möllöha," or by the Turks "æbedjumez" (Forsk.) the *πρασμολοχα* enumerated as esculent by Hierophilus the sophist De alim.,—mentioned also in anon. De mens., may be compared: *M. Tournefortiana* was observed by Forskal, Sibthorp, and Gittard, in calcareous soil along the seashore from the Peloponnesus and Greek islands as far as the Dardanelles. Westward, is termed "alcea minor maritima tenuifolia procumbens" by Hermann par. pl. 2, "a. maritima galloprovincialis geranii folio" by Tournefort inst. 98; and is known to grow on the seashore of Southern France and Spain (Lam. fl. fr., Cav., and Pers.).

Laserpitium aquilegifolium of the East Mediterranean countries. The *πεπεροκυμνον* of Hierophilus the sophist De alim.,—may be compared: *L. aquilegifolium* was observed by Sibthorp in shady woods on the Bithynian Olympus; and farther North and West, is known to grow on stony hills in

* *Ilex Paraguayensis* of the Upper Paraguay. A shrub indigenous there, and its leaves called "maté" or *Paraguay tea* collected from early times and drank in infusion, cultivated besides for the same purpose by the natives,—the cultivation continuing in the same district to the present day (A. Saint-Hilaire, and A. Dec.). Transported to Rio Janeiro, was seen under cultivation by A. Saint-Hilaire, and is termed "cassine gongonha" by Martius (Lindl.).

Austria (Jacq. austr. pl. 145, and Pers.). The seeds of at least some species of *Laserpitium* are excessively bitter (see *L. siler*).

"Dec. 13th" (Nicol.), a synod at Gironne. "For the maintenance of ecclesiastical liberties."

"1098 A. D. (= 492 A. H.) of Ferisht., Elph.), accession of Masaud II. as sultan of Ghazni. — His generals carried on war beyond the Ganges, and for some years he resided with his court at Lahore.

"1099, July 15th" (Blair, and Marcel), capture of Jerusalem by the Crusaders, after journeying all the way by land; and their leader, Godfrey Baldwin, established in the city as king.

"Aug. 13th" (Alst., and Nicol.), Urbanus II. succeeded by cardinal Rainer or Paschalis II., fourth pope. Paschalis II. first employed the "Years of his pontificate" in dating his Bulls.

"In this year" (Bentl. as. res. viii. 243), the Bhasvati composed by a pupil of the Hindu astronomer Varaha Mihira.

"In this year" (palm-leaf ann. Jag., and W. W. Hunter), Sujan Kesari succeeded by Salini Kesari, now king of Orissa. — His queen built the Nat Mandir or dancing-hall of the Siva temple at Bhuvaneswar.

"1100 A. D." (Nicol.), a synod at Lambeth. Proof was given by Maud daughter of Malcolm III. of Scotland, That she had not entered the religious life by her own choice, or by the vow of her parents.

About this time, "942 to 1227 A. D." (J. Nicholson in Kitt. cycl. bibl.), the Samaritan Arabic version of the Bible, by Abu Sa'id: — the last named date, being that of the Barberini manuscript copy.

"1100 to 1101 A. D." (De Wailly pl. xiv. 1), manuscripts of this date presenting the following form of the letter t .

One hundred and sixty-second generation. Jan. 1st, 1101, onward mostly beyond youth: the Jewish writers, Abraham ben Chijja, Solomon ben Isaac, Buchaji, Meir ben Isaac, and Peter Alphonso: the Arab writers, Ghazali, Elzaharawi (Abulcasis) d. 1106 or "1122" (Casiri): the Greek writers, Euthymius Zigabenus, d. after 1118, Theophylactus bishop of Bulgaria d. 1112, Michael Glycas d. 1118, Joannes Cinnamus d. 1118, Joannes Zonaras d. after 1118, Poellus d. after 1105: Hildebertus, Rupertus Tutiensis abbas, Theodoricus abbas Leodiensis, Bernhardus Cluniacensis, Zacharias Chrysopolitanus, Godfridus Vindocinensis, Berengosius, Algerus: the scholastic theologians, Petrus Cluniacensis: the Slavonic writers, Vladimir, V. Monomach, Sylvester of Perejaslavl, and Hegumen Daniel: the Icelandic writer Thorlak Runolfson.

"The same year = 'kian-tchoung-king-koue,' 1st year of Hoei-tsoung, of the Soung" or Twenty-first dynasty — (Chinese chron. table).

"The same year" (Alst.), end of the chronicle of Bertholdus Constantiensis.

"The same year" (art de verif.), Mostaali succeeded by El-Amr of the Fatimite dynasty, seventh sultan of Egypt. A coin issued at Alexandria by El-Amr, is figured in Marcel 126.

"1102 A. D." (T. Wright early trav. Pal., and D'Avezac), pilgrims now thronging to Palestine, and on "Sunday Oct. 12th," the wreck of all but seven out of "thirty very large ships" in the unsafe port of Jaffa, "more than a thousand" persons perishing, witnessed by Sæwulf.

"1104 A. D." (Nicol.), a synod at Rome. Bruno archbishop of Treves was "reprimanded for receiving investiture from the emperor" Henricus IV.

"1105, March 26th" (Nicol.), a synod at Rome. The earl of Mellent and his associates were excommunicated, for supporting the right of the king of England to invest bishops.

"May 29th" (Nicol.), in a synod at Quedlimbourg in Thuringia, prince Henricus rebelling against his father "declared, That he had accepted the sceptre against his own will, and was willing to surrender it." The Diet assembling at Mayence on "Christmas day," Henricus IV. was deposed, and his son Henricus V. crowned emperor by the archbishop of Mayence.

"The same year" (Nicol.), a synod at Florence. "Against the bishop of that city, who averred, That Antichrist was already born."

In this year (= "1027 + 25 + 53 yrs." of Kalhan. hist. Cashm., H. H. Wils. ind. dram. ii. 260), Ananta succeeded by his son Kalasa, now king of Cashmere.

"1106, October" (Nicol.), a synod assembled at Lisieux by king Henry of England. The regulations made, "were rather civil than ecclesiastical, and the lay lords present were more numerous than the bishops."

"The same year" (S. D. in Kitt. cycl. bibl.), date of the *Hebrew manuscript* "154 Kennicott;" the oldest one extant, so far as ascertained; for those conjectured to be older are devoid of any accurate register of their antiquity. — Of private manuscripts in the Rabbinical character, none are more than "five hundred" years old.

"1107 A. D. = 1st year of the 'ta-kouan' of Hoei-tsoung" — (Chinese chron. table).

"1108 A. D. (= 1768th of Synmu," art de verif.), Foricawa succeeded by his eldest son To-ba, now daio of Japan.

"The same year = 2d year ta-kouan" (topog. Cant., and Pauth. 473), the provinces of Tchekiang, Fo-kien, and Kouang-toung, assigned for the admission of foreign ships: a supplementary officer was sent to Tchintcheou. — The following year, foreign merchants wished to visit other ports; and after giving assurance that they had no prohibited articles, were permitted, and were furnished with arms for their defence.

As early as this date, Nicolaus Praepositus writing. He mentions Roger son of Robert Guiscard — "who died in 1111" (Spreng.).

The *gallia muscata* of Nicolaus Praepositus, — and Franciscus Pedemontium, is perhaps *civet* (a perfume procured from a weasel-like animal, *Viverra zibetha*): the "zubbad" is mentioned by Edrisi, and Ebn Baitar; the "zapētīōn," by Actuarius: civet was seen by Cadamosto on the Gambia; by Baumgarten i. 28 in Egypt; by Alpinus iii. 15, used there medicinally; and by myself, a well-known article of commerce at Mocha. The civet animal was found by Browne kept in cages in Darfour, and wild farther South.

Campanula rapunculus of middle Europe. Called in Britain *rampion*, in France "raiponce," in medieval Latin "rapunculus" (Prior): the *rape silvestris* of Nicolaus Praepositus 106 — may be compared: *C. rapunculus* is described by Columna ecphr. i. p. 225; is termed "rapunculus esculentus" by C. Bauhin pin. 92; was observed by Forskal near Marseilles; and is known to grow throughout middle Europe as far as Denmark and Gothland (Pers., and A. Dec.). Was cultivated in Europe for its esculent tubers prior to the introduction of the potato, had become spontaneous in Britain before the days of Ray syn. p. 277, and is regarded by Watson as perhaps exotic there and only naturalized.*

Leontodon taraxacum of Subarctic climates. Called in Britain *swine's snout* or *dandelion*, in France "dent de lion" (Prior), in Germany "löwenzahn," in Italy "tarassaco" (Lenz), in Greece "agriōmarōulia" (Sibth.) or "pikraphakē" (Fraas); in which we recognize the *ταράχιον* of Nicolaus Praepositus — (identified with the "aborsus porcinus" by Marco Gatinaría), and the "rostrum porcinum" of Matthæus Sylvaticus pand. 610; — a name changed according to Ortus sanitatis 152 to 226 by surgeon Wilhelmus to "dens leonis," continued to the present day in "a similar name in nearly every European language" (Prior): *L. taraxacum* is termed "dens leonis latiore folio" by Tournefort inst. 468; was observed by Desfontaines ii. p. 228 in Barbary, by Moris in Sardinia, by Lenz in Italy, and is known to grow throughout middle and Northern Europe as far as Lapland, Spitzbergen, and Iceland (Hook., Wats., and Fries). Eastward, was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus and summit of Taygetus to Caria and Constantinople; is known to grow also along the Taurian mountains and throughout Siberia to Kamtschatka (Bieb., and Ledeb.); was observed by Kaempfer, and Thunberg, along roadsides in Japan and called "fosei," or usually "fudsina" or "tsugumi gusa" or "tampopo." Farther East, is known to grow from Bering's Island to the American continent, the Rocky mountains, Saskatchewan river, Melville Island, Labrador, and Greenland (Hook., R. Brown, and Meyer), in our Northern States multiplying in grass-grown clearings. Clearly by European colonists, was carried to Madeira, and Mexico (A. Dec.), and to the Mauritius Islands (Boj.).

Zacintha verrucosa of the Mediterranean countries. An annual called in Greece "ōrnithōkōli" or "karavithōhōrtōn," and the *SYLVESTRIS ENDIVIA* prescribed in medicinal syrup by Nicolaus Florentinus — is described by Caesalpinus xiii. 9 as springing in neglected gardens, more than a cubit high, branching and leafy with a yellow flower in the axils of the leaves: *Z. verrucosa* is termed "z. sive cichorium verrucarium" by Tournefort inst. 476; and is known to occur in Italy and Southern France (All., and Pers.). Eastward, was observed by Forskal, Sibthorp, and Chaubard, from Crete and other Greek islands to the Peloponnesus and Mount Athos.

"1110 A. D." (Nicol.), in a synod at Constantinople, convened against the heresy of the Bogomiles, a constitution respecting the election and duties of bishops, was published by the emperor Alexis Comnena.

"The same year" (Blair), learning revived at the University of Cambridge.

Egopodium podagraria of Europe and the adjoining portion of Asia. A ferulaceous plant called in Britain *gout-wort* or *gout-weed* or *ax-weed* or *ash-weed* (Mylnes, and Prior), in which we

* *Galeopsis tetrahit* of Northern Europe and Asia. Called in Britain *bee-nettle* or *hemp-nettle* or *hemp-deadnettle* (Prior): the *herbe tetrahit* of Nicolaus Praepositus 125, — and Matthæus Platearius f. 251, is referred here by writers: *G. tetrahit* is known to occur from Switzerland to the Northern extreme of Lapland in "Lat. 71°" (Martins, and A. Dec.); also in Northern Asia (Wats.). Possibly by European colonists carried to Iceland, where it was observed by Hooker; clearly by European colonists carried to Northeast America, where it has been observed by myself in cultivated ground from Lat. 48° on the Lower St. Lawrence throughout New England.

recognize the *Æscythrotu* of Anglo-Saxon glossaries, — referred here by Cockayne: *Æ. podagraria* is described by Dodoens pempt. 320; is termed “angelica sylvestris minor sive erratica” by Tournefort inst. 313; is known to grow along hedges throughout middle Europe as far as Denmark (fl. Dan. pl. 607, Engl. bot. pl. 940, and Pers.). Eastward, was observed by Sibthorp and Chaboud, in the Peloponnesus.*

“Dec. 19th” (T. Wright early trav. Pal.), “Saet” or Sidon captured by Godfrey Baldwin and the crusaders; Sigurd, brother of the king of Norway, co-operating with a fleet.

“The same year” (Abul-Fazil, and Wilford as. res. ix. 168), Jidahana, king of Delhi, slain in battle against Bala-deva of the legitimate Chauhana family.

“1111, Feb. 12th” (Nicol.), a synod at Latran, wherein Henricus V. “instead of resigning the right of investiture as he had previously agreed to do,” took the pope prisoner. He compelled a treaty, signed “April 11th,” whereby the emperor resumed his right.

“The same year = 1st year of the ‘tching-ho’ of Hoi-tsoung” — (Chinese chron. table).

“The same year” (Clint. iv. p. 835, see also Alst.), end of the chronicle of Sigebertus Gemblacensis.

Spiræa filipendula of middle and Northern Europe. Called in Britain *dropwort* (Turn. iii. 31, and Prior), in Anglo-Saxon “dropeworte” (gl. Laud. 553, and ms. Bodl. 536); described by Matthæus Platearius f. 237, — and termed “oenanthe” by Fuchsius 562 (Spreng.): common according to Lindley “in pastures in elevated situations” in Britain; known to grow also from Denmark to middle France (fl. Dan. pl. 935, Pers., and A. Dec.). Eastward, the “philipenthōula” is mentioned by Nicolaus Myrepsus 40. *S. filipendula* according to Lindley is accounted tonic on account of its “bitter astringent qualities.”

“1112, or thereabouts” (Nicol.), by a synod in Jerusalem, the emperor Henricus V. excommunicated.

“1113 A. D. (= 1027 + 25 + 53 + 8 yrs” of Kalhan. hist. Cashm., H. H. Wils.), Kalasa succeeded by Utkarsha, and after “twenty-two days” by Harsha, now king of Cashmere. Harsha patronized literature, and was acquainted with various languages.

Somadeva, the author of the Vrihat-Katha, at this time writing — (H. H. Wils. ind. dram. ii. 257).

“In this year” (Alst.), a military monastic Order founded, that of the Knights of St. John of Jerusalem. — Some centuries later, this Order of monks, under the name “Knights of Malta,” exercised great influence throughout the Mediterranean: until the seizure of their island by Buonaparte.

“1114 A. D. (= 508 A. H.” of Ferisht, Elph.), Masaud II. succeeded by his son Arslan, now sultan of Ghazni.

“In this year (= 1036 an. Saca,” Colebrooke as. res. ix. 351), birth of the Hindu astronomer Bhascara.

In this year = “4th year tching-ho” (topog. Cant., and Pauth. p. 473), tribute of *precious stones*, *rhinoceros* horns, and *elephants’* teeth, sent by the ship-captains.

About this time (“between 1111 and 1117,” Humb. cosm. ii.), the manner of measuring the Westerly *variation of the magnetic needle* mentioned in the Chinese Pentsaoyan as long understood.

“1115 A. D.” (Chinese chron. table), the name Tai-tsoo and the title “ti” or emperor, assumed by the Tartar chief of the Kin; now in possession of the Northern portion of China.

“After Christmas” (Nicol.), a synod in Syria. Arnulph, patriarch of Jerusalem, was deposed.

“1116, March 20th” (Nicol.), a synod at Salisbury. Wherein, king Henry being present, an attempt was made to compel Thurstan, archbishop of York, to promise obedience to the archbishop of Canterbury.

“In this year (= 510 A. H.,” Edrisi, and Jaub.), a palace built at Ghana in Soudan by the Muslim ruler of the city and country.

Canavalia ensiformis of Tropical Africa. Seeds of the *sword bean* are called in Egypt “ful djellabe” or “ful barabra” (Forsk.), and the plant in Hindustanee “suffaid” or “lal kudsumbal,” in Telinga “yerra” or “tellya tumbetten-kaya,” in Tamil “segapoo” or “vella thumbetten,” in Bengalee “mekhun shirn” (Drur.), in Burmah “pai-noung-nee” (Mason), on the Philippines “habas” or on Leite “magtambocao” (Blanco): known from early times: — *C. ensiformis* is known to occur in Equatorial Africa (A. Dec.); a species regarded as probably identical was observed by Grant at Chopeh in N. Lat. 2° on the Nile, the “Wanyamuezi spin its beans as an amusement;” and “dolichos

* *Mentha citrata* of middle Europe. Called in Britain *bergamot mint* (Prior): the *balsmethan* of didax. 15, — or “balsaminta” of gloss. m., is referred here by Cockayne: *M. citrata* is termed “*m. rubra*” by Miller (Steud.); and is known to grow in Germany and Britain (Ehrh., Smith brit. ii. p. 616, and Pers.). The plant according to Lindley “furnishes a fragrant oil, having very much the odour of bergamot.”

faba nigrita” was observed by Forskal p. 133 a single stock under cultivation at Djidda, and beans brought by caravans from Abyssinia worn by Egyptian women and children for ornament. Eastward, *C. ensiformis* was observed by Rheede viii. pl. 44 in Malabar; by Graham, “commonly cultivated” in the environs of Bombay, “varieties with red and white flowers, the half grown pods are eaten;” by Drury, “cultivated in the Peninsula” for “its esculent pods,” also “a common plant in hedges and thickets” (naturalized); by Roxburgh, and Wight, as far as Bengal; by Mason v. 466 “exotic” in Burmah, cultivated “to a small extent, and its young pods” eaten; is described by Rumphius v. pl. 135; was seen by Blanco at Batangas village on the Philippines, the flowers white, and young pods eaten. By European colonists, was carried to Jamaica prior to the visit of Sloane i. pl. 114 (Pers.).

“In this year (= 6th year ‘tching-ho’ of Hoei-tsoung,” Remus. iii. 86), arrival in China of Seng-ka or Kieou-ma-seng-ka, ambassador from Cambodia bearing tribute.

“1117, April” (Nicol.), a synod at Benevento. Wherein the archbishop of Braga was excommunicated, for crowning Henricus V. at Rome during the absence of the pope.

“In or about this year” (according to Klaproth) the *mariner’s compass* brought from China by the Arabs. — It is mentioned as long known in Europe in a poem by Guyot of Provence “in 1199” (Whewell, Kobell iv., and Humb. cosm. v.); the “shipman’s stone that draws the needle to it” is also mentioned by Maundeville xiv.

“1118, Jan. 25th” (Alst., and Nicol.), Paschalis II. succeeded by cardinal John Gaetano or Gelasius II., fifth pope. Louis VI. ruling France; and Alexander, Scotland.

“The same year” (Alst.), Alexius Comnenus succeeded by his son Joannes II. or Calo-Joannes, fifty-second Byzantine emperor.

“The same year” (Nicol.), in a synod at Rouen, king Henry of England “treated with the lords and the archbishop of Canterbury concerning the peace of the realm, whilst Geoffry bishop of Rouen treated of the affairs of the church.”

“In this year (= 512 A. H.” of Ferisht., Elph.), Arslan succeeded by his brother Debram, now sultan of Ghazni. He patronized Literature, — and the Persian poet Nizami resided at his court.

“1119, Feb. 1st” (Alst., and Nicol.), Gelasius II. succeeded by Guy archbishop of Vienne, now Calixtus II. sixth pope.

“The same year” (Alst.), founding of a second military monastic Order, the Knights Templars. — Nine years later (Nicol.), a synod was convened at Troyes, on “the rule and habit to be given” to these military monks.

“1120 A. D. = end of the Fourteenth manwantara,” and of the Graha Munjari tables. None of the Puranas, “in the form they now stand, are older than” this date; — some “are the compilations of still later times” (Bentl. as. res. viii. p. 241).

“In this year (= second year siouan-ho of Hoei-tsoung,” Remus. mel. iii. 88), arrival in China of Ma-la-ma-thou-fang, ambassador from Cambodia bearing tribute.*

“1121 A. D.” (Pouchet, and Major), sailing of bishop Eric from Greenland for Vinland, “to convert his countrymen.”

“1122 A. D.” (Nicol.), by a synod at Soissons, Abelard “compelled to burn his book concerning the Trinity.”

“1123 A. D. = 1st year of the ‘thian-hoei’ of Tai-tsoung of the Kin;” ruling Northern China, while in the South, the Soung dynasty continued — Chinese chron. table).

“March 18th to April 5th” (Nicol.), general Councils no longer held in the East, but the Ninth general ecclesiastical Council assembled at the Lateran in Rome. Marriage among priests was condemned by pope Calixtus II., an additional fast-day instituted, and dissent from the Catholic church prohibited (Alst.).

* *Ocymum sanctum* of Tropical Hindustan. Called in Hindustan “tulsi” or “tulosi,” in Sanscrit “vrinda” or “cut’heraca” or “cat’hinjara” or “tulasi” (W. Jones), in the environs of Bombay “kala toolsee” (Graham), in which we recognize the plant into which the nymph Tulasi is said in the Puranas to have been metamorphosed: — the “tulasi” plant according to H. H. Wilson hind. dram. i. p. 21 continues to be worshipped in some Bengal families as their tutelary divinity or household god: *O. sanctum* is described by Rumphius v. pl. 92; was observed in Hindustan by Rheede x. pl. 86, and Roxburgh; by W. Jones as. res. iv. p. 288, “one or two feet high,” the whole plant having “a dusky purplish hue” and “thence perhaps” held “sacred to Crishna;” by Graham, “common in gardens and about Hindu temples everywhere.” Farther East, is enumerated by Mason v. p. 438 and 790 as “exotic” in Burmah and frequent around dwellings of the Karens: was observed by Blanco on the Philippines, used by the natives, and called in Tagalo “balanoi.” A species of *Ocymum* observed by myself on the top of a column near a Hindu temple seemed the same aboriginally introduced throughout the Feejeean, Samoan, and Taheitian Islands, met with around the native dwellings, and in one instance at Taheiti planted on a grave.

"1124 A. D. (= 1784th of Synmu," art de verif.), To-ba succeeded by his eldest son Sintoku, now dairo of Japan.*

Acacia (Albizia) nemu of Japan. Having native names (Thunb.), and clearly not a Tropical tree :—observed in Japan by Kaempfer v. 840, and Thunberg. Westward, the "djul ilrzim" seen by Forskal in gardens at Constantinople, by Bory under cultivation in Greece, or the "A. julibrissin" of Scopoli delic. pl. 8, seems identical. Transported to North America, this tree continues planted for ornament in our Southern States, and was observed by myself well-grown and in flourishing condition as far as Philadelphia.

"After Dec. 12th" (Nicol.), Calixtus II. succeeded by Lambert bishop of Ostia, now Honorius II. seventh pope.

"In or about this year" (Marcel), the Bathenians or Hassassins, a fanatical sect, founded by Ismael : who, establishing himself in the mountains near Damascus, within the new Christian kingdom, rendered himself formidable all around through his secret emissaries.—The Bathenians are mentioned by Hedessi, and Benjamin de Tudela (Jost. p. 145, and note to Steinschneid. ii. 14) ; and though said to have been exterminated by the Egyptian sultan Beybars, continued extant in the days of Ebn Batuta ; and a remnant termed "Fedouis," was found in the environs of Laodicea by Van Ghistele (Voyag. Belg.).

"1125 A. D." (Lassen, and Buns. iv. 7. 1), the Chronicle of Cashmere composed. Or (according to Kalhana, and H. H. Wilson ind. dram. ii. 260) end of the reign of Harsha king of Cashmere.

"1126 A. D. = 'king-kang,' 1st year of King-tsoung II., of the Soung" or Twenty-first dynasty —(Chinese chron. table).

"In or about this year" (= 1156 — "about 30 years," G. de la Vega, and addit. art de verif.), Lloque Yupanqui succeeded by his son Mayta Capac, now fourth Inca of Peru. Who continued his father's policy, making military conquests,† — and enlarged the bounds of his dominion.

* *Kerria Japonica* of Japan. A weak-stemmed shrub whose flowers were dried and used medicinally as early probably as this date :—observed by Kaempfer v. 344, and Thunberg, in Southern Japan, growing spontaneously and cultivated besides for its ornamental yellow flowers ; described also by Houttuyn vii. pl. 45. Transported to Europe and North America, has become frequent in gardens.

Cydonia Japonica of Japan. Usually a shrub but sometimes becoming a tree, its fruit edible :—observed in Japan by Kaempfer v. 884, by Thunberg, wild on Mount Fakon. Transported to Europe and North America, the *scarlet-flowered quince* has become frequent in gardens.

Saxifraga sarmentosa of Japan. Herbaceous and ornamental, with long creeping or pendent stolons bearing propagated plants :—observed in Japan by Kaempfer v. 870, by Thunberg, among the mountains of Nippon. Transported to Europe and North America, the plant has become a favourite in parlours and greenhouses.

Amaryllis (Verine) Sarniensis of Japan. A lily-like plant called in Anam "tuyen thao," in China "hiuien tsao" (Lour.) ; in Japan "seki san" or "sibito banna" (Thunb.), and its root known to the natives as poisonous as early probably as this date :—observed in Japan by Kaempfer, by Thunberg, on the hills around Nagasaki ; by Loureiro, cultivated for ornament by the Chinese as far as Anam. Transported to Europe, the "narcissus Japonicus" according to Cornuti pl. 158 first flowered "in 1634" (see also Beckmann) : bulbs from a stranding vessel afterwards took root on the seashore of Guernsey, where the plant maintained itself for many years (A. Dec.). By European colonists, was carried to Austral Africa (Pers.).

Funkia Japonica of Japan. White-flowered and lily-like, cultivated there for ornament as early probably as this date :—observed in Japan by Kaempfer v. 863, by Thunberg, both wild and cultivated. Transported to Europe, the plant has become frequent in greenhouses.

Hemerocallis fulva of China and Japan. The *day-lily* is called in Anam "rau hien," in China "kim cham hoa" (Lour.) ; in Japan "ken" or "kwanso" (Thunb.), and cultivated there as early probably as this date :—observed in Japan by Kaempfer v. 872, by Thunberg, growing spontaneously here and there and often cultivated. Westward, was observed by Loureiro under cultivation in China and Anam ; by Mason, "exotic" in Burmah, but no native name given ; by Roxburgh, and Graham, "in gardens" in Hindustan "introduced," and no native name given ; the plant may have reached Europe before the Voyage of Columbus, being termed "*lilium obsoleto flore rubens*" by Dodoens 204 (Spreng.). By European colonists, was carried to Northeast America, where it continues frequent in gardens, and escaping according to A. Gray, has been sometimes found springing up spontaneously.

† *Ionidium microphyllum* of the Equatorial Andes. A Violoid plant called at the foot of Chimborazo "cuichunchulli" (Lindl.), and from early times regarded as a specific in tubercular ele-

"In this year" (Angrim. Jonas, and Relation du Groenl. 201), the Greenland bishop Arnaud, on his way to Norway, shipwrecked on Iceland: and among the articles thrown on shore were "dentes balenarum pretiosi" (*Monoceros unicornu*) inscribed by some sailor with Runic letters so that he could reclaim them. Arnaud or Arnold (according to Major edit. Zen. p. lxxv) set up the episcopal seat at Gardar.

"1127 A. D. = 'kien-yen,' 1st year of Kao-tsoung II., of the Soung" or Twenty-first dynasty (Chinese chron. table). The seat of government was removed by Kao-tsoung II. to Nan-king; — and afterwards, farther South to Hang-tcheou (Pauth. 346).

"November" (Nicol.), in a synod at Troie, the excommunication of Roger II. Norman king of Sicily for assuming the title "duke of Pouille and Calabria," was confirmed.

The same year = "1st year kien-yen" (topog. Cant., and Pauth. 346), a great scarcity of metals having been produced by over-exportation, clandestinely carried on in spite of the severity of the laws, an edict: That many useless things being imported, *precious stones* for rings etc. might be purchased with *silver*, and if the foreigners were fraudulent the Chinese would be severely punished. Officers of the government were however permitted to receive *elephants'* teeth, and *rhinoceros'* horns.

Books in the Tagalo language written by the natives of the Philippine Islands as early probably as this date.*

phantiasis — (Bancroft): observed by Humboldt and Bonpland pl. 495 among rocks at Lactacunga in Quito.

Arracacha esculenta of the Bogotan Andes. An Umbelliferous plant cultivated from early times for its edible root: — described by Bancroft.

Cestrum Mutisii of the Bogotan Andes. Called there "uvilla" (Humb. iv. 10), its fruit furnishing a dye known from early times, — and to the present day used for ink in the city of Bogota: observed and described by Humboldt and Bonpland.

Festuca quadridentata of the Equatorial Andes. A grass called "pigouil" by the natives of Quito (Lindl.), and known from early times as very poisonous and fatal to animals: — observed by Humboldt and Bonpland i. pl. 160 (Pereir. in med. gaz. xvii. pl. 6).

* *Uvaria amuyon* of the Philippines. A tree called in Tagalo "amuyon" (Blanco); its seeds employed medicinally, and according to the books of the country a counter-poison: — observed by Blanco.

Impatiens (Hydrocera) triflora of Ceylon. Called in Tagalo and Pampango "camantigui," in Bisaya "Surañga" or "solañga" (Blanco); and in ancient times according to history, its leaves used by women to paint themselves: — observed by Blanco cultivated by the natives on the Philippines; by Blume, on Java; by Mason in Burmah, enumerated as indigenous; by Hermann par. pl. 105, and Burmann pl. 116, in the marshes of Ceylon (Pers.).

Mocanera thurifera of the Philippines. A large tree called in Tagalo "lavaan" or "sandana," in Bisaya "lavaan" (Blanco); and in ancient times, used in ship-building — (P. Gaspar): observed by Blanco common in Bisayas, Tagalos, and elsewhere.

Mocanera verniciflua of the Philippines. A tree called in Tagalo "malapaho" or "balao" or "panao" (Blanco), yielding the fluid resin mentioned in the books under the name of "malapajo" and "balao," — and to the present day sold for varnish: growing according to Blanco in Bisayas and various places of the Tagalos, common.

Mocanera grandiflora of the Philippines. A large tree called in Tagalo "apiton" or "hapiton" (Blanco), yielding a very similar resin, furnishing besides large canoes and planks for house-building: — observed by Blanco in Bisayas, Marinduque, Mindoro, and other places.

Nauclea lutea of the Philippines. A large Cinchonoid tree called in Tagalo "bangcal," in Pampango "bancal," in Bisaya "bancal" or "gabag hanbabalos," in Ylocano "bulala" (Blanco); and before the arrival of the Spaniards, used by the Bisaya for "ataudes" for their dead: — observed by Blanco, the wood yellow.

Premna odorata of the Philippines. A Verbenaceous tree called "alagao," in Bisaya "adgao" or "pamuhat," in Ylocano "anobran," in Pampango "tanglay maloto" (Blanco), and mentioned in the books; its dried flowers from early times employed medicinally: — growing on all the islands, according to Blanco.

Clerodendron fortunatum of the Philippines. A Verbenaceous shrub called in Tagalo "caso-pañgil gubat" (Blanco); and the superstitious belief giving rise to the name, as early probably as this date: at the same time, cutting a flower of the unfortunate species was believed to cause the breaking of some article in the house: — *C. fortunatum* was observed by Blanco on the Philippines; is described also by Osbeck trav. pl. 11.

Clerodendron infortunatum of Tropical Hindustan and the Malayan archipelago. A shrub called in Sanscrit "bhanti" or "bhantaca," in Bengalee "bhant" (J. F. Wats.), in Telinga "bock-

"1128 A. D." (Nicol.), a synod at Ravenna. "The patriarchs of Aquila and of Venice, or of Grado," were deposed.

"In this year (= 2d year kian-yan of Kao-tsoung," Remus. mel. iii. 88), the prince of Cambodia raised to the dignity of king.

"1130, Feb. 15th" (Nicol.), Honorius II. succeeded by cardinal Gregory now Innocentius II., eighth pope. Lotharius II. ruling Germany and Italy; and David, Scotland.

"The same year" (art de verif), El-Amr assassinated by emissaries of Ismael; and the accession of El-Hafez of the Fatimite dynasty, eighth sultan of Egypt. A coin issued by El-Hafez at Alexandria is figured in Marcel p. 127.

"1131, Oct. 19th" (Nicol.), a synod at Rheims. Wherein "seventeen canons were published:" one of them, prohibiting "canons regular and monks" from acting either as "pleaders or physicians;" and another, prohibiting *tournaments*.

The "Dhanvantari" enumerated as the "Seventh" gem in the council of king Vicrama (Nava-ratna, and Benth. as. res. viii. 243) is perhaps the Sanscrit medical writer Susruta* (called a "pupil

ada" (Drur.); in Burmah "bu-gyee-phyoo" (Mason); and apparently the species regarded as unlucky:—the "bhantaki" of Susruta, may be compared: *C. infortunatum* was observed by Rheede ii. pl. 25 in Malabar; by Law, Nimmo, and Graham, in the Southern Concan and the environs of Bombay, common; by W. Jones as. res. iv. 259. Roxburgh, and Wight, as far as Bengal, the juice of the leaves employed by the natives as a vermifuge, also as a bitter tonic and substitute for chiretta (Drur.); was observed by Burmann z. pl. 29 on Ceylon; by Mason, indigenous in Burmah.

Cynomorium Philippense of the Philippines. Parasitic on the roots of trees, entirely red, called in Tagalo and Bisaya "capulao" (Blanco); and enumerated by botanical writers as astringent and medicinal:—brought from Cebu to Blanco.

Ficus laccifera of Cebu and Negros Island. A tree called in Bisaya "lagnob;" and the *gum lac* produced on it by an insect, regarded by Blanco as probably known in early times:—the tree seems confined to the two islands of Cebu and Negros.

Ficus pseudo-palma of the Philippines. A tree called in Tagalo "niogniogan;" and from identity in name, supposed to possess equal vermifuge powers with *Quisqualis Indica*, mentioned in the native books:—observed by Blanco.

* *Menispermum (Tinospora) cordifolia* of Tropical Hindustan. A woody twining plant called in Sanscrit "amrita" or "guduchi," in Hindustanee "gurcha," in Bengalee "guluncha" (J. F. Wats.), in Tamil "sheendie codie," in Telinga "tippatingay" (Drur.), in the environs of Bombay "gool-wail" (Graham); in which we recognize the "amrita" or "guduchi" prescribed by Susruta sutr. 25 to chik. 15:—*T. cordifolia* was observed by Rheede vii. pl. 21 in Malabar; by Graham, "common everywhere in hedges and jungles" in the environs of Bombay; by Roxburgh, Ainslie, and Wight, as far as Bengal and Assam, much used medicinally by the natives, and the *guluncha* extract a well-known specific in the bites of poisonous insects (Drur.).

Capparis aphylla of Hindustan. An arborescent thorny shrub, with only a few small linear leaves on the younger shoots (Graham); and the "karira" having edible flowers according to Susruta sutr. 46, — is referred here by Hessler: *C. aphylla* was observed by Elphinstone in the midst of the Desert on the route to Cabul; by Powell, and Stewart, in the Punjab, employed medicinally by the natives and the buds eaten as a potherb, also the fruit both green and ripe, prepared or pickled (Drur.); by Law, and Graham, from Guzerat to Broach, and "common in the barren tracts of the Deccan;" by Wight, perhaps somewhat farther South.

Guttaria longifolia of Tropical Hindustan? A tall and very handsome tree called in Sanscrit "daru" or "devadaru" or "pitadaru," in Bengal "devadar" (W. Jones), in Tamil "deva-daru" or "asokh," in Telinga "asoka" or "asoka-chettu" or "asokam," in Hindustanee "asog" (J. F. Wats.), in the environs of Bombay "asoca" or "deodar" (Graham); and the "devadaru" tree of Susruta, — and Kalidasa ragh. ii. 36, may be compared: *G. longifolia* was observed by Graham "in gardens Bombay and the Deccan, the natives have an idea that it is the male of *Jonesia asoca*;" by Sonnerat iv. pl. 131, planted by the road sides at Pondicherry; by W. Jones as. res. iv. 288, and Wight, as far as Bengal.

Acerrhoa carambola of the Malayan archipelago. A small tree called in Sanscrit "kurmurunga," in Bengalee "kumurunga" (J. F. Wats.), in the environs of Bombay "kurmul" (Graham), in Burmah "zoung-ya" (Mason); and the "b'havya" of Susruta sutr. 46, — and Harivansa 126, is referred here by Hessler: *A. carambola* is planted in gardens according to the Canara inscription (transl. Colebr.); is described by Rumphius i. pl. 35; was observed by Rheede iii. pl. 43 in Malabar; by Graham, common "in gardens," its leaves "very sensitive;" by Roxburgh, and Wight, cultivated in other parts of Hindustan; by Mason, "exotic" in Burmah but "quite naturalized," the "sour

of Dhanvantari"). Susrutas — is mentioned in the Puranas (Wils., and Royle antiq. ind. med. 63), and a commentary on his writings by Ubhatta of Cashmere "may be as old as the twelfth century" (Ainsl. ii. præf.).

fruit" making "a good tart, and there is a variety which bears a sweet fruit;" by Nieuhoff, in the Malayan archipelago, and called "karembolas." Transported to Europe, is described by Parkinson, and Cavanilles vii. pl. 220.

Hibiscus cannabinus of the Siamese countries? An annual erect plant called in Bengalee and Hindustanee "nalkee" (J. F. Wats.), in the environs of Bombay "ambaree" (Graham), in Telinga "gongkura," at Muttra "wilaitee sunn" foreign sun-hemp (Royle); and the "nalica" of Susrutas sutr. 46, — planted in gardens according to the Canara inscription, is referred here by Hessler: *H. cannabinus* was observed in Hindustan by Royle fibr. ind., only in the cultivated state; by Graham, "commonly cultivated" around Bombay, its leaves eaten "as greens by the natives," and hemp "made of the fibres of the bark;" by Roxburgh, and Wight, in other parts of the peninsula; and by Mason, in Burmah. Transported to Europe, is described by Miller, Linnæus, and Cavanilles iii. pl. 52 (Pers., and Steud.).

Hibiscus tortuosus of Eastern Hindustan. Called in Sanscrit and Bengalee "bala" (Pidd.); and the "bala" of Susrutas chik. 15 to kalp. 8, — may be compared: *H. tortuosus* is described by Roxburgh, as observed by him in Bengal, and is enumerated by Irvine among the medicinal plants of Patna (J. F. Wats.).

Pavonia odorata of Southern Hindustan. A shrub called in Sanscrit "bala" (Pidd.), in Tamil "peramootie," in Telinga "mootoo-polagum" (Drur.); and the "bala" of Susrutas sar. 10 to chik. 15, — is referred here by Hessler: *P. odorata* was observed by Roxburgh, and Wight, from the Dindigul hills to Coromandel, an infusion of the root used by the natives as a drink in fevers (Drur.).

Shorea lacifera of Southern Hindustan. A large Dipterocarpous tree called in Canara "jalin" or "jalari" (J. F. Wats.), in Telinga "jallari," in Tamil "talura" (Drur.); and the "jalini" of Susrutas chik. 2 — may be compared: *S. lacifera* was observed by Roxburgh, Wight, and Beddome, from Mysore and the Palghaut forests to Wynaad, the timber brought in large quantities to Madras, and very useful for house-building and other purposes: a species of *lac* is also procured from the tree (Drur.).

Amoora rohituka of Tropical Hindustan. A small Meliaceous tree called in Sanscrit "rohituka," in Telinga "rohitakah" (J. F. Wats.), in Malabar "chemmarum," in Hindustanee "hurinhura" or "khana," in Bengalee "tikhta-raj" (Drur.); in which we recognize the "rohitaka" of Susrutas: — A rohituka was observed by Roxburgh, Wight, and Drury, from Travancore to Bengal, an oil extracted from the seeds by the natives and used for many economical purposes.

Leea sambucina of Tropical Hindustan and Burmah. A shrub with elder-like foliage called in the environs of Bombay "kurkunnie" (Graham), in Telinga "ancadoo" or "ankadosa" (J. F. Wats.), in Bengal "kakajangha" (W. Jones), in Burmah "ka-let" (Mason); and the "kakajang'ha" prescribed by Susrutas chik. 19 to 37, — may be compared: *L. sambucina* was observed by Rheede ii. pl. 26 in Malabar; by Graham, "in the densest parts of the jungle" in the environs of Bombay and on the Ghauts, also by myself; by Burmann ind. pl. 24, W. Jones as. res. iv. 260, and Wight, as far as Bengal; by Mason, in Burmah.

Ailanthus excelsa of Tropical Hindustan. A large pinnate-leaved tree called in Sanscrit "aralu" or "araloo" (Ainsl., and Pidd.), in Tamil "peroomarum," in Telinga "peddamanoo" (Drur.); in which we recognize the "aralu" prescribed by Susrutas sutr. 38 to chik. 17: — *A. excelsa* was observed by Lush, and Gibson, from Broach "thinly scattered over the Deccan" (Graham); by Roxburgh cor. i. pl. 28, Ainslie, and Wight, as far as the Circars, its bark aromatic and used medicinally by the natives, its wood light but not durable, much used for sword-handles and sheaths for spears, also for catamarans (Drur.).

Putranjiva Roxburghii of Tropical Hindustan. A very elegant tree with dark green foliage, called in Sanscrit "pootranjiva," in Telinga "putrajiva" or "putra-jivi-chettu" (J. F. Wats.) or "kuduru-juvee," in Malabar "pongolam" (Drur.); in which we recognize the "putranjiva" or "putranjivaka" prescribed by Susrutas chik. 19: — *P. Roxburghii* was observed by Rheede vii. pl. 59 in Malabar; by Law, Nimmo, and Graham, in the Concans and environs of Bombay; by Royle, common along the foot of the Himalayas; by Roxburgh, Ainslie, Wallich, and Wight, as far as Coromandel, Oude, and Nepaul, its wood used for house-building and agricultural implements, its leaves for fodder, and its fruit made into necklaces by the Bramins (Drur.).

Celastrus montanus of Tropical Hindustan. A thorny shrub called in Telinga "danti" or "danti-chettu" (J. F. Wats.); and the "danti" whose root is prescribed by Susrutas su'r. 36 to chik. 2, — may be compared: *C. montana* was observed by Graham "exceedingly common on hills

Flacourtia Ramontchi of Madagascar. The *Madagascar plum* is a small tree called in Sanscrit "swadoo-kuntuka," in Bengalee "booinch" (J. F. Wats.), in Telinga "kanregu" (Drur.), in the environs of Bombay "panawla" (Graham); in which we recognize the "svadukantaka" of Susrutas

in the Deccan," also by myself; by Roxburgh, Wight, Elliot, and Balfour, farther South in the peninsula.

Uraria lagopodioides of Tropical Hindustan and Burmah. Called in Sanscrit "prishnipurnee" (J. F. Wats.); in which we recognize the "prisniparni" prescribed by Susrutas sutr. 16 to chik. 37 and kalp. 8: — the "nagabalas" of Harivansa 112 is referred here by Langlois: *U. lagopodioides* was observed by N. L. Burmann pl. 53 in Hindustan; by others, as far as Bengal; and by Mason, in Burmah.

Desmodium Gangeticum of Tropical Hindustan and Burmah. Shrubby, and called in Sanscrit "shala-purnee," in the Taleef Shereef "saloom," in Hindustanee and Bengalee "shalpani" (J. F. Wats.); in which we recognize the "salaparni" of Susrutas sutr. 38 to chik. 8 and kalp. 8: — *D. Gangeticum* is described by Rumphius vi. pl. 66 (Pers.); was observed by Graham in the environs of Bombay, "common in the rains;" by Wight, in other parts of the peninsula; by Burmann z. pl. 49, on Ceylon; is enumerated by Irvine among the medicinal plants of Patna; and was observed by Mason in Burmah.

Glycine labialis of Tropical Eastern Asia. Twining and bean-like, called in Sanscrit "masha-purnee," in Bengalee and Hindustanee "mashanee" (Pidd.); in which we recognize the "mashaparni" prescribed by Susrutas chik. 19 to 25: — *G. labialis* is known to occur in Bengal (hort. beng. 55, and Voight 214): was observed by Mason indigenous in Burmah.

Mimosa rubricaulis of Tropical Hindustan. A large straggling thorny shrub with prickly legumes (Graham); and the "kavara" or "suvaha" prescribed by Susrutas sutr. 36 to sar. 10, — is referred here by Hessler: *M. rubricaulis* was observed by Graham "common" around Bombay; by myself, on the Deccan; by Roxburgh cor. pl. 200, and Wight, in other parts of the peninsula.

Indigofera enneaphylla of Tropical Hindustan and Burmah. Perennial and procumbent, called in Telinga "cherra-gaddaun," in Tamil "cheppoo-neringie" (Drur.); and possibly the second of its tribe prescribed by Susrutas chik. 8: — *I. enneaphylla* was observed in Hindustan by Burmann ind. pl. 55 (Pers.); by Roxburgh, Ainslie, and Wight, on the Dindigul hills, the juice and an infusion of the whole plant employed medicinally (Drur.); by Mason, in Burmah.

Indigofera aspalathoides of Tropical Hindustan. Erect and shrubby, called in Malabar "man-neli" (Rheede), in Tamil "shevenar-vaymboo" (Drur.); and possibly the second species in question: — *I. aspalathoides* was observed by Rheede ix. pl. 37 in Malabar; by Graham, in the environs of Bombay; by Roxburgh, Ainslie, Wight, and Drury, common on waste lands in other parts of the peninsula, the leaves, flowers, root, and young shoots employed medicinally.

Lagerstroemia reginae of Tropical Hindustan and Burmah. A large tree, when in flower one of the most showy of the Indian forests, in Bengalee called "jarool," in Tamil "kadali" (Drur.), in Sanscrit "cacubha" or "nadisarja" or "indradru" or "arjuna" or "virataru" (W. Jones); and the "virataru" of Susrutas, — may be compared: *L. reginae* was observed by Rheede iv. pl. 20 in Malabar; by Graham, "in gardens" around Bombay, but "wild in the vale of the Nagotnah river near its source;" by W. Jones as. res. iv. 301, Roxburgh, and Wight, as far as Travancore and Bengal, its timber tough and under water very durable, much used for boats (Drur.); by Mason v. 538, and Brandis, in Burmah from Mergui to Toungoo, exceedingly "abundant on the low lands," valued "in ship-building" and used besides for a vast variety of purposes; is known to grow as far as Java (Pers.).

Alangium hexapetalum of Tropical Hindustan. Called in Sanscrit "nieo-chaka" or "niko-chuka" or "unkola-nieochaka" or "unkotha" (J. F. Wats.), in Telinga "wooduga," in Malabar "kara-angolam" (Drur.); in which we recognize the "ankot'ha" prescribed by Susrutas sutr. 36 to chik. 17 and kalp. 1: — *A. hexapetalum* is known to grow from Malabar to Bengal, its wood considered valuable (Wight, and Drur.), and according to Royle, its root is aromatic and "said by the Malays to have a purgative hydragogue property."

Alangium decapetalum of Tropical Hindustan and Burmah. An allied species, a small tree called in Sanscrit "ankola" or "ankolamu," in Telinga "ankolamu," in Mahratta "ankulo" (J. F. Wats.), in Bengalee "bagh-ankra," in Tamil "alingie-marum," in Hindustanee "akola" or "akar-kanta" (Drur.), in the environs of Bombay "ankool" (Graham); and the "ankot'ha" of Susrutas, — is referred here by Hessler: *A. decapetalum* was observed by Rheede iv. pl. 17 on the stony mountains of Malabar; by Gibson, Law, and Graham, from Guzerat to the Elephanta caves, its fruit "somewhat astringent" but "eaten by the natives;" by Roxburgh, and Wight, as far as Coromandel

sutr. 36 to chik. 19: — F. Ramontchi was observed by Graham "in gardens Bombay," its fruit eaten but "by no means good;" by Roxburgh cor. pl. 69, Wight, and Long, as far as Bengal, its thorns used by the native inoculators to break the pustules of the small pox. Westward, by European

and Assam, its timber very beautiful and strong, its root employed medicinally and a reputed antidote in snake-bites (Drur.); was observed by Mason in Burmah.

Momordica myxa of Tropical Hindustan. The "ahinsra" or "kakarta" of Susrutas sutr. 36, — is referred here by Hessler.

Ophiorhiza mungos of Tropical Asia, from Hindustan to Java. A Rubiaceae perennial called in Sanscrit "sarpakshi" (Ell.); in which we recognize the "sarpakshim" of Susrutas kalp. 7: — O. mungos was observed by Roxburgh, Ainslie, Wallich, Wight, and Elliot, from Travancore to Dindigul and the valleys of Nepal; is used against snake-bites on Ceylon (Drur.); was observed by Kaempfer 573 to 577 as far as Sumatra and Java, called "earth gall" by the Malays, intensely bitter, in taste resembling "gentian, but is more penetrating and less unpleasant" (Lindl.).

Paederia foetida of Tropical Eastern Asia. A climbing shrub called in Sanscrit "prubhudra" or "prusarinee" or "prutanika" or "prutaninee" or "pruvula" (Roxb.) in Hindustanee "gundalee" or "gundha-bhudra," in Bengalee "gundha-badhulee" (J. F. Wats.), in Tagalo "cantotai," in Pampango "cantotai" or "dicuta maboloc" or "matabang dicut," in Bisaya "lilitan" (Blanco); in which we recognize the "prasarani" of Susrutas chik. 15: — P. foetida is planted in gardens according to the Canara inscription (transl. Colebr.); is described by Rumphius v. pl. 160; was observed by Nimmo in the Southern Concan (Graham); by Burmann ind. 71, Roxburgh, and Wight, as far as Bengal, the bruised plant having a fetid smell, and the root employed by the natives as an emetic; by Mason, indigenous in Burmah; by Blanco, on the Philippines, universally known to the natives from its vile odour and name. Probably carried to Japan, where it is called "pansa" or "panja and kusa" or "fakubokon," or usually "fekuso kadsura" or "fekuri kadsura" or "feifuri kadsura," and was observed by Kaempfer, and Thunberg, at Nagasaki. By European colonists, was carried to the Hawaiian Islands, observed in gardens there by myself; to Northeast America, where it continues in gardens.

Canthium parviflorum of Southern Hindustan. A thorny Coffeaceous shrub called in Sanscrit "naga-bulla," in Tamil "caray-cheddie," in Canara "kirni" (J. F. Wats.), in the Southern Mahratta country "keernee" (Marshal), in Malabar "kanden-khara," in Telinga "ballusoo-kura" (Drur.); in which we recognize the "nagabala" of Susrutas sutr. 16 to chik. 37 and kalp. 8: — C. parviflorum was observed by Rheede v. pl. 36 in Malabar; by Graham, "in hedges about Rosa near Ellora caves," and found by Marshal common in the Southern Mahratta country; by Roxburgh, Ainslie, and Wight, as far as Travancore and Coromandel, employed medicinally by the natives (Drur.).

Oldenlandia biflora of Tropical Hindustan and Burmah. A Rubiaceae annual called in Sanscrit "kshetra-purputea" (J. F. Wats.); in which we recognize the "kshetraparpati" prescribed by Susrutas sutr. 46 to chik. 37: — H. biflora was observed by Rheede x. pl. 35 in Malabar; by Graham, "common" around Bombay; by Roxburgh, and Wight, in other parts of Hindustan; by Burmann z. pl. 11, on Ceylon; by Mason, indigenous in Burmah.

Hedyotis scandens of Eastern Hindustan. Called in Silhet "gjee." in Bengalee "guji" (J. F. Wats.); and the "goji" of Susrutas sutr. 8 to chik. 18 — may be compared: H. scandens was observed by Roxburgh, hort. beng. 10, and Piddington 139, in Eastern Hindustan.

Loranthus longiflorus of Tropical Hindustan. A parasitic mistletoe-like plant called in Sanscrit "vunda" or "vrikshurooka" or "vrikshubhuksha" or "vrikshadunee" (J. F. Wats.); in which we recognize the "vrikshadani" prescribed by Susrutas sutr. 38 to kalp. 8: — L. longiflorus was observed by Rheede x. pl. 4 in Malabar; by Graham, "common on mango trees" throughout the Concans, "a pretty plant with honeysuckle-looking flowers;" by Roxburgh cor. pl. 139, and Wight, in other parts of Hindustan.

Aerides multiflorum of Tropical Hindustan. Orchideous and with other epiphytes called in Sanscrit "vanda" or "jivantica" or "vricsharura" or "vricshadani," in Bengal "banda" or "persara" or "perasara" (W. Jones); and possibly the "vrikshadani" in question: — A. multiflorum was observed by Graham "in the South Concan;" by W. Jones as. res. iv. 302, and Roxburgh, as far as Bengal, chiefly on "the highest Aegle and mango trees," its flowers "exquisitely beautiful."

Diospyros (Embryopteris) glutinosa of Tropical Hindustan and Burmah. A shrub or small tree called in Sanscrit "timbiri" or "tinduka" or "gab," in Cingalese "timberri" (J. F. Wats.), in Telinga "tumika," in Tamil "panichekai toombika," in Bengalee "gab," in Hindustanee "gaub" (Drur.), in the environs of Bombay "timbooree" (Graham): the "paravata" of Susrutas sutr. 46 to chik. 21 — is referred here by Hessler; and the "tindouca" is mentioned in Harivansa 96: D. glutinosa was observed by Rheede iii. pl. 41 in Malabar, the pulp around the seeds "much employed by carpenters as

colonists was carried to the Mauritius Islands, where it is called "prunier de Madagascar," and is planted near dwellings.

Mollugo cerviana of Tropical Africa and Hindustan. A small annual called in Sanscrit "par-

an excellent glue," and being also obnoxious to insects, used by Jews and Portuguese in book-binding (Graham, and Drur.); by Graham, "pretty common on the hilly parts of Salsette" near Bombay; by Roxburgh, Ainslie, and Wight, as far as Travancore and Bengal, the fruit eaten by the natives, used also medicinally, the juice for paying the bottom of boats, and the infusion for steeping fishing-nets (Drur.); was observed by Parish near Maulmain in Burmah (Mason v. 542).

Wrightia tinctoria of Tropical Hindustan and the Siamese countries. A small Apocynous tree called in Sanscrit "hayamaraka" (Ainsl.), in Tamil "chite-aricaloo" (Drur.), in the environs of Bombay "bhoorcooree" or "kala-kooda" (Graham); in which we recognize the "hayamaraka" of Susrutas sutr. 36 to chik. 18: — *W. tinctoria* was observed by Buchanan in the jungles South of Bangalore, the leaves according to Graham "deciduous in the cold weather;" by Roxburgh, Ainslie, and Wight, as far as Coromandel, the fresh leaves chewed said to remove toothache, the close-grained wood resembling ivory and much used for ornamental and useful purposes (Drur.); was observed by Burmann z. pl. 77 on Ceylon; by Loureiro i. 116, in Anam.

Monetia barlerioides of Tropical Hindustan? A thorny furze-like Apocynous shrub called in Sanscrit "kundali" (Pidd); and the "kundali" prescribed by Susrutas sutr. 16, — may be compared: *M. barlerioides* was observed by Law "in abundance about Dharwar Fort" (Graham); by Roxburgh, and Ainslie, in other parts of Hindustan. Possibly by European colonists was carried to Austral Africa (see Pers.). Transported to Europe, is described by Seba i. pl. 13, and L'Heritier. (See *Clerodendron inerme*).

Ophioxylon serpentinum of Tropical Hindustan and the Siamese countries. An ornamental Apocynous shrub called in Sanscrit "karuvee" or "vasoopooshpa" or "chundruka" or "chundru-shoora" or "bhudra" or "nundunee" (J. F. Wats.), in Tamil "chivan-amelpodi," in Telinga "patal-ganni," in Bengalee "chandra," in Hindustanee "chotachand" (Drur.); in which we recognize the "karavi" or "vishapushpa" prescribed by Susrutas kalp. 8: — *O. serpentinum* was observed by Rheede vi. pl. 47 in Malabar; by Lush in "Goa jungles," by Nimmo in "the Concans," and by Graham "in gardens Bombay;" by W. Jones as. res. iv. 308, Roxburgh, and Wight, as far as Bengal, the root used against the bites of poisonous animals and for other medicinal purposes (Drur.); by Burmann z. pl. 64, on Ceylon; by Mason, in Burmah; and by Blume hydr. 1034, as far as the Malayan archipelago.

Gymnema sylvestre of Tropical Hindustan. A large twining Apocynous plant (Graham): the "vishanika" or "mesharingi" prescribed by Susrutas chik. 2 to kalp. 1. — is referred here by Hessler: *G. sylvestre* was observed by Law on hills in the Southern Mahratta country (Graham); by Retz, Roxburgh, and Wight, in other parts of the peninsula.

Agathotes chirayta of the Eastern Himalayas. The *chiretta* is a Gentianaceous annual, imported in the dried state and called in Sanscrit "chirataka" or "chirata-tikta" or "kirata-ticta" or "kairata," in Bengalee and Hindustanee "chirata" (J. F. Wats.): in which we recognize the "kirata-tikta" or "kairata" prescribed by Susrutas sutr. 46: — *A. chirayta* is known to grow in Nepal, is described by Roxburgh, Wallich, and Royle, is imported Southward and much used medicinally, being "an excellent tonic bitter" (Lindl.); is imported also into Burmah, and was found by Mason v. 494 "a common Burman medicine."

Bignonia (Calosanthus) Indica of Tropical Hindustan. A tall tree with very large supra-decompound leaves, called in Sanscrit "shyamaka" (Pidd.), in the environs of Bombay "taetoo" (Graham): the "tuntuka" or "katvanga" or "kutannata" or "g'hantapatali" or "mushkaka" or "suka" or "syonaka" of Susrutas sutr. 33 to chik. 17. — is referred here by Hessler: *C. Indica* was observed by Rheede i. pl. 43 in Malabar; by Auld in "jungles in Kandeish," and by Graham on "hills throughout the Concans;" by Buchanan, and Roxburgh, in other parts of Hindustan; by Mason v. 411, around native dwellings in Burmah, planted for ornament; by Loureiro ii. 460, in Anam.

Tiaridium Indicum of Tropical Hindustan. A hairy annual called in Sanscrit "bhooroondie" or "srihastini" (J. F. Wats.), in Tamil "tayl-kodukho," in Telinga "tayl-munnie," in Bengalee "hatee-shoora" (Drur.), in the environs of Bombay "hatti soora" or "bhooroondie" (Graham); in which we recognize the "b'hurundi" or "srihastini" prescribed by Susrutas chik. 17: — *T. Indicum* was observed by Rheede x. pl. 48 in Malabar; by Graham, "common" in waste places "during the rains;" by Roxburgh, Ainslie, and Drury, as far as Travancore and Chittagong, employed medicinally by the natives. By European colonists, was carried to Tropical America, where also it is employed for medicinal purposes (Pluk. alm. pl. 64, Browne jam., Pers., and Martius).

Solanum Jacquini of Tropical Hindustan. A prickly trailing species called in Sanscrit "kuntu-

pata" or "parpataka" (J. F. Wats.), in Telinga "parpatakum," in Tamil "parpadagum," in Bengalee "ghimashak" (Drur.); in which we recognize the "parpata" prescribed by Susrutas sutr. 46 to chik. 37:—*M. cerviana* was observed by Elliot among the Northern Circars; by Ainslie, Pidding-

karee" or "kunthukarika" or "kunthalika" or "kunthakinee" or "kshoodra" or "vrihutee" or "vyaghree," in Bengalee "kanta-karee" (J. F. Wats.), in Tamil "cundunghatrie," in Telinga "van-kuda" or "nella mollunga," in Hindustanee "kootaya" (Drur.); in which we recognize the "kanta-kari" or "kantakarika" or "kshudra" prescribed by Susrutas sutr. 44 to chik. 37:—*S. Jacquini* was observed by Nimmo, and Graham, "common" around Bombay and on the Deccan, "a native officinal article of some importance;" by Roxburgh, Ainslie, and Wight, as far as Travancore and Bengal, its fruit considered expectorant by the natives, also eaten by them in curries, and cultivated for this purpose in the Circars (Drur.).

Solanum Indicum of Tropical Eastern Asia. A prickly-leaved branching shrub called in Sanscrit "kakamachi" or "vributee" (J. F. Wats.), in Tamil "moolie," in Telinga "tella mulaka," in Bengalee "byakoor" (Drur.); in which we recognize the "kakamachi" prescribed by Susrutas sutr. 46 to chik. 1:—*S. Indicum* was observed by Rheede ii. pl. 36 in Malabar; by Graham, "common in the Deccan," and around Bombay; by Roxburgh, Ainslie, and Wight, "all over India," the root employed medicinally; by Burmann z. pl. 102, on Ceylon; by Mason, in Burmah, enumerated as indigenous; by Loureiro i. 131, in Anam.

Ocymum villosum of Tropical Hindustan. A species of *basil* called in Telinga "arjakam," in Bengalee and Hindustanee "toplusee" or "toolsi" (J. F. Wats.), and possibly the "ar-jaka" in question:—*O. villosum* was observed by Powell in the Punjab, by the author of hort. beng., Piddington, and Long, in Bengal, the seeds and juice of the leaves employed medicinally (Drur.).

Stemodia viscosa of Tropical Hindustan. A small hairy glutinous annual called at Patna "nukachoonie" (Irv.); and the "nikochana" prescribed by Susrutas sutr. 36 to chik. 17 and kalp. 1.—may be compared: *S. viscosa* was observed by Graham in the environs of Bombay; by Roxburgh, cor. ii. pl. 163 as far as Coromandel (Pers.); and is enumerated by Irvine 279 among the medicinal plants of Patna (J. F. Wats.).

Clerodendron inerme of Tropical shores from Hindustan to the Samoan Islands. A flowering shrub called in Sanscrit "kundali" (Pidd.): in Tagalo "casopangil" or "laroan anito" or "macalalauang" or "igiña," in Bisaya "asuangai" or "pacapis" or "colocolog" or "alocasoc" (Blanco); and the "kundali" prescribed by Susrutas sutr. 16,—may be compared: *C. inerme* was observed by Rheede v. pl. 49 in Malabar; by Graham, "common" on "the verge of high water mark" in the vicinity of Bombay, and found by Law used for hedges at Madras; by Roxburgh, and Ainslie, in Eastern Hindustan, occasionally employed in medicine (Lindl.); by Mason, indigenous in Burmah; by Blanco, on the Philippines, employed medicinally by the natives; is termed "*jasminum littoreum*" by Rumphius v. pl. 46; and was observed by myself, submarine on the Feejeean, Tongan, and Samoan Islands. (See *Monetia barlerioides*.)

Clerodendron siphonanthus of Tropical Hindustan and Burmah. Suffruticose and tall, called in Sanscrit "brahmuna" or "brahmunayustica" (J. F. Wats.), in the environs of Bombay "barungee" (Graham): the "b'hargi" or "bahmi" or "p'hanjika" or "vajra" of Susrutas sutr. 16 to chik. 37,—is referred here by Hessler: *C. siphonanthus* was observed by Gibson, and Graham, "common in Bombay gardens, said to grow wild on the hills east of Ahmednuggur;" by Burmann ind. pl. 43, and Roxlurgh, in other parts of Hindustan; by Mason, in Burmah, enumerated as indigenous; and is known to grow as far as Java (Pers.).

Clerodendron phlomoides of Tropical Hindustan. A large shrub called in Telinga "tilaka" (Ell.), in the environs of Bombay "irun" (Graham); in which we recognize the "tilaka" tree of Susrutas kalp. 7,—Jay adevas ii. 6, its flower according to Kalidasa kum. iii. 30 to ragh. ix. 40 the beauty of spring, mentioned also in the Canara Inscription; *C. phlomoides* was observed by Graham very common "in hedges and about villages in the Deccan," its "white fragrant flowers in terminal panicles" appearing "in the cold weather;" by Burmann ind. pl. 45, Ainslie, and Roxburgh, in other parts of Hindustan.

Asteracantha longifolia of Tropical Hindustan and Burmah. A Ruellioid annual called in Sanscrit "vanasnigata" or "gocshuraca" or "gocantaca" (W. Jones) or "gokantuka" or "ikshugandha," in Hindustanee "gokshura" (J. F. Wats.), in Tamil "neer-moolie," in Telinga "neer-goobbie," in Bengalee "kanta-koolika" (Drur.); in which we recognize the "ikshugandha" or "gokshura" prescribed by Susrutas sutr. 46 to chik. 30:—*A. longifolia* was observed by Rheede ii. pl. 45 in Malabar; by Gibson and Graham, in the environs of Bombay, "a very common herbaceous plant," its seeds prescribed medicinally under the name of "tal-mugami;" by W. Jones as. res. iv.

ton, and Wight, in other parts of Hindustan, and in medicinal use (Drur.). Westward, is known to occur in Guinea, but clearly through human intervention was carried to Spain (Pers.) and Rostock in Russia (Gmel. sib. iii. pl. 20).

291, Buchanan, Roxburgh, Ainslie, and Wight, as far as Bengal, in damp situations and by the side of rice-fields, its roots and leaves employed medicinally; by Mason, indigenous in Burmah.

Barleria coerulea of Tropical Hindustan and Burmah. The "artagala" or "karbudara" of Susrutas sutr. 6, — is referred here by Hessler. *B. coerulea* was observed by Roxburgh in Eastern Hindustan; and by Mason, in Burmah: the "wahitee" of the environs of Bombay, "an unarmed shrub" with large beautiful blue flowers, is regarded by Graham as perhaps identical.

Justicia (Gendarussa) vulgaris of Tropical Eastern Asia. A shrub called in Bengalee "jugut-mudum," in Telinga "nūlla vavali," in Tamil from the dark-purple bark of its young parts "caroonochie" (Drur.), in Burmah "ba-wa-net" (Mason), in Tagalo "limang-sugat" or "silisilihan," in Bisaya "mopio" or "panaptun" or "alyopyop" (Blanco); and the "rushaka" or "vasaka" or "vrisha" prescribed by Susrutas sutr. 44 to chik. 37. — is referred here by Hessler: *J. vulgaris* was observed by Rheede ix. pl. 42 in Malabar; by Nimmo, and Graham, in the Northern Concan as far as Bombay, strong scented, the leaves preserving clothing from insects, used also by the natives in intermittent fevers; by Roxburgh, Ainslie, and Wight, as far as Travancore, the leaves employed for various medicinal purposes (Drur.); by Mason v. 434, "indigenous" in Burmah, but "often planted for borders in gardens;" in Java is considered a good emetic (Drur.); is known to occur also on Amboyna (Rumph. iv. pl. 28, and Lindl.); was observed by Blanco frequent on the Philippines, employed in wounds and diseases of the throat, and on Zebu called "mandalusa" from being eaten by the "usa," a species of deer.

Plumbago rosea of the Malayan archipelago. Perennial and shrubby, called in Sanscrit "lal-chitra," in Hindustanee "lal-chita" (J. F. Wats.), in Bengalee "rukto chita," in Telinga "yerracithra moolum," in Tamil "shencodie vaylie" (Drur.), in the environs of Bombay "lal-chitra" (Graham), in Burmah "ken-khyoke nee" (Mason); and according to Hessler, one of the two kinds of *Plumbago* mentioned by Susrutas chik. 17: — *P. rosea* was observed by Rheede xii. pl. 9 in Malabar; by Graham, "in gardens common, and in flower throughout the year;" by Roxburgh, Ainslie, and Drury, common in gardens, the root acrid and stimulating, sometimes employed in Bengal as an acro-narcotic poison; by Mason v. 432 to 789, "exotic" in Burmah, cultivated for the vesicatory power of its root; by Horsfield, on Java, employed by the natives for blistering, also in ulcers, cutaneous diseases, and rheumatism, is termed "radix vesicatoria" by Rumphius v. pl. 168 as observed on Amboyna (Lindl.).

Aristolochia Indica of Tropical Eastern Asia and the Malayan archipelago. A twining shrubby plant called in Bengalee "eeshwur-mool" (Lindl.), in Hindustanee "isharmul," in Telinga "ishvaraveru" or "dula-govela," in Malabar "ishvaramuri," in Tamil "ich-churamuli" or "peru-marindu" or "perum-kizhangu" (Drur.), in Tagalo "malaubi" or from its balance-shaped old capsules "tim-bagan" (Blanco); in which we recognize the "isvara" prescribed by Susrutas chik. 8 to kalp. 8: — *A. Indica* was observed by Rheede viii. pl. 25 in Malabar; by Graham, on "hills throughout the Concan, not very common;" by Roxburgh, Ainslie, and Wight, as far as Travancore and Bengal, its root nauseously bitter, employed medicinally and as an antidote in snake-bites (Drur.); by Loureiro ii. 528, in Anam; by Blanco, on the Philippines, employed medicinally; and is termed "radix pulonoria" by Rumphius v. pl. 177.

Basella alba of Tropical Eastern Asia. A twining herbaceous plant called in Sanscrit "pootika" or "oopodaki" (J. F. Wats.), in Hindustanee "pol," in Bengalee "rukhto-pooi," in Telinga "alla-batsalla" (Drur.), in the environs of Bombay "doodie" or "wahlea" or "myal-ke-bajee" (Graham), in Burmah "gyen-baing" (Mason), in Tagalo "libato," in Ylocano "ylaibaquir" (Blanco); in which we recognize the "potika" or "upodika" enumerated among potherbs by Susrutas sutr. 46, — mentioned also by Harivansa 137. *B. alba* was observed by Rheede vii. pl. 24 in Malabar; by Graham, "generally cultivated as spinage by the natives;" by Roxburgh, Wight, and Drury, as far as Bengal, "cultivated in almost every part of the country," and according to Faulkner sometimes employed medicinally; by Mason v. 472 to 780, "exotic" in Burmah, cultivated by the Burmese for spinage; by Loureiro, in Anam; is known to occur in China (Pluk. alm. pl. 63, and Pers.); was observed by Kaempfer, and Thunberg, in Japan, used for dyeing; by Blanco, seemingly wild on the Philippines and eaten by the natives; by Rumphius v. 417 and pl. 154, on Amboyna (Pers.). "*B. rubra*, *B. lucida*," and "*B. cordifolia*," are regarded as not distinct.

Tetranthera Roxburghii of Tropical Hindustan and the Siamese countries. A Lauraceous tree called in Telinga "meda" (Ell.), in the environs of Bombay "chickna" or "warus" (Graham); and the "meda" of Susrutas chik. 17 to 37 — may be compared: *T. Roxburghii* was observed by Graham

Sida cordifolia of Tropical climates from the Atlantic to Burmah. Suffruticose, having a Sanscrit name (Roxb., and Pidd.), and called in Bengalee "baryala," in Hindustanee "bariala" (Pidd.): the "atibala" or "vatya" of Susrutas chik. 15 to kalp. 8, — is referred here by Hessler: *S. cordifolia*

in "Parell garden" near Bombay, and "wild" on Parell hill; by Retz obs. vi. 27, Roxburgh cor. ii. pl. 147, Wallich, and Elliot 114, as far as the Circars, Sylhet, Goalpara, Monghir, Chittagong, and Java (Lindl.); by Loureiro ii. 783, in Anam, the leaves and branches full of glutinous matter, the fruit yielding a greasy exudation manufactured into candles of bad quality, and serving as the basis of salves (Pers., and Lindl.).

Epicarpurus asper of Tropical Hindustan and the Siamese countries. A small Urticoid tree called in Sanscrit "sakotuka" (Pidd.) or "sacotaca," in Bengal "syaura" or "syura" (W. Jones) or "sheora," in Hindustanee "seura," in Telinga "pukkie," in Tamil "peerahi" (Drur.): the "sak'hota" yielding oil according to Susrutas chik. 18, — is referred here by Hessler: *E. asper* was observed by Rheede i. pl. 48 in Malabar; by Graham, "generally throughout the Concans;" by Retz obs. v. 30, W. Jones, Roxburgh, Wight, and Drury, "common all over India," employed medicinally, a fibre procured from the stem, and the rough leaves used by the natives for polishing ivory; is termed "streblus aspera" by Loureiro, as observed by him in Anam.

Artocarpus lakoocha of Eastern Hindustan. A species of bread-fruit called in Sanscrit "laccocha," in Telinga "lakuchamu" or "laku-chamma" (J. F. Wats.), in the environs of Bombay "lowi," in Burmah "myouk-loke" (Mason); in which we recognize the "lakucha" of Susrutas sutr. 16 to 46, — and Harivansh 126: *A. lakoocha* was observed by Nimmo, and Graham, under cultivation only in the environs of Bombay, the leaves "deciduous in the cold weather," and the yellow edible fruit of the "size of a large orange;" by W. Jones, and Roxburgh, wild in Bengal, the male spadix eaten by the natives in their curries, and the roots used for dyeing yellow (Drur.); by Mason, "exotic" in Burmah, occasionally "raised near native" dwellings, and regarded by European residents as "a kind of fig."

Ficus (Covellia) oppositifolia of Tropical Eastern Asia. A small tree called in the environs of Bombay "kurwut" (Graham), in Tagalo "as-is" or "is-is" or "issio" or "isioisio" (Blanco): the "p'halgu" or "malapu" or "vayasi" of Susrutas sutr. 46 to chik. 8 — is referred here by Hessler: *F. oppositifolia* was observed by Graham in the environs of Bombay; by Roxburgh, Wight, and Drury, on the banks of rivulets as far as Bengal, the fruit having several equidistant ridges, and with the seeds and bark employed medicinally; by Blanco, on the Philippines, "*F. hispida*" being regarded as not distinct (Pers., and Steud.).

Colocasia Indica of the Siamese countries. The "st'hulakanda" whose root is enumerated as esculent by Susrutas sutr. 46, — is referred here by Hessler: *C. Indica* according to Drury "is cultivated in Bengal for its esculent stems and small pendulous tubers," one variety having "dark-coloured petioles, but they seldom produce ripe seeds;" is described by Loureiro, as observed in Anam (Steud.); and the "seet-tung" of Burmah is regarded by Mason as perhaps identical.

Arum (Amorphophallus) campanulatus of Tropical Hindustan. Called in Sanscrit "kanda" or "kunda" (J. F. Wats.), in Telinga "muncha kunda," in Malabar and Tamil "karuna," in Hindustanee "ol" (Drur.), in Burmah "wa" (Mason); in which we recognize the "kanda" having an esculent root according to Susrutas sutr. 46, — and the "karuna" compared with laughing by Jayadevas i. 31: *A. campanulatus* was observed by Rheede xi. pl. 18 in Malabar; by Gibson, and Graham, cultivated "to a considerable extent about Surat," also in the environs of Bombay, and "its large tuberous roots" eaten by the natives; by Powell, in the Punjaub; by Roxburgh, Wight, and Drury, as far as Bengal, the flowers small, sessile on the ground, exhaling a carrion-like odour, and appearing when there are no leaves, roots very nutritious, and in the crude state employed medicinally; by Mason, "exotic" in Burmah, very generally cultivated by both Karens and Burmese for its "much esteemed" root which is "like a yam." The same figures of Rheede and Rumphius are quoted by Graham 1624 for "a very common plant" throughout the Concans, "stemless" with leaves appearing "in July," supra-decompound and on long petioles, the scape "at the commencement of the rains, and has a most unpleasant smell."

Pothos (Scindapsus) officinalis of Eastern Hindustan and Burmah. A rooting epiphytic perennial called in Sanscrit "vushira" or "shreyusee" or "kupi-vullee" or "kolu-vullee" or "kuri-pippulee" or "guja-pippulee" (Lindl.), in Bengalee "guj-pippul," in Tamil "attie-tippilie," in Malabar "auna tippilie" (Drur.); in which we recognize the "sreyasi" or "kapivalli" or "kolavalli" or "kari-pippali" or "gajapippali" of Susrutas chik. 2 to 15: — *S. officinalis* was observed by Roxburgh, and Wight, from Calicut to Bengal, and at Midnapore cultivated for its fruit, which is cut into transverse pieces, dried, and used medicinally (Drur.); by Mason v. 505, wild in the forests of Burmah.

Maranta dichotoma of Tropical Eastern Asia and the Malayan archipelago. A Scitamineous

was observed by Rheede x. pl. 54 in Malabar; by Graham, in "the Concans;" by Fleming as. res. xi. 178, and Wight, in other parts of Hindustan, its velvety leaves mixed with rice "to alleviate the bloody flux" (Lindl.); by Mason, in ligenous in Burmah. Westward, is known to grow in Austral Africa (Pers.) and in dry and sandy situations as far as Senegal (tent. fl. Seneg., and Benth. fl. nigr.); was on the West Indian seashore before the visit of Sloane i. 218; was observed by Macfadyen in dry situations on the lower portion of Jamaica (A. Dec.).

Euphorbia tirucalli of Tropical Hindustan. The *Indian tree-spurge*, a small tree with swollen green branchlets in place of leaves, is called in Bengalee "lunka-sij" or "lunka-shij," in Tamil "tirucalli" (J. F. Wats.), in Tagalo "catuit" (Blanco): the "amara" of Susrutas chik. 25 to 37,—is referred here by Hessler: *E. tirucalli* was observed by Rheede ii. pl. 44 in Malabar; by Graham, used for hedges in Guzerat and "common about villages in the Deccan and Concan," also by myself; by Buchanan, Roxburgh, and Ainslie, as far as Bengal, employed medicinally, and on the Coromandel coast for hedges (Drur.); by Blanco, on the Philippines, supposed to unite broken bones, but flowers not met with, by myself in wild situations there; is termed "ossifraga lactea" by Rumphius vii. pl. 29. Westward, was observed by Delile in a garden at Cairo.

plant called in Sanscrit "vula" or "vula-hwa" or "ghata" or "godunika" or "kulyanee" (J. F. Wats.), in Bengalee "mookto-patee" or "madarpatee" or "pattee patee" (Drur.), in Burmah "then" (Mason), in Tagalo "tagbactagbac" (Blanco); in which we recognize the "ghata" or "godanika" or "kalyanini" of Susrutas chik. 16 to kalp. 6:—*M. dichotoma* was observed by Colebrooke as. res., and Roxburgh, from Coromandel to Bengal, the mats called "sital-pati" made of the split stems; by Mason v. 521, indigenous in Burmah, and mats made of the split stems by the natives; by Loureiro i. 11, in Anam; by Blanco, on the Philippines; by Forster prodr. 3, as far as Mallicollo in the New Hebrides (Pers., and Steud.). By Nimmo, was brought from Bengal to the environs of Bombay (Graham).

Asparagus racemosus of Tropical Hindustan. A straggling scandent shrub called in Sanscrit "satavari" (Ell.), in Telinga "satavari" or "pilli-tega" or "pillipichara," in Tamil "shadavari" or "tannir-muttan," in Malabar "shatavali," in Bengalee "sat-muli," in Hindustanee "shakakul" (Drur.); in which we recognize the "satavari" whose root is prescribed by Susrutas sutr. 16 to chik. 26:—*A. racemosus* was observed by Roxburgh, Ainslie, Wight, and Drury, from the Deccan to Travancore, perfuming the air with its fragrant flowers, and the bark and leaves employed medicinally.

Asparagus sarmentosus of Southern Hindustan. A scandent armed shrub called in Bengalee "sooti-mooli" (J. F. Wats.), in the environs of Bombay "satavree" (Graham); and possibly the "satavari" in question:—*A. sarmentosus* was observed by Rheede x. 10 in Malabar; by Graham, "in gardens as an ornamental plant, Deccan and Concans;" by Burmann z. 124, on Ceylon; its roots according to Ainslie are pickled, also boiled in oil, and employed medicinally, and according to Modeen Sheriff, when dried and split are the "suied mush" of the bazaars of Southern India (Drur.): in the candied "state they are often brought from China" (Graham).

Scirpus kysoor of Hindustan. A rush called in Bengalee and Hindustanee "kesoor" or "kesoorree" or "kesooriya" (J. F. Wats.); and the "kaseru" whose root is commended by Susrutas sutr. 46 to chik. 22,—is referred here by Hessler: *S. kysoor* was observed by Graham "in the beds of rivers both Concans;" by Roxburgh, hort. beng. 6, Piddington, and Birdwood 78, as far as Madras and Bengal. (Compare the "kuseeroo" *Cyperus rotundus*, J. F. Wats.)

Andropogon (Lipeocercis) serratus of Tropical Hindustan. A grass called in Sanscrit "uguree" or "guree" or "guraguree" or "kharaguree" or "khura" or "venee" (J. F. Wats.); in which we recognize the "agari" or "gari" or "garagari" or "k'haragari" or "k'hara" or "veni" of Susrutas chik. 18:—*A. serratus* was observed by Law, Nimmo, and Graham, "near Dharwar," also in the Concans; by Retz obs. v. 21, and Roxburgh, as far as Bengal.

Marsilea dentata of Tropical Hindustan. The "chuchu" of Susrutas sutr. 46,—is referred here by Hessler.

Salvinia cucullata of Tropical Hindustan and Burmah. A Cryptogamous leafy aquatic: the "talapatri" or "putrasreni" or "mushika" or "mushikaparni" of Susrutas sutr. 36 to chik. 18,—is referred here by Hessler: *S. cucullata* was observed by Graham in the environs of Bombay; by Roxburgh, in Eastern Hindustan; and by Mason, in Burmah.

Lycopodium imbricatum of Hindustan. The "grishti" or "mad'huparnika" of Susrutas sar. 10,—is referred here by Hessler.

Hemionitis cordifolia of Eastern Hindustan and Burmah. A fern: the "atiguha" or "kalasi" or "prit'hakparni" of Susrutas sutr. 36 to chik. 21,—is referred here by Hessler: *H. cordifolia* was observed by Roxburgh in Eastern Hindustan; and by Mason, in Burmah.

Spondias acuminata of Tropical Hindustan. A species of *hog-plum*, a middle-sized elegant tree called in the environs of Bombay "ambut" or "ambada" (Graham), in Bengal "amra" or "amla," in Sanscrit "amrataca" or "pitana" or "capitana" (W. Jones); and the "amrata" or "pitana" or "kapitana" of Susrutas, — may be compared: *S. acuminata* is perhaps the tree bearing fruit of the size of a large Damask prune seen by Ebn Batuta 9 in Hindustan; was observed by Graham "on the hills near Kennery caves, not common," its fruit "about the size of a chicken's egg;" by Roxburgh, in Eastern Hindustan.

Sesbania grandiflora of the Hawaiian Islands. Called in Sanscrit "agastia" or "buka" or "vuka," in the Taleef Shereef "agust" or "agusti," in Bengalee "augusta" or "buko," in Hindustanee "agast," in Tamil "agathi" or "agati" (J. F. Wats.), in Telinga "anisay" (Drur.) or "tella-avisi" (Ell.), in Burmah "pouk-ban" (Mason), in Tagalo "caturai" (Blanco); in which we recognize the "agasti" or "vaka" of Susrutas sutr. 46: — *S. grandiflora* was observed by Rheede i. pl. 51 in Malabar; by Graham, in the environs of Bombay, "generally found" about temples and villages, cultivated for "its large flowers and pods, both of which are eaten by the natives;" by Roxburgh, and Wight, in gardens as far as Travancore and Bengal, employed medicinally by the natives (Drur.); by Mason, "exotic" in Burmah, "seen in perhaps every town and village," its pods "a favourite vegetable with the natives;" by Blanco, on the Phillippines, cultivated by the natives and its flowers cooked and eaten; is described by Rumphius i. pl. 77; was observed by myself under cultivation in Hindustan and throughout the Malayan archipelago, indigenous only on the Hawaiian Islands, where I found it usually trailing, but sometimes a small tree like the cultivated form. By Polynesian colonists, was carried to the Society and "Botanices" Islands (Pers.); and by European colonists has been carried back to the Hawaiian Islands, observed by myself in the gardens of residents. Westward from Hindustan, the "dolichos arboreus" or "seseban" seen by Forskal p. 134 under cultivation in Yemen, is referred here by Steudel.

Mucuna prurita of Tropical Eastern Asia. The *cowitch* is an annual twining bean-like plant called in Sanscrit "atmagupta" or "alkushee," in Bengalee "alkushee," in Tamil "poonaykali" or "peelia-doooghoo-kaila," in Telinga "peeliadagoo-kaila," in Hindustanee "kiwach" (J. F. Wats.), in Burmah "klwæ-læ" (Mason), in Tagalo "lipai" or "buquitquit" (Blanco); in which we recognize the "atmagupta" of Susrutas sutr. 36 to chik. 26: — *M. prurita* was observed by Rheede viii. pl. 35 in Malabar; by Graham, in the environs of Bombay, "one of the commonest plants in hedges and jungly tracts during the rains," the "pod shape of the letter S, clothed with stinging hairs;" by Roxburgh, Ainslie, and Wight, as far as Bengal and Dheyra Dhoon, employed medicinally by the natives, sometimes as a mechanical anthelmintic (Drur.); by Mason v. 490, in Burmah, "very common in the Karen jungles from Mergui to Toungo;" by Blanco, on the Philippines.

Adenanthera pavonina of Tropical Eastern Asia. A Leguminous tree called in Sanscrit "kambhoji," in Bengalee "ranjuna," in Hindustanee "ranjana" (J. F. Wats.), in Telinga "bandi gooroovinha," in Tamil "anai-kundamunie" (Drur.), in Burmah "rwæ-gyee" (Mason); in which we recognize the "kamboji" prescribed by Susrutas chik. 19 to 25, — and the "rochana" pigment of Kalidasa ragh. xvii. 24: *A. pavonina* was observed by Rheede vi. pl. 44 in Malabar; by Gibson, and Graham, in gardens around Bombay, but said to grow "wild in some parts of Guzerat and Kandesh," its scarlet seeds "used as weights" and "worn by women as beads," its wood yielding a dye used by "Bramins for marking their foreheads runjuna;" was observed by Roxburgh, Ainslie, and Wight, as far as Travancore and Bengal, the inner wood of the larger trees of a deep red colour (Drur.); by Mason v. 511 to 522, indigenous in Burmah, its wood hard and valuable, and its seeds "in common use by the Burmese" for weights.

Fambosa vulgaris of Tropical Eastern Asia. The *rose apple* has Arabic and Persian names (A. Dec.). is called in Sanscrit "jambu," in Tamil "jambu-nawel-marum" (J. F. Wats.), in the environs of Bombay "jamblee" or "gulab jamb" (Graham), in Hindustanee "gulab jamun" (Drur.); in Tagalo "yambo" or "macupa" (Blanco); in which we recognize the "jambu" of Susrutas sutr. 16 and nid. 14 to chik. 18, — having according to Kalidasa vicram. 4 shady branches and luscious roseate fruit: *J. vulgaris* was observed by Rheede i. pl. 17 in Malabar; by Graham, "commonly cultivated" around Bombay; by Roxburgh, Wight, and Ouseley, as far as Bengal; and by Moon, on Ceylon. Farther East, a "kind of apple very similar to a pomegranate full of juice and sweet" was seen in the country around Ava by Nicolo Conti, but as known to Mason v. 450, *J. vulgaris* is enumerated as "exotic" in Burmah and not cultivated by the natives; was observed by Wallich on Penang; by Blume, under cultivation on Java; by Loureiro, in Anam and the adjoining countries; by Navarrete in 1653, the "xambos of Malacca having the taste and smell of a fragrant rose" at Manila, by Blanco also on the Philippines, a tree nine to twelve feet high. Westward, was observed by myself under cultivation on Zanzibar. By European colonists, was carried to the Mauritius Islands (Boj.); to the West Indies (Descourtilz), to Brazil, observed there by myself; and to the opposite African coast (Hook. p. 359).

Mukia scabrella of Equatorial Africa. A climbing Cucurbitaceous vine called in Burmah "tha-bwot-kha" (Mason); and the "gavakshi" prescribed by Susrutas sutr. 36 to kalp. 7, — is referred here by Hessler: *M. scabrella* was observed by Rheede viii. pl. 13 in Malabar; by Graham, "common about Bombay in the rains," the "fruit size of a pea, smooth;" by Roxburgh, and Wight, in Eastern Hindustan; and by Mason, in Burmah. Westward, was observed by Grant on the banks of the Nile below Lat. 5°. Transported to Europe, is termed "*cucumis maderaspatanus*" by Linnæus (Graham).

Foeniculum panmorium of Northern Hindustan. A species of *fennel* called in Persian "badian," in Hindustanee "sonf" (Royle), in Arabic "razeeanuj" in Sanscrit "mudhoorika" or "mudoorika," in Bengalee "pan-muhoree" or "panmuhori" (J. F. Wats.): the "misi" or "mishi" of Susrutas chik. 38, — is referred here by Hessler: *F. panmorium* was observed in Hindustan by Roxburgh ii. 95, Piddington, and Royle him. 229, having fruit "exactly as in *F. vulgare* and with the same taste," and employed medicinally "as a warm aromatic and carminative" (Lindl.). Westward, the "razianadsh" is mentioned by Ebn Baitar, and other Arab writers.

Anethum sowa of Northern Hindustan. A species of *dill* called in Sanscrit "misreya" or "misreya" or "shaleya," in Hindustanee "sowa" (J. F. Wats.) or "suva soyah," in Bengalee "soolpha," in Telinga "somp," in Tamil "satha-cooppa" (Drur.), in Burmah "sa-myeik" (Mason); in which we recognize the "saleya" of Susrutas sutr. 38 to chik. 17: — *A. sowa* was observed by Graham p. 248 at Bombay, "extensively used in native cookery and medicine;" by Roxburgh ii. 96, Ainslie, and Wight, under cultivation in the peninsula as far as Bengal, the seeds sold in every bazaar, forming one of the chief ingredients in curry-powder, yielding besides a valuable oil; by Mason, "exotic" in Burmah, often cultivated by the natives, and "possessing similar aromatic and carminative properties" with dill.

Hydrocotyle Asiatica of Tropical Africa and Asia. A species of *penny-wort* called in Sanscrit "bheka-purni" or "manduka-parni" (Pidd.), in Telinga "babassa," in Tamil "vullarei," in Bengalee "thulkuri" (Drur.), in Tagalo "taquip suso" or "taquip cohoh" (Blanco); in which we recognize the "b'hekaparni" or "mandukaparni" prescribed by Susrutas sutr. 46: — *H. Asiatica* was observed by Rheede x. pl. 46 in Malabar; by Graham, "in moist shady places" in the environs of Bombay; by Roxburgh, Wight, and Drury, as far as Travancore, the leaves employed medicinally by the natives; by Horsfield, on Java and considered diuretic; by Loureiro, in Anam (Spreng.); by Blanco, on the Philippines and well known to the natives; by Rumphius v. pl. 169, also in the Malayan archipelago; is known to grow in Australia West and East, and as far as Tasmania and New Zealand (J. D. Hook., and A. Dec.). Westward from Hindustan, in Abyssinia (A. Rich.), the Mauritius Islands, Austral Africa (herb. Dec.), and as far as Guinea and Senegal (fl. Nigr.). Probably by European colonists, was carried to Rio Janeiro and Chili (Schlecht.).

Vangueria edulis of Madagascar. A small Coffeaceous tree called on Madagascar "voua-vanga" (Boj.), in Sanscrit "kurahata" or "kurahatuka" or "grunthiphula" or "chhurduna" or "pindeetuka" or "shulya" or "shulyuka" (J. F. Wats.), in the environs of Bombay "aloo" (Graham); in which we recognize the "karahata" or "grant'hip'hala" or "ch'hardana" or "pinditaka" or "salya" or "salyaka" of Susrutas sutr. 36 to chik. 18: — *V. edulis* was observed by Gibson, Law, Auld, and Graham, seemingly wild and "very common" on "the Ghauts and throughout the Concan," the Southern Mahratta country, and Kandesh, its fruit size of an apple "eaten both raw and roasted, but" far from palatable; is known to occur also in China (Rohr., and Steudel). Westward, was observed by Bojer on Madagascar, and was carried to the Mauritius Islands where it has become naturalized.

Eclipta prostrata of Tropical Africa? A weed called in Egypt "sa'deh" (Del.), in Yemen "tolak" (Forsk.), in Sanscrit "brinraj," in Hindustanee "brinraj" or "bhringraj" (J. F. Wats.) or "brinraj bungrah," in Bengalee "keshooryia," in Tamil "kaiantagarie" or "kursalenkunnie," in Telinga "goontagelinjeroo" (Drur.), in the environs of Bombay "bungrah" or "maaka" (Graham), in Japan "takasabro" or "kavatiso" (Thunb.); in which we recognize the "b'hringa" or "b'hringaraja" of Susrutas chik. 25 to kalp. 8, — and "bhringaras" of Harivansa 78: *E. prostrata* was observed by Rheede x. pl. 41 in Malabar; by Graham, "a common weed" in the environs of Bombay, sometimes eaten by the natives "as a potherb;" by Roxburgh, Ainslie, and Wight, in other parts of Hindustan, and employed medicinally by the natives (Drur.); by Loureiro, in Anam, employed for blackening the hair; by Beechey's Expedition, in China (Hook. and Arn.); by Thunberg, in Southern Japan; is known to occur on the Moluccas and the Ladrone Islands (Endl., and A. Dec.); was observed by myself in the Malayan archipelago, and carried by the natives as far as the Feejeean Islands. Westward from Hindustan, was observed by myself on Zanzibar; by Drège, in Austral Africa; by Forskal, in Yemen; by him, and Delile, in Egypt; and by Aucher, in Palestine. By European colonists, as verified by myself, was carried to the Hawaiian Islands; probably also to Peru and Southern Brazil, seen by myself only in cultivated ground; and to the West Indies (Pers.). "*E. erecta*" is regarded by Roxburgh as not distinct.

Convolvulus (Batatas) paniculata of Tropical shores from the Atlantic to the Malayan archipelago. A twining perennial called in Sanscrit "vidaree" or "kroshtree" or "ksheeravidaree" or "ksheerushookla" (J. F. Wats.), in Telinga "matta-paltiga," in Bengalee "bhoomi-koomra" (Lindl.), in Tagalo "puntaspuntas" (Blanco); in which we recognize the "vidari" or "kroshtri" or "kshiravidari" or "kshirasukla" whose root is prescribed by Susrutas sutr. 46 to chik. 30: — *B. paniculata* was observed by Rheede xi. pl. 49 in Malabar; by Graham, around Bombay, flowering "in the rains;" by Roxburgh, in Eastern Hindustan, its large turnip-shaped roots eaten by cattle, and employed medicinally by the natives (Drur.); by Mason, indigenous in Burmah; is known to grow on Java and as far as Australia (Lindl.); was observed by Blanco frequent on the Philippines, the root employed by the natives as a purgative. Westward from Hindustan, was received by Jacquin from Mauritius (Steud.); is known to grow also in Tropical Africa and America (Lindl.).

Solanum verbascifolium of Madagascar and the Mauritius Islands? A mullein-leaved shrub called in Sanscrit "lavana-bhantaca" or "samashthila" or "gandira," in Bengal "lona-bhant" or "sulatiya" (W. Jones); in which we recognize the "gandira" prescribed by Susrutas chik. 46: — *S. verbascifolium* was observed by Lush near Dharwar, and is probably the unarmed species seen by Gibson "in Deccan gardens" (Graham); was observed in Bengal by W. Jones as. res. iv. 250, but by Roxburgh in gardens (Pers.); by Mason, in Burmah, enumerated as though indigenous; by Loureiro i. 128, in Anam; by Blanco, sparingly on the Philippines and not known to the natives, with the slight exception that it is called "noog noog" on Zebu. Westward, is known to grow on Madagascar and the Mauritius Islands (Scop., and Pers.). By European colonists, was carried to Tropical America (Pluk. alm. pl. 316, and Pers.).

Ocimum gratissimum of Tropical Arabia. The *shrubby basil* is called in Yemen "hobokbok" (Forsk.), in Malabar "cattu tirtava" (Rheede), in Bengalee "ram-tulsee" (J. F. Wats.), in the environs of Bombay "ram-toolsee" (Graham): the "kut'heraka" or "k'harapushpa" prescribed by Susrutas sutr. 36 to chik. 17, — is referred here by Hessler: *O. gratissimum* was observed by Rheede x. pl. 86 in Malabar; by Graham, "common in gardens" in the environs of Bombay, "flowering chiefly in the rains, very fragrant;" by Roxburgh, Piddington, and Voight, as far as Bengal; and by Burmann z. pl. 80, on Ceylon. Westward, was observed by Forskal wild among the mountains of Yemen.

Ocimum canum of Tropical Hindustan and Burmah. The *hoary basil* is annual and called in Sanscrit "arjaca" (Ainsl. and Pidd.); and the "arjaka" prescribed by Susrutas sutr. 36 to chik. 17, — may be compared: *O. canum* was observed by Graham in the environs of Bombay; by Roxburgh iii. 15, in Eastern Hindustan; by Mason, in Burmah, enumerated as indigenous. Westward, was observed by Grant near cultivated ground in Lat. "2° N." on the Nile.

Barleria prionitis of Tropical Asia, from Arabia to Burmah. Shrubby with stellate thorns and large yellow flowers, called in Sanscrit "kuruntuka" (Pidd.), in Bengalee "kantha-jathi," in Tamil "shem-muli," in Telinga "mullu-gounta," in Malabar "coletta-veetla" (Drur.), in the environs of Bombay "kholeta" (Graham); in which we recognize the "kurantaka" or "kuruntaka" prescribed by Susrutas sutr. 46 to chik. 25: — *B. prionitis* was observed by Rheede ix. pl. 41 in Malabar; by Graham, "every where" in the environs of Bombay; by Roxburgh, Ainslie, and Wight, as far as Bengal, employed medicinally by the natives (Drur.); by Mason, in Burmah; and Westward, by Forskal p. 6 among the mountains of Yemen.

Boerhaavia diffusa of Tropical America? A diffuse annual called in Tamil "mookaretti," in Telinga "ataka-mamidi," in Bengalee "gada-poorna" or "swhet-poorna," in Malabar "tameerama" or "taludama," in Hindustanee "tikri" (Drur.), in Tagalo "paan balivis," in Ylocano "tabtabocol ti Nuañg" (Blanco); and according to Hessler, mentioned as a potherb by Susrutas sutr. 46 to chik. 38: — *B. diffusa* was observed by Rheede vii. pl. 46 in Malabar; by myself, in the environs of Bombay; by Graham "common every where but particularly abundant in the Deccan," sometimes eaten by the natives as greens; by Burmann ind. pl. 1, Roxburgh, Ainslie, Wight, and Drury, a weed "common in all parts of India," its pulverized root employed medicinally; by Blanco, on the Philippines, common around stone buildings in the province of Batangas, the dried root employed medicinally. Westward from Hindustan was observed by Forskal p. 3 in Tropical Arabia; by Delile, in Upper Egypt; by Baldwin, as far North as Anastasia Island Lat. 30° in Florida; is known to grow also on Jamaica and as far as Peru (Pers.); was observed by myself, exotic and clearly carried by the natives to Metia, Taheiti, the Samoan, Tongan, and Feejeean Islands.

Euxolus polygamus of Hindustan and Burmah. A diffuse herb called in Sanscrit "tundooleeya" (Pidd.), and is the *common bajee* of Bombay called "choolae" (Graham): the "tandula" of Susrutas sutr. 16 to chik. 27, — is referred here by Hessler: *E. polygamus* is termed "blitum indicum album" by Rumphius v. pl. 82; was observed by Graham "much cultivated" in the environs of Bombay; by Roxburgh, hort. beng. 67, and Piddington 218, as far as Bengal, according to Long

sometimes employed medicinally (Drur.); by McClelland, in Burmah (Mason v. 472). Westward, was received "from Africa" by Moquin and A. Decandolle.

Celosia cristata of Tropical Eastern Asia. The *cock's-comb* is called by the Greeks "sathōri" (Forsk.), in Sanscrit "deepya," in Bengalee "deepuk" or "lal-moorga," in Hindustanee "lal-moorga" (J. F. Wats.), in the environs of Bombay "lal-moorga" (Graham), in Burmah "kyet-mouk" (Mason), in Tagalo "palongpalongan" (Blanco); in which we recognize the "dipya" of Susrutas sutr. 29 to chik. 18:—*C. cristata* is described by Rumphius v. pl. 84; was observed by Graham "cultivated in gardens" in the environs of Bombay; by Roxburgh, in Eastern Hindustan; by Mason v. 431 to 780, indigenous in Burmah, cultivated besides "by the natives," and the "kyet-yet" variety or species, having a long drooping panicle either red or yellow, a highly "elegant plant when cultivated by the Karens;" by Blanco, in gardens on the Philippines; is known to occur in China (Royle him. 116); was observed by Kaempfer, and Thunberg, attaining superior size and beauty in Japan, and degenerating elsewhere. Westward, from Hindustan, by Forskal, in Yemen, and in gardens at Constantinople; and was cultivated in Europe before the days of Lobel, and Bauhin. By European colonists, was carried to Northeast America, where it has become a frequent garden flower.

Alternanthera sessilis of Tropical Asia and Africa. A depressed annual called in Egypt "hamel" (Forsk.) or "hamoul" (Del.), having a Sanscrit name (Pidd.), and called in Malabar "coluppa" (Rheede); the "pattura" prescribed by Susrutas chik. 19,—is referred here by Hessler: *A. sessilis* was observed by Rheede x. pl. 11 in Malabar; by Graham, "a common weed" around Bombay; by Roxburgh, in Eastern Hindustan; by Burmann z. pl. 4, on Ceylon; by Mason, in Burmah, enumerated as indigenous. Westward, the "kavar el abid" seen in Yemen by Forskal p. ciii, may be compared: *A. sessilis* is known to occur as far North as the Caspian (A. Dec.); was observed by Hasselquist at Jerusalem; by Forskal p. 28, and Delile, in Lower Egypt; by Desfontaines, in Barbary (Steud.); and is known to occur in Western Equatorial Africa (Benth. fl. nigr.). By European colonists, was carried to the Mauritius Islands, Brazil, and the West Indies (Pluk. alm. pl. 133, and Moq.).

Marsilea quadrifolia of Tropical Eastern Asia? A Cryptogamous Oxalis-leaved annual called in Egypt "qourayeta" (Del.), in Sanscrit "chittoor-dulla" (J. F. Wats.), in Japan "ukingusa" (Thunb.): the "sunishannaka" of Susrutas sutr. 19 to 46,—is referred here by Hessler: *M. quadrifolia* was observed by Graham on the "margins of tanks" in the environs of Bombay; by Ainslie 252, in other parts of Hindustan; by Thunberg, frequent in the rice-grounds of Japan; by myself, on the Feejeean, Taheitian, and Hawaiian Islands, introduced with taro-culture and by Polynesian colonists. Westward from Hindustan, was observed by Delile in rice-grounds and moist situations in Egypt: the "lens palustris altera" sent to Matthioli by Cortusi, and "lemma" of Dalechamp 1014, are referred here by Sprengel.

"1132 A. D." (palm-leaf ann. Jag., and W. W. Hunter, Stirling giving 1131), Suvarna Kesari succeeded by Chorganga, now king of Orissa and head of the Ganga-Vansa or Gangetic dynasty.

Harivansa* is enumerated among the "five hundred" authors at the court of Sri Boja—(Langlois introd. p. vii).

* *Ehretia serrata* of Eastern Bengal and Nepaul. A Cordia-like tree called in Bengalee "kala-oja," in Nepaul "nulshima" (Drur.); and from early times, its tough light durable wood used for sword-handles: the "caliyaca" of Harivansa 126—may be compared: *E. serrata* was observed by Roxburgh, and Wallich, from Eastern Bengal to Chittagong, Dheyrah Dhoon, Nepaul, and Bhootan, growing "both on mountains and in valleys," the flowers emitting "a powerful honey-like smell" (Drur.).

Jasminum hirsutum of Tropical Hindustan. A climbing shrub called in Bengalee "koondo," in Sanscrit "koonda" or "koondum" (J. F. Wats.); in which we recognize the "cunda" of Harivansa 137,—teeth compared with its flowers by Jayadeva: *J. hirsutum* was observed by Nimmo, and Graham, in the "Southern Concan," and besides "in gardens," its flowers "in terminal umbels, large, pure white;" by Burmann pl. 3, Retz (Pers.), and Roxburgh, as far as Calcutta.

Phoenix paludosa of Bengal and Burmah. The *marsh date-palm*, slender-stemmed and elegant-looking, is called in Burmah "then-boung" (Mason): the "hintala" of Harivansa 96—is referred here by Langlois: *P. paludosa* was observed by Roxburgh "characteristic of the Sunderbunds" or mouths of the Ganges, the smaller trunks used for walking-sticks, larger ones for rafters, and fronds for thatch (Drur.); was observed by Mason, as far as Burmah.

Barleria buxifolia of Tropical Hindustan. A shrubby spreading plant with large beautiful pink flowers: the "couravaca" rouge of Harivansa 126—may be compared: *B. buxifolia* was observed by Rheede ii. pl. 47 in Malabar; by Nimmo, in "the Concan" as far as Bombay; by Buchanan, and Roxburgh, in other parts of Hindustan.

Barleria ciliata of Tropical Hindustan. Called in Sanscrit "kuruvuka" (Pidd.), and this or

Ipomoea reptans of Tropical Africa and Asia. The *water convolvulus* is called in Tagalo and Pangango "cangcong," in Bisaya "tancong" (Blanco), in Malabar "ballel" (Rheede); and the "calambica" of Harivansa 137 — is referred here by Langlois: *I. reptans* was observed by Rheede xi. pl. 52 in Malabar; by Graham, "margins of tanks and other moist places throughout the Concans" to and beyond Bombay, the "flowers rose-coloured;" by Roxburgh, in other parts of Hindustan, and is termed "olus vagum" by Rumphius v. pl. 155; was observed by Loureiro, in Anam; by Blanco, on the Philippines, slightly purgative but cooked and eaten by the natives, the flowers white. Westward of Hindustan, by Forskal p. 44, in Yemen, "in rivulis repens" its flowers "violacei;" by Grant, from the "Equator and 2° N." to "Nile edges 18° N."

1133 A. D. (= 1082 + "50 yrs. 5 mo. 3 days" of Deccan records, Mackenzie, and Wilford as. res. ix. 157), end of the reign of raja Bhoja.

One hundred and sixty-third generation. May 1st, 1134, onward mostly beyond youth: the Jewish writers, Abraham ben David, R. Abraham Ibn Ezra, Moses Ibn Ezra, Jehuda Halevi, Jehuda ha-Abel Hedessi, Menahem ben Solomon: the Arab writers, Ebn-altalimidh, Mohammed Kaisi, Humenus, Abu'l Salt Omayya d. 1151, Albucasis, Abul Abbas Elhafits, and Artefius: the Greek writers Anna Comnena d. after 1137, Bryennius d. after 1137, Joannes Antiochenus, Manasses d. about 1150, Joannes Tzetzes d. about 1150, Aristenus d. 1166: William of Malmesbury; Geoffrey of Monmouth; Arnoldus Brixiensis, Elizabeth of Germany, Ekbertus Treverensis: the scholastic theologians, Hugo de S. Victore, Richardus de S. Victore, and Petrus Lombardus.

"1135 A. D. = 13th year of the 'thian-hoei,' the name being continued by Hi-tsoung of the Kin," ruler of Northern China — (Chinese chron. table).

"1136, October" (Nicol.). a synod at Burgos in Spain. For the introduction of the Roman ritual: and to reconcile the kings of Navarre and Castile.

"1138 A. D." (De Wailly pl. vi. 6), in manuscripts from this date, the full-stop or period (.) placed at the end of sentences.

"1139, April 20th" (Alst., and Nicol.), tenth general ecclesiastical Council. Assembled at the Lateran in Rome, "a thousand" bishops being present, "For the re-union of the church. Thirty canons were made, similar to those" adopted at Rheims: and excommunication decreed against whoever should strike a priest, removable only by the pope. Monks were forbidden to exercise the art of medicine (Humb. cosm. ii. note).

"Aug. 29th" (Nicol.), a synod convened at Winchester by the bishop Henry of Blois. Against his brother king Stephen, for requiring "the bishops of Ely, Lincoln, and Salisbury, to surrender their castles."

Maruta cotula of Europe and the adjoining portion of Asia. Called in the North of England *baldeyebrow* (E. Gillet), in some parts of Sweden "baldersbra" (Mallet), and the Anglo-Saxon *baldar herbe** — is referred here by Cockayne: the "cotula" growing in towns and along

other species in Bengal "curubaca" (W. Jones); the "kuravaka" trees of Harivansa 126, — Jayadevas vii. 23, with which according to Kalidasa ragh. ix. 32 to vikram. spring ornaments the woods with beauty, may be compared: *B. ciliata* as observed in Eastern Hindustan is described in hort. beng. 45 (J. F. Wats.).

Strobilanthes ciliata, perhaps not distinct from the preceding, is called in the environs of Bombay "karwee," is further described by Graham as an erect branchless shrub growing "in great abundance on the Ghauts, frequently covering acres of ground," its bright blue flowers appearing in October, a "most useful plant" to the natives, who employ the stems in "mud walls and for making fences," and "have a tradition that it flowers only once in ten years." Possibly was carried to the Mauritius Islands, for "*Barleria lupulina*" is suspected by Graham to be identical.

* *Centaurea nigra* of middle Europe. Called in Britain *knabweed* or *knob-weed* or *loggerheads*, in old manuscripts "clobbewed" (Prior): the Anglo-Saxon *bolvvves* — is referred here by Cockayne: *C. nigra* is described by Linnæus; and is known to grow in meads in France and throughout middle Europe (Lam. fl. fr., Engl. bot. pl. 278, and Pers.), but according to Ledebour does not occur in Siberia (A. Dec.). By European colonists, was carried to Northeast America, where it continues in waste ground from Newfoundland throughout Eastern New England (Torr., and A. Gray).

Hippophae rhamnoides of Northern Europe and Asia and mountains farther South. A shrub called in Britain *willow-thorn* (Prior), in Norfolk (E. Gillet) by the Anglo-Saxon names *VVIRVVIVVLE* or *VVYVVIVVLE* — (Cockayne): *H. rhamnoides* is described by Linnæus; was observed by Scopoli in Carniolia; and is known to grow in stony mountainous situations in Central Europe, and farther North, only along the seashore in Sweden (Pers., Wahl., and A. Dec.). Eastward, is known to grow in Siberia (Hort. Belv., and Steud.).

Fucus nodosus of the North Atlantic. Called in Britain *tang*, in Danish "tag," in Frisian "mar-

roadsides, is mentioned by J. Jacobi de Manliis; the "*cotula fetida*," in the *Ortus Sanitatis* 81 as one of the two kinds of "*butalmos*" growing within cities; the "*cotula*," by Hieronymus Barbarus, and Matthioli: *M. cotula* is described by Brunfels i. 225, and Fuchsius 583 (Spreng.); is known to occur in waste places in Italy, Sicily, Barbary, the Canaries, Portugal, and throughout middle and Northern Europe nearly to Lapland (Ten., Boiss., Fries, and A. Dec.). Eastward, was observed by Chaubard, in the Peloponnesus; is known to occur in Abyssinia (A. Rich.), Persia (Dec.), around Caucasus and in the neighbouring portion of Siberia (Ledeb.). By European colonists, was carried to Madeira and the Azores (Dec., and Wats.); to Northeast America, where it has become frequent along roadsides; to Brazil and Buenos Ayres, occurring along the seashore (A. Dec.); to the Philippines, where it was found by Blanco hardly known to the natives, but called in Tagalo "*higuís manoc*," in Ylocano "*tin-tatinta*;" and to the Loo Choo, and the Bonin Islands (Hook. in Beech. voy. 265). Every part of the plant according to Lindley "is fetid and acrid, blistering the skin when much handled."

Anthemis arvensis of Europe and the adjoining portion of Asia. Called in Britain *corn chamomile* (A. Gray), in Sweden "*eckergras*" or "*balsebro*" (Linn.), and probably the plant in question: — termed "*chamæmelum inodorum*" by C. Bauhin pin. 135. and Tournefort inst. 494, and known to occur in cultivated ground from Sweden throughout Europe (Gaertn. ii. pl. 166, engl. bot. pl. 602, and Pers.): observed by Linnæus in Sweden, as far as Scania; by Sibthorp, D'Urville, and Chaubard, in cultivated ground from the Peloponnesus to Cyprus. By European colonists, was carried to Northeast America, occurring according to A. Gray in "fields, New England and New York, sparingly introduced."

Bromus sterilis of Europe and the adjoining portion of Asia. Called in Greece "*agriōvrōmōs*" (Sibth.), and included among the weeds called in Britain *dravick* or *drake* or *drawk*, in Welsh "*drewg*," in Breton "*draok*," in Dutch "*dravig*," and perhaps the Anglo-Saxon *ēdrōc* of the Epinal glossary — (Prior p. 67 to 70): *B. sterilis* is termed "*gramen avenaceum panicula sparsa locustis majoribus et aristatis*" by Tournefort inst. 526; and is known to grow in Barbary and throughout middle and Northern Europe as far as Lapland and Iceland (Pers., and Wats.). Eastward, was observed by Sibthorp, and Chaubard, from the Peloponnesus to Constantinople.

Glyceria aquatica of Northern Climates. Called in Cambridgeshire *leed* or *white leed* (E. Gillet), and the Anglo-Saxon *līd*, — described by Camden as a sort of rank hay abounding in fens, is referred here by Cockayne: *G. aquatica* is described by Morison viii. pl. 6. f. 25; is termed "*gramen aquaticum paniculatum latifolium*" by Tournefort inst. 523; was observed by Savi in Italy; and is known to grow throughout middle and Northern Europe as far as Sweden (Pers., Dec., and Wats.). Eastward, was observed by Sibthorp around Constantinople; is known to grow in the Tauro-Caspian countries (Bieb.), and throughout Siberia (Gmel.?, and Kunth). Farther East, is known to grow along the Saskatchewan to Lake Winnipeg (Hook.); and has been observed by myself in wet marshes from Lat. 46° near St. John to about 42° 30' in New England. In the Southern Hemisphere, is known to occur in Australia (Kunth).

"The same year" (Blair), Lisbon captured from the Muslims by Alphonso earl of Portugal. Who was now proclaimed king.

"1142 A. D. (= 1802d of Synmu," art de verif.), Sintoku succeeded by Konjei, eighth son of To-ba, and now dairo of Japan.

"1143 A. D." (Alst.), Joannes II. succeeded by his son Emanuel Comnena, fifty-third Byzantine emperor. Verses addressed to the emperor by Theodorus Ptochoprodromus are regarded as the earliest specimen of *modern Greek* (E. A. Soph.).

"Sept. 26th" (Nicol.), Innocentius II. succeeded by cardinal Guy de Castro of Tuscany, now Celestinus II., ninth pope. Conradus III. ruling Germany and Italy; and Louis VII., France.

"Oct. 1st" (Nicol.), a synod at Constantinople. Against the monk Niphon: — as also a second synod, on the ensuing "Feb. 22d."

"1144 A. D. = 14th year of the 'chao-king' of Kao-tsoung II., and 4th year of the 'hoang-tsoung' of Hi-tsoung" (Chinese chron. table), beginning of the Sixty-fourth cycle.

The Mangarevan or Gambier Islands colonized by Teatumoana, their first king, "twenty-five generations" before — the visit of Mairi (Hale ethnogr. expl. exp. 139). The first settlers are regarded by Hale as Rarotongans; — shown by examination of the language to this day spoken. The line of

tag," corresponding to the German "*dach*" roof, and Anglo-Saxon *thæce* thatch, from seaweed having formerly been used to cover houses — (Prior).

Porphyra laciniata of the sea-coast of Northern Europe. One of the seaweeds called in Britain *laver*, in Anglo-Saxon *læfer* — (Prior).

Ulva latissima of Northern Europe. Included under the same names with the preceding seaweed — (Prior).

successive kings has been interrupted, Koa, the thirteenth on the list, becoming the head of a new dynasty: from him "the fourteenth in a direct line," Maputeva, was found reigning by Maigret.

Eleusine Indica of Equatorial Africa. A coarse weedy grass, having no Sanscrit name (A. Dec.), but called in Japan "smootali kusa" (Thunb.); carried to the islands of the Pacific as early possibly as this date: — observed by myself abundantly naturalized on Metia, Taheiti, the Samoan Islands, and Tongatabu; but on the Hawaiian Islands regarded by intelligent natives as introduced by the Whites (and admitted by residents to have increased within a few years). Westward, was received by Decaisne from Timor; was observed by Rumphius v. pl. 76 on Amboyna, and is known to occur on Luzon (Kunth); was observed by Thunberg in Japan; by Roxburgh, in Hindustan; used while young for feeding cattle; by Rheede xii. pl. 78, in Malabar; by Graham, as far as Bombay; by myself, at Muscat and on Zanzibar; by Forskal p. 18 (Steud.) among the mountains of Yemen; was received by Kunth from Egypt; was observed by Grant in Equatorial Africa, "as grazing for cattle the natives esteem it, though tough, more than any other species;" is known to grow as far as Guinea and the Cape Verd Islands (Benth. fl. nigr.). By European colonists, was carried to the Mauritius Islands (Boj.); to Southern Brazil (Nees fl. br.); to Northeast America before the visit of Michaux (Pers.), has become a frequent weed in our Middle and Southern States, was observed by Nuttall in gardens on the Arkansas, and seemingly indigenous along the Mississippi.

The remote island of Rapa also ascertained by Hale through the language, to have been peopled from Rarotonga: — and the intermediate islands, Raivaivai, Rurutu, and Rimatara, partly from Rarotonga and partly from Taheiti: the peopling of Tupuai having taken place within two centuries (see also Ellis res. Polynes. 281, and J. Williams miss. ent. 449).

The Paumotuian coral-archipelago is regarded by Hale ethnogr. expl. exp. p. 143 as more recently peopled than the surrounding high islands; otherwise, the Paumotuans would have taken possession of those high islands. Yet the language, though in part similar to the Taheitian, contains a peculiar element, "unlike any that we find elsewhere;" many of the words being "such as are usually original in a language." In the Western portion, the coral-islands are all inhabited as far as Hau or Bow; but on proceeding East, uninhabited ones are met with, increasing in number until the eight nearest the Mangarevan Group are all in that condition.

"March 12th" (Alst., and Nicol.), Celestinus II. succeeded by Gerard Caccianimico, cardinal of Santa Croce in Jerusalem and now Lucius II., tenth pope.

"In this year" (Neumann note to Vahram in Orient. transl. lond.), Edessa captured by the Turks. An elegy on the event composed by Nerses Clajensis, the Armenian patriarch.

"In or about this year" (Blair), the Aristotelian philosophy restored in Germany by Otho Frisingensis.

"1145, Feb. 27th" (Alst., and Nicol.), Lucius II. succeeded by abbot Bernard of Rome, or Eugenius III. eleventh pope.

As early possibly as this year (= 1225 + "3 + 3 + several years reign," addit. art de verif.), a *suspension bridge* six hundred feet long over the Apurimac, constructed of large woody vines by the Inca Mayta Capac; a novelty having great influence over the surrounding tribes.*

"1147, Feb. 26th" (Nicol.), a synod at Constantinople. The patriarch Comas was deposed.

"After Easter" (Nicol.), a synod at Paris. "On the errors of Gilbert bishop of Poitiers respecting the Trinity."

"The same year" (Blair), through the preaching of Bernard of Clairvaux, the Second crusade undertaken.

Carex paniculata of Europe and the adjoining portion of Asia. The natural tumps of this large sedge are called in Britain *hassocks* (Prior), in which we recognize the *hassocum* of the foundation-charter in the above year of Sawtrey abbey, — mentioned also in the attestation of Alex. Maufe, the "hassok" identified with the "ulphus" by Galfridus pr. pm., and the "hassokes" recorded respecting "the castle of Guysnes in 1465" (Way): *C. paniculata* is described by Linnæus; was observed by Savi in Italy; by Brotero, in Portugal; and is known to grow from Switzerland throughout middle and Northern Europe as far as Lapland (Pers., Dec., and Wats.; see *C. Virginiana*).

"December, or early in 1148" (Nicol.), in a synod at Treves, the writings of the abbess Hildegard examined. — She died "in 1180" (Trithem., and Spreng.).

Polygonum persicaria of Europe and the adjoining portion of Asia. Called in Britain *peach-wort* or *red-shanks* (Prior), in Greece "agria pipōuria" or by the Turks "pere oti" (Sibth.): the

* *Aristolochia fragrantissima* of the Eastern slope of the Peruvian Andes. A woody vine climbing to the tops of trees, and from early times employed by the Peruvians medicinally, applied bruised fresh to bites and stings of reptiles and insects, and its stems stripped of their bark used for ropes: — observed by Ruiz mem. pl., by Spanish colonists called "bejuco de la estrella" (Pers., and Lindl.).

RAZEL of Hildegard ii. 174 — is referred here by Sprengel: the “cronesanke” of gloss. Harl. 978, is referred here by Cockayne; and the “persicaria” with a fuscous spot in the middle of the leaf is mentioned in *Ortus Sanitatis* 379: *P. persicaria* is described by Ruellius, Fuchsius, Lacuna, Dodoens, Lobel, and Gerarde; is termed “*persicaria mitis maculosa et non maculosa*” by Tournefort inst. 509; and is known to occur throughout middle and Northern Europe as far as Lapland (fl. Dan. pl. 702, Pers., and Wats.). Eastward, was observed by Forskal, and Sibthorp, frequent in moist places in Crete and around Constantinople; by Forskal, and Delile, at Alexandria and Rosetta on the Mediterranean border of Egypt; and is known to occur in the Tauro-Caspian countries (Bieb.). By European colonists, was carried to Iceland (Hook.); and prior to 1547, the “*persicaria*” or “*herba maculata*” to the West Indies (Ovied. gen. hist. xi. 2); thence perhaps to Florida (Chapm.) and throughout our Atlantic States, where it has become naturalized; was observed by Short in Kentucky; by Drummond, at Cumberland House in Central North America; and by myself, accompanying the introduction of cultivation at the Kooskoosky mission-station in Oregon; was also carried to Southeast Australia (Corder, and A. Dec.).

Cicuta virosa of Subarctic Climates. Called in Britain *cowbane* or *water-hemlock* (Prior): the *CICULA* of Hildegard ii. 159 — is referred here by Sprengel; and the Anglo-Saxon “brocthung” of gloss. Laud. 576, is referred here by Cockayne: *C. virosa* is termed “*sium alterum*” by Dodoens 589, is described also by Thalius 33 (Spreng.); and is known to grow in Switzerland, and from France throughout Northern Europe as far as Lapland (Blackw. pl. 574, Hall. fl. Dan. pl. 208, Pers., and Wats.). Eastward, is known to grow in Siberia (Dec.). And farther East, in North America, in the wooded country from “Lat 64° to 54°” (Hook.). The plant is a dangerous poison, causing according to Christison “true tetanic convulsions” and death (Lindl.).

Erodium cicutarium of Europe and the adjoining portion of Asia. A *stork's-bill* called in Germany “*storcken schnabel*” (Trag.), in Greece “*kalôgērô*” (Sibth.); in which we recognize the *STORCKENSCHNABEL* of Hildegard ii. 160: — *E. cicutarium* is described by Tragus i. pl. 113; is termed “*g. cicutæ folio minus et supinum*” by Tournefort inst. 260, “*g. chaerophyllum*” by Cavanilles iv. pl. 95; and is known to occur in waste and cultivated ground from Sweden and Russia throughout Western Europe (Curt. lond. i. pl. 51, Pers., and Wats.); was observed by Sibthorp, and Chabaud, from the Peloponnesus throughout the Greek islands; by Delile, seemingly wild near Cairo. By European colonists, was carried to Chili, where it has become naturalized (Hook., and myself); to California, where it is called *pin-grass* or by the Spaniards “*alfilerilla*,” and its stem eaten (R. Brown jun.), has also become naturalized as far as the Great falls of the Columbia and the Rocky mountains (Hook.); to Northeast America, observed by Knieskern on the “shore of Oneida Lake” (A. Gray).

In or about 1148 A. D. (= 1648 — “500 yrs.” of Flacourt præf. and i. 16), Zaffe-Ramini or Zaffer-Amini, from the region around Mecca, settling at the Southern extreme of Madagascar; — where they continued to rule a province until conquered by the French.

Nymphaea Madagascarensis of Madagascar. A water lily called “*tantamou*,” the root esculent and well-flavoured, — and according to Flacourt i. 36 the flower “*violette*” This is doubtless the beautiful species with dentate leaves observed by myself in the pool or pond near the city of Zanzibar. By European colonists, carried to the Mauritius Islands and cultivated there (Boj., and Dec. syst. p. 50).

Vouandzeia subterranea of Madagascar and the Comoro Islands. An annual Leguminous plant, called “*voua-hanzou*” in Madagascar, and cultivated there as early probably as this date: — observed there by Flacourt, and Bojer; and the exported pods containing esculent beans known in commerce as *African groundnuts*. By European colonists, the living plant carried to the Mauritius Islands (Boj.); “from Africa” to Brazil prior to 1658, under the name of “*mandobi*” and distinguished by Piso pl. 256 from the Brazilian kind (A. Dec. geogr. bot. p. 964); and thence to Surinam (Linn. jun. dec. xxxvii. pl. 17, and Pers.).

Cerbera tanghin of Madagascar. A tree called “*voua-tanghine*,” the kernel of the fruit not larger than an almond but sufficient to destroy twenty persons, used in Madagascar as an ordeal. — but the practice is now discontinued (Lindl.): the tree was observed by Bojer everywhere in the forest, but on the Eastern side of the island only. Carried to the Mauritius Islands and cultivated there. But according to Lindley, “it is very doubtful whether this is” a distinct species from *C. manghas*.

Canarium harami of Madagascar. A tree called “*harami*,” — described by Flacourt i. 36. 97 as very large, yielding the fragrant balsamic resin called *tacamahaca* which is employed medicinally, and may even form a substitute for pitch; the timber besides suitable for ship-building. By European colonists, carried to the Mauritius Islands and cultivated there (Boj.).

Hydrogeton fenestralis of Madagascar. An aquatic perennial called “*ouvirandran*,” the root as large as the thumb, esculent, — and commended by Flacourt i. 36. 4. observed by Bojer in rivers

and marshes around Tamatave and Ivoundrou. By European colonists, carried to the Mauritius Islands and cultivated there.

Strychnos spinosa of Madagascar. A bush called "voua-vountaka," — the fruit according to Flacourt i. 36. 13 as large as a quince, with a gourd-like shell full of large flat seeds resembling those of nux-vomica and smaller, the juice and watery pulp agreeable when ripe : observed by Bojer on the margin of the forest throughout the Eastern coast and in the plain at Foulepointe. By European colonists, carried to the Mauritius Islands and cultivated there : and from transported specimens, described by Lamarck.

Agathophyllum aromaticum of Madagascar. A tree called "ravinsara ;" — described by Flacourt i. 36. 24 as taller than the European laurel, the fruit, leaves, and young bark having the taste of cloves, and one of the best spices of the island, producing fruit only once in three years, when the tree is cut down by the natives to save the trouble of climbing. By European colonists, carried to the Mauritius Islands and cultivated there (Sonnerat, and Boj.) ; and from transported specimens, described by Jussieu, and Gaertner.

Buddelia Madagascarensis of Madagascar. Called there "seva," — and described by Flacourt i. 36. 98 as a shrub or small tree, the leaves brownish-green above, cottony and white beneath, astringent and good to foment contusions and sprains, and boiled with "vin de miel" to stop diarrhœa. By European colonists, carried to the Mauritius Islands and cultivated in gardens (Boj.) ; to Ceylon, observed by Gardner escaping from cultivation (A. Dec.). From transported specimens, described by Vahl (Lam. pl. 69, and bot. mag. pl. 2824).

Terminalia fatrœa of Madagascar. A small tree called "voua-fatré," — described by Flacourt i. 36. 65 as yielding "la litemente ou le benjoin ;" observed by Bojer at Tamatave and Foulepointe. By European colonists, carried to the Mauritius Islands and cultivated there : and from transported specimens, described by Decandolle prodr.

Terminalia badamia of Madagascar. A tree called "hatafang," — observed by Bojer along the river Ivoundrou near Tamatave. By European colonists, carried to the Mauritius Islands and very generally cultivated : and from transported specimens, described by Decandolle prodr.

Alafia Thouarsii of Madagascar. A shrubby Apocynaceous vine called "voua-laffi." — The "laffa" is described by Flacourt i. 36. 120 as an "arbre" yielding very strong filaments, used by the Negroes for making fishing-lines. By European colonists, carried to the Mauritius Islands and cultivated there (Boj.).

Intsia Madagascarensis of Madagascar, the Seychelles, and Galega Island. A Leguminous tree called in Madagascar "intsi : " — the "marointsi" is described by Flacourt i. 36. 148 as good for stanching blood and stopping diarrhœa. *I. Madagascarensis* is described also by Petit-Thouars ; by European colonists was carried to the Mauritius Islands (Boj.) ; and from transported specimens, is termed "tamarindus intsia" by Sprengel.

Mithridatea tambourissa of Madagascar and the Comoro and Mauritius Islands. An evergreen tree called in Madagascar "ambora : " — the "tamboure cissa" is described by Flacourt i. 36. 69 as bearing apples that open in fours, the pulp full of seeds covered with a thick orange-coloured skin that affords a dye like arnotto. *M. tambourissa* was observed also by Commerson ; by Bojer, throughout Mauritius, in the dense and humid forest. From transported specimens, described by Jussieu gen., and Lamarck ill. pl. 784

Ampalis Madagascarensis of Madagascar. An Urticaceous tree called "ampali," — observed by Bojer in the forest around Tamatave : the "ampalatanghvari" or "fitourauen" described by Flacourt i. 36. 129 as a large tree with astringent leaves, may be compared. By European colonists, *A. Madagascarensis* was carried to the Mauritius Islands (Boj.) : and from transported specimens, is described by Jacquin rar. iii. pl. 617, and termed "morus mauritiana" by Poiret.

Alpinia ? magnifica of Madagascar. Also perennial and called "longouze." — By European colonists carried to the Mauritius Islands, where it was observed by Bojer under cultivation, and besides growing spontaneously. From transported specimens, described by Roscoe scit.

Nepenthes Madagascarensis of Madagascar. The "anramitaco" — is described by Flacourt i. 36. 43 as two cubits high, having at the end of the leaves a sort of hollow flower covered with a lid and containing water after rain, the plucking of this flower avoided by the natives and supposed to induce rain. From transported specimens, *N. Madagascarensis* is described by Poiret (Steud.).

"1149 A. D. = 1st year of the 'thian-te' of Tchou-liang, of the Kin," ruler of Northern China — (Chinese chron. table).

"1149 to 1150 A. D." (. . .), El-Hafez succeeded by Dhafer of the Fatimite dynasty, ninth sultan of Egypt. A coin issued by Dhafer at Alexandria, is figured in Marcel p. 128.

"1150 A. D." (Blair), the *Civil law*, for the first time after Justinian, restored in Germany by Irnerius Wernerus.

"In the Twelfth century" (Pouchet), Adelard of Bath visiting Greece and Egypt.

"1151 A. D." (Blair), "after twenty-four years labour," the composition of the *Canon law* by Gratian of Tuscany.

"1152 A. D. (= 547 A. H." of Ferisht., Elph.), Behram having put to death his son-in-law, prince of the dependent territory of Ghor, and afterwards a brother of the deceased, Ghazni, now perhaps the greatest city in Asia, was captured and destroyed by a third brother Ala-u-din Ghor: Behram was driven across the Indus, where dying, his son Khusru continued the retreat and established his seat of government permanently at Lahore.

"In this year" (palm-leaf ann. Jag., and W. W. Hunter, Stirling giving 1151), Chorganga succeeded by Gangeswar, now king of Orissa. His territories are said to have extended from the Ganges to the Godaveri. — He excavated a splendid tank between Pippli and Khurdha.

"After September" (Nicol.), a synod at Mellifont in Ireland. The archbishopsrics of Armagh, Dublin, Cashel, and Tuam, were appointed.

"1153 A. D. (= 548 A. H." of Ferisht., Elph.), after capturing and reinstating Ala-u-din Ghor, the Seljuks under Sanjar overwhelmed by the Uses, a hitherto unknown tribe of Tartars.

"July 9th" (Nicol.), Eugenius III. succeeded by Conrad cardinal-bishop of Sabino, now Anastasius IV., twelfth pope. Fredericus Barbarossa ruling Germany and Italy; and Malcolm IV., Scotland.

"In this year, in the time of Fred. Barbarossa" (Galvan.), arrival at Lubec of a small barge propelled by oars containing strangers whose language the Germans could not understand, nor could they ascertain from what country — (probably aboriginal North Americans).

"The same year" (Lubke and Lutrow), the Baptistery at Pisa built by Diotisalvi.

"1154, Jan. (= 548 A. H. chewal," Jaubert), the geographical work of Edrisi completed.

Ficus salicifolia of Tropical Arabia. Called in Yemen "thaab" (Forsk.); the "talhat el-melik" tree marking the boundary between Mecca and Yemen, and described by Edrisi ii. 5 as resembling the willow but larger, — may be compared: *F. salicifolia* was observed by Forskal p. 179 frequent among the mountains of Yemen, a very large tree with pendent branches, its bark furnishing igniting-cords for matchlock muskets.

Cynosurus ? durus of Syria and Egypt. A grass called in Nubia "anbarfeh," in Egypt "halfeh" (Del.), and the "halfa" growing according to Edrisi v. 7 on mountains on the East side of the Caspian, collected and sold by the inhabitants and their principal resource, — may be compared: the "halfa" is also mentioned by Ebn Baitar. *C. durus* is known to grow in Palestine (Linn. fl. pal.); was observed by Forskal as far as Ghomfude in Arabia; by Lippi, Forskal p. 21, and Delile, in Egypt, used to heat ovens and made besides into coarse cordage; by myself, frequent throughout on the river-flat, especially towards its margin. Eastward from the Caspian, is said to grow in Hindustan (Roxb. i. p. 333, and Graham).

"In this year = 10th year of the seventy-sixth daïro Konjei" (Kaempf. ii. 5), birth of Joritomo at the court of Japan. The dragon at this time infesting the palace, — in the accounts of Japanese historians (art de verif.), seems an allusion to internal dissensions and the change in form of government eventually effected by Joritomo.

"During Lent" (Nicol.), a synod in London. "The ancient customs contained in the charter of king Edward, and the privileges of the clergy" were revived.

Beginning of "the party names of Guelfs and Gibbelines" (Blair): the Guelfs siding with the pope; and the Gibbelines, with the German emperor (Alst. p. 184).

"Dec. 3d" (Alst, and Nicol.), Anastasius IV. succeeded by cardinal Nicolas Breakspeare, now Hadrianus IV., thirteenth pope: the only Englishman ever placed at the head of the Catholic church.

"1155 A. D." (Alst. p. 393), Ireland ceded by the English pope Hadrianus IV. to Henry II. of England. on condition, That tithes should be exacted annually, and the ecclesiastical rights maintained intact.

"The same year" (art de verif.), Dhafer succeeded by Fayez of the Fatimite dynasty, tenth sultan of Egypt.

Berberis aristata of the mountains of Hindustan. Called in Arabic "aarghees" (J. F. Wats. index); in which we recognize the "aargis" of Gafeki, — and Ebn Baitar. *B. aristata* is mentioned in the Ulfaz Udwiye 1, and by Birdwood cat. bomb. 5.

Geranium nodosum of Europe and Northern Asia as far as Cashmere. Called at Lahore "ibrat-ut-rai" (Honiqb. 313, and J. F. Wats. index), in which we recognize the "ibrat alrai" of Gafeki, — and Ebn Baitar. *G. nodosum* was observed by Sibthorp on the mountains of the Peloponnesus: and farther West, is described by Tournefort inst. 267; and is known to grow in Southern France, and even in England (Cav. iv. pl. 88, Pers., and Engl. bot. pl. 1091).

"1156 A. D. (= 551 A. H." of Ferisht., Elph.), Ala-u-din Ghor succeeded by his son Seif u-din Ghor, now sultan of Ghor and Ghazni.

"In this year" (ann. Jap., and art de verif.), Konjei succeeded by Go-sijrakawa, fourth son of To-ba, and now seventy-seventh daïro of Japan. In the first year of his reign, a revolt.

"In or about this year" (Garc. de la Vega), Mayta Capac succeeded by his son Capac Yupanqui, fifth inca of Peru. — He built a floating bridge across the outlet of Lake Titicaca, vine-bridges across rivers, also roads, extensive canals of irrigation, and extended the empire Northward, beyond its limit of "seven leagues" from Cuzco. He commenced the fortress of Sacsahuaman near Cuzco (Salcam. edit. Markh. 88).

Galipea officinalis of the Upper Orinoko. A Xanthoxyloid tree called there "orayuri" (Lindl.), its bark from early times bruised and employed to intoxicate fishes; * — being *carony* or true *angostura bark*, one of the most valuable febrifuges known: observed by Hancock (med. bot. trans. 1829 pl. 2) on the higher lands "of Carony between 7° and 8° N.," well known also in "the Southern and back missions of the Orinoko."

"1157, Jan. 26th" (Nicol.), a synod at Constantinople. "On the celebration of divine service."

"In this year (= 552 A. H." of Ferisht., Elph.), Seif-u-din Ghorî succeeded by Gheias-u-din Ghorî, now sultan of Ghor and Ghazni. He associated his brother Shahab-u-din in the government, and left to him the chief conduct of military operations.

1159 A. D. = "1084 an. jav." (Madura trad., Nata Kasum., and Raffles x.), Muda Sari succeeded by his son Raden Pankas, now king of Java. Who removed the seat of government to Pajajaran. — The site of Pajajaran, marked by a heap of stones, and lines of fortification, continues to be pointed out.

"In this year" (ann. Jap., and art de verif.), the revolt and civil war continuing, abdication of Go-sijrakawa or Go-ziro-kawa, who retired among the bonzes or priests. He was succeeded by his eldest son Nidsioo, now at the age of sixteen years daïro of Japan.

"Sept. 7th" (Nicol.), Hadrianus IV. succeeded by cardinal Roland, now Alexander III., fourteenth pope.

"1160 A. D." (Elph.), Khusru succeeded by his son Khusru Malik, now second sultan of Lahore, — and as it proved the last.

"In this year" (Nicol.), in a synod at Oxford, thirty heretics condemned.

"The same year" (Alst.), at Lyons in France, the Waldenses, an association for moral and religious reform, commenced by Waldus.

"The same year" (Crawford vii. 11), the city of Singhapura founded by a Malay colony under Sri Turi Buwana, from the original country of that people by the way of Palembang in Sumatra. (According to Malay annals, by Sang Nila Utama son of Sang Sapurba chief of Menangkabau, Raffles x.).

"The same year" (art de verif.), Fayez succeeded by Adhed, of the Fatimite dynasty, eleventh sultan of Egypt.

"In this year" (Clavig. i. 112, Holmes suppl., see also Humb. iii), commencement of the Aztec migration: the Aztecs leaving Aztlan on their way South, — removing during several years from place to place towards Mexico.

Cucurbita maxima of Tropical or Subtropical America. The *pumpkin* called in Brazilian "juru-mu" (Marcgr. 44), in Carib "jujuru" or "babora" (Desc.), and cultivated from early times: † —

* *Galipea cusparia* of Eastern Equatorial America. An evergreen forest-tree sixty to eighty feet high, — and erroneously supposed to yield angostura bark: observed by Humboldt ii. pl. 57 and termed "*cusparia febrifuga*:" observed also by A. Saint-Hilaire (Dec. prodr. i. 731, and Lindl.).

Galipea ? *sp.* of Columbia. A tree furnishing *malambo bark*, aromatic — "with very active bitter astringent and febrifugal properties" (Lindl.): supposed by Bonpland to be furnished by some tree allied to *Galipea*; and described by Wm. Hamilton (med. bot. trans. 1834).

Ayendron laurel of Venezuela. A Lauroid tree with olive-like fruit, and aromatic seeds — erroneously supposed to be pichurim beans: observed by Humboldt and Bonpland ii. 126 in marshy grounds by Calabozo (Lindl.).

† *Ambrosia artemisifolia* of Northeast America. A weed called in Carib "atyonaragle" (Desc.), and known from early times: — observed by Descourtilz in the West Indies; by Baldwin in Florida in Lat. 31°, in "cultivated ground everywhere" according to Chapman; by Michaux, among the Alleghany mountains of Carolina; by Nuttall, in Arkansas. Probably accompanied the native tribes beyond its natural limits, for it now occurs abundantly in cultivated ground as far as Lat. 45°

Amaranthus spinosus of the West Indies and neighbouring portion of North America. An herb called in Carib "coety" (Desc.), and known from early times: — termed by Sloane in 1707 "*blitum americanum spinosum*," and described as occurring along roadsides in the West Indies, and abounding in Mexico and Louisiana; observed also in the West Indies by Descourtilz; by Chapman, in

"pompions" were seen by Columbus in 1493 on Guadalupe (F. Columb. 47): "melones" too large for a man to lift, some of them internally yellow, by Oviedo nat. hyst. 80 in the West Indies; and a furrowed variety resembling a huge muskmelon, by myself in Peru: *C. maxima* was observed by De Soto in 1542 in Florida; and is known to have been cultivated by the North American tribes as far as the St. Lawrence. By European colonists, was carried Westward across the Pacific to the Philippines, called there in Tagalo "calabasang bilog," and termed "*c. sulcata*" by Blanco; to the neighbouring islands (Rumph. v. pl. 145); to Anam and China, widely cultivated (Lour.); to Burmah, called there "shwæ-pha-yung" (Mason); to Hindustan, observed by Rheede viii. pl. 2 in Malabar, by Roxburgh, Wight, Graham, and Drury, cultivated throughout. Transported to Europe, is termed "*pepo rotundus major*" by Dodoens 666, "*pepo maximus indicus compressus*" by Lobel pl. 641; is described also by Matthioli pl., and Bauhin hist. ii. 219; was observed by Chaubard in Greece; by Forskal, and Delile, in Egypt, called there "*kara estombouli*" gourd of Constantinople; is known to be cultivated in Abyssinia under an Arabic name "*doubba*" (A. Rich., and A. Dec.); was observed by Grant in central Africa, from "5° S. to 2° N." on the Nile: and later perhaps than the visit of Forster, was carried to the islands of the Pacific; observed by myself, the Peruvian variety on Taheiti, and the North American on the Feejeean Islands and New Zealand.

Chenopodium ambrosioides of our Southern and Gulf States. An herb called in Mexican "epazolt" (Span. transl. Linn., and Blanco), and cultivated from early times: — a kind of "atriplex" four or five feet high was found by Hariot in 1584 cultivated on the Roanoke, and the only salt used by the natives procured from its stem, its seeds besides making good pottage, and leaves cooked by his own party for greens (De Bry i): *C. ambrosioides* was observed by Nuttall on the Arkansas; but farther East has the aspect of an introduced weed, occurring in waste places and around dwellings in our Southern and Middle States as far as Philadelphia. By European colonists, was carried Westward across the Pacific to the Philippines, its Mexican name becoming "*apasotis*" in Tagalo, Bisaya, and Pampango, and the plant cooked and eaten by the natives and employed medicinally; to Japan, observed by Thunberg around Nagasaki, but no native name given; to Hindustan, where it has acquired native names (Pidd.). Transported to Europe "in 1619" from Mexican seed, is termed "*botrys ambrosioides mexicana*" by C. Bauhin pin. 138; was observed by Barrelier pl. 1185, and Brotero, seemingly wild in Portugal; by Ray hist. i. 96, Bonamy 26, Koch, and others, naturalized from Algeria to middle Europe (A. Dec.); was called at Verona in 1745 "*thé allemand*," because drank in infusion by the Germans (Sequier fl. i. 90); was observed by Chaubard around Mistra in the Peloponnesus; by Forskal, around Constantinople: by European colonists also was carried to the Azores and Canaries: to St. Helena by Burchell (A. Dec.); to Western Equatorial and Austral Africa (Benth. fl. nigr., and Moq.); and to the Mauritius Islands, where it has become naturalized (Boj.)., "*C. anthelminticum*" or *American wormseed*, regarded by A. Gray as not distinct, is known to occur also in waste places from Florida to Philadelphia and Kentucky (Chapm., Pursh, and Short), and according to Elliot is indigenous.

"1161 A. D. = 1st year of the 'ta-ting' of Chi-tsoung of the Kin," ruler of Northern China.

"The same year (= 557 Hej.," Pall. trav. i. 192), date of an *Armenian inscription* in the cemetery among the ruins of Bolgari on the Lower Volga, the ancient capital of Bulgaria.

"1162, May 26th" (Nicol.), election, in a synod at Westminster, of Thomas-a-Becket as archbishop of Canterbury.

"The same year" (Blair), Milan destroyed by the German emperor Fredericus Barbarossa. The churches only left standing.

"1163 A. D. = 'loun-king,' 1st year of Hiao-tsoung, of the Soung" or Twenty-first dynasty — (Chinese chron. table).

"fields and waste places, Florida and Northward;" and known to occur in "waste places" as far as Pennsylvania and Ohio (A. Gray). By European colonists was carried Westward across the Pacific to the Philippines, where it has become abundant throughout, and is called in Tagalo "*quilites*" (an American word according to Blanco), in Bisaya "*calites*" or "*tilites*" or "*orayi*" or "*harum*" or "*rayang bayang*," in Pampango "*ayantoto*," in Ylocano "*cuanton*;" to the neighbouring islands (Rumph. v. pl. 83, and A. Dec.); to Burmah, called there "*hen-ka-nway*," a "common weed in some parts," eaten as "*a potherb*" by the natives (Mason v. 472); to Hindustan, devoid of a Sanscrit name (Roxb., and Pidd.), but called in Bengalee "*kanta-mari*," in Tamil "*mulluk-kirai*," in Malabar "*mulan-chira*," in Telinga "*mundla-tota-kura*" or "*nalla-doggali*," and known to occur from Bengal to Malabar (Drur.), observed by Graham as far as Bombay, "a common weed among rubbish during the rainy season," by Moon, on Ceylon. Transported to Europe, is described by Hermann hort. Lugd. 33 (Spreng.): by European colonists also, was carried to Western Equatorial Africa (Webb, and Benth. fl. nigr. 173 to 492); to the Mauritius Islands, according to Bojer only naturalized; and by French colonists, is called "*brède de Malabar*" (A. Dec.).

"May 19th" (Nicol.), a synod at Tours. "Against the Manichæans or Albigenses, and on discipline." Monks were forbidden to read writings on physical science (Humb. cosm. ii.).

"After six or seven years" (G. de la Vega iii. 18), the Inca Capac Yupanqui sending an army Northward, under his son Rocca, and "eighteen leagues from Cuzco" they reached the valley of Amancay.*

"1164, Jan. 25th" (Nicol.), a synod and "assembly of all the realm" at Clarendon. The archbishop of Canterbury with the other bishops "promised to observe the royal customs, but subsequently declined to subscribe to them." King Henry II. in consequence, delivered over the priests accused of theft, homicide, and other crimes, to the secular power.

"The same year (= 1220 samvat," Colebrooke as. res. vii. p. 175), date of an inscription by raja Vighraha on the column projecting above a stone building at Delhi, Lacshana Pala, a Rajaputra, being prime minister.

The Sanscrit poet Jayadevas, born according to his own account at Cenduli, about this time writing † (see Lassen proleg. p. v); he mentions as cotemporary poets Umapatidharas, Caranas, Govardhana, and Dhoyin: and was earlier — than Kalidasa according to the Hindus (W. Jones).

"In or about this year" (T. Wright early trav. Palest.), arrival in Bagdad of Benjamin de Tudela; the first traveller from Western Europe known to have penetrated beyond Palestine and Syria. He found in Bagdad extensive buildings and "medical warehouses" for the care of the sick poor, also a hospital for the insane; and obtained information respecting Tartary, Thibet, Hindustan, Ceylon, and the passage by sea to China. Returning Westward, he found independent Jews at Aden, possessing "cities and fortresses on the summits of the mountains" (the walls so conspicuous there at the present day), and making incursions into "Maatum also called Nubia." — Continuing up the Red Sea, he reached Assuan on the Nile, and after an absence of three or four years descended the river. Next proceeding to Constantinople, he describes the Greeks as luxurious and unwarlike, hiring "soldiers of all nations whom they call 'barbarians' for the purpose of carrying on their wars with the sultan of the Thogarmin, who are called Turks." He further states, that the Slavonians and Russians "sell their children to all nations."

"1165 A. D. (= the year 'yei-man' of the dairo Ni-sio," San-kokf transl. Klapr.), under investiture from China, the Second or Tsiou-san dynasty ruling the Loo Choo Islands, arrival there of Tame-tomo from Japan. He married the younger sister of the an-zi of Dai-ri (Ta-li) or king; — and after the birth of his son Soun-ten-o "in 1167," returned to Japan; where he was followed by his wife and child.

"1166 A. D." (Nicol.), a synod in London. An appeal was made to the pope by the bishops of England, "Against the legation and the sentences of the archbishop of Canterbury, then a refugee in France."

"April 11th" (Nicol.), a synod at Constantinople. "Concerning marriage."

"The same year" (ann. Jap., and art de verif.), Nidsioo or Ni-sio succeeded by his son Roku-dsioo, now seventy-ninth dairo of Japan.

One hundred and sixty-fourth generation. Sept. 1st, 1167, onward mostly beyond youth: the Jewish writers, Joseph Kimchi, Maimonides, and Petachja: the Arab writer Ebn Alwam: the Greek writers, Eustathius of Thessalonica d. after 1200, Neophytus d. after 1190, Xiphilinus d. 1199, Joel d. after 1200: Theorianus, Hugo Etherianus, Arnoldus Carnotensis, Joachimus: the scholastic theologian Petrus Comestor: the Icelandic poet and historian Sæmund.

"The same year" (Alst.), "*Indulgences*" remitting sin, mentioned as "pias fraudes" by Petrus Cantor of France. (The beginning of the contest between the Bible and a visible church).

* *Ismene amancaes* of Western Peru. The *amancaes lily*; from its abundance giving its name to the valley in question, — and fully described by G. de la Vega iv. 15: *I. amancaes* was observed by myself in a well-known ravine near Lima.

† *Gualteria Corinti* of Tropical Hindustan. A climbing shrub allied to the species called in the environs of Bombay "asoca" (Graham), and W. Jones as. res. iv. 275 was informed "that one species of the asoca is a creeper;" the voluble "asoca" of Jayadevas, — may be compared: *G. Corinti* was observed by Rheede v. pl. 14 in Malabar; by Nimmo, and Graham, in "the hilly parts of the Con-cans;" by Wight, in other parts of the peninsula.

Dalbergia scandens of Tropical Hindustan. A beautiful scandent shrub (Graham); and the bower of bloomy and elegant "vanjula" plants interweaving their branches, described by Jayadevas, — may be compared (the "vanjula" of Susrutas chik. 19 to Kalp. 7 being referred by Hessler to an allied species): *D. scandens* was observed by Rheede vi. pl. 22 in Malabar; by Graham, having "long drooping racemes of light rose-coloured flowers" and "well adapted for covering trellises," common "throughout the jungly tracts of the Concan," and according to Gibson "in the Mawul districts;" by Roxburgh cor. pl. 19, and Wight, as far as Coromandel.

"1168 A. D." (Munk, and Marcel), an army of crusaders, brought from Palestine into Egypt to repel a Syrian invasion, assuming the offensive captured Bilbeis (Bubastis) and advanced as far as Cairo; but were finally compelled to retire.

Cocculus cebotha of Tropical Arabia. A woody vine called in Yemen "kebath," in which we recognize the "kabath" of Ebn Alawan landwirths.,—and Ebn Baitar: *C. cebotha* was observed by Forskal p. 171 among the mountains of Yemen, the ripe berries acrid but edible, and a spirituous liquor procured from them.

"1169 A. D." (Caradoc of Llancarvan, and Major 2d edit. Columb. p. xxi), death of Owen Gwynedd, prince of North Wales. Contention arising among his numerous sons, one of them named Madawe or Madoc sailed with a small fleet "westward, and leaving Iceland on the north, came at length to an unknown country where everything appeared new and uncommon and the manner of the natives different from all that he had ever seen:" the fertility and beauty of the country inviting settlement, he left behind most of his men; and returning to Wales, persuaded "a considerable number" of his countrymen to accompany him, and "with ten ships" bade "a final adieu to his native soil."—The event is alluded to by Meredyth ab Rhys, a Welsh bard who died "in 1477."

"In this year" (art de verif.). Roku-dsioo, succeeded by Takakura, third son of Go-sijrakawa, and now at the age of "nine" daio of Japan.

"1170 A. D." (Nicol.), a synod at Constantinople. The propositions of the emperor Emanuel Comnena for the union of the two churches, were rejected

"In this year" (= 1192 — 142 + "120th yr." of hist. Prithw., and Wilford as res. ix. p. 171), adoption or accession of Prithwi-raja or Pithaura as king of Delhi, uniting the Tomara and Chauhana families. According to some authorities, he was a son of Vighraha-Deva (H. H. Wils. ind. dram. ii. p. 154).

The Sanscrit poet Kalidasa,* "eighth gem in the council of king Vicrama" (Navaratna, and

* *Elæocarpus oblongus* of Tropical Hindustan. A very beautiful tree when in full bloom called in the environs of Bombay "khas" or "kassow" (Graham); and the "namerui" tree of Kalidasa kum. i. 56 to iii. 45, its flowers and leaves gathered and worn,—is referred here by Stenzler: *E. oblongus* was observed by Rheede iv. pl. 24 in Malabar; by Graham, at Mahableschwur and in the vale of the Yena, its petals fringed and foliage "frequently tinged with red;" by Wight pl. 46, in other parts of the peninsula.

Calysaccion longifolium of Western Hindustan. A large Clusioid tree called in Canara "taringee" or "woondee" (Bed.), in the environs of Bombay "suringee" or "gordeoondy" (Graham), or the female "poonag" (Bed., and Graham); and possibly the "punnaga" trees the bees abandoning in Kalidasa ragh. iv. 57:—*C. longifolium* was observed by Graham "on the Ghauts and throughout the Concan," its flowers "collected and exported to Bengal for dyeing silk;" by Wight pl. 1999, Cleghorn, and Drury, as far as Mysore, its flowers emitting a fragrance not unlike that of violets and used as a perfume, its fruit delicious to the taste. (See *Rottlera tinctoria*).

Aleurites laccifera of Southern Hindustan and Ceylon. Called in Sanscrit "laksha" (Ainsl.); and the "lacsha" of Kalidasa sacont., its juice staining her feet exquisitely red,—may be compared: *A. laccifera* was observed by Burmann pl. 91 on Ceylon; and it or its product is mentioned by Ainslie 23 (J. F. Wats.).

Ixora parviflora of Tropical Hindustan and Burmah. The torch tree is small and erect, called in the environs of Bombay "whorn" or "gooavee-luckree" or "raicoorah" (Graham); and the slender "karnikara" of Kalidasa vikram. iii. 2, spreading its brilliant blossoms around the skirts of the mountain, and elsewhere termed a flame of the woods—(W. Jones as. res. iv. 251), may be compared: *I. parviflora* was observed by Graham "common on the Ghauts" and "in the jungles about Nagpore, the dak runners make torches of it;" by Roxburgh, and Wight, in other parts of Hindustan; and by Mason, in Burmah.

Azanosma Roxburghii of Tropical Hindustan. A very ornamental climbing Apocynous shrub called in Sanscrit "malati" (Ell.); in which we recognize the fresh blossom of the "malati" of Kalidasa sacont.:—*A. Roxburghii* was observed by Rheede vii. 55 to ix. 14 in Malabar; by Graham, only in "gardens" in the environs of Bombay; by Roxburgh ii. 11, in Eastern Hindustan.

Convolvulus (Argyreia) speciosa of Tropical Hindustan. The elephant creeper is a twining plant called in Sanscrit "samutra-putrum" (Ainsl.), in Tamil "samutra-pallum" or "samudra-chedi" (J. F. Wats.) or "shamuddirap-pachchai" or "kadal-palai," in Telinga "samudra-pala" or "chandra-poda" or "kokkita," in Hindustanee "samundar" (Drur.), in the environs of Bombay "samudra shoka" or "googulee" (Graham); and the "vratati" of Kalidasa sacont., its twining stems entangling elephants,—may be compared: *A. speciosa* was observed by Rheede xi. pl. 61 in Malabar; by Graham, "common" in the environs of Bombay and "at the bottom of hills in the Deccan," the

Bentl. as. res. viii. p. 242), mentions king Prithue, and "Siva's bull steep to climb as mount Kailasa's side" (Dowlutabad).

Betula bhojputra of the mountains of Hindustan. A species of *birch* called in Sanscrit and Telinga "bhurjamu" (J. F. Wats.); in which we recognize the "bburja" tree of Kalidasa kum. i. 7 to ragh. and vikram. ii., its bark used for epistles by maidens on the mountains:—*B. bhojputra* was observed by Elliot, and Balfour, on the Northern Circars.

"The same year" (Clavig. ii., and Humb. ii. 6), the Chéchémécas making their appearance on the Mexican table-land, speaking the Toltec language.*

"1171 A. D." (art de verif), death of Adhed and end of the Fatimite dynasty: the claim of the Egyptian sultans to spiritual authority being abandoned, and that of the Abbassid khalifs acknowledged. Saladin now became the real ruler of Egypt; though to some extent acting under the orders of Nooreddin of Damascus.

"The same year" (Lubke and Lutrow), in England, a new cathedral commenced at York.—The southern wing was finished "in 1227;" the northern cross-arm and tower, "in 1260;" the nave, in 1321; and the building completed in the "beginning of the Fifteenth century."

"In or about this year" (rudim. chron. Lond.), the *woollen manufacture* established in England, at Worsted and Norwich.

"The same year" (Nicol.), a synod at Armagh. "All the English who were in bondage" in Ireland, were released.

Euphorbia hyberna of Western Europe. A large-leaved species of *spurge*, from early times "used by the peasants of Kerry" for capturing fish by poisoning the water—(Major edit. Bethenc. p. 131): *E. hyberna* is described by Dillenius elth. pl. 290; and is known to grow on the mountains of Southern Europe (Pers.).

"1172 A. D." (Blair), invited by Dermot one of the local kings, Henry II. entered and took possession of all Ireland: returning "about the beginning of February." Or (according to the London rudimentary chronology) "the church in Ireland first becomes subject to the Roman see."

"The same year" (rudim. chron. Lond.), building of Dublin castle.

"upper side of the leaves" according to Gibson used by the natives "as a discutient, the under or white side as a maturant;" by Burmann pl. 20, Wight, and Drury, in other parts of the peninsula.

Convolvulus (Rivea) fragrans of Tropical Hindustan. The *clove-scented creeper* is perennial and twining, called in the environs of Bombay "kulmilata" (Graham); and the "camalata" of Kalidasa sacont.,—may be compared: *R. fragrans* was observed by Vaupell, Nimmo, and Graham, from Guzerat to Bombay and the Concans, its flowers "expanding at sunset and perfuming the air with the scent of cloves," leaves "used as a potherb;" was observed by W. Jones as. res. iv. 257 as far as Bengal.

* *Guazuma ulmifolia* of the West Indies and neighbouring portion of South America. A Theobromoid tree with yellow flowers, its mucilaginous fruit eaten from early times: the "guaçuma"—is described by Oviedo hist. gen. viii. 7; is known to grow on Martinique (Lindl.); and was observed by A. Saint-Hilaire plant. us. pl. 14 in Brazil, its bark employed medicinally, and on account of its abundant mucilage to clarify sugar (Lindl.). Transported to Europe, is described by Plukenet alm. pl. 77: and by European colonists was carried to Hindustan, where it is called in Telinga "oodrick" (Drur.), and is now cultivated throughout, its light loose-grained wood used for furniture, and its leaves for feeding cattle (Roxb., Royle, Wight, and Drur), was observed by Graham "planted" as far as Bombay.

Plumiera rubra of Mexico and the West Indies. An Apocynous tree with large fragrant flowers, called in Mexican "quauhlepatlis" (Hernand.), and known from early times:—observed by Hernandez in Mexico; by Catesby pl. 92, and Descourtilz, in the West Indies; and known to grow as far as Surinam (Ehret pl. 10, and Pers.), its milky juice according to Lindley "excessively corrosive."

Plumiera alba of Mexico and the West Indies. Arborescent, called in Mexican "chupirena" or "quauh-tlepatli" (Hernand.), and its delightfully fragrant flowers known from early times:—observed by Hernandez in Mexico; by Plumier pl. 231, Jacquin am. pl. 174, and Descourtilz, in the West Indies, but no Carib name given. By European colonists was carried Westward across the Pacific to the Philippines, where it has become well known though fruit is excessively rare, is called in Tagalo "carachucha" or "calachuchi" or "calasasi," and its bark used in Ylocos as cathartic and vermifuge (I. de Mercado, and Blanco); to the neighbouring islands (Rumph. iv. pl. 38); to Anam (Lour.); to Burmah, enumerated as "exotic" by Mason; to Hindustan, observed by Roxlurgh, and Forbes or. mem., by Graham as far as Bombay, but "very rarely bears seeds perhaps from being always propagated by cuttings," by myself only around villages.

"May 21st" (Nicol.), a synod at Avranches. Henry II. "was absolved from the murder of Thomas-a-Becket, after swearing to abolish all the unlawful customs established during his reign."

"1173 A. D." (Nicol.), in a synod at Westminster, reading of the Bull for the canonization of Thomas-a-Becket. Richard prior of Dover was elected archbishop of Canterbury; and "twenty-seven canons were made on discipline."

"The same year" (art de verif.), death of Nooredin; Saladin becoming the acknowledged sultan of both Egypt and Syria. Gold and silver were coined by Saladin, to redeem the *glass money* in circulation (Marcel 139 and 144). He replaced the brick wall around Cairo with stone; built the citadel, and cleared the deep well therein, — to the present day called from him "Joseph's" well (Wilk. theb. and eg. p. 305).

The removal of the outer stone coating of the Great pyramid, is attributed to Saladin (Marcel 141).

"1174 A. D." (rudim. chron. Lond.), building of the leaning tower at Pisa.

"1175 A. D." (= 571 A. H.) of Abu-Abdallah ben Ahmed Muhrim, Badjer edit. Varthem. p. 59), the walls and towers on the mountains around Aden chiefly built by Othman ez-Zenjily, appointed governor by Turan Shah, a brother of Saladin.

"In this year" (palm-leaf ann. Jag., and W. W. Hunter, Stirling giving 1174), Madan Mahadeva succeeded by Anang Bhim Deo, now king of Orissa. — He built the great temple of Jaganath, and reigned "twenty-seven years."

"1176, Jan. 25th" (Nicol., see also Alst.), a synod at Northampton. Wherein an unsuccessful attempt was made by the archbishop of York "to compel the Scotch bishops to acknowledge his jurisdiction."

"The same year" (Blair), in England, the dispensing of justice by Circuits, first appointed.

"The same year" (rudim. chron. Lond.), London bridge commenced by Peter Coleman, a priest of Colechurch.

"In this year (= 572 A. H.) of Ferisht., Elph.), Shahab-u-din, associate sultan of Ghor and Ghazni, commencing operations against Hindustan by the capture of Uch, at the junction of the rivers of the Panjab with the Indus.

"1177 A. D." (Nicol.), a synod at Tarsus. For the reunion of the Armenians and Greeks.

"1178 A. D. (= 575 A. H.) of Ferisht., Elph.), unsuccessful expedition against Guzarat by Shahab-u-din; who however overran Sind to the seashore.

"In this year" (Clavig. ii., and Humb. ii. 6), the Nahuatlacs making their appearance on the Mexican table-land: like the Chichimecs, speaking the Toltec language.

Dioscorea sativa of Tropical America. Cultivated by the Waraus of the delta of the Orinoko *—

* *Dioscorea alata* of Tropical America? Cultivated by the Waraus (Schomb.), and called in Carib "couaheu" — (Descourt.). Westward, from an early period cultivated by the Polynesians, and observed by myself on the Tahitian, Samoan, and Tongan groups, and on the Feejeean constituting the main support of the population: called in Tahitian and Tongan "ubi" (Forst., and A. Dec.), or according to Hale, "uhi" or "uh" on Rotuma, "uhj" or "ui" or "ufi" by Polynesians generally, "uvi" by the Feejeeans, and according to Blanco, "ubi" by the Tagalo of the Philippines, and "quinampai" on Zebu: was also observed under cultivation in the Malayan Archipelago by Rumphius v. pl. 121; is enumerated by Mason v. p. 813 as wild in Burmah; in Hindustan, has no Sanscrit name (Roxb. iii., and Pidd.), but was seen there under cultivation by Rheede vii. pl. 38, and myself, and is given by Graham as "wild in both Concans." Farther West, the *purple yam* was observed by myself on Zanzibar, and was said to be also cultivated on the neighbouring main land by African tribes. (See *Colocasia antiquorum*).

Colocasia sagittifolia of Tropical America. Cultivated by the Waraus (Schomb.), and called in Carib "ouaheu" — (Descourt.): the "agi's" cultivated by the natives on Hayti, are described by F. Roman Pane 26 as "certain roots like turnips and some like radishes" (F. Columb.); according to Oviedo nat. hyst. 80 and gen. hist. vii. 3, the "ajes" are distinct from batatas and resemble the great turnips "nabos grandes" of Spain; and *C. sagittifolia* was observed in the West Indies by Plumier iv. pl. 35. Farther North, the "cocushaw" of the aborigines on the Roanoke, growing in marshy places and after expressing a poisonous juice used for making bread (Harriot, in De Bry i.), may be compared; *C. sagittifolia* continues to be cultivated from Florida to Carolina, and is called *tanier* (Pursh, Muhl., Ell., Baldw., and Mc. Euen), the leaves very large. By European colonists, was carried to the Mauritius Islands, where it is called "tongo" (Descourt.: see also *C. antiquorum*).

Cedrela odorata of Eastern Equatorial America. Employed by the Waraus of the delta of the Orinoko for making canoes — (Schomb. edit. Raleigh): observed in the West Indies by P. Browne pl. 10; and within the borders of Peru, by Ruiz and Pavon (Pers.). By European colonists, was carried Westward across the Pacific to the Philippines, where "plenty of cedar" called "calanta" was found

(Schomb. edit. Raleigh) : the word "igname" was heard by Vespucci on the coast of Paria, and was found by Cabral in 1500 applied in Brazil to a root from which bread was made (A. Dec.) ; very large white-rooted yams are imported from the West Indies, belonging to a species I have not seen growing. By European colonists, *D. sativa* was carried to the Malayan Archipelago, "injames" of the Portuguese after the Brazilians, called "byra" by the Javanese and Malaysians, and "siatsini" by the Chinese, a root on which thirty persons may dine but the taste not near so good as potatoes, were seen in Java by Nieuhoff; the "cassab el darrir" figured by Alpinus as cultivated in Egypt, may also be compared. "*D. Cliffortiana*" regarded as a distinct species, was observed by Hænke wild in Peru, by Martius wild in Brazil, and is not with certainty known to be cultivated.

"1179, March 5th to 19th" (Nicol.), Eleventh general ecclesiastical Council. Convened at the Lateran in Rome; "two hundred and eighty" bishops being present. Among other acts, Petrus was sent as legate into France, to inquire into and suppress the "heresy of the Waldenses or Albigenes" (Alst.).

The local princes of Japan now nearly independent, defeated by Joritomo, to whom the military authority had been delegated by Takakura. Joritomo now assumed the title of "cubo" (corresponding to "maire du palais" under the early French kings, or "sultan" under the califs, art de verif.).

"1180 A. D." (Alst.), Emanuel succeeded by Alexius II. Comnena, fifty-fourth Byzantine emperor.

"June 24th to Oct. 18th" (Nicol.), a synod at Tarragona. The use of the Christian era was substituted for the "Era of Spain."

"1181 A. D." (ann. Jap., and art de verif.), Takakura succeeded by his eldest son Antoku, now eighty-first daio of Japan.

"Sept. 1st" (Alst., and Nicol.), Alexander III. succeeded by cardinal Ubaldo Allocingoli, now Lucius III., fifteenth pope. Philip II. ruling France; and William, Scotland.

"In or about this year" (Blair), compilation of a Digest of the *Laws of England*, by Ranulph de Glanville.

"The same year (= 1103 Salivahan., Colebrooke as. res. ix. p. 431), latest date in an inscription chiefly in the Old Canara language — found among the ruins of Curogode in Southern Hindustan.

"1182 A. D." (Alst.), Alexius II. succeeded by his son Andronicus, fifty-fifth Byzantine emperor.

"1184 A. D." (Blair), massacre of all the Latins in Constantinople. Arranged by the emperor Andronicus.

"In this year (= 1844th of Synmu, art de verif.), abdication of Antoku in favour of his fourth brother Toba II. or Go-Toba, now daio of Japan.

"1185 A. D." (Alst.), Andronicus succeeded by Isaacus II. Angel Comnena, fifty-sixth Byzantine emperor.

"Nov. 25th" (Nicol.), Lucius III. succeeded by cardinal Hubert Crivelli, now Urbanus III., sixteenth pope. Urbanus III. "dated his pontificate from the day of his election."

by De Morga, and *C. odorata* according to Blanco is employed for canoes, and is called in Tagalo and Pampango "calantas," and in Bisaya "lanigpa" or "lanigda;" and Eastward across the Atlantic to Senegal, where too it is employed for canoes (Desc.).

Euterpe sp? of Guayana. The "manica" or "manicole" palms, furnishing the laths of the dwellings of the Waraus — (Schomb.).

Manicaria saccharifera of Guayana. The "trouli" palm, furnishing the thatch of the dwellings of the Waraus — (Schomb.): the palm described also by Jacquin (Steud.). And from transported specimens, by Gaertner ii. pl. 176.

Carapa Guayanensis of Guayana. Oil of the "carapa" nut employed by the Warau women to anoint their hair — (Schomb. edit. Raleigh) : the tree observed also in Guayana by Aublet ii. pl. 387.

Bignonia chica of Guayana. Affording with some other species the "chico" or "caraweru" pigment employed among the Waraus — (Schomb.): observed also in this portion of South America by Humboldt and Bonpland (Steud.).

Strychnos toxifera of Eastern Equatorial America. A climbing plant, the juice furnishing the basis of the celebrated "woorari" poison employed by the Waraus to envenom their arrows — (Schomburgk). The bark applied externally is regarded by Hancock med. gaz. xx. 281 as a good remedy for foul ulcers (Lindl.).

Arundinaria Schomburgkii of Eastern Equatorial America. The arrows blown through a "curata" or internode of this reed, — and Schomburgk in travelling along the Paracaima mountains witnessed the effect of the poison; so nearly instantaneous, that a deer at the top of its speed was scarcely able to "run forty yards." *A. Schomburgkii* is described as fifty to sixty feet high, the weight of its numerous branchlets causing the upper part to droop and form an arch (geogr. plant. lond. tract soc.).

"The same year" (Alst.), end of the chronicle of Gothofridus Viterbiensis.

"1186 A. D. (= 582 A. H." of Ferisht., Elph.), after years of hostilities, Shahab-u-din partly by stratagem captured Khusru Malik, and obtained possession of Lahore.

"Sept. 14th" (Blair), *Great conjunction of the sun, moon, and all the planets* in Libra.

"1187 A. D." (Klapr. note to San-kokf), Soun-ten-o having returned to the Loo Choo Islands, now at the age of "twenty-two" made king; the first of the Tame-tomo dynasty. He introduced the "i-ro-fa" or Japanese alphabet.

"In this year" (Marco Polo 65), revolt of the Tartars against their legitimate ruler Unecan or Ung-kan; and Jenghiz elected khan.

"The same year" (Munk, and Marcel), the crusaders driven from Jerusalem and Palestine into a few fortified posts along the coast: — which were held by them many years.

"Oct. 20th" (Nicol.), Urbanus III. succeeded by cardinal Albert di Morra or Gregorius VIII.; and "Dec. 19th," by cardinal Paul Scolaro or Clemens III., eighteenth pope. Clemens III. "added the year of his pontificate to the dates of the place and day in his common Bulls; which practice was adopted by nearly all his successors."

The same year ("45th year of Manuel Comnena," editor), Gregorius Degha being Armenian patriarch, end of the chronicle of Samuel of Ania.

"1188 A. D." (Blair), Third crusade. — King Richard of England and Philip II. of France, departing in the following year with the crusaders.

"1189 A. D. (= 5th year of the nengo boun-zi," Klapr. transl. San-kokf p. 221), Yosi-tsoune defeated by his brother Yori tomo seeking refuge among the Ainos; where he married a chief's daughter, received the name of Oki-gurou, and built a castle in the Eastern part of Yeso. — Remains of this edifice were visible in the days of the narrator, and the memory of Yosi-tsoune continued to be venerated by the Ainos, his history being celebrated in songs in their theatrical representations or pantomimic dances.

"1190 A. D. = 'tchao-hi,' 1st year of Kouang-tsoung of the Soung, and 1st year of the 'ming-tchang' of Tchang-tsoung of the Kin" — (Chinese chron. table).

"The same year" (Alst.), founding of a third military monastic Order; the "Teutonic knights."

"The same year" (rudim. chron. Lond.), rise of *heraldry*.

"1191, March 30th" (Alst., and Nicol.), Clemens III. succeeded by cardinal Hyacinth Bubona, now Celestinus III., nineteenth pope: and the first one who granted "absolution ad cautelam." Henricus VI. ruling Germany and Italy.

"In this year (= 587 A. H." of Ferisht., Elph.), Shahab-u-din totally defeated on the great plain beyond Tanesar by Prithwi, Hindu king of Delhi and Ajmir. Leaving the wreck of his army at Lahore, he retired across the Indus.

"Towards the end of the Twelfth century" (Lubke and Lutrow), the new cathedral at Strasburg commenced. — The spire, "four hundred and ninety-one feet" high, was completed "in 1439."

"1193 A. D. (= 589 A. H." of Ferisht., Elph., Bentley giving "588 A. H." = 1192). Shahab-u-din with a new army entering Hindustan defeated Prithwi, put him to death on the battle-field, and obtained possession of Delhi and Ajmir. The biography of Prithwi or Pithaura is included in a history of Rajputana by Chand, a Hindee or Hindustanee poet who had resided at his court (G. de Tassy pref. and p. 138).

Kutb-u-din Eibak, left behind as the representative of Shahab-u-din, commenced near Delhi the Kutab Minar, a round tower — "two hundred and sixty-five feet high" (Lubke and Lutrow).

"In this year" (art de verif.), Saladin succeeded by Melek-Aziz Othman, second Ayoubite sultan of Egypt. A copper coin issued by Melek-Aziz Othman, is figured in Marcel p. 146.

"1194 A. D. (= 591 A. H." of Ferisht., Elph.), returning to Hindustan and Delhi, Shahab-u-din defeated the Hindu king Jeia Chandra farther down the Jamna, and obtained possession of Canouj and Benares. The greater part of the Rahtor clan abandoning Canouj founded a principality at Marwar, — now in alliance with the British government.

The roof of Peterborough cathedral, "of the date of about 1194" (hist. viol.), contains as far as known the earliest representation of the *violin*, the only musical "instrument that, like the human voice, possesses the power of perfect intonation." Bows, perhaps a British invention, had been previously applied to other instruments for two or three centuries. — "Fiddlers" are said to be mentioned by old English poets prior to Chaucer. But the Cremona manufacturers, whose violins have never been equalled, were of the "Sixteenth" century.

"1195 A. D. = 'tsing-youan,' 1st year of Ning-tsoung, of the Soung" or Twenty-first dynasty — (Chinese chron. table).

The same year (= "12th year of Toba II.," art de verif.), Joritomo after new victories visiting Toba II. at Meaco, was confirmed by him in the title of "cubo" or general in chief. — The title became hereditary.

"The same year" (Alst.), Isaacus II. succeeded by Alexis III. Angel, fifty-seventh Byzantine emperor.

"In this year (= 592 A. H." of Ferisht., Elph.), after capturing Biana near Agra, and laying siege to Gwalior, Shahab-u-din appears to have been called away by troubles in the West, and left Kutb-u-din to complete his conquests in Hindustan.

"1196 A. D." (Blair), Henri Dandolo doge of Venice.

"The same year" (Azt. hierog. annals, Clavig., and Humb. ii. 6), the Acolhuans and Aztecs making their appearance on the Mexican table-land: speaking, like their predecessors, the Toltec language.

The cochineal insect, *Coccus cacti*, discovered at an early period by the Mexicans, and reared extensively to procure its brilliant dye.* — When the Spaniards entered the country in 1519, *cochineal* first became known to Europeans (Pereir.); but to the present day Mexico continues the source of commercial supply.

"1197 A. D." (G. de Tassy i. p. 519), Gwalior in the district of Agra captured by the Muslims. — The city was retaken by the Hindus; but was finally subjugated in "1225" by Altamsch sultan of Delhi. A History of Gwalior is extant, written by the Hindee or Hindustanee poet Vargaraya.

"In or about this year" (G. de la Vega, = 1249 — "near 50 years reign," Blas Valera, and addit. art de verif.), Capac Yupanqui succeeded by his son Roca, now sixth Inca of Peru. — He enlarged the empire to "two hundred leagues from North to South, by one hundred from East to West;" and afterwards added fifty leagues to its length and breadth.

Myrospermum Peruiferum of Eastern Peru. An Amyroid tree called there "quiquino" (Lindl.), yielding the fragrant bitter aromatic *balsam of Peru*, known from early times† — (Hernand. mex. pl. 51, and Ruiz): growing in the Peruvian forest, in low warm sunny situations near the river Maranon (Lindl.).

Cinchona sp. of the Eastern slope of the Peruvian Andes. Forest-trees affording *Peruvian bark*, from early times employed to intoxicate fishes — (Saunders, and Lindl. fl. med. 211).

Phytelephas macrocarpa of the Eastern side of the Peruvian Andes. A palm, its long fronds employed from early times to cover dwellings, and the ivory-like kernel of its fruit for making implements: — observed by Ruiz and Pavon 301 in the forest in the warm region, its fruit very large and called by colonists "caleza de negro" (Pers.). The imported kernels under the name of *vegetable ivory* have become well known in the arts.

* *Opuntia coccinellifera* of Mexico and the West Indies. A species of *prickly pear*, said to be that on which the cochineal insect feeds, — described by Lopez de Gomara (Spreng.): *O. coccinellifera*, red-flowered and nearly thornless, is known to grow on Jamaica (Pers.). Transported to Europe, is described by Knorr del. ii. pl. O, and Dillenius elth. pl. 297: and by European colonists was carried to Hindustan, observed "in gardens Bombay" by Graham; to Burmah, called there "ka-la-sounglet-wa" (Mason).

† *Baccharis genistelloides* and *B. venosa* of Peru. Allied species abounding in bitter extractive matter and from early times employed medicinally: — called in Brazil "carqueja dulce" and "c. amarga" (Lindl.), or the first according to Marcgraf and Piso pl. 78 "canambaga" (Pers.): "particularly serviceable in chronic diseases of horses, which are very fond of this herb" (Mart., and Lindl.).

Canna edulis of Peru. Called there "achiras" (Lindl.), its fleshy tubers containing a large quantity of starch resembling arrowroot, and from early times eaten as potatoes: — described by Ker (bot. reg. ix. 775).

Polypodium crassifolium of the Eastern side of the Peruvian Andes. A fern called "puntu-puntu" (Lindl.), and from early times its root in infusion and decoction used as a sudorific: — observed by Ruiz in the mountain-forest, in gravelly and rocky naked warm situations (Lindl.). From transported specimens, is termed "phyllitis maculata amplissimo folio" by Petiver fil. pl. 8.

Polypodium calaguala of the Peruvian Andes. A fern called "calaguala" or "ccallahuala" (Lindl.), its dried root extremely bitter and from early times used medicinally, — having great deobstruent, sudorific, antivenereal, and febrifuge virtues: observed by Ruiz in the elevated cold region, in clefts and on the side of rocks (Lamb. cinch. 120 pl. 2). Seldom to be had genuine in Europe (Lindl.).

Acrostichum huacsaro of Peru. A fern called by Spanish colonists "cordoncillo" or "calaguala m diana," in Peruvian "huacsaro" (Lindl.), its root from early times used medicinally, — in cold infusion and decoction yielding a red colour and slight astringent taste, but very inferior in action to true calaguala: observed by Ruiz in elevated cold situations along the Andes (Lamb. cinch. 128, and Lindl.).

"1198, Jan. 8th or 9th" (Alst., and Nicol.), Celestinus III. succeeded by cardinal Lothaire de Conti di Segni, now Innocentius III., twentieth pope. The writings of Innocentius III. are voluminous.

"Towards the close of the twelfth century" (Way pref. pr. pm.), Uguitio or Hugo of Pisa holding the office of bishop of Ferrara. — He died "about 1212" (Ughelli). His dictionary is quoted by Galfridus pr. pm.

Thymus vulgaris of the Mediterranean and Tauro-Caspian countries. Called in Britain *thyme* or *garden thyme*, in France "thym" (Nugent), in which we recognize the *timum* or *tima* of Uguitio — and the C. F. vocabulary, identified by Galfridus pr. pm. with the "tyme herbe:" *T. vulgaris* is described by Brunfels, Tragus, Fuchsius (Spreng.), Dodoens, and Tournefort inst. 196; is known to grow wild in Italy, Spain, and Southern France (Pers., and Lenz), and is besides cultivated throughout middle Europe (Woodv. med. bot. pl. 109). Eastward, was observed by Sibthorp in mountainous situations in Greece and on the Greek islands; is known to grow also in Siberia (Pers.). By European colonists, was carried prior to 1670 to Northeast America, where it continues under cultivation as a seasoning herb. According to Lindley, "is fragrant and stimulating, its essential oil is administered to remove flatulence."

"The same year" (art de verif.), Melck-Aziz Othman succeeded by Melek-el-Mansur, third Ayoubite sultan of Egypt. A copper coin issued by Melek-el-Mansur, is figured in Marcel p. 147.

"The same year" (Stirling res. Asiat. xv. 315 to 327, and Elphinstone iii. 7), the pagoda of Jagannat, on the Eastern shore of Hindustan, completed.

"At the end of the Twelfth century" (Pouchet), six different species of *seals*, *Phoca*, described by the Norwegian author of the "Miroir Royal" — (transl. Einersen p. 176).

"1199 A. D. (= 1859th of Synmu," art de verif.), abdication of Toba II. in favour of his eldest son Tsatsi or Tsutsi, surnamed Mikaddo, now at the age of three years daïro of Japan. In the first year of his reign, death of Joritomo; leaving his title of "twenty" years standing (Kaempf. ii. 5) to his own son Jori-sje. — After two years, Jori-sje was slain.

"In the beginning of the Thirteenth century" (Jap. centen. comm. 106), seeds of the *tea* plant brought by the priest Miyoye from China to Japan, and its cultivation introduced.

"1200 A. D." (art de verif.), Melek-el-Mansur succeeded by Melek-Adel Seif-Eddin, fourth Ayoubite sultan of Egypt. Silver and copper coins issued by Melek-Adel, are figured in Marcel p. 149.

"In this year (= 6th year khing-youan of Ning-tsoung," Remus. mel. iii. 88), a letter and tribute sent to China by the king of Cambodia on his accession. — He reigned "twenty" years.

"The same year" (Alst.), end of the chronicle of Dodechinus.

One hundred and sixty-fifth generation. Jan. 1st, 1201, onward mostly beyond youth: the Jewish writers, Samuel ben Samson, Charisi, R. Isaac the blind, Sheshet ha-Nassi, and Samson of Germany: the Arab writer Boha-eddin: the Greek writers, Nicetas Choniates d. 1216, and Balsamon d. 1204: Conradus Urspergensis, Honorius Augustudunensis; William of Newburgh; Campanus of Lombardy; Gervase of Canterbury; Ralph of Diceto; Saxo Grammaticus; Walter of Coventry; Accursius; Antonius of Padua: the astronomer Jean de Sacrobosco (Pouchet).

"The same year" (Nicol.), by a synod at Paris, Evrard of Nevers convicted of heresy and burned.

"1202 A. D. (= 599 A. H." of Ferisht., Elph.), death of Gheias u-din. Shahab-u-din or Mohammed Ghorî now becoming sole sultan of Ghor and Ghazni.

"1203 A. D. (= 600 A. H." of Ferisht., Elph.), Shahab-u-din proceeding North against Kharizm, defeated by the Khitans.

"In this year" (Blair), Fourth crusade. Sailing from Venice, the expedition arrived on the "14th of June" at Chalcedon.

Ibn Roshd or Averrhoes at this time writing. — He died "in 1217."

Geranium molle of Europe and the adjoining portion of Asia. Called in Britain *culver foot* (Cockayne), and probably one of the four kinds of "pede columbino," little differing, known to Averrhoes — (J. Jacobi de Manlijs): the "pes columbae" of ms. Bodley 536, and "geran columbina" of Lyte are referred here by Cockayne: *G. molle* is termed "g. columbinum minus majori flore et foliis florum bifidis" by Tournefort inst. 268; is known to occur in waste and fallow ground from Denmark throughout middle Europe (fl. Dan. pl. 679, Vaill. paris pl. 15. Pers., and A. Dec.); was observed by Forskal near Marseilles; by Sibthorp, and Chaubard, in the Peloponnesus and on the Greek islands. (See *G. columbinum*).

Geranium dissectum of Europe and the adjoining portion of Asia. Probably one of the four kinds of "pede columbino" known to Averrhoes — (J. J. de Manl.): *G. dissectum* is termed "g. columbinum maximum foliis dissectis" by Tournefort inst. 268; is known as a weed in waste and cultivated ground from Denmark throughout middle Europe (fl. Dan. pl. 936, Curt. lond. vi. pl. 45, Vaill. paris

pl. 15, Cavan. iv. pl. 78, and Pers.); was observed by Sibthorp, and Chaubard, in the Peloponnesus and other parts of Greece; by Delile, in the cultivated fields of Lower Egypt.

Geranium Pyrenaicum of Europe and the adjoining portion of Asia. Probably the fourth kind of "pede columbino" known to Averrhoes — (J. J. de Manl.): *G. Pyrenaicum* is termed "*g. columbinum perenne pyrenaicum maximum*" by Tournefort inst. 268; is known to grow wild in middle Europe (Lorey and Dur.), and naturalized as far as Normandy, Paris, Britain, and Ireland (Cav. iv. pl. 99, Curt. lond. iii. pl. 42, Wats., and A. Dec.); was observed by Sibthorp from mount Athos to the Peloponnesus.

"1204 A. D. = 4th year of the 'kia-tai' of Ning-tsoung, and 4th year of the 'tai-ho' of Tchang-tsoung" of the Kin (Chinese chron. table), beginning of the Sixty-fifth cycle.

"The same year" (. . . F. Mason i. 6 and iii. 67), in Burmah, by Nara-padi-sæthu, king of Pagan, building of the great pagoda at Tavoy point.

"The same year" (Blair), after "about three hundred years" separation, Normandy conquered and re-united with France. — Three years afterwards, towns in Normandy were elected into corporations, Rouen, and Falaise being the first.

"The same year" (Blair), the *Inquisition* instituted. Against the Albigenses.

"July 20th" (Alst., and Blair), Constantinople captured by the crusaders, and "a great number of libraries" there destroyed by the soldiers (Ramusius, Gibbon, Michaud, and Pouchet). Henri Baldwin was now made king, under the spiritual dominion of the pope: the Venetians receiving as their share the island of Crete. Alexis III. was however succeeded at Adrianople by Theodorus Lascaris as the legitimate Byzantine emperor.

The "Chronicle of the conquest of Constantinople" by Geoffrey de Villehardouin, almost the earliest literary production by a layman (rudim. chron. Lond.).

"1205 A. D. (= 602 ann. H., J. T. Blunt as. res. iv. p. 316), accession of Cuttub Shaw as sultan of Delhi. — He reigned five years; and his tomb is pointed out near the Cuttub Minar tower.

About this time (= "about six hundred years" before 1804, tradit., and Colebrooke as. res. viii. 467), the celebrated Sri Bhagavata composed by a grammarian.

"1206, March 14th (= 602 A. H., Shaban 2d" of Ferisht., Elph.), Shahab-u-din, during a second expedition against Kharium, assassinated on the Indus by a band of Gakkars, who had lost relatives in his wars. Kutb-u-din now became first sultan of Delhi, and received the insignia of royalty from Mahmud Ghori, the successor of Shahab-u-din.

"In this year" (Yule p. cxvii, and Pauth. 348), the Western Tartars acquiring prominence in History, Chinghiz elected khan and invited by Ning-tsoung to aid him against the Kin.

"1208 A. D." (rudim. chron. Lond.), England laid under an interdict by the pope.

"The same year" (Alst., and Pouchet), a mendicant Order of monks founded by Franciscus; and named from him "Franciscans." — The Dominicans were founded eight years later. For the next two or three centuries, nearly all the distinguished writers belong to the mendicant monastic Orders (Pouchet).

"1209 A. D. = 1st year of the 'ta-ngan' of Tchou-young-ki, of the Kin," ruler of Northern China — (Chinese chron. table).

"In this year" (Tchao yuan phing, and Klapr. mem. ii. 331), the "fourth" of Jenghiz-khan, voluntary submission of Barchu-Arte-Tieghin, chief of the Ouigours, a Turkish tribe on the Selenga.

"1210 A. D." (Blair), the persecution against the Albigenses very severe.

"October" (Alst., and Nicol., see also Blair), a synod at Paris. "Fourteen disciples of Aumari" or Almaric were condemned to be burned; together with the metaphysical writings of Aristotle, just imported from Constantinople and translated into Latin.

"The same year" (= 607 ann. H., Elph., and J. T. Blunt as. res. iv. 316), Kutb-u-din Eibak succeeded by his son Aram, — and within a twelvemonth by Altamsh, now sultan of Delhi.

"1211 A. D. (= 1871st of Synmu," art de verif.), abdication of Tsatsi-mikaddo in favour of his younger brother Siuntoku, now dairo of Japan. Sonnetomo, second son of Joritomo, being refused the title of his father and brother, commenced war, — built the first *ships of war* seen in Japan, and at length obtained confirmation of the title of cubo.

"The same year" (Lubke and Lutrow), building of the cathedral at Rheims.

"1212 A. D." (Alst.), end of the chronicle of Robertus de Monte.

"1213 A. D. = 1st year of the 'tchi-ning' of Tchou-young-ki of the Kin, who died in this year; and 1st year of the 'tchin-yeou' of his successor Hiouan-tsoung" — (Chinese chron. table).

"July" (Nicol.), a synod at St. Albans. King John, on swearing to observe the laws of Edward III. the Confessor and of Henry, was reconciled to the prelates and barons.*

* *Aethusa cynapium* of middle and Northern Europe. Called in Britain *fool's parsley*, and apparently the same plant by old writers "ass-parsley" (Prior): the *briddes nest* identified in

"Aug. 25th" (Nicol.), a synod in London. The pope having confirmed king John's absolution, the interdict was removed and the clergy were permitted to read "divine service in public."

"1214 to 1215 A. D." (Nicol.), a synod at Bordeaux. All persons holding Jews were enjoined "to compel them to remit usury to those who had taken the cross:" and a provision was adopted, "That widows and others should not be compelled to marry against their inclinations."

"1215 A. D." (Way ed. pr. pm. pref.), Alexander Neccham appointed abbot of Cirencester. His writings are voluminous, — and are quoted by Galfridus, pr. pm.

"June 10th" (Blair), *Magna Charta* signed by king John and the barons.

"Nov. 11th to 30th" (Alst., and Nicol.), Twelfth general ecclesiastical Council. Convened at the Lateran in Rome. Among other acts, *Auricular confession* was sanctioned (a measure connected with Indulgences and their prospective use). — Forty years later, Indulgences were for sale in England (Alst. p. 395).

"1216, July 18th" (Alst., and Nicol.), Innocentius III. succeeded by cardinal Cencio Savelli, now Honorius III., twenty-first pope. Fredericus II. who wrote on Falconry (Pouchet), ruling Germany and Italy; Alexander II. ruling Scotland; and in England "Oct. 19th," king John succeeded by Henry III.

"The same year" (Clavig. ii.), arrival of the Aztecs at Tzompanco, a city in the vale of Mexico.*

"1218 A. D." (Munk), Melek-Adel Seif-Eddin succeeded by Melek-Kamel, fifth Ayoubite sultan of Egypt. A gold coin issued at Cairo by Melek-Kamel — is figured by Marcel p. 151.

Astragalus glycyphyllus of Northern and middle Europe. Called in Britain *milk-wetch* or *liquorice-wetch* (Prior); in which we recognize the "bathrat" or "schalin" seen by Abul Abbas elnabati at Seville in Spain, and identified by a botanist there with the root of "glycirrhiza urbana" — (Ebn Bait.); also the medieval Latin "liquiricia" (Prior), and the "licoris" plant of Chaucer c. t. 13690: *A. glycyphyllus* is described by Morison ii. pl. 9; is termed "*a. luteus perennis procumbens vulgaris sive sylvestris*" by Tournefort inst. 416; and is known to occur in waste and cultivated ground principally in Northern Europe (Engl. bot. pl. 203, and Pers.). Eastward, was observed by Sibthorp on mount Athos.

Nouada procumbens of the Northern Sahara, from the Atlantic as far as Arabia. Called in Egypt "saadan," in which we recognize the "sadan" growing in the sand of the treatise Elrujlat (by A. A. Elnabati), — and Ebn Baitar: *N. procumbens* was observed by Forskal, Delile, and myself, in the Egyptian portion of the Desert; and is known to grow also in Barbary and Arabia (Linn., Lam. ill. pl. 393, and Pers.).

Nerium obesum of the Southern border of the Sahara as far as Arabia. The "zakkum" described in the treatise Elrujlat as a tree of extraordinary shape, like a root as large as a man rising more or less, the flowers jessamine-like, — and by Ebn Baitar as purple-flowered with Sesamum-like pods but longer and containing woolly seeds, may be compared: *N. obesum* was observed by Forskal p. 205 among the mountains of Yemen, and called "aden" or "öddæjn;" and by myself, on the hills at Aden.

gloss. Laud. 553 with the *daucus asininus*, — having according to Gerard p. 873 leaves like hemlock, may be compared: *Ae. cynapium* is termed "*petroselinivium*" by Tragus 100 (Spreng.); is described also by Blackwell pl. 517; and is known to grow in mountainous situations (Pers.), and in cultivated ground from Austria to France and Britain (Crantz, and Engl. bot. pl. 1192). Eastward, is known to occur in the Tauro Caspian countries (Bieb., Trevir., and Steud.). By European colonists, was carried to Northeast America, where it has been observed by myself sparingly around dwellings in New England. Its leaves according to Lindley "are poisonous, producing nausea, vomiting, headache, giddiness, drowsiness, spasmodic pain, numbness, etc."

* *Cassia alata* of Tropical America. A shrub eight to twelve feet high, with showy yellow flowers: — observed by Meriam in Surinam (Spreng.); by Swartz, and Descourtilz, in the West Indies, but no Carib name given; termed "*c. herpetica*" by Jacquin obs. ii. pl. 45. By European colonists was carried Westward across the Pacific to the Philippines, called in Tagalo "*acapulco*" or "*gamot sa buui*" remedy against herpes or "*catanda*" or "*sonting*," in Pampango "*pacayungoon castila*," in Bisaya "*casitas*" or "*sunting*" (Blanco), observed by myself naturalized in Interior Luzon; to the neighbouring islands (Rumph. vii. pl. 18); to Burmah, "*exotic*" although "often found apparently growing wild," called "*mai-za-lee-gyee*," and "much cultivated by the natives for its medicinal properties in diseases of the skin" (Mason v. 499); to Hindustan, called in Sanscrit "*dadrooghna*," in Bengalee "*dad-murdun*," in Telinga "*mitta tamara*," in Tamil "*wandu rolle*" (Lindl.) or "*wandukolli*" or "*seemee aghatie*," in Hindustanee "*veleytie aghatie*" (Drur.), observed by Ainslie, Roxburgh, Wight, and Drury, under cultivation as far as Travancore, the juice of its leaves mixed with lime-juice as a remedy for ringworm; by Graham, and myself, in gardens at Bombay.

Jatropha glandulosa of Tropical Arabia. Called in Yemen "öbab" or "bocka," in which we recognize the "baka" of Abul Abbas Elnabati, — and Ebn Baitar: *J. glandulosa* was observed by Forskal p. 163 in Yemen, in stinging emitting a watery and somewhat milky juice, acrid enough to corrode iron, the fresh stems applied to boils or felons to soften the tumour and soothe the pain. Farther East, a shrub suspected by Graham to be "*J. glandulifera*" has been found in the Bombay Presidency only "near Punderpore in the Deccan, where a fabulous legend is connected with its first springing up;" but "*J. glandulifera*" was observed by Roxburgh in other parts of Hindustan, and according to Lindley "the pale or whey-coloured thin juice which exudes from a fresh wound is employed by the Hindus as an escharotic to remove films from the eyes."

Jatropha glauca of Tropical Arabia. Possibly included with the preceding; — found by Forskal p. 162 sometimes substituted in Yemen though inferior in medicinal virtue, and called "öbab" or "medjersche." According to Ainslie, and Lindley, the "seeds yield stimulating oil recommended by the Hindus as an external application in cases of chronic rheumatism and paralytic affections." As transported to Europe, the plant is described by Plukenet alm. pl. 220, and Vahl.

Barleria bispinosa of Tropical Arabia. The *Justicia* tribe called in Yemen "uusar" (Forsk.), and the "haischar" of the Elrujlat of A. A. Elnabati growing at Medina, spiny, the flowers between white and blue, — may be compared with this species: *B. bispinosa* was observed by Forskal p. 6 along the base of the mountains of Yemen, and called "kulibe" or "schechad."

Grewia velutina of the mountains of Yemen. A shrub called in Yemen "nescham," in which we recognize the white "nascham" of the treatise Elrujlat, — and of Ebn Baitar (art. "gabariyat"): *G. velutina* was observed by Forskal p. 106 on the mountains around Hadie.

Ruellia guttata of the mountains of Yemen. A shrubby species called in Yemen "kasr" or "ghobeire," and the "gubaira" mistaken for a different plant according to the author of the Elrujlat — (Ebn. Bait. art. "gabariyat"), may be compared. *R. guttata* was observed on the mountains of Yemen by Forskal p. 114.

Not earlier than this year ("1218–30" Lubke and Lutrow, rudim. chron. Lond. giving "1228"), building of the Franciscan cathedral at Assisi; the earliest example in Italy of the *pointed arch*.

Eryngium alpinum of the mountains of middle Europe. The more simple-stemmed beautiful kind called "spinam Sancti Francisci," growing on mount Aucerno of the Appenines, — and further described by Caesalpinus xiii. 28 as held sacred and having "cacuminibus cæreuleis," seems to correspond: *E. alpinum* is described by Linnæus; and is known to grow on the mountains of Switzerland (Jacq. rar. pl. 94, and Pers.).

"1219 A. D." (Munk, and Marcel), Sixth crusade. The Expedition landing in Egypt, and capturing the city of Damietta. — After advancing in the course of two years as far as the head of the Delta, the crusaders were compelled to capitulate and leave the country.

"In this year" (Yule cath. i. p. cxviii), the Tartars under Jenghis Khan extending their conquests Westward: his armies penetrating to Russia, Georgia, and Armenia.

"In this year (=12th of the 'kia-ting' of Ning-tsoung," geogr. Chin. transl. Klapp. 36), submission of Tchihé, king of Corea, to the Mongols.

"1220 A. D." (rudim. chron. Lond.), in England, "rebuilding of the abbey church of Westminster;" and commencement of Salisbury cathedral.

"1221 A. D. (= 618 A. H." of Ferisht., Elph. vi. 1), the Sultan of Kharism having been defeated and his country overrun by the Mogul Tartars under Jenghis Khan, his son Jelal-u-din driven across the Indus into Hindustan seeking refuge with sultan Altamsh of Delhi.

"In this year" (Lubke and Lutrow), Mary and the child; a painting by Guido of Siena — extant to the present day.

"1222 A. D." (Alst.), at Adrianople, Theodorus Lascars succeeded by Joannes III. Ducas as the legitimate emperor. "At Constantinople in this year" (Nicol.), a synod, On the differences between the Greek and Latin bishops of Cyprus.

"The same year (= 619 Hej.," Pall. trav. i. 192), date of Arabic inscriptions in the cemetery of the ruined city of Bolgari, on the Lower Volga.

"The same year" (art de verif.), abdication of Siuntoku in favour of Foricawa II. or Go-Forikawa, grandson of Takakura, and now at the age of thirteen dairo of Japan.

"In the reign of Go-Horikawa" (Jap. centen. comm. 60), "Kato Shirozayemon went to China, and after having seen some of the Chinese *potteries*, returned and settled in the province of Owari," — but the pottery which he made was "a kind of *stoneware*."

"1223 A. D." (Blair), in France, the slaves all franchised, set at liberty by Louis VIII.

"1224 A. D. = 1st year of the 'tching-ta' of Ngai-tsoung, of the Kin," ruler of Northern China — (Chinese chron. table).

"The same year" (Remusat mel. iv. 169, and Pauth. 382), end of the historical encyclopedic work "Wen-hian-thoung-khao," — written many years later by the Chinese archæologist Ma-touan-lin (see 1317 A. D.).

"1225 A. D. = 'pao-tsing,' 1st year of Li-tsoung, of the Soung" or Twenty-first dynasty — (Chinese chron. table).

"May 15th" (Nicol.), a synod at Paris. Louis VIII. treating with the pope's legate, ceded his rights against the English, and prepared to march against the Albigenes or "heretics."

"The same year" (rudim. chron. Lond.), by the English parliament, a subsidy granted the king on condition of the confirmation of Magna Charta: the earliest instance of combining "a grant of supply with a redress of grievances," and thus establishing "a check on the king's prerogative."

"1226 A. D. (= 623 Hej.)," Pall. trav. i. 192), date of "twenty-two" Arabic inscriptions in the cemetery of the ruined city of Bolgari, on the Lower Volga.

"1227, March 19th" (Alst. and Nicol.), Honorius III. succeeded by cardinal Ugolino de' Conti di Segni, now Gregorius IX., twenty-second pope. Louis IX. le Saint ruling France.

Veronica officinalis of Northern Climates. Called in Germany "erenbreiss" or "gruntheyl" (Trag.) or "grundheil" from "grind" leprous diseases, in Britain *groundheele*, in France "herbe aux ladres" from having cured a French king of leprosy (Prior) or "veronique" (Nugent) or "veronica" after the healed French king — (Braunschw.): the "vērōnikēs" is mentioned by Nicolaus Myrepsus antid. 327: *V. officinalis* is described by Tragus i. pl. 68, and Dodoens 40; is termed "v. mas supina et vulgatissima" by Tournefort inst. 143; and is known to grow from Lapland throughout middle Europe (fl. Suec. ii. 12, fl. Dan. pl. 248, and Pers.); was observed by Sibthorp in Northern Greece; is known to grow also in Siberia (Wats.). Westward, was observed by Hooker on Iceland; by Drummond, at 53° on the Rocky mountains; by A. Gray in central New York. "certainly indigenous in many places, especially in the Alleghanies;" by myself, to all appearance wild in the forest from the mountains of Western Massachusetts to the environs of Philadelphia.

"Nov. 18th" (Nicol.), a synod at Rome. The excommunication against the emperor Fredericus II. 'for not proceeding to the Holy land,' was repeated.

"The same year" (Lubke and Lutrow), in Spain, the cathedral at Toledo commenced; — "two hundred" years later the building was finished.

"The same year" (Desvergers), death of the Tartar chief Jenghis Khan. Whose wars and those of his immediate successors, though directed against Persians and Arabs, contributed to the extension of Muslim power Eastward, in Central Asia and towards the frontier of China. He was succeeded by his son Okkodai, now khan of the Tartars.

Sesbania Aegyptiaca of Equatorial Africa? Called in Burmah "yæ-thoo-gyee" (Mason), in the environs of Bombay "shewaree" (Graham), in Egypt "seiseban;" in which we recognize the "sisaban" of Madschul, — and Ebn Baitar: *S. Aegyptiaca* was observed in Egypt by Alpinus pl. 82, and Delile, and according to Forskal, is planted for hedges on account of its rapid growth, is useful also for firewood, but requires copious irrigation. Eastward, was observed in Hindustan by Rheede vi. pl. 27. Roxburgh, Wight; under cultivation there, by myself; and according to Graham is "a small tree of very quick growth," found by Gibson "cultivated and extensively used in the plain parts of the Deccan as a substitute for the bamboo." Farther East, was observed by Mason "exotic" in Burmah, cultivated by the natives and termed "water-chief," the leaves being applied "to promote suppuration."

"1228 A. D." (Elph. iv. 1), the Salonka dynasty succeeded by another dynasty of Hindu kings of Guzerat.

Indigofera pauciflora of Scinde and the neighbouring portion of Hindustan. Its twigs from early times used for teeth-scrubbers in Scinde and by the Hindus of India — (Badger edit. Varthem. p. 64).

"1229, Apr. 29th" (Nicol.), a synod at Westminster. The lay lords refused "to grant to the pope a tenth of all the revenues of England and Ireland, to be employed in the war against the emperor" Fredericus II.

"1230 A. D." (Blair), in the University of Paris, several persons killed in the disputes about Aristotle.

"In this year" (Hugh Davies, and A. Dec. geogr. bot. 627), by the Welsh prince Rhys Grug, land and privileges granted to the physician Rhywallon, to relieve him and his descendants from pecuniary cares in pursuing their medical investigations. — The family were established at Myddfai, have left manuscripts relating to the properties of indigenous herbs, and continued extant until about "1740."

The encyclopædic work "De rerum natura" by Thomas Cantipratensis, in this year professor at Louvain (Humb. cosm.).

"In or about this year" (Ramus., and Stanley edit. J. Barbaro p. 46), Seleucha in Cilicia taken from the Turks by Rubino and Leone, brothers of Armenia.

"1231 A. D." (Elph. iv. 1), Ujen captured by Altamsh, and the dynasty of Hindu kings of Malwa terminated.

Trichosanthes anguina of Tropical Eastern Asia. Mentioned perhaps in the Nabathean land-wirtschaft of Sagrit (Safarit) — of Ebn Bait. art. "kuthn?" as well as by Abu Abdallah, for "schlangengurke" occurs in the translations by Sontheimer anmerk. ii. 12 and 26: *T. anguina* was observed by Graham "commonly cultivated about Bombay" and called "chiconda;" and by Rumphius v. pl. 148, Roxburgh, and Wight, in other parts of Hindustan. Farther East, is enumerated by Mason as "exotic" in Burmah, called "pai-len-mwæ," and in "very general demand for vegetable curries;" from its contorted long slender-striped fruit is called *snake-gourd* by the colonists. As transported to Europe, is described by Miller pl. 32.

"1232 A. D." (Nicol.), a synod at Nice. "On the jurisdiction of the patriarch."

"The same year" (Nicol.), a synod in London. The authors of the ill-treatment of "Roman clerks who had benefices in England," were excommunicated.

"In this year (= 5th of the tchao-ting," geogr. Chin. transl. Klapp.), a Mongol army under Ogotai entering Corea, and "seventy-two" inspectors established in the principal cities, notwithstanding the renewal of submission on the part of king Tchhë.

"1233 A. D." (art de verif.), Foricawa II. succeeded by his eldest son Sidsio, now at the age of five daïro of Japan.

"From Apr. 24th to May 10th" (Nicol.), a synod at Nympha in Bithynia. "On the procession of the Holy Ghost."

"The same year" (Blair), the *Inquisition* committed to the care of the Dominican Order of monks.

"The same year" (rudim. chron. Lond.), discovery of *coal* at Newcastle in England.

"1234 A. D. = 1st year of the 'touan-ping' of Li-tsoung" of the Soung, "end of the rule of the Kin" (Chinese chron. table). The Tartar khan Okkodai having consolidated with his empire all the provinces North of the Kiang (Yule i. p. cxviii).

One hundred and sixty-sixth generation. May 1st, 1234, onward mostly beyond youth: the Chinese astronomer Ye-lou-thsou-tsai: the Persian writer Nasir-eddin Tousi: the Jewish writers, Meir Abulafia, Abul Menni ben Abi Nassar ben Hafidh el-Atthar, David Kimchi, Jacob of France: the Arab writer Abraham Ibn Sahl: the Greek writers, Germanus of Constantinople d. 1254, Nicephorus Blemmides, d. after 1255, Arsenius of Corinth d. after 1264: Hugo de S. Caro, Jacobus a Vitriaco, Matthæus Paris; John of Halifax; Peter de Vignes; Grostest; Bruno de Lungoburgo: the scholastic theologians, Gulielmus Antisiodorensis, Gulielmus Parisiensis, and Alexander de Ales: the painter Margaritone d. 1275 (Bryan).

"In or about this year" (Hillel ben Samuel, and Steinschneid. ii. 11), a controversy among the Jews respecting Maimonides, and the "Jewish creed" submitted by them "to the judgment of Christians." The result was, that the Talmud and other Hebrew writings "to the number of about twelve thousand volumes" were publicly burned at Paris.

Verbal information received from Abd-allatif by Ebn Baitar (art. "jimjim").

Malva verticillata of China. Called in Egypt "khobbeyzeh," in which we recognize the "melukiyya" seen in Egypt by Abd-allatif, and identified by him with the "khobbeiza:" — a cultivated and esculent *mallow* resembling *M. rotundifolia*, was seen in Egypt by Forskal; *M. verticillata* was observed there by Delile, and its field-culture, mentioned by Clot-Bey, was witnessed by myself. As transported Westward, *M. verticillata* is described by Linnæus, Jacquin hort. pl. 40, and Cavanilles ii. pl. 25; and since 1843, has made its appearance in cultivated ground near Llanelly in Wales (Engl. bot. pl. 2953, Bab., and A. Dec.).

Citrus limonum of Tropical Eastern Asia. The "limon de baume an inch long and of the shape of an elongate egg," seen in Egypt by Abd-allatif, — may be compared: *limes* were seen in Egypt by Belon; and the "leymoun maleh" of Delile, may also be compared. Farther North, the "limon pusillus" is described in 1638 by Ferrari pl. 211; and *C. limonum*, recognized by the crenulate leaves, is figured as a greenhouse plant by Parkinson. Eastward from Egypt, *C. limonum* was observed by myself at Muscat; the "lime tree" is enumerated by Graham as "common in gardens" in the environs of Bombay; and the "small acid lime" is described by Mason v. p. 453 and 760 as "exotic" in Burmah, but "seen almost everywhere in abundance." By European colonists, *C. limonum* was carried to the islands of the Pacific, as ascertained by myself at the Hawaiian, Taheitian, and Tongan Groups; and a single tree of unknown origin was said to exist on the Samoan Group.

Sorghum saccharatum of Abyssinia? Called in Yemen and Egypt "dokhn," in which we recognize the "dokhn," described by Abd-allatif as cultivated only at the Southern extreme of Egypt: — *S. saccharatum* was observed by Forskal in a garden at Rosetta, the seeds given to birds; by Delile, in a garden at Cairo; and as transported Westward, is described by Linnæus, and Mieg pl. 4. Southward from Egypt, was found by Forskal p. 174 extensively cultivated in Yemen as an esculent grain. Eastward, was observed in Hindustan by Roxburgh; according to Graham, was found by Sykes cultivated in the Deccan and called "shaloo;" and farther East, is mentioned by Mason v. p. 476 as

occasionally met with in Burmah, and called "pyoung." By European colonists, was carried to North-east America, where it is now cultivated for making brooms, and is called *broom corn*.

"1235 A. D." (Lubke and Lutrow), in Germany, the Elizabeth church at Marburg commenced. — The building was finished "in 1283."

"1236, April (= 633 A. H. 20 Shaban" of Ferisht., Elph. vi. 1), Altamsh succeeded by his son Rukn-u-din, and after "seven months" by his daughter Rezia, now sultana of Delhi.

"June 10th" (Nicol.), a synod at Tours. "In favour of the Jews."

In this year (= "633 Hej." at Damascus, first meeting of Ebn Abi Osaibiah with Ebn Baitar. Who on his way through Cairo received the title of vizir from Malek Kamel, also an honorary degree from the Arab academy; — and who died in "1248" (Ebn Abi Osaib., Abulfed., Spreng., and Sonth.).

Reaumuria vermiculata of the Northern Sahara. Called in Egypt "a'dbeh" or "mulleyh," in which we recognize the "mollah" or "kaschkah" of the Arabs identified by Ebn Baitar with the "androthakos:" — *R. vermiculata* was observed by Forskal p. 101, and Delile, in the Egyptian portion of the Desert, the plant bruised and applied externally against psora, or taken internally in decoction; is known to grow also on the seashore of Syria, Sicily, and Barbary (Desf. i. p. 431, and Pers.). From transported specimens, is described by Morison iii. pl. 9.

Dorema ammoniacum of Persia. An Umbelliferous plant called there "ooshak" or "oshac" (Lindl.), in which we recognize the "oshak" of Ebn Baitar, — referred by Sontheimer to gum *ammoniac* (probably from the evidence collected by Don linn. trans. xvi. 601): *D. ammoniacum* is described by Don as growing in Irak in "very dry plains and gravelly soil exposed to an ardent sun," and he regards it as really furnishing "the ammoniacum of the shops" (Lindl. see *Ferula Tingitana*).

Valeriana Pyrenaica of the Pyrenees. The "sathwal" mentioned by Ebn Baitar as the name of zerumbet among the people of the North and remaining Franks, — may be compared with the "setewale" of Chaucer c. t. 13690, and "setwal" of Lyte iii. 17, referred by Prior to *V. Pyrenaica*; formerly "sold by ignorant or fraudulent apothecaries" for zeduar sometimes spelt "zedualle:" *V. Pyrenaica* is described by Plukenet alm. pl. 232, and escaping from gardens has become naturalized in various parts of Britain (Hook., Wats., and Bab.): in its wild state, is known to be confined to the Pyrenees.

Cineraria maritima of the Mediterranean shores. Called in Egypt "achauan abiat," and possibly included in the "ukhuvan" of Ebn Baitar — and other Arab writers: observed by Alpinus pl. 28 used medicinally in Egypt; and by myself growing as far inland as Cairo. Farther North, observed by Sibthorp, and Chaubard, on the Greek islands and the Peloponnesus: and Westward, described by Lobel pl. 227, termed "jacobæa maritima" by Tournefort inst. 486, and known to grow on the seashore of France (Pers.; see *Anthemis nobilis*).

Verbesina sativa of Abyssinia. A sunflower-like plant called in Hindustanee "kalatill," in Bengalee "ramtil," in Telinga "valesuloo" (Drur.); and the "kurthum hindi" yielding oil according to Ebn Baitar, — may be compared: *V. sativa* was observed by Graham "commonly cultivated" on the Deccan for "the oil it affords;" by Roxburgh, and Royle, under cultivation in Bengal; is known to be also cultivated in Mysore, and the oil "from the larger seeds" according to Drury "is the common lamp-oil of Upper India." Westward, was observed by Bruce trav. in Abyssinia, yielding an oil employed throughout the country for domestic purposes (Grev): is termed "polymnia Abyssinica" by the younger Linnæus suppl. 383, "guizotia oleifera" by Decandolle prodr.

Arnica montana of Subarctic climates. At Lahore called in Arabic "khanek-ul-zeib" (Honigb. 375. and J. F. Wats.); in which we recognize the "chanik eldsib" of Ebn Baitar: — *A. montana* is described by Matthioli p. 51, Dalechamp p. 1169 (Spreng.), and Clusius hist. iv. pl. 18; is known to grow from Lapland throughout Northern Europe (fl. Lapl. p. 305. and fl. Dan. pl. 63), and on mountains farther South to the snow-limit on the Pyrenees and Swiss Alps (Brot., and Dec.). Eastward, is known to grow throughout Siberia, as far as the Yenisei river and Bering's Island (Gmel.). And farther East, was observed by E. James along the Rocky mountains; by Nuttall, on the Upper Missouri; and is known to grow on Melville Island in Arctic America, and in Greenland (Sab., and Hook.). According to Lindley, "a virulent plant" that on the Continent has obtained the name of *panacea lapsorum*, its activity "seems however to have been exaggerated."

Solanum Forskalii of Yemen. Called there "bokæme," in which we recognize the "bokkam" of Ebn Baitar: — observed by Forskal p. 47 along the base of the mountains of Yemen.

Solanum Arabicum of Yemen. Called there "bokæme" or "bonkom," and possibly the "bokkam" of Ebn Baitar: — described by Forskal p. 47 as "horrida armata," and observed by him along the base of the mountains of Yemen.

Solanum incanum of Tropical Arabia. Called in Yemen "ærsæn" or "ersan," in which we recognize the "arsam" mentioned by Ebn Baitar as a wild melongena growing in Yemen: — *S. incanum* was observed there by Forskal p. 46, the smoke of the seeds employed against toothache, the

leaves applied to wounds, and boiled with those of *Physalis somnifera* in water for washing hypochondriacs, regarded as labouring under "dæmoniacoismo."

Eulophia salep of Northern Hindustan. Called there "khusyat-ul-salib" or "khusyat-ul-kulb" (ulfaz udwieh 860, Royle 369, and Birdw. 86), in which we recognize the "chusa elkalb" of Ebn Baitar:—Royle's specimens of the *Eulophia* yielding *salep* at Cashmere, were found by Lindley insufficient for ascertaining the species (see *Orchis papilionacea*).

Agrostis alba of Europe and Northern Asia. A grass called *white bent* (A. Gray), in Greece "agriokalamia" (Sibth.), in Egypt "naæjm" (Forsk.), in which we recognize the "najm" of Ebn Baitar:—*A. alba* is termed "phalaris semiverticillata" by Forskal p. 17, and was observed by him, and Delile, frequent about Rosetta and Cairo; by Sibthorp, on Zacynthus and in marshy ground around the Bithynian Olympus; by Bieberstein, on the subalpine portion of Caucasus; and is known to grow in Siberia (Kunth). Westward, is known to grow throughout middle Europe as far as Sweden (engl. bot. pl. 1189, and Wats.); and was observed by Hooker on Iceland. Probably by European colonists was carried to Northeast America, where it occurs around dwellings and along roadsides and seemingly wild in the forest; was received by Kunth from Nutka in Northwest America. *A. stolonifera*, regarded as not distinct, was observed by Sibthorp, and Chaubard, frequent in grassy situations in Greece; by Bieberstein, in the Southern portion of Tauria; is known to grow throughout middle Europe (engl. bot. pl. 1532); is termed "the hindering knot-grass" by Shakespeare m. n. d. iii. 2 (Prior); and was observed by Hooker on Iceland.

"1237 A. D." (Talvi ii. 1, and Pauth. 1), invasion of Europe by the Tartars under Batou, nephew of Okkodai Khan: Moscow was captured and the Russians defeated and rendered tributary,—remaining in bondage more than "two" centuries.

"In this year" (palm-leaf ann. Jag., and W. W. Hunter, Stirling giving 1236), Rajrajeswar Deva succeeded by Languliva Narsinh, now king of Orissa.—He built the great Sun-temple at Kanarak by the sea (the Black pagoda), and reigned "forty-five years."

"Nov. 19th to 22d" (Nicol.), a synod in London. One of the decrees proposed by the legate Otto was, "That all acts should from thenceforth be dated on the day, year, and at the place, when and where they were subscribed."

Manuscripts in this year (De Wailly pl. xv. 5), presenting the following form of the letter *k*.

"1238, May 17th" (Nicol.), a synod in London. Satisfaction having been tendered, the interdict suspending the exercises of the University at Oxford, laid by the legate Otto in consequence of an insult, was removed.

"The same year" (art de verif), Melek-Kamel succeeded by Melek-Adel II., sixth Ayoubite sultan of Egypt.

The itch insect, *Acarus scabiei*, described by Avenzoar.—He died "in 1262" (Pouchet).

1239 A. D. (= "7th year of Sidsio," art de verif.), visit of the general in chief Joritzne to Sidsio at Meaco.

"In this year (= 637 A. H." of Ferisht, Elph.), Rezia succeeded by her brother Moizz-u-din Behram, now sixth sultan of Delhi.

Limonia acidissima of Tropical Eastern Asia and the Malayan archipelago. A pinnate-leaved Aurantiaceous shrub called in Malabar "tsjeru caat-naregam" (Drur.); and from early times, its leaves root and fruit employed medicinally: *—observed in Malabar by Rheede iv. pl. 14, its dried fruit form-

* *Guatteria (Polyalthia) cerasoides* of Western Hindustan. An Anonaceous tree called in Telinga "dudugu" or "chilka dudugu" (Drur.); and from early times, its whitish close-grained timber used in carpentry and for boats and small spars:—observed by Roxburgh, Wight, and Beddome, from the Godavery "common in all the dry forests near the foot of all the mountains on the western side of the Madras Presidency" (Drur.); by Graham, on the "Tull Ghaut, Jowar Forests," in the region around Bombay.

Flacourtia sepiaria of Western Hindustan. A thorny shrub called in Tamil "sottacla," in Telinga "conrew" (Drur.), in the environs of Bombay "tamboot" or "atroon" (Graham); and from early times, its berries eaten, and leaves root and bark employed medicinally:—observed by Rheede v. pl. 39 in Malabar; by Graham, common "throughout the hilly parts of the Concan" as far as Bombay; by Ainslie, Roxburgh, Wight, and Drury, "common everywhere" in the peninsula.

Ionidium suffruticosum of Western Hindustan. A nearly stemless Violaceous plant called in Bengalee "noonbora," in Telinga "pooroosharatanum," in Tamil "orala-tamaray" (Drur.); and from early times, its root and leaves employed medicinally:—observed by Rheede ix. pl. 60 in Malabar; by Nimmo, in "the Concans" (Graham), as far as Bombay: by Ainslie, Roxburgh, Wight, and Drury, in other parts of the peninsula as far as Travancore, flowering "nearly all the year."

Abutilon polyandrum of Western Hindustan. An erect annual, known from early times:—

ing according to Gibson an article of commerce with the Arabs; by Law, "common on sandstone hills at Padshapore, and at the falls of Gokauk" (Graham); by Roxburgh, and Wight, as far as Coromandel, Hurdwar, and Assam. Is described by Rumphius ii. pl. 43 (Pers.), and according to Drury, the

observed in Hindustan by N. L. Burmann pl. 47; by Roxburgh, Wight, and Drury, "on the Neilgherries and about Nundigrood, yielding "a long silky fibre resembling hemp, also fit for making ropes;" by Graham, as far as "Kandalla" near Bombay.

Sida retusa of Tropical Eastern Asia and the Malayan archipelago. Shrubby, and from early times, its root employed medicinally by the Hindus: — observed by Rheede x. pl. 18 in Malabar; by Graham, as far as "Kandalla" near Bombay; by Wight, and Waring pharm. ind., in other parts of the peninsula as far as Tranquebar (Pers., and Drur.). Farther East, is described by Rumphius vi. pl. 19, and is known to occur on the Philippines and Amboyna (Pers.). Also on the Mauritius Islands (Pers.), probably carried there either by European or prior navigators.

Hibiscus furcatus of Western Hindustan. Annual; its strong white fibre known from early times: — observed by Law on "the Ghauts" (Graham), to and beyond Bombay; by Royle, in other parts of Hindustan. From transported specimens, is described by Willdenow (Steud.).

Atalantia monophylla of Western Hindustan. An Aurantiaceous shrub or small tree called in Tamil "cat-ilimicham," in Telinga "adivi-nimma" (Drur.), in the environs of Bombay "maker limboo" or "ranlimboo" (Graham); and known from early times: — observed by Rheede iv. pl. 12 in Malabar; by Graham, "common on the Ghauts" as far as Bombay, and at "Mahableschwur;" by Roxburgh, in the forests of Coromandel, its hard heavy close-grained wood suitable for cabinet-work (Drur.).

Cissus pedata of Tropical Eastern Asia and the Malayan archipelago. Called in Tagalo "ayo" (Blanco); and from early times, its root employed medicinally on the Philippines: — observed by Rheede vii. pl. 10 in Malabar; by Graham, to and beyond Bombay, in "the Concans, Mahableschwur etc., common;" by Roxburgh, Wallich, and Wight, in other parts of Hindustan; by Mason, in Burmah; and by Blanco, on the Philippines.

Xanthoxylon triphyllum of Tropical Eastern Asia and the Malayan archipelago. A small unarmed tree, its aromatic berry-like capsules from early times used as a substitute for pepper: — observed by Graham in "the ravines at Kandalla" near Bombay, "Parr Ghaut, and table land of Mahableschwur, not very common;" by Wight pl. 140 (Drur.), under cultivation in Hindustan. Farther East, was received by Roxburgh i. 410 from Pulo Penang; was observed by Rumphius ii. pl. 62 on Amboyna, a cosmetic for the complexion prepared by women from its bark; is known to grow also on the Philippines (Pers.); and the "Evodia hortensis" seen by Forster on the New Hebrides and Friendly Islands, is by some writers regarded as not distinct.

Ailanthus Malabarica of Western Hindustan. A very handsome pinnate-leaved tree called in Telinga "perumarum," in Malabar "peroomarum" (Drur.), in the environs of Bombay "wood" (Graham); its fragrant resin from early times employed medicinally: — observed by Rheede vi. pl. 15 in Malabar; by Graham, in "ravines at Nagotnah" and in other localities around Bombay; by Buchanan, in the Annamullay forests, its resin called "muttee-pal;" by Ainslie, Wight, and Drury, as far as Travancore.

Naregamia alata of Western Hindustan. A small ornamental Meliaceous shrub called in Malabar "nela-naregam" (Drur.); and from early times, its leaves root and juice employed medicinally: — observed by Rheede x. pl. 25 in Malabar; by Nimmo, in "the country east of" Bombay, "rare" (Graham); by Wight, and Drury, "wild in the Travancore forests," and flowering "freely when introduced in gardens."

Chloroxylon swietenia of Western Hindustan. The *satin-wood* tree is large and mahogany-like, called in Tamil "moodooda" or "vum-maay" or "kodawah-porsh," in Telinga "billo billuda" (Drur.), in the environs of Bombay "billoo" (Graham); and its close-grained box-like timber valued from early times, and known to bear immersion in water: — observed by Gibson on "the Alleh Belah hills," and by Law "about the falls of Gokauk" (Graham); by Roxburgh, and Wight, in the mountainous districts of the peninsula as far as the Circars; by Tennent, in size and durability "by far the first of the timber-trees of Ceylon" (Drur.).

Samadera Indica of Western Hindustan. A Simarubous tree called in Malabar "karinghota" (Drur.); and from early times, its bark used as febrifuge, and oil extracted from its seeds: — observed by Rheede vi. pl. 18 in Malabar; by Lush in the "Goa jungles," by Nimmo "throughout the South Concan" (Graham), nearly as far as Bombay; by Wallich, Wight, and Drury, at Balghotty and abounding in Travancore and Cochin, its bruised leaves applied in erysipelas, and seeds "strung together and tied round children's necks as a preventive" of affections of the chest.

Tragia chamaelea of Western Hindustan. Erect and linear-leaved, called in Malabar "codi

very acid pulp of its fruit "is used by the inhabitants of Java instead of soap." By Nimmo, the living plant was introduced into the environs of Bombay (Graham).

Calophyllum elatum of Western Hindustan. A large tree called in Malabar "poon" or "poon-

avanacu" (Rheede); and from early times beaten up with leaves of *Argyreia Malabarica* to promote the maturation of abscesses:—observed by Rheede ii. pl. 34 in Malabar; by Nimmo, in "S. Concan" (Graham); by Burmann pl. 25, on Ceylon; mentioned also by Roxburgh, and Drury p. 52.

Zizyphus xylopyra of Western Hindustan. A small thorny tree called in Telinga "gotee" (Drur.), in the environs of Bombay "gootee" (Graham); and from early times, its fruit used by Moochies for making blacking, and the kernels eaten:—observed by Law at Duddi, and by Gibson, and Graham, "common on the Ghauts;" by Retz, Roxburgh, and Wight, as far as Cochin and Courtallum and in "Southern India generally," its wood "very hard and durable and not heavy," and its "young shoots and leaves" eaten by cattle (Drur.).

Casearia esculenta of Western Hindustan. A Samydaceous shrub, its leaves eaten from early times and its roots employed medicinally:—observed by Rheede v. pl. 50 in Malabar; by Nimmo, on "the hilly parts of S. Concan" (Graham) nearly as far as Bombay; by Roxburgh, on the Circar mountains, its "bitter purgative roots much used by the mountaineers" (Drur.).

Acacia (Albizziæ) amara of Western Hindustan. An unarmed tree thirty feet high called in Tamil "woonja," in Telinga "nalla-eegoo" or "nalla-eenga" or "narlinjie" (Drur.); and from early times, its leaves used for washing the hair, and its handsome hard and durable timber for building and other purposes:—observed by Law "common on the banks of the Krishna, about Nalutwar" (Graham); by Roxburgh, Wight, and Beddome, as far as Mysore and the Madras Presidency, its wood "superior to sal and teak in transverse strength and cohesive power" (Drur.).

Mimosa (Dichrostachys) cinerea of Western Hindustan. A thorny shrub six to seven feet high called in Tamil "vadatara" or "waratara," in Telinga "vellitooroo yeltoor," in Hindustanee "vurtuli" (Drur.); and from early times, its bruised young shoots applied in ophthalmia:—observed by Graham "common on the sterile plains of the Deccan," also by myself; by Ainslie, Roxburgh, and Wight, as far as Coromandel, its wood "very hard" (Drur.); and by Burmann pl. 2, on Ceylon.

Cassia auriculata of Western Hindustan. A shrub called in Tamil "averie," in Telinga "tangedu," in Hindustanee "turwer" (Drur.), in the environs of Bombay "turwar" or "awul" (Graham); and from early times, its seeds and bark employed medicinally, its bark also in tanning, its root in tempering iron with steel, and its branches preferred for making "datuns" or tooth-scrubbers:—observed by Gibson, Burn., and Graham, growing "abundantly in the sterile tracts of the Deccan and Goozerat;" by Ainslie, Roxburgh, Wight, and Drury, common in other parts of the peninsula.

Mucuna gigantea of Western Hindustan. A large woody climber called in Malabar "kaka-valli" (Drur.); and from early times, its bark employed in rheumatism:—observed by Rheede viii. pl. 36 in Malabar; by Nimmo, in "the Concans" (Graham), to and beyond Bombay; by Roxburgh, and Wight, as far as Coromandel (Drur.): is described also by Rumphius v. pl. 6.

Hardwickia binata of Western Hindustan. A tree with binate leaflets called in Tamil "acha karachi" or "kat-udugu," in Telinga "nar-yepi" (Drur.); and from early times, its timber highly valued, a strong fibre procured from its bark, and its leaves eaten by cattle:—observed by Gibson, and Auld, "common in the Lulling pass" in the Bombay district (Graham); by myself, in the region around the Adjunta caves; by Roxburgh, Wight, and Beddome, from Mysore and the Western slope of the Neilgherries to the Salem and Coimbatore districts, growing as far as the elevation of "thirty-five hundred feet" (Drur.).

Cynometra ramiflora of Western Hindustan. A Leguminous tree sixty feet high called in Malabar "iripa" (Drur.); and from early times, its leaves and root employed medicinally, and an oil procured from its seeds:—observed by Rheede iv. pl. 31, and Wight, in Malabar (Drur.); by Nimmo, in "S. Concan" (Graham), nearly as far as Bombay; described also by Rumphius i. pl. 63.

Sonneratia acida of the seashore from the mouths of the Indus throughout the Malayan archipelago. A flowering maritime tree called in Tagalo "pagatpat" or "palatpat" or "palapat" (Blanco), in Burmah "tabu" or "tamu" (Mason), in Bengalee "orchaka," in Malabar "blatti," and its radical excrescences in Ceylon "kirili-now" meaning kirili root (Drur.); from early times, its fruit eaten and its timber and radical excrescences used for various purposes:—observed by Rheede iii. pl. 40 in Malabar; by Graham, in a "salt marsh" near Bombay, and the supply of "tewar" wood according to Heddle "inexhaustible in the delta of the Indus;" by Tennent, on Ceylon; by Roxburgh, as far as the Sunderbunds or mouths of the Ganges; by Mason v. 534, in Burmah, "in the mangrove swamps and on the banks of almost every stream" as "far as tide-waters reach;" by myself, within reach of the tide on the Philippines, where according to Blanco its fruit is eaten, its radical excrescences used medicinally and as a substitute for cork, and its strong timber for house and boat building; by Son-

goo" (Drur.), and known from early times:—growing according to Beddome, and Drury, in the forests of the Western Ghauts and from Coorg and Mysore to Travancore, not in dry deciduous woods, but only in the damp jungles of the Western coast, and furnishing the genuine *poon spars* of commerce, so highly prized.

nerat, on the seashore of the Moluccas and New Guinea (Pers.). The excrescences according to Drury are spindle-shaped, sometimes "two feet long and three and a half inches wide," and when sawn into little boards are unequalled for lining insect-boxes.

Lagerstroemia microcarpa of Western Hindustan. A large Lythraceous tree called in Tamil "ventek" or "veveyla" (Drur.); and from early times, its timber much used for building purposes:—observed by Wight pl. 109, and Beddome pl. 30, "abundant in all the western forests of the Madras Presidency," but "not on the eastern side" (Drur.). The "naneh," with flowers in terminal panicles and fruit of the size of a pea, observed by Graham in the "Kennery forests" near Bombay and "common on the Ghauts," seems identical.

Conocarpus latifolius of Western Hindustan. A large Terminalioid tree called in Tamil "veckelie" or "vallay-naga," in Telinga "yella-maddi" or "siri-maun" (Drur.), in the environs of Bombay "daura" or "dabria" (Graham); and from early times, its timber considered almost equal to teak for house and ship building, its leaves used for dyeing leather, and its ashes in demand in the diet of certain wild tribes of the Neilgherry forests:—observed by Gibson, and Graham, from the "Kennery forests" near Bombay to "the inland Deccan hills," common; by Powell, in the Punjab; by Roxburgh, Wallich, and Wight, as far as the Circar mountains and Dheyra Dhoon (Drur.).

Notonia grandiflora of Western Hindustan. A shrubby yellow-flowered Composite plant, known from early times:—said by Gibson "to be a remedy in hydrophobia," and observed in "high rocky places in the Deccan;" by Wight, and Drury, on the Neilgherries and as far South as Travancore.

Hoya pendula of Western Hindustan. A woody Asclepioid twiner, from early times much used medicinally:—observed by Rheede ix. pl. 13 in Malabar; by Dickinson, on "hills about Nagotna," and by Nimmo in "S. Concan" (Graham); by Roxburgh, and Wight, from the Neilgherries to the Circar mountains (Drur.).

Holostemma Rheedii of Western Hindustan. A perennial twining Asclepioid called in Malabar "ada-kodian," in Telinga "palla-gurgi" (Drur.); and from early times, employed medicinally, and its flowers eaten:—observed by Rheede ix. pl. 7 in Malabar; by Nimmo, and Graham, "running up trees and in hedges" in the environs of Bombay, "common in the rains;" by Roxburgh, Wight, and Drury, from the Covalum jungles near Trevandrum to Mysore and the Circars, or "from the southernmost province to the base of the Himalaya."

Cryptostegia grandiflora of Western Hindustan. A woody Asclepioid twiner with showy rose-coloured flowers, called in Malabar "palay" (Drur.): and known from early times:—observed by Graham "in gardens Bombay;" by Roxburgh, Wight, and Drury, in Malabar and Coromandel, yielding a fibre that "may be spun into the finest yarn," also caoutchouc in sufficient quantity to be "prepared for rubbing out pencil-marks."

Exacum bicolor of Western Hindustan. A showy Gentianoid annual, one to two feet high, and from early times used as a febrifuge:—observed by Graham in the environs of Bombay, generally "by the margins of rivulets;" by Roxburgh, Wight, and Drury, from the Neilgherries and Malabar to Cuttack, the dried stems "sold at Mangalore and elsewhere in the Southern Peninsula under the name of *country karivat*," and "may be advantageously substituted for" gentian.

Schrebera swietenoides of Western Hindustan. A large pinnate-leaved Bignonoid tree, called in Tamil "mogalinga marum," in Telinga "muccadi chettoo" (Drur.), in the environs of Bombay "mokha" or "mokadee" (Graham); and from early times, its hard close-grained wood, less liable to warp than most kinds, used for a variety of purposes and especially for weaver's beams:—observed by Hedde, and Giberne, "on the Hala hills west of the Indus, also on the Tullghaut near Bhawndy," by Nimmo at Jowaur (Graham); by Roxburgh cor. ii. pl. 101, on the Circar mountains (Drur.).

Bignonia (Spathodea) Roxburghii of Western Hindustan. A large pinnate-leaved tree called in the environs of Bombay "warrus" (Graham); and from early times, its timber used for a variety of purposes:—observed by Auld in Kandesh, by Lush, and Graham, from Bombay to the Ghauts, Mahableshwar, and the Southern Mahratta country; by Roxburgh, as far as Coromandel (Drur.).

Convolvulus (Argyria) Malabarica of Western Hindustan. A woody twiner called in Tamil "paymoostey," in Malabar "kattu kalangu" (Drur.): and from early times, its root and leaves employed medicinally:—observed by Rheede xi. pl. 51 in Malabar; by Graham, near Bombay and "pretty common on the Ghauts;" by Ainslie, and Roxburgh, as far as Mysore (Drur.).

Solanum trilobatum of Western Hindustan. A prickly woody climber called in Tamil "toodavullay," in Telinga "moondla moosteh" or "oochinta kura" (Drur.); and from early times, its leaves

Buchanania angustifolia of Western Hindustan. A Terebinthoid tree called in Tamil "colah mavuh" (Drur.); and from early times on the Western coast, its bark much used for its adhesive properties and oil for lamps obtained from it:—observed by Graham in "the Adjunta jungles;" by Roxburgh, Wight, and Drury, as far as the Trichore forests where it "is common," the bark "frequently mixed with chunam."

Poinciana elata of Tropical Arabia and as far as Guzerat. A small unarmed tree with showy yellow flowers, called in Yemen "ranf" or "mschillech" (Forsk.), in Tamil "pade rarayan," in Canara "neerangi," in Telinga "sooncaishla" (Drur.); and known from early times:—observed by Lush "in Goozerat," by Gibson "in the square of the great temple at Fultun," by Auld in "gardens Kandesh" (Graham); by Best, its leaves much used at Cuddapah for manuring indigo-fields; by Wight, and Drury, planted for its shade on roadsides, and for protecting "the footings of rivers and channel banks," from Malabar to Coromandel. Westward, was observed by Forskal p. 86 among the mountains of Yemen; by myself, in mountain-ravines at Aden.

Portulaca quadrifida of Tropical Arabia and Hindustan. Annual, procumbent from a central root, and called in Yemen "mortah" or "koraat errai" (Forsk.), in Tamil "passalie keeray," in Malabar "neelacheera," in Telinga "sun pail kura," on the Deccan "cholee" (Drur.); and from early times, eaten and employed medicinally:—observed by Rheede x. pl. 31 in Malabar; by Graham, "a common weed during the rains" in the environs of Bombay; by Roxburgh, and Wight, in other parts of the peninsula (Drur.). Westward, by Forskal p. 92 in Yemen, eaten crude and the bruised leaves applied in headache. *P. meridiana*, with flowers opening for two hours only, is regarded by Wight as probably not distinct.

Cassyta filiformis of Tropical Asia, the Malayan archipelago, and islands of the Pacific. A green-stemmed dodder-like epiphytic plant called in Yemen "djdh" or "hadeg môdeq" (Forsk.), in Tagalo "malabohoc" (Blanco), in Tamil "cottan," in Bengalee "akash-bulli," in Telinga "pauneh-tiga"

eaten, and together with the berries flowers root and tender shoots employed medicinally:—observed by Gibson "in Guzerat and a few parts of the Deccan" (Graham); by N. L. Burmann pl. 22, Ainslie, Roxburgh, and Wight, as far as Cape Comorin (Drur.).

Justicia (Rungia) repens of Western Hindustan. A diffuse plant called in Tamil "kadaga saleh" (Drur.): and from early times, its leaves in appearance and taste resembling those of thyme employed medicinally:—observed by Graham in the environs of Bombay, "appearing in the rains;" by Ainslie, Roxburgh, Wallich, and Wight, in other parts of the peninsula; and received by Burmann pl. 3 from Ceylon.

Ficus nitida of Western Hindustan. A tree; its root and leaves from early times boiled in oil and applied to wounds and bruises:—observed by Rheede iii. pl. 55 in Malabar; by Graham, in "the Concans," to and beyond Bombay; is described also by Rumphius iii. pl. 90.

Dioscorea triphylla of Western Hindustan. Called in the environs of Bombay "mar-chaina" (Graham); and from early times, its intoxicating intensely-bitter root put into toddy to increase its potency:—observed by Rheede vii. pl. 33 in Malabar; by Nimmo, "common in both Concans" (Graham), to and beyond Bombay; and is termed "ubium sylvestre" by Rumphius v. pl. 128.

Phoenix farinifera of Western Hindustan. A diminutive slender-stemmed palm, only two to three feet high, called in Tamil "ceethie," in Malabar "eentha," in Telinga "chiruta-ita" (Drur.); and from early times, its fruit eaten together with the farinaceous substance from its stem, and the leaflets and petioles of its fronds made into mats and baskets:—observed by Roxburgh cor. i. pl. 74, and Drury, in Travancore and in "sandy situations and plains in the Deccan;" is termed "p. pusilla" by Loureiro (Steud.).

Pontederia vaginalis of Tropical Eastern Asia. Called in Tagalo "calaboa" (Blanco), in Burmah "lay-pa-douk" (Mason), in Malabar "carimgola" (Rheede); and known from early times:—observed by Rheede xi. pl. 44 in Malabar; by Nimmo, and Graham, to and beyond Bombay, "rice-fields and margins of tanks, Concans;" by Roxburgh, in other parts of Hindustan; by Mason, in Burmah; by Blanco, on the Philippines, employed medicinally by the natives; and is described by Rumphius vi. pl. 75.

Tradescantia cristata of Tropical Eastern Asia and the Malayan archipelago. Called in Tagalo "alichangon," and from early times used medicinally on the Philippines—(Blanco): observed by Graham in the environs of Bombay, "the most common of" its tribe, "during the rains;" received by Linnæus, and Jacquin hort. pl. 137, from Ceylon; and observed by Blanco on the Philippines.

Anilema tuberosum of Western Hindustan. A stemless Cyanotoid perennial, its tubers from early times employed medicinally:—termed "commelyna scapiflora" by Roxburgh; observed also by Buchanan, Wallich, Royle, Dalzell, and Powell, from the Punjaub to the "Southern Concan" (Drur.) beyond Bombay.

(Drur.); and from early times, employed medicinally and put by Brahmins as a seasoning into butter-milk: — observed by Rheede vii. pl. 44 in Malabar; by Graham, on hedges and “trees throughout the Concans;” by Roxburgh, and Drury, as far as Cochin and Bengal; by Loureiro, in Anam; by Blanco, on the Philippines, hardly known to the natives; described by Rumphius v. pl. 184; and was observed by myself from the Feejeean throughout the Southern Polynesian groups to the remotest coral-island. Westward from Hindustan, by Forskal p. 84 in Yemen, its berries eaten by boys, and applied bruised to the wound called “oruk.”

“1240 A. D.” (Alst., and Nicol.), a synod at Senlis. “A twentieth of the ecclesiastical revenues” was granted to the pope.

“The same year” (art de verif.), Melek-Adel II. succeeded by Melek-Saleh, seventh Ayoubite sultan of Egypt. The name of Melek-Saleh occurs at Cairo in an inscription over the door of his tomb — (Wilk. theb. and eg. 297 and 551).

“Twenty generations ago” (Speke trav. ix. 9), a large party of pastoral Wahuma under Rohinda sought protection of king Nono of Karagúé, inhabited by the Wanyambo people. Nono was treacherously put to death, and Rohinda became the head of a new dynasty. — He “was succeeded by Ntaré, then Rohinda II., then Ntaré II., which order only changed with the eleventh reign, when Rúsatira ascended the throne, and was succeeded by Mehinga, then Kaliméra, then Ntaré VII., then Rohinda VI., then Dagara, and now Rūmanika” in 1861.

Hexalobus Senegalensis of Tropical Africa. An Anonaceous tree called by the Wanyamuesi “imkooa” (Grant); and from early times, its drupes used to color the “gums and teeth:” — observed from “5° S. to 2° North” Westward, described by A. Decandolle, as received from Senegal.

Boscia *sp.* of Eastern Equatorial Africa. A moderately-sized Capparideous tree called in Madi “m’zazza” (Grant), and probably as early as this date.

Flacourtia *sp.* of Eastern Equatorial Africa. A slender hazel-leaved tree with a few thorns, called in the Kinyoro language “m’sengeerra” (Grant), and as early perhaps as this date: — observed in Madi, on the Nile.

Lophira alata of Equatorial Africa. A Dipterocarpous tree called “meeenzerrah” (Grant); and from early times, a leaf used as a charm: — observed only at 3° 15' N. near the Nile, but “the handsomest tree seen on the route,” the leaves “two feet” long. Westward, is described by C. F. Gaertner fr. iii. pl. 188 as received from Western Equatorial Africa.

Harrisonia *sp.* of Eastern Equatorial Africa. A thorny Simaruboid tree called “m’ceenango” (Grant), and as early probably as this date: — observed at Madi, the branches catching “one’s clothes in the woods.”

Gymnosporia coriacea of Equatorial Africa. A small Celastroid tree called “m’thoozee” (Grant); and from early times, its roots used medicinally by women, also as a purgative: — observed from “5° S. to 3° N.,” very frequent. Westward, described by Guillemain and Perrotett, as observed in the countries on the Atlantic.

Rhus *sp.* of Eastern Equatorial Africa. A shrub called “m’sangool’a” (Grant); a superstitious belief continuing from early times, that plants for spinage can be found if its seeds are thrown about: — observed in Madi, its wood made into tooth-scrubbers.

Odina fruticosa of Eastern Equatorial Africa. A tall elegant tree called “m’sangar’a” (Grant); and from early times, its wood made into posts: — “Madi heights, 3° North.” Described by Hochstetter.

Tephrosia Vogeli of Equatorial Africa. Bushy and seven feet high (Grant), hedging dwellings; and from early times, a mash of its leaves used in destroying fish: — observed from “1° to 2° North.” Described by J. D. Hooker.

Aeschynomene Schimperii? of Eastern Equatorial Africa. A bushy tree twenty feet high called “kong’golo” (Grant); its wood light, and from early times used for shields, — as at present by the Waganda: used “as trimmers and door-bolts” by the Wanyoro, and “as load-levers” by the Wanyamuezi.

Vigna luteola of Tropical Africa. A coarse bean called “koondé” (Grant); and from early times, cultivated by the natives: — observed in Karagúé, and from “5° S. to 2° North.” Westward, is described by Linnæus, and Jacquin hort. pl. 90, as received from Tropical America.

Lonchocarpus laxiflorus? of Tropical Africa. A small tree called “mowaleh” (Grant), and as early perhaps as this date: — observed in “Madi, 3° N.”

Ptilostigma Thonningii? of Equatorial Eastern Africa. A brushwood tree called in the Kinyoro language “m’keendambogo,” in Suabili “keeteembee” (Grant); and from early times, short lashings stripped from its bark: — “found everywhere,” the leaves “used to cover sores.”

Cassia *sp.* of Eastern Equatorial Africa. A bush six feet high called “m’cækæ’s’æ” (Grant); and from early times, used as fencing: — observed at “3° N.,” common.

Cassia *sp.* of Eastern Equatorial Africa. A shrub six feet high (Grant); and from early times,

its branches from their disagreeable odour used to drive away mosquitoes: — observed at “1° 42' S., alt. 5000 feet.

Swartzia marginata of Eastern Equatorial Africa. An ordinary-sized tree called “m'nyembe” (Grant), and from early times. — Described by Bentham.

Nov. gen. near Copaifera of Eastern Equatorial Africa. A tree called “m'chenga” (Grant), and from early times, its bark made into fibred kilts, band-boxes, and round stores for grain: — “covers the Wanyamuezi forests.” Farther South, the name “chenga” was found by Livingstone applied to a similar tree.

Acacia *sp.* near *A. seyal*, of Eastern Equatorial Africa. Called “m'seekeezee” (Grant): and from early times, its inner bark used for lashings for temporary huts: — observed from “2° S. to 3° N.”

Acacia *sp.* of Eastern Equatorial Africa. A small thornless tree called “m'footamvool'ah” (Grant); and from early times, its roots boiled for steaming the eyes in ophthalmia, — as at the present day by the Wanyamuezi: observed in Madi.

Acacia *sp.* of Eastern Equatorial Africa. A large tree called “m'gongwah” (Grant); and its wood, said to sink in water, used from early times for hatchet-handles and building purposes: — observed in “5° S., plentiful.”

Albizzia *sp.* of Eastern Equatorial Africa. A thornless tree called “m'sangal'a” (Grant); and from early times, used in building: — growing on the “stream bank, 3° N.”

Bryonia laciniosa of Eastern Equatorial Africa. A climber; its beautiful scarlet and white berries known from early times, — and beads like them according to Grant “would be vastly admired by the natives:” observed in “2° N.,” in Unyoro. Probably through Arab or Banyan traders carried to Hindustan, observed by Rheede viii. pl. 19 in Malabar, by Graham “common in hedges” in the environs of Bombay, by Roxburgh, and Wight, in other parts of Hindustan, and received by Linnæus from Ceylon.

Steganotania *sp.* of Eastern Equatorial Africa. An Umbelliferous forest-tree called “meonga Pembe” (Grant); and from early times, a branch superstitiously believed to enable the bearer to steal without discovery: — observed in “Madi, etc.”

Crossopteryx febrifuga of Eastern Equatorial Africa. A Cinchonaceous bushy-growing tree called “m'tæloambai” (Grant); and from early times, its roasted seeds used to fumigate bark-cloth, or to form a scented pomade, — as at the present day by the Wanyamuezi: observed from “5° S. to 3° North.” Described by Afr.

Hymenodyction *sp.* of Eastern Equatorial Africa. A Cinchonaceous shrub eight feet high called “m'fo” (Grant), and as early perhaps as this date: — observed at “Madi-burn bank.”

Gardenia lutea of Eastern Equatorial Africa. Called “kolola” (Grant); and from early times, its contorted branches used for fencing, and boiled roots medicinally against hæmaturia, — as by the Wanyamuezi of the present day: observed from “5° S. to 3° North.” Described by Fries.

Psychotria *sp.* of Eastern Equatorial Africa. A shrub called “m'sweet'æ” (Grant), and as early perhaps as this date: — observed at “Faloro, 3¼° N.”

Vernonia stoechadifolia of Eastern Equatorial Africa. From early times mixed and burned with *Hygrophila spinosa* and salt extracted from the ashes, — as at the present day on the Upper Nile; observed by Grant growing in the forests and open woods “2° to 3° North.” Described by Sch. bip.

Pluchea *sp.* of Eastern Equatorial Africa. A bush five feet high (Grant); and from early times, salt extracted from its ashes: — growing around a saline at “Kanyenyé. 6° 24' S.”

Embelia *sp.* of Eastern Equatorial Africa. A small tree called “m'sækær'a” (Grant), and as early perhaps as this date: — observed in “3° 15' N.”

Landolphia florida? of Eastern Equatorial Africa. An Apocynous climber, covering lofty trees (Grant); and from early times, playing-balls made of its rubber, — as by the Wahiyow of the present day.

Gomphocarpus *sp.* of Eastern Equatorial Africa. Four feet high (Grant); and from early times, worn as a charm, and eaten medicinally, — as by the natives at the present day: observed in “2° N.”

Brachystelma? *sp.* of Eastern Equatorial Africa. Nine inches high (Grant); and from early times, its bulbous tasteless root eaten: — observed in “1° 42' S.”

Strychnos *sp.* of Eastern Equatorial Africa. A scrubby-looking tree called “m'phoondoo” (Grant), and as early perhaps as this date: — observed from “6° 21' S.” to “woods, 3° N.”

Argyreia *sp.* of Eastern Equatorial Africa. Three feet high with immense flowers, and called “mohambo” (Grant); and from early times, skulls of wild animals placed by it, or with a branch in hand the hunter certain of sport: — observed in “2½° N.”

Torenia pumila of Eastern Equatorial Africa. Its roots from early times eaten with salt and used as a gargle, — as by the natives at the present day: observed by Grant in “5° 45' alt. 4300 ft., and 1° 42' S. alt. 5500 ft.,” abundant in swamps. Described by Bentham.

Cycnum sp. n. of Eastern Equatorial Africa. Creeping on bare open sandy heights, and called "m'sweera m'dogo" (Grant); and from early times, its fibrous roots used to cure the bite of a particular snake, — as by the Wanyamuezi of the present day: observed in "3° 15' N."

Sopubia ramosa of Eastern Equatorial Africa. An erect woody plant in grassy plateaux (Grant); and from early times, salt water for cooking purposes obtained from its ashes, — as by the Wahiyow of the present day: observed in "2° N.," uncommon.

Stereospermum sp. of Eastern Equatorial Africa. A Bignoniaceous tree called in the Kinyoro language "mololo" (Grant), and as early perhaps as this date: — observed in "3° 15' N.," frequent by water, its wood useless.

Hygrophila spinosa of Eastern Equatorial Africa. An Acanthaceae plant from early times cultivated for the salt procured from its ashes: — observed wild also by Grant from "4° 18' S. to 3° 15' North." Described by T. And. (See *Vernonia stoechadifolia*.)

Clerodendrum sp. n. of Eastern Equatorial Africa. A shrub two feet high used for drinking-tubes called "meereej'a" by the Wanyambo (Grant), and as early perhaps as this date: — observed in "1° 43' S., alt. 5000 feet."

Vitex sp. of Eastern Equatorial Africa. Bush-sized and called "m'thalassee" (Grant), and as early perhaps as this date: — observed in "Madi, 3° 15' N."

Coleus barbatus of Abyssinia and Yemen. From early times smoke of its burning leaves regarded an immediate cure for fever: — the plant observed by Grant "in Euphorbia hedges, 4° 18' to 1° 42' South." Eastward, was observed by Forskal p. 109 on the higher mountains of Yemen and called "medan." Probably by Arab or Banian traders carried to Hindustan, observed by Gibson in the rice-fields of Guzerat; by Graham in the environs of Bombay, sold in market, and "commonly cultivated in native gardens for the roots which are pickled;" by Roxburgh, and Wallich, in other parts of Hindustan, as far even as Nepal.

Hyptis spicigera of Tropical Africa. Called "neeno" (Grant); and from early times, cultivated as a grain, and to extract oil, — as by the natives of Gani at the present day: observed by Grant in "3° North;" known to occur also in Ethiopia, Madagascar, and Senegambia (Benth., and A. Dec.); on the Cape Verd Islands (Webb.). Farther West, in Brazil and other parts of Tropical America; received also by Benthams from Manila (possibly by European colonists carried across the Pacific). Described by Lamarck.

Boerhaavia sp. of Eastern Equatorial Africa. A foot high (Grant); and from early times, its roots eaten in famines, — as by the Wahiyow of the present day: observed "in cleared ground, 2° N."

Acalypha sp. of Eastern Equatorial Africa. Called "m'cætæ" (Grant); and from early times, its wands of great length made into strong trays and baskets, — as by the people of Unyoro at the present day: observed "by rivulets 1° 42' S., to 2° N."

Croton sp. of Eastern Equatorial Africa. A tree having immense leaves, called "m'pæfoo" (Grant), and as early perhaps as this date: — observed "in shady moist ground, 3° 15' N."

Hymenocardia Heudelotii of Equatorial Africa. An Euphorbiaceous tree called "m'palanyonga" (Grant), and as early perhaps as this date: — observed in "3° 15' North." Described by Planch.

Euphorbia hypericifolia of Tropical Africa? Its juice already perhaps rubbed upon snares to attract Guinea fowl? — as observed by Grant in "2° N." (on the Nile). Westward, was received by Benthams p. 500 from Nigritia (A. Dec.). Probably through European traders carried to the West Indies, observed by Sloane i pl. 126 in cultivated ground on Jamaica; and thence perhaps has extended into Northeast America where it is now seemingly wild, observed by Baldwin in 31° in Florida, by Pursh in cultivated ground as far as Canada, by Elliot in Upper Carolina and Georgia, by Short in Kentucky, by Nuttall on the Arkansas, by E. James on the Missouri, and by myself along the Atlantic as far as 42° 30'.

Celtis integrifolia of Tropical Africa. A large tree called "m'læwch" (Grant); and from early times, its seeds made into necklaces, — as by the natives of Fipa at the present day: observed in "3° 30' North." Westward, described by Lamarck as received from —

Angræcum ? sp. of Eastern Equatorial Africa. Epiphytic on a *Kigelia* (Grant); and from early times considered a remedy for ophthalmia: — observed in "3° 15' N."

Ansellia sp. of Eastern Equatorial Africa. In thick clusters upon lofty-stemmed trees, and called by Uhiyow men "mitoolo" (Grant); its jointed roots from early times used medicinally: — observed at "M'bwiga, 7° 30' S."

Amomum sp. of Eastern Equatorial Africa. Four feet high with scarlet underground fruit; the pulp around the seeds sucked from early times: — observed by Grant in Uganda, "2½° N.," frequent.

Dracaena sp. of Eastern Equatorial Africa. Ten feet high and called "mpopo m'weeto" wild beetul (Grant); and from early times, used as fences: — observed in "2° N."

Smilax Kraussiana of Eastern Equatorial Africa. Called "m'kolol'a" (Grant); and from early times, its roots used medicinally, — as by the Wanyamuezi of the present day: observed, Sept. (1½° to) "3° 15' North." Described by Meisner.

Dioscorea sp. of Eastern Equatorial Africa. A *yam* called "veezee-koo" (Grant), and as early perhaps as this date : — "grown here and there on mounds," from "5° S. to 2° N."

Auchomanes Hookeri? of Eastern Equatorial Africa. An Araceous plant three feet high with curving-down thorns, and called "yal'wah" (Grant); its large bulb from early times boiled and eaten, — as by the Wanyamuezi of the present day : observed in "3° 15' North."

Gymnandropogon sp. of Eastern Equatorial Africa. Its millet from early times eaten in famines, — as according to Grant at the present day : observed in "5° 5' S., alt. 3600 ft."

Anthistiria imberbis of Tropical Africa. Two to two and a half feet high, and known from early times : — the grass that clothes and waves like corn on the treeless hills of Karagüé, "alt. 5000 to 5500 feet:" cattle according to Grant "are never grazed upon it." Described by Retz obs. iii. p. 11, and Thunberg (Pers., and Steud.).

Anthistiria ciliata of Tropical Africa. Two and a half feet high; and from early times, its grain eaten in famines : — growing according to Grant "under trees in rich low ground with great luxuriance, 5° 5' S., alt. 3600 feet." Eastward, possibly by Arab or Banian traders carried to Hindustan, where it was observed by Graham growing "most abundantly throughout the Concans, and is commonly converted into hay for feeding horses;" by Retz, and Roxburgh i. 247, in other parts of Hindustan. Clearly through European traders, was carried to the West Indies (Pers.).

Setaria aurea of Eastern Equatorial Africa. Liable to small round fungi, their dust from early times eaten by the natives : — observed by Grant in "2° North." Described by Hochst.

Chloris Meccana of Abyssinia. Three to four feet high, and known from early times : — observed by Grant in "plantain-groves" under the Equator. Described by Hochst.

Kyllingia macrocephala? of Eastern Equatorial Africa. Eighteen inches high and called "keelolo" (Grant); and from early times, its pounded roots rubbed on the skin as a perfume, — as by the Wanyamuezi women of the present day : observed "by rocky burn, 3° 15' N."

Fuirena umbellata? of Tropical Africa. Three feet long, called "keekal'a" (Grant); and from early times, salt extracted by the natives from its ashes : — observed by Grant "on sandy edges of burn, Madi;" known to grow in other parts of Tropical Africa as well as on Madagascar (Ad. Juss.), and in Tropical Asia (R. Brown). Westward, occurring also in Tropical America (Vahl ecl. amer. 2, Pers., R. Brown, Kunth, and A. Dec.), possibly brought by imported negroes. Described by Linnæus the younger.

"1241, April 12th" (Yule cath. i. p. cxx), a Tartar army having entered Poland and destroyed Cracow found Breslaw abandoned and in ashes, and near Lignitz defeated with great slaughter the forces of Poland, Silesia, and Moravia. Batu with the main army ravaging Hungary, capturing and destroying Pesth : but the Tartars were suddenly recalled by the death of Okkodai, who was succeeded by Kuyuk.

"Oct. 6th" (Greenhill in Sm. b. d.), *eclipse* of the sun. Witnessed at Nicaea, at the court of the excluded Byzantine emperor Joannes III., by Nicolaus Myrepsus.

Agrostemma githago of middle Asia. Called in Britain *cockle* or *corn cockle*, in Anglo-Saxon "coccel" (Prior), in Germany "kornrade," in Italy "gettone" or "gettajone" (Lenz), in Lithuania "kukalei," in Poland "kakol," in Russia "kukal" (A. Dec.), in Greece "göggöli" or "kökköli" (Sibth.); in which we recognize the *κακαλιδα του σιτου* of Nicolaus Myrepsus iv. 2 : — *A. githago* was observed by Sibthorp, and Chaubard, in the cultivated fields of Greece and the Greek islands; is known to grow in Armenia and around Caucasus, and in Siberia as far as Irkutsk (Koch, Bieb., and Turcz.). Westward, is mentioned by Gerarde, and Ray, as known from time immemorial in Britain; is termed "nigella" in the *Ortus sanitatis* pl. 310, and "lychnis segetum major" by Tournefort inst. 335; was observed by Desfontaines i. p. 363, and Munby, in Barbary; and is known to grow in Sicily, Sardinia, Southern Spain, Portugal, Italy, and throughout middle Europe as far as Denmark and Courland (flor. Dan. pl. 576, Moris, and A. Dec.). By European colonists, was carried to North-east America, where it has become a weed in grain-fields.

Neslia paniculata of Europe and the adjoining portion of Asia. Called in Greece "kökōulia" (Fraas), and possibly the "kökalitha tōu sitou" in question : — *N. paniculata* was observed by Sibthorp, and Fraas, in cultivated and fallow ground from Attica to Constantinople. Westward, is termed "rapistrum arvense folio auriculato acuto" by Tournefort inst. 211, "myagrum paniculatum" by Linnæus; and is known to occur in fallow ground in Piedmont and throughout middle Europe as far as Denmark (All., fl. Dan. pl. 204, and Pers.).

Artemisia camphorata of middle Europe. The *καφουρας βοτανης* of Nicolaus Myrepsus, — is referred here by Sprengel, and Hase : *A. camphorata* has not been observed by modern travellers in Greece; but is described by Lobel pl. 769, and is known to grow on rocks in middle Europe (Wulff in Jacq. coll. iv. p. 295, Vill. delph. iii. p. 242, Dec. fl. fr., and Pers.).

Leonurus cardiaca of Eastern Asia. Called in Japan "sitsisu soo" or usually "susu kaki" (Thunb.), in Britain *motherwort* (Prior) : the *καρδιοβοτανον* of Nicolaus Myrepsus iii. 60 — is referred

here by Fuchsius: *L. cardiaca* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Constantinople; is known to occur also about Caucasus and in Siberia (A. Dec.); and was observed by Kaempfer, and Thunberg, in Japan. Westward, is described by Brunfels, and Gerarde; is termed "cardiaca" by Tournefort inst. 186; and is known to occur in waste places in Hungary and throughout middle Europe as far as Denmark (fl. Dan. pl. 727, Lam. fl. fr., and Pers.). By European colonists, was carried to Northeast America, where it continues frequent in waste places in our Northern and middle States; to Brazil, where it was observed by A. St. Hilaire in the outskirts of Rio Janeiro. Its "reputed tonic powers" and use in the "disease of the stomach called heart-burn, are now little regarded," though according to Burnett "a stimulant which has been extolled by the Russians as a preservative against canine madness" (Lindl.). Its English name and alleged power in female complaints mentioned by Linacre, and Parkinson, may have arisen from its outward resemblance to *Artemisia vulgaris*.

Betonica Orientalis of middle Asia. The *δροσισβοτανον* of Nicolaus Myrepsus i. 1 — is referred here by Sprengel: *B. Orientalis* is known to grow "in Oriente" (Pers.); and from transported specimens, is described by Linnæus, and Thuillier (Lam. ill. pl. 507, and Steud.).

Corrigiola littoralis of Europe and the adjoining portion of Asia. Diminutive, prostrate from a central root, and called in Britain *strapwort*, in medieval Latin "corrigiola" (Prior): mentioned by Nicolaus Myrepsus, — according to transl. med. art. princ. 520 a. *C. littoralis* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Constantinople. Westward, is described by Morison v. pl. 29; and is known to grow in sandy situations in Barbary and throughout middle Europe as far as Denmark (fl. Dan. pl. 334, and Pers.).

Phalaris Canariensis of the Canary Islands. Called in Britain *Canary grass* (Prior), in Greece "kōukoulē" or "kōukoulōhōrtōn" (Sibth.) or "anēmōhōrtō" (Forsk.), in which we recognize the *ανεμοχρorton* of Nicolaus Myrepsus: — *P. Canariensis* was observed by Forskal, and Sibthorp, in Greece and at Constantinople, frequent in cultivated ground; by Forskal, Hasselquist, and Delile around Alexandria and Cairo. Westward, is enumerated by Stapel as frequent on Malta, and was observed there by Forskal; is termed "gramen spicatum semine miliaceo albo" by Tournefort inst. 518; is known to occur in cultivated ground on the Canary Islands (Pers.); and since the domestication of Canary birds has been cultivated in Western Europe for feeding them with its seeds, in Britain tending to become naturalized (Wats. and A. Dec.). By European colonists, was carried to Northeast America, where it continues under cultivation and is occasionally met with growing spontaneously.

"Towards the end of October" (Alst., and Nicol.), Gregorius IX. succeeded by cardinal Geoffrey de Castiglione, now Celestinus IV, twenty-third pope. Dying on the "17th or 18th of November" before being consecrated, the office continued vacant — more than eighteen months.

"Nov. 29th" (Nicol.), a synod at Oxford. It was resolved, to send a deputation, praying the emperor Fredericus II. to leave the election of the pope to the cardinals.

"The same year" (Stirling res. Asiat. xv. 315 to 327, and Elphinstone iii. 8), the Black pagoda, near that of Jagannat on the Eastern shore of Hindustan, completed.*

* *Cocculus villosus* of Eastern Hindustan and Burmah. A woody twiner called in Hindustanee "dier" or "faridbuti," in Telinga "doosra-tiga," in Bengalee "huyer" (Drur.); and from early times, its leaves and root employed medicinally: — observed by Ainslie, Roxburgh, and Wight, in the peninsula and as far as Bengal (Drur.); by Mason, in Burmah.

Sida rhomboidea of Assam? Called in Bengalee "swet-baryala," in Hindustanee "sufed-bariyala" (Drur.), and known perhaps from early times: — observed by Roxburgh, and Wight, "cultivated" from Assam to Negapatam and Coromandel, its long silky fibres of great strength (Drur.); according to Hannay hort. soc. beng. 1862, growing "luxuriantly in Assam."

Buchanania lanceifolia of Chittagong. A Terebinthoid tree, its tender unripe fruit from early times eaten in curries: — observed by Roxburgh (Drur.).

Canarium Bengalense of Silhet and the adjacent mountainous countries. A Terebinthoid tree, its copal-like but brittle resin known from early times, — sold at a cheap rate in the Calcutta bazaar, and not valued by the natives (Madras exhib. rep., and Drur.).

Lica Indica of Assam and Chittagong. An Amyroid tree seventy feet high called in Bengalee "nayor" (Drur.); and from early times, its hard close-grained wood used for furniture: — observed by Wallich and termed "bursera serrata," its timber "tough as oak, and much heavier" (Drur.).

Bauhinia diphylla of Eastern Hindustan. Called in Burmah "pa-lan" (Mason), at Cuddapah and Guntoor "authee nar" or "yepy" or "apa" (Drur.); and its fibres known from early times: — observed by Buchanan, and Roxburgh, "common about Cuddapah and Guntoor" (Drur.); by Mason, in Burmah.

Cassia (Cathartocarpus) Roxburghii of Eastern Hindustan. A beautiful tree resembling the

"1243 A. D." (ann. Jap., and art de verif.), Sidsio succeeded by Saga II. or Go-Saga, younger son of Tsatsi-mikaddo and now eighty-seventh dairo of Japan.

"In the Thirteenth century" (Jap. c. c. 90), the third colossal statue of Budha, "the well-known Daibutsu, of Kamakura," was built "with an alloy containing a small percentage of gold."

"June 24th or 25th" (Alst., and Nicol.), cardinal Sinabaldo di Fiesco or Innocentius IV. elected twenty-fourth pope. He introduced into his Bulls the celebrated clause, "Non obstantibus."

"1244 A. D." (Nicol.), a synod at Tarragona. "Against such as robbed, ill-treated, or defamed priests."

"The same year" (Munk), the sultan of Damascus having made a treaty again admitting the crusaders into Jerusalem, Melek-Saleh extended an invitation to the Kharesmians, already then in Syria. In accordance therewith, the Kharesmians advanced upon and captured Jerusalem. — At the end of three years, they were expelled by the combined forces of the Syrians and Egyptians.

The number of Memluks increased beyond precedent by Melek-Saleh; who purchased some thousands of young "Turks," to whom he gave a military education, and thus obtained a formidable body of soldiers exclusively devoted to his interests.

"In this year (= 642 A. H.' of Ferishta, Elphinst.), irruption of Mogul Tartars through Tibet*

weeping ash, its hard handsomely-marked timber known from early times: — observed by Roxburgh on the Gingie hills, rare in the wild state (Drur.).

Dalbergia sissoides of Eastern Hindustan. Its timber valued from early times: — observed by Roxburgh (Drur.).

Olea robusta of Silhet. Its hard and durable timber known from early times: — observed by Roxburgh (Drur.).

Echaltum piscidium of Silhet. A perennial climbing Apocynoid called there "echalat" (Drur.); and from early times, the fibres of its bark used as a substitute for hemp: — observed in Silhet by Roxburgh (Wight pl. 472, Royle, and Drur.).

Wrightia mollissima of Cachar. Its timber known from early times, — being according to Brownlow in a. h. s. 1864 "the nearest approach to boxwood there is in that part of the country" (Drur.).

Premna esculenta of Chittagong. Its leaves from early times used there medicinally: — observed by Roxburgh (Drur.).

Artocarpus chaplasha of the forests East of Bengal as far as Chittagong. An immense tree; and from early times, river-canoes made of its trunk, its timber used besides for other purposes, especially for anything under water: — enumerated by Drury.

Calamus erectus of Silhet. Its seeds from early times used there by the poorer classes as a substitute for betel-nut: — observed by Roxburgh (Drur.).

* *Aconitum heterophyllum* of the Himalayas. Shrubby, its imported root called in Hindustanee "atis," on the Deccan "atvika" or "vajjè-turki," in Telinga "ativasa," in Tamil "ativadayam" (Drur.), and from early times sold in bazaars as aphrodisiac tonic and febrifuge: — observed by Wallich, and Royle, on the Himalayan mountains, at the elevation of "nine to ten thousand feet" (Drur.).

Aconitum palmatum and *A. luridum*, two other species growing on the Himalayan mountains, "and yielding similar properties" (Drur.).

Thalictrum foliolosum of the Khasia mountains. Called there "pila jari" yellow-root, exported from the Kumaon mountains under the name of "momeeree" (Drur.), and from early times employed medicinally: — observed by Buchanan (Steud.), and Royle ill. 51 (Drur.).

Grewia elastica of Hindustan. A Tiliaceous tree, its timber from early times highly esteemed for its strength and elasticity, for making bows and the shafts of vehicles: — observed by Royle, its berries having a pleasant acid taste and used for making sherbet (Drur.).

Pavia Indica of the Himalayan mountains. The *Himalayan horse-chestnut* is a lofty tree called "kunour" or "pangla" (Drur.); and from early times, its seeds eaten, and its soft strong timber used for building and cabinet purposes: — observed by Colebrooke, Wallich, Royle, and Jacquemont, at the elevation "of from eight thousand to ten thousand feet in Kumaon Gurwhal" Sirmore and near the sources of the Ganges to Kunawur (Balfour, and Drur.).

Xanthoxylon hastils of the Himalayas. Prickly, and from early times its aromatic fruit used as a condiment, its seeds and bark as an aromatic tonic, and its small branches for tooth-scrubbers: — described by Wallich, and observed by Powell in the Punjaub, its larger branches used for triturating the hemp-plant, and its capsules and seeds "said to intoxicate fish" (Drur.).

Exacum tetragonum of Subtropical Hindustan. A Gentianoid annual one to two feet high, powerfully bitter and called "ooda chiretta" purple chiretta (Royle): from early times, employed as a tonic and febrifuge: — observed by Roxburgh, Wallich rar. pl. 276, and Royle, "common in the

into Bengal, the only one by this route "during the period of authentic history." It was repelled by the local authorities.

Asparagus ascendens of Rohilcund. Affording according to Modeen Sheriff the genuine "sufed mush," called on the Deccan "shakakul-hindi," and from early times used medicinally as a substitute for and better than salep:—known to grow in Rohilcund (Waring pharm. ind. suppl.), enumerated by Drury. (See *A. sarmentosus*.)

"1245, June 28th to July 17th" (Alst., and Nicol.), Thirteenth general ecclesiastical Council. Assembled at Lyons. The emperor Fredericus II. was excommunicated, and his subjects absolved from their allegiance. The "red cap" for cardinals, was at the same time instituted.

"The same year" (Clavig. ii. and Humb. iii. 8), arrival of the Aztecs at Chapoltepec on the Western shore of lake Tezcuco.

Arachis hypogea of Eastern Equatorial America. The *peanut* called in Peru "anchic" (Monard.), in Brazil "mandubi" (Marcgr.), in Mexico "cacauate" (Blanco), in the West Indies "mani" (J. Acost.), and cultivated from early times—(Humb. iv. 9): the "mani" was seen in the West Indies or neighbouring portion of Tropical America by Oviedo gen. hist. vii. 5, and J. Acosta; *A. hypogea*, by Leriux 215, and Marcgraf 37, in Brazil. By European colonists was carried Westward across the Pacific to the Philippines, called in Tagalo "mani" (Blanco), and seen in 1693 by Kamel (Spreng.); to the neighbouring islands and Japan (Rumph. v. 426); to China and Anam (A. Dec.); to Burmah, called there "myæ-bai" (Mason); to Hindustan, having neither Sanscrit nor Bengalee names (Roxb., and Pidd.) but called in Tamil "vayer" or "nelay-cadalay," in Telinga "nela sanagalu," in Hindustanee "moong-phulle," sometimes by colonists *Manilla-nut* (Drur.), in the environs of Bombay "velaiti-moong" or "boi-moong" (Graham), is now cultivated from Calcutta throughout the peninsula (Drur.), was observed by myself abundantly cultivated on the Deccan; to Eastern Equatorial Africa (Lour. fl. coch.), observed by myself on Zanzibar, and according to some Unamuezi from N'yasa lake cultivated in their own country, observed by Grant "cultivated to a small extent from 7° S. to 2° N." on the Nile; to Egypt, called there "foul sennar" Sennar bean (Clot-Bey). By European colonists also, was carried before 1620 to Western Equatorial Africa (Purchas, Sloane i. 184, and Guillemain fl. seneg.); and more recently to Northeast America, where in our Southern States it is now abundantly cultivated.

"1246 A. D." (Roux in rec. soc. geogr. i., and mem. Chin. v. p. 2), an embassy to the Tartars first sent by pope Innocentius IV.: Plan Carpin and Benedict of Poland crossing the Volga "April 8th" and continuing Northward of the Caspian reached the court near Karakorum. "July 22d," and received an audience from the newly proclaimed khan Kayu or Cuiuc, a grandson of Jenghiz. The journey proved the Caspian to be an inland sea, as already stated by Herodotus:—a conclusion confirmed a few years later by Rubruquis.

"In this year (= 639 A. H.) of Ferisht., Elph.), Ala-u-din Masaud succeeded by Nasir-u-din Mahmud, grandson of Altamsh and now eighth sultan of Delhi.*—He reigned "twenty" years,

Himalaya and the mountains and plains of Bengal and Central India" (Drur.); by Giberne, as far South as "Salsette" (Graham), near Bombay.

Rhazya stricta of Scinde. An excellent bitter tonic, from early times employed medicinally, mixed with Withania berries:—observed in Scinde by Stocks (Drur.). From transported specimens, described by Decandolle.

Hyoscyamus insanus of Beluchistan. Called there "kohl bung" mountain hemp (Drur.), and its powerfully poisonous properties known from early times:—common, "smoked in small quantities, and also employed for criminal purposes" (Waring pharm. ind., Stocks, and Drur.).

Scopolia lurida of Nepaul. Known from early times,—its bruised leaves emitting "a peculiar tobacco-like odour, a tincture prepared from them" found to dilate the pupil (Braithwaite, and Drur.).

Withania coagulans of Beluchistan, Scinde, and the mountains of Affghanistan. A densely tomentose shrub called in Scinde "puneer" (Drur.); and from early times, its fresh ripe fruit used as an emetic, dried and employed for other medicinal purposes, and universally throughout Beluchistan for coagulating milk:—observed by Stocks bomb. soc. 1849 (Wight pl. 1616, and Drur.).

Salvia plebeia of Subtropical Hindustan. A purple-flowered *sage*; its seeds from early times used as mustard by the Hindus, employed also medicinally:—described by R. Brown prodr. 501; observed by Roxburgh from Bengal to Silhet and Oude, by Dalzell 209 as far as Kandalla near Bombay (Drur.).

Salvia lanata of Northern Hindustan. From early times, its stems peeled and eaten, and its leaves root and seeds employed medicinally:—described by Roxburgh, and observed by Stewart punj. at Lahore.

* *Polanisia icosandra* of Hindustan and Burmah. A Cleomaceous plant two or three feet high called in Tamil "nayavaylie" or "nahi kuddaghoo," in Malabar "kat-kuddaghoo," in Hindustanee

patronised Persian Literature, and the "Tabakati Nasiri," a general history of Persia and India, was written at his court.

Acalypha fruticosa of Tropical Arabia and Hindustan. A birch-leaved shrub called in Tamil

"hoorhoorya" (Drur.); and from early times, eaten as salad, and its mustard-like leaves and seeds used also medicinally:—described by Rumphius v. pl. 96; observed by Burmann pl. 99 on Ceylon; by Graham, "common in waste places during the rains" as far as Bombay; by Ainslie, and Wight, as far as Bengal; by Mason in Burmah, enumerated as indigenous. "*P. viscosa*" seen by Rheede ix. pl. 23 in Malabar, known to grow also on Ceylon (Pers.), is regarded by some writers as not distinct.

Polanisia chelidonii of Hindustan. A pretty annual with rose-coloured flowers (Graham); its pungent seeds in like manner used for mustard from early times:—received by the younger Linnæus from "Transchaur" (Pers.); enumerated by Graham among the plants of the vicinity of Bombay; and observed by Royle, and Wight, in other parts of Hindustan (Drur.).

Drosera peltata of Hindustan and Burmah. A yellow-flowered *sundew*, known from early times:—observed by Royle, and Wight, on the "Neilgherries, Bababoodens," avoided by cattle, the leaves curdling milk, and "mixed with salt" said to blister the skin (Drur.); by Mason, as far as Burmah.

Polygala telephioides of Hindustan. From early times used medicinally in catarrhal affections:—known to grow in Hindustan (Waring pharm. ind., and Drur.). From transported specimens, described by Willdenow (Pers., and Steud.).

Mollugo spargula of Hindustan and Burmah. A species of *carpet-weed* called in Burmah "gyen-ga" (Mason), in Bengalee "ghimi shak," in Telinga "chatarashi," in Tamil "toora" (Drur.); and from early times, its bitter leaves employed medicinally:—observed by Rheede x. pl. 24 in Malabar; by Graham, a "common" weed "in gardens" at Bombay; by Ainslie, Roxburgh, and Wight, as far as Bengal; by Mason, in Burmah, enumerated as indigenous.

Melanthesea rhamnoides of Tropical Hindustan. A Phyllanthoid shrub called in Tamil "pavalapoola," in Hindustanee "surasaruni" (Drur.); and from early times, its leaves and bark employed medicinally:—observed by Rheede v. pl. 44 in Malabar; by Nimmo, in "the Concans" (Graham), to and beyond Bombay; by Ainslie, Roxburgh, and Wight, as far as the Coromandel coast, its bright red fruit making a lively appearance, and in Behar the dried leaves smoked when the tonsils are swollen (Drur.).

Tragia canuabina of Tropical Hindustan. An annual Euphorbiaceous twiner, covered with stinging hairs, and called in Tamil "sirroo-canchorie," on the Deccan "kanch koorie," in Telinga "trinuadoolagondie" (Drur.); its root from early times employed medicinally:—described by N. L. Burmann pl. 63, and known to grow in Malabar (Pers.); observed by Ainslie, Roxburgh, and Drury, from Travancore to Coromandel and Bengal, its root in decoction prescribed "as an alterative," and "in infusion in ardent fevers." Transported to Europe, is described by Plukenet alm. pl. 120.

Casearia anavinga of Tropical Hindustan. A Samydaceous shrub or tree called in Malabar "anavinga" (Drur.), very bitter in all its parts, and from early times employed medicinally:—observed by Rheede iv. pl. 49 in Malabar; by Graham, "a very common shrub" in the environs of Bombay (Graham); by Roxburgh, on the banks of the Hoogly and as far as Goalpara, a large tree, its leaves "used in medicated baths, and the pulp of the fruit" diuretic (Lindl., and Drur.).

Acacia (Albizzia) stipulata of Tropical Hindustan and Burmah. An unarmed tree forty to fifty feet high called in Telinga "konda-chiragu," in Bengalee "amlooki" (Drur.); and from early times, its close-grained strong timber valued for furniture and other purposes:—observed by Graham "common on the Ghauts, about Kandalla, etc.," as far as Bombay; by Roxburgh, Wight, and Drury, from Travancore to Courtallum and the mountains North of Bengal; by Mason, in Burmah.

Casalpinia sepiaria of Southern Hindustan and Burmah. The *Mysore thorn* is a woody twiner armed with strong recurved prickles and called in Burmah "hsoo-kyan-bo" (Mason), in Hindustanee "Hyder ka jhar" (Drur.), in the environs of Bombay "chillur" (Graham); known from early times:—indigenous according to Drury in Mysore; planted by Hyder Ali around his strongholds as an additional means of defence, and forming an almost impenetrable hedge is generally used "in the Baghayat lands of the Deccan," and has become well known throughout the country (Gibs., and Drur.); observed also by Roxburgh, and Wight. Farther East, by Mason in Burmah, enumerated as indigenous.

Fussieua villosa of Hindustan and Burmah. A perennial-rooted herb called in Malabar "carambu," in Bengalee "lal-bunlunga" (Drur.); and from early times employed medicinally:—observed by Rheede ii. pl. 50 in Malabar; by Graham, "in moist places at Kandalla, and throughout the Concans," to and beyond Bombay; by Ainslie, Roxburgh, and Wight, as far as Bengal; by Mason, in Burmah.

Lagerstroemia parviflora of Tropical Hindustan. A large Lythraceous tree called in Telinga

"sinnie," in Telinga "tsinnie," on the Deccan "chinnie" (Drur.), in Yemen "bortam" or "schohat" or "anschat" or "dæfran" (Forsk.); and from early times, employed medicinally:—observed by Forskal p. 161 among the mountains of Yemen, its leaves macerated in water to wash infants afflicted

"chinangee" (Drur.); and from early times, its excellent wood used for ploughs, axe-handles, building and boats:—observed by Roxburgh cor. i. pl. 66, Wight pl. 69, and Beddome pl. 31, from the Neilgherries to the Circars, Courtallum and Bengal (Drur.).

Cucumis momordica of Tropical Hindustan. Cultivated from early times:—observed by Graham in the environs of Bombay, "cultivated, much like the common cucumber but smother and larger;" by Ainslie, and Roxburgh, in other parts of Hindustan, "a good substitute for the common cucumber" (Drur.).

Trianthema decandra of Tropical Hindustan. A prostrate purslane-like annual called in Tamil "vally-sharunnay," in Telinga "tella ghalijeroo," in Bengalee "gada buni," on the Deccan "bhees khupra" (Drur.); and from early times, its root employed medicinally:—was observed by Graham in the environs of Bombay, "a common weed, particularly abundant in moist places;" by N. L. Burmann pl. 31, Ainslie, Roxburgh, and Wight, as far as Bengal.

Trianthema obcordata of Tropical Hindustan. Perennial and prostrate, called in Tamil "sha-runney," in Telinga "ghelijehroo," in Bengalee "sabuni," on the Deccan "nasurjanghi" (Drur.); and from early times, its leaves and tender tops eaten in times of scarcity, and its root employed medicinally:—observed by Stewart in the Punjaub; by Ainslie, Roxburgh, and Wight, as far as Coromandel and Bengal.

Nauclea parvifolia of Tropical Hindustan. A Cinchonoid tree thirty to forty feet high called in Tamil "neer-cadamba," in Telinga "bota-cadamie" (Drur.), in the environs of Bombay "kuddum" (Graham); and from early times, its timber used for flooring and other purposes:—observed by Gibson, and Graham, "common in the Mawul districts," and "about villages throughout the Concan;" by Roxburgh, and Wight, from Malabar to Coromandel and Bengal.

Gardenia gummiifera of Tropical Hindustan and Ceylon. An unarmed Cinchonoid tree, known from early times:—observed by Law in the Bombay district, "very common about Duddi on the Gutpurba" (Graham); by Roxburgh, and Wight, in other parts of Hindustan, and is known to grow on Ceylon, exuding from the buds and wounds in the bark a yellow resin similar to gum elemi (Pers., and Drur.). From transported specimens, is described by the younger Linnæus.

Pavetta Indica of Tropical Hindustan. A Cinchonoid shrub, three or four feet high and deciduous-leaved, called in Bengalee "kookoora-choora," in Hindustanee "cancra," in Tamil "pavuttay," in Telinga "paputta" or "nooni-papoota" (Drur.), in the environs of Bombay "paput" (Graham); and from early times, its fruit made into pickles, its leaves used for manuring fields, and its root employed medicinally:—observed by Rheede v. pl. 10 in Malabar; by Graham, from hills near Bombay "along the Ghauts," and "one of the commonest shrubs at Mahableschwur;" by Ainslie, Roxburgh, and Wight, as far as Coromandel, Bengal, Silhet, and Chittagong (Drur.).

Spermacoce hispida of Tropical Hindustan and Ceylon. A Cinchonoid annual called in Tamil "nuttee choorie," in Telinga "madana" (Drur.); and from early times, its root employed medicinally:—observed by Rheede ix. pl. 76 in Malabar; by Graham, "common in the ruins" in the environs of Bombay; by Ainslie, Roxburgh, Wight, and Drury, as far as Travancore and Bengal; and is known to grow on Ceylon (Pers.).

Vernonia cinerea of Tropical Hindustan. From early times, used in decoction to promote perspiration in fevers:—observed by Rheede x. pl. 64 in Malabar; by Graham, in the environs of Bombay "a common weed during the rains;" by Ainslie, Roxburgh, and Wight, in other parts of Hindustan; by Burmann pl. 96 on Ceylon; and is described by Rumphius vi. pl. 14. Transported to Europe, is described by Plukenet pl. 177.

Damia extensa of Tropical Hindustan. A frutescent Asclepioid twiner, called in Bengalee "chagul-bantee," in Tamil "vaylie partie" or "ootamunnie," in Telinga "jutuga," in Hindustanee "sagowania," on the Deccan "oobrun" (Drur.); and from early times, employed medicinally:—observed by Law, and Graham, in hedges and on bushes from Bombay to Ahmednuggur, "and almost everywhere," next to "the commonest" of its tribe; by Ainslie, Roxburgh, and Wight, as far as Bengal and the Himalaya, yielding a fibre "recommended as a fair substitute for flax" (Drur.).

Erythraa Roxburghii of Hindustan. An herb, powerfully bitter, and from early times held in great repute as a tonic:—observed by Roxburgh, and Wight, in the peninsula and Bengal, "common in cultivated fields after the rains."

Bignonia (Stereospermum) chelonoides of Tropical Hindustan. A large pinnate-leaved Bignonoid tree called in Tamil "pompadyra marum," in Telinga "tagada" or "kalighootroo," in Malabar "padrie-marum" (Drur.), in the environs of Bombay "padree" or "purrul" (Graham); and from

with "tyff" pustules. Eastward, was observed by Ainslie, Retz, and Roxburgh, in Mysore and the peninsula, its leaves in infusion prescribed by Hindu physicians "as a stomachic in dyspeptic affections and cholera" (Drur.).

early times, its beautiful flowers offered in temples, and its hard durable timber much used:—observed by Rheede viii. pl. 24 in Malabar; by Graham, near Bombay, and "on the Ghauts pretty common;" by Ainslie, Roxburgh, Wight, and Beddome, as far as Coromandel and Silhet.

Bignonia suberosa of Southern Hindustan and Burmah. An ornamental tree, its firm close-grained wood known from early times, and its cracked spongy bark used as an inferior substitute for cork:—growing from Tanjore to Madras and Courtallum (Roxb., and Drur.); but at Bombay, observed by Graham only "in gârdens" and planted for ornament. Eastward, was observed by Mason in Burmah, enumerated as indigenous. From transported specimens, is termed "*millingtonia hortensis*" by the younger Linnæus.

Bignonia xylocarpa of Tropical Hindustan. A large tree with bipinnate deciduous leaves, called in Tamil "vadencarni" (Drur.), in the environs of Bombay "khursing" or "khursingee" (Graham), at Daung in Kandesh "bairsingee" (Auld); its wood from early times used for cabinet purposes, and its tender pods eaten:—observed by Auld, Graham, and others, in the "Concans," on the Ghauts and in other parts of the district around Bombay; by Roxburgh, and Beddome, common "in almost all the Madras forests" and from Mysore to Bengal (Drur.).

Evolvulus alsinoides of Tropical Hindustan and Burmah. A creeping prostrate herb called "vishnugarandi" (Burm.), in Tamil "vistnoo-krandie," in Telinga "vistnoo-krandum," in Malabar "vistna-clandi" (Drur.); and from early times, reputed a sovereign remedy in dysentery:—observed by Rheede xi. pl. 64 in Malabar; by Graham, near Bombay, and "very common on the plains of the Deccan during the rains;" by Burmann pl. 6, on Ceylon; by Ainslie, and Roxburgh, as far as Bengal; and by Mason, in Burmah.

Leucas aspera of Tropical Hindustan. A white-flowered Labiate annual, the juice of its leaves from early times applied medicinally in cutaneous affections:—observed by Graham in the environs of Bombay, its flowers "appear in the rains;" is termed "*phlomis esculenta*" by Roxburgh, was also observed in other parts of Hindustan by Waring pharm. ind. (Drur.).

Anisochilus carnosum of Tropical Hindustan and Burmah. A small Lavandula-like perennial called in Tamil "karpuravalli," in Telinga "roga-chettu" or "omamu," in Malabar "chomara" or "kattu-kurrka" or "patu-kurrka," in Hindustanee "panjiri" (Drur.), in the environs of Bombay "vova" (Graham); and from early times, its leaves and stems much employed medicinally:—observed by Rheede x. pl. 90 in Malabar; by Ainslie, Roxburgh, and Drury, in Mysore, and in "clefts of rocks among mountains in N. Circars;" by Mason, in Burmah.

Anisomeles ovata of Tropical Hindustan and Burmah. A Labiate annual three or four feet high called in Malabar "tsjadaen" (Rheede); and from early times, an oil distilled from it used medicinally:—observed by Rheede x. pl. 88 in Malabar; by Graham, as far as Bombay: by Roxburgh, and Wight, in other parts of Hindustan; by Burmann pl. 71, on Ceylon (Drur.); and by Mason, in Burmah.

Clerodendrum serratum of Tropical Hindustan and Burmah. A flowering ornamental shrub called in Tamil "chiru-dekku," in Malabar "tsjeru-teka" (Drur.), in the environs of Bombay "barungee" (Graham); and from early times, its flowers and leaves eaten, and its root and seeds employed medicinally:—observed by Rheede iv. pl. 29 in Malabar; by Nimmo, and Graham, from "Kandalla" near Bombay "throughout the Mahal districts above the Ghauts;" by Ainslie, Roxburgh, and Wight, at Courtallum and its root under the name of "gunta-bharinjie" largely exported from the Northern Circars for medicinal purposes; and according to Drury is "cultivated in Travancore." Farther East, by Mason in Burmah, enumerated as indigenous.

Gisekia pharuceoides of Tropical Hindustan and Burmah. A Phytolaccoid herb; from early times, employed as a powerful anthelmintic in cases of tapeworm:—observed by Nimmo in the "Concans" (Graham), to and beyond Bombay; by Roxburgh cor. pl. 183, Wight, Drury, and Lowther, "common in pasture-grounds all over the country;" by Mason, in Burmah. From transported specimens, described by Linnæus.

Tetranthera monopetala of Tropical Hindustan. A middling-sized Lauraceous tree, flowering from the branches below the leaves, called in Bengalee "buro kookoorchitta," in Telinga "narra mamady" (Drur.), in the environs of Bombay "peesah" or "kalla jhar" (Graham); and from early times, its leaves given to silk-worms, its bark used medicinally, and oil for candles and ointment procured from its berries:—observed by Powell in the Punjaub; by Graham, "on Kandalla Ghaut and the hills about Parr" in the Bombay district, the leaves having the "smell of cinnamon when bruised;" by Ainslie, Roxburgh cor. ii. pl. 148, and Wallich, as far as Bengal and Oude.

Amaranthus campestris of Tropical Hindustan. From early times employed medicinally as demul-

Acacia concinna of Tropical Hindustan. A large woody climber full of recurved prickles and called in Bengalee "kochai," in Tamil "shika," in Telinga "shikaya," in Malabar "chinik" (Drur.), at Bombay "chicakai" (Graham); and from early times, its succulent pods used by the Hindus for marking their foreheads, also for washing the head, and its acid leaves substituted for tamarinds in cookery: — observed by Nimmo, and Graham, the pods "sold in the bazaar" at Bombay; by Burmann pl. 1, growing on Ceylon; by Roxburgh, and Wight, from Mysore to Bengal and Assam (Drur.).

Typha elephantina of Hindustan. Called in Scinde "pauna"-grass (Heddle) in Bengalee "hogla" (Drur.); and from early times, its stems cut for matting, tied also in bundles from their buoyancy used to swim with: — observed by Heddle in Scinde, its long tortuous roots carefully guarded, being of great importance in binding the soil along the Indus; by Powell, in the Punjaub; by Nimmo, on "margins of tanks and in the beds of rivers throughout the Concans" (Graham), to and beyond Bombay; by Roxburgh, as far as Bengal, and from elephants being fond of it termed *elephant grass* (Drur.).

"Oct. 19th" (Nicol.), a synod at Lerida. James king of Arragon, under excommunication "for having caused the tongue of the bishop of Gironne to be cut out, was reconciled to the church."

"Dec. 1st" (Nicol.), a synod in London. On the demand of the pope, of "a third of the revenues of the clergy of England."

"1247 A. D." (Nicol.), a synod at Tarragona. Muslims desiring baptism were required to "abide for some days with the rectors of the church, to prove their conversion."

"The same year" (ann. Jap., and art de verif.), Saga II. succeeded by his second son Fikakusa II. or Go-Fikakusa, now eighty-eighth daïro of Japan.

"1248 A. D." (Nicol., see also Alst.), a synod at Breslau. A fifth of the revenues of the Polish clergy granted for three years to the pope, to aid him against the emperor Fredericus II.

"The same year" (Lubke and Lutrow), on the Rhine, the cathedral at Cologne commenced, under the superintendence of Gerhardus. — To the present day, the work of completion is going on.

"1248 or 1249 A. D." (Nicol., see also Alst.), a synod at Shening. Against the marriage of the clergy, a practice continuing in Sweden "after the example of the Greeks."

"1249 A. D." (Blair), Seventh crusade. Led into Egypt by Louis IX. le Saint; and on "June 5th," Damietta again captured.

"In or about this year" (Garc. de la Vega), Roca succeeded by his son Yahuarhuacac, now seventh Inca of Peru.

Scoparia dulcis of Peru and the neighbouring portion of Tropical America. A Rhinanthoid annual called in Brazil "basourinha" or "vacourinha" (Lindl.), and from early times employed medicinally as a cooling laxative (Mart.), in Spanish America in infusion to cure agues — (Humb.): observed by myself, introduced in the environs of Rio Janeiro, but to all appearance indigenous in Lower Peru; by J. D. Hooker, on the Galapagos Islands; by Descourtiz, in the West Indies, but no Carib name given. By European colonists, was carried Westward to the Tabeitian Islands (Beechey voy.); to Australia, before the visit of R. Brown; to the Philippines, naturalized and

cent, — observed by Ainslie "given in decoction" in strangury (Drur.). Transported to Europe, is described by Willdenow (Pers.).

Antidesma bunias of Tropical Hindustan. A small or middle-sized tree called in Tamil "nolai-tali," in Malabar "nuli-tali" (Drur.), in the environs of Bombay "amtee" (Graham); and from early times, regarded as a remedy in snake-bites, and ropes made of its bark: — observed by Rheede iv. pl. 56 in Malabar; by Graham, as far as Bombay, "on the Kandalla Ghaut, rare;" by Roxburgh, Wight, and Drury, from Travancore to Coromandel and Nepaul, its trunk in Assam sometimes "twelve or fourteen inches in diameter," its wood by immersion in "water becoming heavy and black as iron;" is termed "bunias sativus" by Rumphius iii. pl. 132.

Ficus heterophylla of Tropical Hindustan. A harsh-leaved shrub called in Bengalee "goori-shiori," in Telinga "buroni," in Malabar "valli-teragam" (Drur.); and from early times, its root employed medicinally: — observed by Rheede iii. pl. 62 in Malabar; by Graham, from Bombay to the Ghauts; by Roxburgh, Wight, and Drury, "common in moist places in the Peninsula and Bengal."

Ficus cunia of Tropical Hindustan and Burmah. A tree called in Malabar "perina teregam" (Drur.); and from early times, its bark and fruit used medicinally, and its rough leaves for polishing furniture: — observed by Rheede iii. pl. 61 in Malabar; by Graham, in "the Concans" to and beyond Bombay; by Roxburgh, and Wight, as far as Coromandel and Oude; is described also by Rumphius iii. pl. 95; and was observed by Mason in Burmah.

Eleusine stricta of Hindustan. Cultivated to a great extent, and perhaps from early times: — differing according to Drury "in having the spikes straight, being of a larger size, and more productive, the seeds are also heavier, which cause the spike to bend down horizontally."

sometimes used as a substitute for tea, and called in Tagalo "chachachachan" (Blanco); to Burmah (Mason); to Hindustan, having no Sanscrit name (Pidd.), and confined to the Southern portion (A. Dec.); to Arabia, observed by Forskal p. 31 at Ghomfude on the Red Sea, and called "dfar" (from Dhofar); to Eastern Equatorial Africa, observed by Grant "common in waste ground 5° 1' S., alt. 4000 ft." Also by European colonists was carried across the Atlantic to Western Equatorial Africa (R. Brown cong. 58); to the Mauritius Islands, observed by Bojer naturalized.

"1250 A. D." (Humb. cosm.), Vincentius Bellovacensis or Vincent of Beauvais writing his "Speculum naturale," an encyclopedic work. He had charge of the earliest *public library* in France, founded by Louis IX. — (Pouchet), and died "in 1256" (Spreng.).

The *herring*, Clupea, mentioned by Vincentius of Beauvais, and as salted for provision. — Salting of "alech" or herring, is also mentioned by Albertus Magnus.

"Apr 5th" (Blair, and Marcel), after advancing to the head of the Delta, the crusaders again defeated, obliged to capitulate, and leave Egypt.

The death of Melek-Saleh (fixed to this year by an Arabic inscription on his tomb near Cairo, Wilk. theb. and eg.) kept secret several months, was now declared; his son Turan Schah becoming the eighth Ayoubite sultan of Egypt.

At the end of two months (Clot-Bey, and Marcel), the Memluks or military slaves, perceiving, that they held their master's power in their own hands, put him to death and made one of their own number sultan. The Institution was at the same time rendered permanent by continual purchases of recruits from abroad. Ibek thus became the head of the Bahrite Memluk dynasty. A copper coin issued by him, is figured in Marcel p. 158.

"In or about this year" (Raffles ix. and x.), prince Haji Purwa returning from Hindustan, where he had been converted to Mohammedanism. With an Arab companion he attempted to convert his brother Munding Sari and others of the royal family of Java; but proving unsuccessful and fearing a tumult, he fled and "is believed to have found an asylum in Cheribon then an uninhabited wilderness." The earliest mention of Mohammedanism in Javan history, the troubles leading to the removal of the capital farther Westward where it retained the name Pajajaran.

"In this year" (Crawford vii. 11), colonists from Gilolo in the Moluccas settling in the island of Ternate.

"In this year" (Klapr. note to San-kokf), abdication of Ghi-fon in favour of Yei-so, of the ancient royal family and now king of the Loo Choo Islands; the "fourth" of the Tame-tomo dynasty.

"In or about this year" (Humb. atl. pict.), in the reign of Nopaltzin king of the Chichimecs, the culture of *cotton* and *maize* and the art of making bread, long neglected and in danger of being lost, revived by a Toltec named Xiuhtlatō.

Nicotiana tabacum of Mexico. The most generally known species of *tobacco* called in Brazilian "petume," in Carib "youly," in Mexican "quauhyeti" (Desc.), and cultivated as early doubtless as this date: *—following the coast of Honduras South, Columbus in 1502 observed natives on the

* *Nicotiana quadrivalvis* of Oregon. A species of *tobacco*—cultivated according to Nuttall by the natives along the Missouri, but on the Columbia probably indigenous: communicated to and described by Pursh.

Rhus copallinum of North America. A species of *sumach*, its leaves from early times "used as tobacco by the" tribes on "the Missouri and Mississippi"—(Pursh): "lentisci" were seen by Le Moyne in 1564 in Florida: *R. copallina*, by Chapman from "Florida to Mississippi;" by Baldwin at 31°; by Michaux, in Carolina and Virginia; by Pursh, in New Jersey; by myself, from 38° to 43° along the Atlantic; by Pitcher, on the Arkansas; by Lewis and Clark ii. 136, on the Rocky mountains and as far as the Pacific.

Liquidambar styraciflua of Northeast America. The *sweet-gum* is a forest-tree exuding a fragrant resinous fluid, mingled with tobacco in smoking at the court of the Mexican emperors—(Humb. iv. 10): "a gume which bleedeth from a kind of maple," "not much unlike a balsome both in sent and vertue," was observed by Newport on James river; *L. styraciflua* grows wild within or near the border of Mexico, is at least described by Hernandez 56 (Spreng.); was observed by Cabeza de Vaca in Texas; by Darby, on the Sabine; by Nuttall, on the Arkansas; by Chapman, "Florida to Mississippi, and northward;" by Baldwin, at Matanza in Florida; by Catesby ii. pl. 65, and Elliot, in Carolina; by myself, as far as 41°, near New York city; by Eaton, more than a degree farther North along the Hudson and Connecticut. According to F. A. Michaux, a very small quantity of storax can be procured from the trunk by incision.

Prosopis sp. of the Rio del Norte. The *mezquite* tree called "mezquiquez;" and from early times, its flour rendered sweet and wholesome by mixing earth eaten by the natives:—the tree, with

shore making hostile demonstrations, "chewing herbs" and "spurting it towards" him (F. Columb. 88 to 108); "tabaco" and "fuente de betum" are described by Oviedo gen. hist. v. 2 to vi. 12; and "petum" by Hieronymus Benzoni, who returned from the West Indies in 1556. Before the close of the year, the living *N. tabacum* became known to Nicotius in Lisbon (Pers., and Spreng.); is described somewhat later by Monardes, Lobel, and Camerarius; was observed by Forskal, Delile, and Clot-Bey, under cultivation in Egypt; by Forskal, in Yemen; was introduced "in 1605" into Hindustan (Royle him. 282), is cultivated abundantly in Guzerat and on the Deccan (Graham, and Drur.); was observed by Mason in Burmah, called there "hsa;" by Blanco in various parts of the Philippines; and according to Thunberg, was introduced by the Portuguese into Japan. Directly or indirectly through European colonists its cultivation has extended throughout the warmer parts of the Globe, was witnessed by myself in Brazil, Peru, Australia, on a limited scale among the natives on the Hawaiian, Taheitian, Samoan, and Tongan Islands, the manufactured article being in request even among the Feejeeans. The custom that most prominently distinguishes modern society, was taught by American tribes.

Nicotiana rustica of Northern Mexico. A species of *tobacco* called on the Saco "pooke" (Jossel.), on James river "apooke" (Strach.), on the Roanoke "uppowoc" (Har.), and from early times cultivated in Mexico (Humb. iv. 9) and in Northeast America: — clearly the species observed by Jacques Cartier under cultivation by the natives along the St. Lawrence; by Josselyn rar. 54 (near the mouth of the Saco), "a small kind with short round leaves;" by Strachey on James river, bearing a little yellow flower like henbane; by Hariot. 16, springing up spontaneously along the Roanoke and cultivated besides by the natives (figured by John With, De Bry i. pl.): *N. rustica* has been observed by myself, a weed in fallow ground in New England; by A. Gray, in "old fields, from New York westward and southward, a relic of cultivation by the Indians." Transported to Europe, is described by Matthioli, Lobel, Cæsarpinus viii. 44. and Gerarde 356; has become naturalized in middle Europe, occurring in waste places from Paris to the South of France and Venice; was observed by Delile, and Clot-Bey, under cultivation in Egypt; and the "Syrian and Turkish tobaccos" according to Lindley "are prepared from this species, which is much" milder than *N. tabacum*.

Argemone Mexicana of Mexico. A prickly yellow-flowered Papaveraceous weed, widely diffused among the American tribes as early perhaps as this date: — said to grow wild in unwooded mountainous situations in Mexico (Pers., and Dec.), observed in Northwestern Mexico by companions of Beechey (A. Dec.): in Northeast America, occurring in "waste places, not common" in our Middle States (A. Gray), and "exotic" in South Carolina (Ell.): probably an introduced weed only in Surinam (Merian pl. 24), Brazil, Buenos Ayres, Chili, and Peru (C. Gay, Hook. and myself). Spanish colonists calling it "figo del inferno" (Grah., and Lindl.). Farther West, was carried by European colonists across the Pacific to the Hawaiian Islands, observed there by myself; to the Philippines, called in Ylocano "casubhang aso" from resemblance to *Carthamus dentatus* (Blanco); to Java (Blume); to the environs of Bombay, observed by Graham "common everywhere and in flower all the year," by myself under cultivation on the Deccan, lamp-oil according to Gibson being extracted by the natives from its seeds; to Zanzibar, observed there by myself. Eastward from America, was carried to Europe as early as 1593, when seeds were received from England by Camerarius (C. Bauhin prodr.); is described by Ferrandus Imperatus 873 (Spreng.); was also carried across the Atlantic to St. Helena, Senegal, Guinea, Austral Africa (Le Prieur, Thonning, Burch., and Sonn.), and to the Mauritius Islands (Boj).

"1253 A. D." (voyag. Belg.), journeying Eastward across the Volga, Rubruquis on "Dec. 27th" reached Karacorum, near the frontier of China, and the seat of government of Mangou, khan of the Tartars. Rubruquis found here an embassy from Hindustan, another from a Turkish sultan; and among the population of the city, Nestorian Christians, Sarrasins or Muslims, Cathayan or Chinese

fruit hanging like the carob, first seen by Cabeza de Vaca journeying Westward on approaching the Rio del Norte.

Opuntia sp. of Texas. Its fruit eaten by the natives from early times: — West of the Mississippi, Cabeza de Vaca found the natives removing to another part of the country to eat prickly pears, of the size of a hen's egg, vermilion and black in colour and of agreeable flavour, and for three months have nothing else: the species commencing according to Darby at Natchitoches on the Red river, may be compared; as well as that seen by E. James at the base of the Rocky mountains, and said to grow as far as Monterey.

Gamassia Nuttallii of the Upper Mississippi. Its onion-like bulb from early times eaten by the native tribes — (A. Gray): observed by Nuttall near the confluence of Huron river and Lake Erie, also near St. Louis and on the Lower Ohio; by Short, near Lexington in Kentucky; by E. James, and Pitcher, on the Arkansas; and according to A. Gray grows in Wisconsin.

artisans, and even Europeans, most of them captives. He also procured here information respecting China (mem. Chin. v. p. 4).

Polygonum (Helxine) Tataricum of Central Asia. Called by the Tartars "dikusch," or by Tartars and Russians "kyrlik" (Moritz.): the *alud granum* sold according to Rubruquis at Karacaroum, though rarely,* — may be compared: *P. Tataricum* was observed by Gmelin wild near the Yenisei; is known to occur throughout Siberia, and nearly naturalized in Russia (Ledeb.); and according to Don fl. nep. p. 74 has been cultivated from time immemorial in Nepaul and on the confines of China. Westward, has been carried to Britain, where it continues under cultivation and sometimes springing up spontaneously, but not as yet naturalized (A. Dec.). By European colonists was carried to Northeast America, observed by myself under cultivation in Northern New Hampshire.

As early probably as this date (Kaswini lex. geogr.), the island of "Ramana in the China Sea" described by Muhammed ben Zakarya Alrazi as containing people four span high and covered with red down, living on trees, and their language like the notes of birds unintelligible (the Borneo *orang*).

The great island of "Zanig" in the same vicinity described by Zakarya ben Muhammed ben Khakan as containing white yellow and red parrots; and a bird called "alhavari" talker, smaller than a pigeon, white beneath with a black neck, red feet and yellow bill, and speaking more distinctly than a parrot (the *maina*).

"In or about this year" (Blair), under the direction of Alphonso IX. king of Castile and Leon, the Alphonsian *astronomical tables* composed by R. Ishak Aben Sid.

1254 A. D. (= "1179 an. jav.," Raffles x.), Prabu Munding Sari succeeded by Munding Wangi, now king of Java at New Pajajaran.

"Dec. 12th" (Alst., and Nicol.), Innocentius IV. succeeded by cardinal Reinaldo de' Conti di Segni, now Alexander IV., twenty-fifth pope. Alexander III. ruling Scotland.

"1255, Jan. 13th" (Nicol.), a synod in London. "Against the exactions of the Courts of Rome and of England." — Two years afterwards, another synod was convened on the same subject.

"The same year" (Alst.), at Adrianople, Joannes III. succeeded by Joannes IV. Theodorus, as the legitimate Byzantine emperor.

The "grotto-temple" at Mahamalaipur, on the Coromandel coast of Hindustan, said to have been constructed in the "Thirteenth century" (Lubke and Lutrow).†

* *Polygonum (Helxine) emarginatum* of Central Asia. An allied species cultivated with the preceding and from time immemorial in Nepaul and on the confines of China (Don, and A. Dec.), and possibly the plant in question: — *P. emarginatum* does not appear to have been met with farther West; but is attributed to China (Pers.); and from transported specimens is described by Roth cat. i. p. 48.

† *Michelia Nilagirica* of the mountains of Southern Hindustan. A Magnolioid tree, its handsome mottled timber from early times used in house-building: — observed by Wight (Drur.).

Flacourtia crenata of the mountains of Southern Hindustan. Its white very hard and dense timber valued from early times: — according to Beddome pl. 78, and Drury, "common on the Neilgherries and Shevaroys." The "*F. montana*" called "attuck ka jhar," a thorny "middle-sized tree" observed by Graham "on the Ghauts rare," its "fruit size of a crab apple eaten by the natives," may be compared.

Vateria Indica of Ceylon. Distinguished by its larger fruit and leaves (Drur.); and known from early times.

Dipterocarpus Indicus of South Canara. Known probably to the natives from early times, — but only "in 1865" discovered by Europeans (Drur.).

Garcinia pedunculata of Southern Hindustan. A large Calophylloid tree called in Hindustanee "tikul" or "tikoor" (Drur.); and its very large agreeably acid fruit known from early times: — growing according to Roxburgh, and Wight, at Rungpore, the fleshy part of the fruit used by the natives in curries and for acidulating water, dried slices retaining their quality for years (Drur.).

Pterospermum rubiginosum of Southern Hindustan. A large Sterculioid tree called in Tamil "kara-toveray" (Drur.): and from early times, its excellent timber used for building and other purposes: — observed by Wight, and Beddome, "common in Tinnevely, Wynaad, the Annamullays and western forests" (Drur.).

Kleinhovia hospita of Tropical Eastern Asia, the Malayan archipelago, and as far as the Samoan Islands. A Sterculioid tree called in Tagalo "tan-ag," in Bisaya "tanag" or "hamitanag," in Pam-pango "panampat," in Ylocano "bitnong" (Blanco); and from early times, its leaves cooked and eaten, employed also medicinally: — growing according to Persoon, and Blanco, on the Philippines; observed by Rumphius iii. pl. 113 on Java and Amboyna (Pers.); by myself, from the Feejeean to

Canarium strictum of Southern Hindustan. A large Terebinthoid tree called in Tamil "congillum-marum," in Malabar "thelly" (Drur.); its resin, distinguished as *black dammer*, known from early times:—observed by Roxburgh, Wight, and Drury, from the mountain "forests about Courtal-

the Samoan Islands. Westward, by Roxburgh, and Wight, in Hindustan; by Nimmo, in "S. Concan" (Graham), nearly as far as Bombay.

Gordonia obtusa of the mountains of Southern Hindustan. A beautiful Camellioid tree called "nagetta" (Drur.); its beech-like timber much used from early times:—observed by Wallich, Wight, and Beddome, "common on the Neilgherries, Wynaad, and Western Ghauts of Madras from twenty-five hundred to seventy-five hundred feet" in elevation (Drur.).

Cleyera gymnanthera of the mountains of Southern Hindustan. A large Camellioid tree, its timber from early times valued by the natives as strong and durable:—observed by Wight "common about Ootacamund" on the Neilgherries (Drur.).

Hugonia mystax of Ceylon and Southern Hindustan. A yellow-flowered shrub ten to fifteen feet high called in Tamil "agoore," in Malabar "modera canni" (Drur.); and from early times, its root employed in snake-bites and for other medicinal purposes:—observed by Rheede ii. pl. 19 in Malabar; by Drury, "commonly met with in Travancore;" by Wight, as far as Coromandel; and is known to grow on Ceylon (Pers.).

Euonymus crenulatus of the mountains of Southern Hindustan. A small tree, its close-grained box-like wood known from early times:—observed by Wallich, Wight, and Beddome, on the Neilgherries, Pulneys, and Western Ghauts, its wood may be used "for wood-engraving" (Drur.).

Sarcostigma Kleinii of Southern Hindustan. A Hernandioid woody climber; its oil, called "adul" or "odul" (Drur.), from early times much used on the Western coast for rheumatism:—observed by Wight pl. 1854 in Travancore (madr. exh. rep., and Drur.).

Euphorbia cattimandoo of Southern Hindustan. A shrub or small tree called in Telinga "cattimandu" (Drur.); and from early times, its juice used as a vesicant, and when boiled as a cement:—observed by W. Elliot at Vizagapatam, the boiled juice "sold in the bazaar" (Wight pl. 1993).

Chisanthus patulus of Southern Hindustan. A large Euphorbiaceous tree called in Telinga "jiguru" (Drur.); and its hard durable timber known from early times:—observed by Roxburgh cor. pl. 170, and Wight, at Courtallum and on the Circar mountains (Drur.).

Macaranga Injica of Southern Hindustan. A peltate-leaved Euphorbiaceous tree called in Tamil "vuttathamaray," in Malabar "putta-thamara" (Drur.); and known from early times:—observed by Wight, and Drury, on the Neilgherries and in Travancore, its gum little known but affording superior impressions of leaves coins and medallions.

Macaranga tomentosa, growing also in Travancore, exudes a similar gum (Drur.).

Zizyphus glabrata of Southern Hindustan. An unarmed tree twenty feet high called in Tamil "carookoova," in Telinga "kakooopala" (Drur.); and from early times, its leaves used medicinally:—growing in Mysore, and observed by Ainslie, Roxburgh, and Wight pl. 282, a decoction of its leaves given in cachexia (Drur.).

Gluta Travancorica of Southern Hindustan. A large Terebinthoid tree called in Tamil "shenkurani" (Drur.), its fine-grained timber known from early times:—observed by Beddome on the Tinnevely mountains and in Travancore, its wood taking a good polish and "well adapted for furniture" (Drur.).

Acacia sundra of Southern Hindustan. A tree twenty to thirty feet high called in Tamil "karungali," in Telinga "sundra" (Drur.); and from early times, its very hard and durable timber preferred by the natives for house-posts:—observed by Roxburgh cor. iii. pl. 225, Wight, and Beddome, from the Bombay Presidency and Mysore to Travancore and the Northern Circars, abundant, a tree much resembling *A. catechu*, and yielding a similar resin.

Acrocarpus fraxinifolius of Southern Hindustan. A large Leguminous tree, deciduous-leaved, and called in Tamil "mallay-kone," by the Burghers on the Neilgherries "kilingi" (Drur.); its flesh-coloured light timber from early times used for building and furniture:—observed by Wight, Beddome, and Drury, on the Travancore mountains and Western Ghauts and in South Canara, a tree of rapid growth, largely used for shingles in Coorg and hence called *shingle tree*.

Casulpinia digyna of Southern Hindustan. From early times, an oil for lamps expressed from its seeds:—observed in Southern Hindustan by Rottler, and Wight (Steud, Graham, and Drur.).

Terminalia coriacea of the Coromandel mountains. A large tree called in Tamil "kara-maradoo," in Canara "mutti" (Drur.); and from early times, much used for the solid wheels of buffalo-carts, its wood being heavy hard and strong:—observed on the Coromandel mountains by Roxburgh, and Wight (Drur.).

Lobelia nicotianifolia of the mountains of Southern Hindustan and Ceylon. A stout annual

lum in the Tinnevely district" to Malabar, the Trichore forests, and Pulney hills, the resin sold along the Canara coast.

Lumnitzera racemosa of the seashore from Madagascar to Hindustan and Burmah. A Termi-

called in Mahratta "boke-nul" or "deonul" (Drur.), and probably from its uses as a reed in incantations "dawul" (Gibson); from early times, its leaves used medicinally, and its dried hollow stalks as koluri horns:—observed by Graham from Kandalla near Bombay to the Parr hills and Mahableshwur; by Roxburgh, Wight, and Drury, on the Neilgherries and as far as Canara and the mountains of Ceylon.

Conocarpus acuminatus of the Circar mountains. A large Terminalioid tree called in Telinga "pachi-man" (Drur.); and from early times, its wood if kept dry almost equalling teak used for house-building:—observed on the Circar mountains by Roxburgh, Wallich, and Wight.

Gyrocarpus Asiaticus of Southern Hindustan. A large Terminalioid tree called in Telinga "tanukoo" (Drur.); and from early times, its light timber preferred above all others for catamarans, used also for cowrie-boxes and toys:—observed by Law "on the banks of the Krishna near Nalutwar" (Graham), in the Bombay district; by Roxburgh cor. i. pl. 1, and Wallich rar. ii. 68, on the mountains of Coromandel.

Myrtus (Rhodomyrtus) tomentosa of Tropical Eastern Asia and the Malayan archipelago. A shrub or small tree, its fruit eaten from early times:—according to Wight, and Drury, "common on every part of the Neilgherries," also on Ceylon and Malacca, its ripe fruit "very palatable," much like the gooseberry; was observed by myself as far as Singapore; by Loureiro, in Anam (Steud.); is known to grow in China, where also its fruit is eaten and preserved. Transported to Europe and North America, has become frequent in greenhouses.

Zanonía Indica of Ceylon and Southern Hindustan. A Cucurbitaceous vine climbing over tall trees and called in Malabar "penar-valli" (Drur.); its leaves from early times employed medicinally:—observed by Rheede viii. pl. 47 in Malabar; by Wight, and Drury, at "Alwaye near Cochin," and called *bandolier fruit*; and is known to grow on Ceylon (Pers.).

Bryonia callova of Southern Hindustan. A woody Cucurbitaceous climber called in Tamil "toomutti," in Telinga "boddama" (Drur.); and from early times, its seeds used as a vermifuge, employed also in diseases of horses, and yielding an oil for the lamps of the poorer classes:—observed by Rottler in Coromandel (Ainsl., and Drur.).

Bryonia epigaea of Southern Hindustan. A woody Cucurbitaceous climber called in Tamil "kolung kovay," in Telinga "akasa-gherooda," in Hindustanee "rakus" (Drur.); and from early times, its root regarded as a remedy in snake-bites, used also for other medicinal purposes:—observed by Rottler, Roxburgh, and Wight, in Coromandel, its root living in the air without water, and well known in Mysore and on the Deccan (Ainsl., and Drur.).

Blumea balsamifera of Tropical Eastern Asia and the Malayan archipelago. Suffruticose and yellow-flowered, called in Tagalo and Pampango "sambon," in Ylocano "sobosob," in Bisaya "lalacdan" or "lacad bulan" or "guitinguitin" or "gabuen" or "ayoban" or "alibun" (Blanco); and from early times employed medicinally:—observed by Nimmo in "the Concans," the bruised plant smelling of camphor (Graham); growing also on Ceylon and in Assam, its taste pungent (Drur.); "is in very general use among the Javanese and Chinese as an expectorant" (Horsf.); is termed "baccharis salvia" by Loureiro, as observed in Anam, used there as stomachic, antispasmodic, and emmenagogue; was observed by Blanco on the Philippines, much used medicinally by the natives, and regarded at Manila as a substitute for "salvia;" by Rumphius vi. pl. 24, on the Moluccas (Drur.).

Rhododendron arboreum of the mountains of the Punjab and Southern Hindustan. A tree; from early times, a good subacid jelly made from its flowers:—observed by Stewart on the mountains of the Punjab; by Wight, Hoffmeister, and Drury, on the "Neilgherries and other lofty mountain-ranges," its young leaves according to Madden poisonous to cattle.

Gaultheria Leschenaultii of the mountains of Southern Hindustan. A glabrous shrub, flowering all the year, its berries blue, and known from early times:—observed by Wight, Drury, and Broughton, abounding on the Neilgherries, an oil procured from it identical with that from the Canadian *G. procumbens*. From transported specimens, described by Decandolle prodr. vii. 593 to 606.

Isonandra acuminata of the mountains of Southern Hindustan. A Sapotoid tree eighty to ninety feet high, rising to a great height before branching, called in Tamil "pali" or "pauley," in Malabar "pashonti" or "pauchotee" (Drur.); and known from early times:—observed by Lascelles in 1850 in the Wynad forests, by Cullen, and Cleghorn, from the Travancore forests to Coorg and the Annamallay mountains and on the Eastern and Western Ghauts to the elevation of "three thousand feet," its exudation bearing some resemblance to the gutta percha of commerce (Drur.); by Dalzell fl. bom. as far as the Bombay district.

Diospyros calycina of Southern Hindustan. Called there "vellay toveray" (Drur.); and its

naloid shrub or tree called in Malabar "kada kandel" (Drur.); and its very strong durable wood known from early times: — observed by Rheede vi. pl. 37 in Malabar; by Nimmo, on the "margins of salt water creeks S. Concan" (Graham), nearly as far as Bombay; by Drury, among the man-

valuable light-coloured timber much used from early times: — observed by Beddome pl. 68 "in the Tinnevely district and southern provinces of Madura, being very abundant up to three thousand feet of elevation" (Drur.).

Exacum pedunculatum of Southern Hindustan. A Gentianoid annual, known from early times as a bitter tonic: — observed by Wight, and Drury, "common in the Western districts of Mysore." Transported to Europe, is described by Plukenet mant. pl. 343 (Pers.).

Ophelia elegans of the mountains of Southern Hindustan. A shrubby branching Gentianoid called "salaras" or "salajit" (Drur.); and from early times, in great request as a bitter and febrifuge: — observed by W. Elliot, and Wight, on the Pulney hills and Northern Circars, the dried stems sold in the bazaars, and exported in bundles (Drur.).

Ophelia multiflora of the Neilgherries. White-flowered; its dried root from early times used at Bombay as a substitute for gentian and chiretta, — and apparently its stems and leaves also (Waring pharm. ind.): observed by Dalzell fl. bomb. 156 growing at Mahableshwar (Drur.).

Ipomaea gemella of Southern Hindustan? From early times, its mucilaginous leaves employed medicinally: — observed by Koenig, and Ainslie, in waste places in Tranquebar, known to occur also on Java (Pers., Steud., and Drur.).

Ehretia buxifolia of Southern Hindustan. A Cordia-like shrub or small tree called in Tamil "coorvingie," in Telinga "bapana boory," in Hindustanee "poluh" (Drur.); and from early times, its root employed medicinally, and by Mohammedan physicians considered an antidote to vegetable poisons: — observed by Ainslie, and Roxburgh, in Coromandel, by Drury "common on barren lands and in forests."

Gmelina Asiatica of Southern Hindustan. A thorny yellow-flowered shrub called in Tamil "neelacoomil," in Telinga "nelagoomadi" (Drur.); and from early times, its mucilaginous demulcent root employed medicinally: — described by Rumphius i. pl. 40 and ii. pl. 39; observed by Roxburgh, and Drury, from Travancore to Coromandel; but by Graham, "common in Bombay gardens," and "forms an elegant and excellent hedge," its flowers "large." Transported to Europe, is described by Plukenet alm. pl. 14.

Premna latifolia of Coromandel. A Verbenaceous tree called in Telinga "pedda-nella-kura" (Drur.); and from early times, its leaves eaten in curries, and its firm white wood used for many economical purposes: — observed by Roxburgh, and Wight pl. 869.

Premna tomentosa of Southern Hindustan. A shrub or small tree, its hard close-grained ornamental wood known from early times: — observed by Wight, and Drury, common from Travancore to the Circar mountains. From transported specimens, described by Willdenow, and Lamarck.

Justicia (Adhatoda) Tranquebarensis of Southern Hindustan. Fruticulose, and called in Tamil "tavashu-moorungie" or "poonakoo poondoo," in Telinga "pindi-konda" (Drur.); from early times, its leaves employed medicinally: — received by the younger Linnæus from Tranquebar; and observed by Ainslie, and Wight, along the Eastern coasts of the peninsula (Drur.).

Justicia (Rottleria) procumbens of Southern Hindustan and Burmah. A spreading shrub, jointed and often rooting at the joints, called in Tamil "nereipoottie," in Telinga "nakapootta chitto" (Drur.); and from early times, the juice of its leaves applied in ophthalmia: — observed by Ainslie, Roxburgh, and Wight, "very common on pasture-ground on the Coromandel coast" (Drur.); is known to grow also on Ceylon (Pers.); and was observed by Mason in Burmah. Transported to Europe, is described by Plukenet alm. pl. 56.

Antidesma dianthum of the Circar mountains. Its timber from early times used for many purposes: — observed by Roxburgh (Steud., and Drur.).

Antidesma pubescens of Southern Hindustan. A small tree called on the Circars "pollarie" (Drur.); and from early times, its fruit eaten: — observed by Nimmo in "S. Concan" (Graham), nearly as far as Bombay; by Roxburgh cor. ii. pl. 167, on the Northern Circars (Drur.).

Arum montanum of the Northern Circar mountains. Stemless and called in Telinga "kondarakis" (Drur.); its root from early times employed by the mountaineers to poison tigers: — observed by Roxburgh, and Wight pl. 796 (Drur.).

Arum lyratum of the Circar mountains. Its root from early times cooked and eaten, — regarded very nutritious when prepared "in a particular manner;" observed by Roxburgh (Drur.).

Areca Dicksonii of Southern Hindustan. A palm, its nut from early times eaten by the poorer classes as a substitute for betel-nut: — growing according to Drury wild in great abundance on the mountains of Malabar and Travancore.

groves "in the backwater in Cochín;" by Rottler, Roxburgh, and Wight, as far as the Sunderbunds or mouths of the Ganges, and used for fuel in Calcutta; by Mason, in Burmah. Westward, is termed "*bruguiera madagascariensis*" by Decandolle.

Cyperus bulbosus of the shores of Tropical Arabia and Hindustan. Called in Tamil "sheelandie," on the Coromandel coast "sheelandie arisee," in Telinga "pura-gaddi" and its root "puri dumpa" (Drur.); and from early times, flour from this root eaten:—observed by Roxburgh, and Wight, "in sandy situations near the sea on the Coromandel coast" (Drur.); is known to grow also on Ceylon, and Westward in Southern Arabia (Retz, and Pers.).

"The same year" (Abyss. chron., and M. Russell 151), in Abyssinia, through the interposition of the monk Tecla Haimanout founder of the monastery of Devra Libanos, the line of Solomon restored: the reigning monarch abdicating in favour of Icon Amlac, on condition that one-third of the kingdom should be ceded for the maintenance of the church; and in place of an Abyssinian abuna, that the head of the church should always be named by the patriarch of Egypt.

"1256 A. D." (Danish Chronicle, and Relat. du Groenl. 190), Greenland revolting and refusing to pay tribute to king Magnus of Norway, the Danish king Eric, who had married his daughter, sent a fleet and enforced obedience: but would take no further advantage,—and the treaty of peace was signed in Norway "in 1261" by three leading Greenlanders, whose names are given by Angrimus Jonas.

"1257 A. D." (art de verif.), Ibek succeeded by Nooreddin Ali, second Memluk sultan of Egypt.

"In this year" (Klapr. mem. ii. 365), the remnant of the Ouigour in the country of Cha tcheou subjugated by the Mongols.

"The same year" (Crawf. ind. arch.), Chico, the first king or kolano of Ternate, reigning.

"1258, June 6th" (Nicol.), a synod at Merton. To defend the liberties of the church of England "against the grant of a tenth, made by the pope to king Henry III."

"The same year" (Desvergers, and Marcel), Bagdad captured by the Tartars under Hulagu, a general of Mangu Khan, and the hereditary spiritual khalifate abolished.—At the end of three years (Marcel), some members of the Abbassid family sought refuge in Egypt; where one of them being proclaimed khalif, the highest religious office among Muslims was continued.

"The same year" (rudim. chron. Lond.), proclamation of king Henry III. to the people of Huntingdonshire, the earliest specimen of the *English language* bearing a precise date.

A tradition among the Senekas, that the *fortifications* "in their territory were raised by their ancestors in their wars with the western Indians, three, four, or five hundred years ago. But their uncertainty about the time," and "the total want of tradition respecting them" among other American tribes, are circumstances tending to invalidate the testimony.

Cucurbita polymorpha of Tropical or Subtropical North America. The *squash*, called by the New England tribes "askutasquash" (R. Will.), and cultivated from early times: *—observed under

* *Mollugo verticillata* of North America. A prostrate spreading weed, sometimes called *carpet-weed* (A. Gray), known from early times to the natives:—observed by myself from about Lat. 44° frequent in waste and cultivated ground throughout our Middle States, but possibly indigenous in the sands of the seashore; by Chapman in our Southern States, in "cultivated ground common." Westward, was received by Hooker from the banks of the Columbia and the Northwest Coast; was observed by Brackenridge, coming South with our land-party, on the Upper Sacramento near Shasty mountain. Transported to Europe, is termed "*planta mihi incognita Rauwolfii*" by Jungermann (Schmied. Geon. i. fig. cl), is described also by Plukenet mant. ix. pl. 332.

Prunus Chicasa of Arkansas and Texas. The *Chicasaw plum*, a small tree, said by the natives to have been brought from the country West of the Mississippi—(Ell.); was observed by Nuttall, and E. James, clearly indigenous along the Arkansas. De Soto on his way to Apalache found plums growing in the fields without planting and better than those of Spain, and after reaching the Mississippi met with "red" plums: Strachey on James river found among the natives fruit much like a "damoizin" but of the taste and colour of cherries: *P. Chicasa* was observed by Baldwin from Lat. 30° in Florida, by J. Read at St. Augustine, by Chapman in "old fields forming thickets;" by Walter, Michaux, Elliot, and Schweinitz, in the Carolinas; by Short, in Kentucky; by myself, along the Atlantic planted as far as Lat. 39°, and its cultivation increasing.

Caulophyllum thalictroides of the Alleghanies and tributaries of the Ohio and St. Lawrence. Called by the native tribes "co-hosh," and from early times "esteemed as a medicinal plant among them"—(Pursh): observed by myself on the White mountains and Berkshire hills; by Darlington, and Conrad, not far from Philadelphia; by Elliot, on the Alleghanies of Carolina; by Short, in Kentucky; by Nuttall, in the States West of the Alleghanies; and was received by Hooker from various parts of Canada.

Actaea Americana of Northeast America. Called red and white "co-hosh," and from early times

cultivation by the natives by W. Wood, R. Williams, and Josselyn; is known to have been cultivated throughout our Middle and Southern States; and by the natives in the West Indies, as appears from Dalechamp pl. 616, and was seen by Chanvalon on Martinique (Poiret dict. nat. xi. 234). Trans-

"considered by the natives as a valuable medicine" — (Pursh): the red-fruited variety growing according to Hooker from Hudson's Bay to 60° on the Rocky mountains, according to A. Gray from "New England to Penn. and Wisconsin;" observed by Lapylae at 51° on Newfoundland; by myself, as far South as 42° along the Atlantic; and by Mc Ewen, at Sacketts Harbor on Lake Ontario. The white-fruited variety, by myself along the Atlantic as far North as 43°; by Conrad at 40°; by Elliot, on the Alleghanies of South Carolina (Chapm.); and according to A. Gray is "more common southward, extending to Virginia and Kentucky;" was received by Hooker from Lake Huron. Transported to Europe, is described by Cornuti pl. 77.

Dentaria diphylla of the Alleghanies and affluents of the Ohio and St. Lawrence. Its pungent roots from early times "used by the natives instead of mustard" — (Pursh); observed by Michaux from the Alleghanies of Carolina to Tennessee; by Pursh, "in shady beech-woods, on high mountains, Pennsylvania to Carolina;" by Drummond, on the Alleghanies and at St. Louis, was received by Hooker from Lake Huron; and according to A. Gray, grows from "Maine to Kentucky."

Psoralea esculenta of the Upper Missouri. The *bread-root* of the native tribes, from early times eaten either crude or cooked, and stored besides "for winter use" — (Ph. and Nutt.): observed by Lewis and Clark "on the banks of the Missouri;" by Bradbury and Nuttall, "a few miles from St. Louis" on high hills near the Merimek, also "on the elevated plains of the Missouri," and called by Canadian boatmen "pomme de prairie."

Galium tinctorium of Northeast America. From early times used by the native tribes to "dye their feathers, porcupine quills, and other ornaments, of a beautiful red" — (Ph. and Nutt.): the plant does not seem well known to botanists, but is regarded as distinct from *G. trifidum* by Linnæus, Decandolle, and Pursh; was observed by Torrey as far North as 41° on the Hudson; by Schweinitz, at 36° in Upper Carolina; and by Short, in Kentucky.

Bidens bipinnata of North America. A weed called *Spanish needles* (A. Gray), known to the native tribes from early times: — observed by Torrey as far North as Lat. 41°: by myself, multiplying in clearings and cultivated ground in our Middle States; by Schweinitz, and Elliot, in Carolina; by Chapman, in "cultivated grounds common;" by Baldwin, as far as 29° in Florida; by Short, at Lexington in Kentucky; by Nuttall, and Pitcher, on the Arkansas. By European colonists, was carried Westward across the Pacific to the Philippines, observed by Blanco in two localities, but remaining unknown to the natives; is perhaps the "agrimonia moluccana" of Rumphius vi. pl. 15, and "b. Wallichii" seen by Mason in Burmah, by Roxburgh in Hindustan, and by Graham "a very common annual" in the outskirts of Bombay: was also carried across the Atlantic to Guinea (fl. Nigr). Transported to Europe, is described by Zanoni 32 in 1675; somewhat later by Morison vi. pl. 7; by Gouan, as growing in the open air; and has since become a troublesome weed in the Tyrol (A. Dec.).

Solanum nigrum of North America and the West Indies. A low herb with black nauseous inedible berries, known as a weed from early times: — was in New England before 1670, as appears from Josselyn; observed by myself along the Atlantic in waste and cultivated ground from Lat. 43° to 33°; by Chapman, from "Florida to Mississippi;" by Nuttall, along the Arkansas and the Missouri to its source; was received by Hooker from the Saskatchewan and Hudson's Bay; and observed by myself on the banks of the Upper Sacramento prior to visits of settlers. In the West Indies, was received by Torrey from Key West: and the "yerua mora'o solatrum" supposed by Oviedo to be identical with that of Spain, may be compared. By European colonists, *S. nigrum* was carried to Bermuda (Baldw.); to Britain, observed by Josselyn, and the *garden nightshade* or *petty morel* (Prior) having according to Lindley the berries "black;" also to Sweden (fl. Dan. pl. 460, and Fries 16. See *S. miniatum*).

Aristolochia serpentaria of Northeast America. The *Virginia snake-root*, from early times "so very highly" esteemed by the native tribes, — and subsequently by the colonists (Ph.): observed by Catesby i. pl. 29 in Virginia; by Chapman, from "Florida to Mississippi;" by Elliot, in South Carolina; by Croom, near Newbern; by Darlington, frequent at 40° on the Brandywine; by Torrey, as far as 41° on the Hudson; by Short, in Kentucky; by Nuttall, in Arkansas; and according to A. Gray, grows from "Connecticut to Indiana." Transported to Europe, is described by Gerarde 848, and Plukenet phyt. pl. 223 f. 2 and alm. p. 53; and continues in medicinal use "as a stimulant, tonic, diaphoretic, and in certain cases as an antispasmodic and anodyne" (Lindl.).

Panicum capillare of the Hawaiian Islands? A coarse annual grass, from early times known as a weed in Northeast America: — observed by Michaux 48; by myself, frequent in waste and

ported to Europe, is termed "*cucumis turcicus*" by Fuchs in 1542 (Dalech.); from 1561 was cultivated by J. Bauhin hist. ii. 224 (A. Dec.); is described also by Dodoens, and Lobel, soon becoming an agricultural product throughout middle and Southern Europe; was observed by Chaubard abundantly cultivated in the Peloponnesus; by Delile, and Clot-Bey, in Egypt, called there "*kara mogrebi*" Western gourd. By European colonists, was carried to Austral Africa, and thence to Hindustan, where *vegetable marrow* was found by Graham "in gardens Bombay, not very common;" and "*C. verrucosa*," regarded as a variety, to Japan (Thunb.).

Helianthus annuus of Northwest America. The *sunflower* called in Mexico "*chimalatl*" and known there from early times (Humb. iv. 9); also from early times cultivated in our Atlantic States,—as appears from the figures accompanying Hariot's account of the Roanoke (De Bry i. 14 and pl. 20); the custom of planting the sunflower among maize adopted by colonists as far as Northern New England. In Europe, *H. annuus* was first made known through a description sent by Cortusi to Matthioli and published in 1568; is described somewhat later by Dodoens, Monardes, and Gerarde, now becoming well known in gardens; was observed by Forskal at Constantinople; by him, Delile, and Clot-Bey, in the gardens of Egypt; and by Roxburgh, and Graham, in the gardens of Hindustan.

Helianthus tuberosus of North America. The "*girasole*" or *jerusalem artichoke*, called in French "*topinambour*" (Nugent), in Spanish "*pataca*" (Herrera agr.), known in New England from early times:—Gookin coll. 3 found the natives mixing "*jerusalem artichokes*" in their pottage: its cultivation, adopted by the colonists, has been observed by myself as far as the border of Canada, the plant sometimes escaping and springing up spontaneously: *H. tuberosus* was observed by Chapman "commonly cultivated" also in our Southern States; but was not met with by Humboldt ii. 473 in Mexico, nor in any of the Spanish colonies, nor by Martius in Brazil (A. Dec.). Transported to Europe, was seen by Columna ecphr. ii. 11 in 1616 in the Farnèse garden; is termed "*battatas canadensis*" by Parkinson, becoming now an object of agriculture, sometimes escaping but hardly naturalized (A. Dec.); was observed by Clot-Bey, recently introduced into Egypt; by Gerarde, about Sabathoo on the Himalayas and called "*kuchaloo*" or "*pinaloo*" (Edin. journ. sc. ix. 235), by Lush, "cultivated in Deccan gardens" and thriving "remarkably well" (Graham).

Catalpa bignonioides of our Gulf States. The *catalpa* or *catawba* tree, known from early times, and supposed to have been brought Northward by the Creeks and Cherokees — (. . .): observed by Nuttall clearly indigenous in Alabama; by Chapman, on "river-banks, Georgia, Florida, and westward." Farther North, by Catesby i. pl. 29, Walter, and Elliot, in Carolina; by myself, planted for ornament as far as 43° along the Atlantic. Transported to Europe, was observed by A. Decandolle flowering in the open air at Geneva in Switzerland; is known to be planted in Italy (Lindl.); and according to Clot-Bey has recently been introduced into Egypt.

Carya olivæformis of the Lower Mississippi and Texas. The *pecan hickory* known from early times, and oil to season their "*sagamitty*" with, made from its nuts "*pacannes*" by the native tribes of Louisiana — (Bossu trav. 349): the walnuts West of the Mississippi were found by De Soto 23 to 24 soft shelled, like unto acorns, and stored by the natives (soc. Hackl.): *C. olivæformis* was known to Walter (Pers.); was observed by Chapman on "river-bottoms, Mississippi, northward and westward;" by Darby, from Natchitoches to the Rio Colorado of Texas; by Nuttall in Arkansas; by F. A. Michaux, from the St. Francis river in Arkansas to Illinois, and along the Mississippi to about Lat. 42°; by Long's expedition, as far as 41°; by myself, on the Lower Ohio; and by Short, in Kentucky. Transported to Europe, is described by Aiton, and Gaertner; and *pecan nuts* have become a well-known article of commerce.

Amaranthus retroflexus of Mexico and the unwooded central portion of North America. A coarse weed known to the natives from early times:—received by Moquin from Mexico; observed by Nuttall along the Arkansas: by Chapman, in "cultivated grounds, Florida, and northward;" by Short, in Kentucky; by myself, frequent in waste and cultivated ground from Philadelphia to about 44° in New England. From New England, according to Ray, was carried to Europe; is termed "*a. maximus Novæ Angliæ totus viridis*" by Zannichelli in 1735, "*a. spicatus*" by Lamarck in 1778, has since become a weed throughout middle Europe from France to Silesia, the pest of the gardens according to Bieberstein in Southern Russia as far as the Ukraine (A. Dec.); was observed by Sestini at Constantinople, by Chaubard in the Peloponnesus. "*A. hybridus*" as well as "*A. chlorostachys*" are regarded by A. Gray as perhaps not distinct.

cultivated ground in New England and our Middle States; by Chapman, in "sandy fields, Florida, and northward;" by Nuttall, on the Arkansas; is known to occur on Jamaica (Pers.); and was received by Kunth from Montevideo. Transported to Europe, is described by Linnaeus, and Retz obs. iii. 9; and was observed by Balbi springing up spontaneously near Nice (Dec.). This or a species much resembling it was observed by myself indigenous on the Hawaiian Islands.

Amaranthus albus of the unwooded central portion of North America. A weed known to the natives from early times, — and probably the species seen by Nuttall on the Arkansas: was observed by Chapman in "cultivated grounds, Florida, and northward;" was received from Pennsylvania by Linnæus, and observed near West Chester by Darlington; by A. Gray in Central New York, in "waste grounds, near towns, and road-sides, common." Transported to Europe, the "*blitum maritimum minus calyculis aculeatis*" found by Micheli naturalized in the sands near Viaregio in Tuscany, is referred here by Tilli in 1723, also by Willdenow pl. 1: *A. albus* was observed by Desfontaines "in 1797" in Barbary, and has since become a weed in Sicily, Sardinia, Spain, Portugal, and France, as far even as Paris (Loisel., Guss., Boiss., and A. Dec.).

Phytolacca dracandra of central North America. The *poke*, called by the natives of Virginia "pocan" (Lindl.), and known from early times: — observed by E. James on the Upper Arkansas, by Nuttall lower down on the Arkansas, and by N. A. Ware in Opelousas; but along the Atlantic, observed by myself a weed in waste and cultivated ground from about Lat. 44° throughout our Middle States; by Chapman, "margins of fields and uncultivated ground, Florida, and northward," by Croom as far as 30° 30'. Transported to Europe, was seen in France about 1650 by Barrelier pl. 150, was at first cultivated for colouring Bordeaux wine with its berries, called "*raisin d'Amerique*," is mentioned as a cultivated plant by Ray "in 1693," but subsequently became naturalized (A. Dec.); is termed "*ph. americana majori fructu*" by Tournefort inst. 299; is called in Italy "*uva Turca o di Spagna*" (Poll.); is known to occur in Barbary (Pers.); was observed by Forskal, Sibthorp, and Chaubard, naturalized from Constantinople to the Peloponnesus and called "*agriostaphitha*;" by Forskal, and Delile, in Egypt, in gardens and springing up spontaneously and called "*sabaghah*" dye-stuff.

Poa annua of the Andes of South America? A low annual grass, known as a weed from early times: — this or an allied species observed by myself near the snow on the Peruvian and Chilian Andes: *P. annua* was received by Kunth from South America and the Falkland Islands; was observed by Nuttall on the Arkansas; by Short, in Kentucky; by Chapman, in "yards and gardens, Florida, and northward introduced;" by myself, a weed around dwellings and in waste ground in our Middle States and New England; by Hooker, in Iceland. In Europe, is described by T. Johnston (Ger. emend. 3) in 1633, subsequently by Ray syn. 408; is termed "*gramen pratense paniculatum minus album*" by Tournefort inst. 521; is known to occur along roadsides and in irrigated ground from Lapland to the Mediterranean (Pers., and Wats.); was observed by Sibthorp on the Bithynian Olympus, and along the shore of Asia Minor, also in the Peloponnesus; by Hasselquist, at Damietta in Egypt; is known to grow in waste ground along the Taurian mountains (Bieb.), and in Siberia (Kunth). Clearly by European colonists, was carried to the Interior towns of Southern Brazil (A. Saint-Hil.); and to either Auckland or Campbell's Island, in the absence of inhabitants found on the grave of a French sailor (A. Dec.).

Echinochloa crus galli of North America. A coarse grass known as a weed from early times: — observed by Nuttall on the Arkansas; by myself, to all appearance indigenous on mud-flats along the Delaware, and within reach of brackish water along the New England shores, but multiplying as a weed in cultivated ground; by Chapman, in "wet places, Florida, and northward." Transported to Europe, is described by Matthioli, and Camerarius, had become frequent in the days of the Bauhins, occurring in waste places around London in the days of Parkinson, and Ray (Wats., Bab., and Bromf.); is termed "*p. vulgare spica multiplici longis aristis circumvallata*" by Tournefort inst. 515; is known to occur around Paris, and as far as Holland (A. Dec.); was observed by Forskal, Sibthorp, and Chaubard, in cultivated ground from the Bithynian Olympus to Smyrna and the Peloponnesus, and called "*kéhri*" or "*kékri*;" by Forskal, and Delile, in rice-fields near Rosetta in Egypt. Clearly by European colonists, was carried to Austral Africa (E. Mey.), and Australia (Kunth). *E. crus-cervi* regarded as distinct, was observed by Thunberg near Nagasaki in Japan, called there "*ko kibi*" little sorghum; by Roxburgh i. 296, in Hindustan, and by Graham in the environs of Bombay.

"1259 A. D." (Yule cath. i. p. cxxi), Mangu succeeded by Khoubilai, now khan of the Tartars.

"In this year" (art de verif.), Nooreddin Ali succeeded by Kotoz, third Memluk sultan of Egypt. Who, before the close of the year (Marcel 162) defeated the Tartar army of Hulagu-Khan in Palestine.

"In this year" (Humb. cosm. v.), the *magnetic variation* in Italy found by Petrus Peregrine to be "5° east."

"In or about this year" (Gildem.), Ebn Alwardi writing.

As early possibly as this year (see Malay ann., and Raffles x.), the city of Malacca founded by Sekander Shah, fourth ruler of Singa pura: from which place he had been driven out by the Javan forces.

"1260 A. D." (ann. Jap., and art de verif.), abdication of Fikakusa II. in favour of his younger brother Kame-jamma or Ki-zan, now eighty-ninth dairo of Japan.

"The same year = 1st year of the 'king-ting' of Li-tsoung." Commencement of the reign in Northern China of Khoubilai khan of the Tartars, under the name of "Chitsou of the Youan" (Chinese chron. table, and Pauth. 349). Khoubilai introduced *Lamaism* or the Tartar religion; but through his minister the sage Hiu-heng, governed the Chinese according to their own usages. — He constructed the Northern portion of the Great canal.

The event amounted to a dissolution of the Tartar Empire, the middle portion having a seat of government at Almalik in Central Asia, and Kipchak or the Western portion at Sarai on the Wolga — (Yule p. cxxi).

"The same year" (Alst.), at Adrianople, Joannes IV. succeeded by Michael VIII. Palaeologus, as the legitimate Byzantine emperor.

"The same year" (Lubke and Lutrow), by Nicola Pisano. his marble-reliefs on the pulpit of the Baptistery at Pisa finished. — Those on the pulpit of the cathedral at Siena, were finished "in 1266."

"The same year" (art de verif.), Kotoz succeeded by Beybars, fourth Memluk sultan of Egypt. Besides his mosque and tomb at Cairo, Beybars constructed various works of public utility, here, and at Alexandria, Damietta, and Rosetta. His inscriptions and coins are remarkable for an accompanying figure of a lion; in violation of the precepts of the Muslim religion.

The fanatical sect of Bathenians or Hassassins (according to Marcel) exterminated by Beybars: — (evidence will however be given, that the sect continued to exist more than two centuries later).

"1261, July" (Alst., and Blair), Constantinople recovered from the crusaders by the emperor Michael VIII.

"The same year" (Nicol.), a synod at Paris, "To implore the aid of Heaven against the conquest made by the Tartars over the Christians." Also synods at Lambeth, and Ravenna, on the same subject. And at Mayence, "To make preparations for resisting the Tartars."

"Aug. 29th" (Alst., and Nicol.), Alexander IV. succeeded by James Panteleon patriarch of Jerusalem, now Urbanus IV., twenty-sixth pope. Richard of Cornwall ruling Germany and Italy, though residing almost constantly in England; being a brother of king Henry III.

"1263, Nov. 18th" (Nicol.), a synod at Paris. A hundredth "of the revenues of the clergy of France was granted for five years, in aid of the wars in the Holy Land."

"1264 A. D. = 5th year of the 'king-ting' of Li-tsoung, and 1st year of the 'tchi-youan' of Chi-tsou" or Khoubilai-Khan (Chinese chron. table), beginning of the Sixty-sixth cycle.

"May 14th" (Blair), Henry III. defeated and taken prisoner by the barons under Montfort earl of Leicester: and "according to some" authorities, the *Commens* of England first summoned to parliament. — The earl of Leicester was defeated in the following year by prince Edward.

"Aug. 26th" (Nicol.), a synod at Paris. A tenth of the revenues of the French clergy was granted "for the conquest of Sicily" to Charles d'Anjou. To whom the pope had transferred the throne from Manfred (Alst.).

"1265 A. D. = 'hian-tchun,' 1st year of Tou-tsoung, of the Soung" or Twenty-first dynasty — (Chinese chron. table).

"Feb. 5th" (Alst., and Nicol.), Urbanus IV. succeeded by cardinal Guy Foulquois, now Clemens IV., twenty-seventh pope. Who wrote besides on jurisprudence.

"The same year" (rudim. chron. Lond.), introduction of *hereditary nobility* into Sweden.

Robertus Sorbona, founder of the college of the Sorbonne at Paris, at this time writing — (Alst. p. 407).

"In or about this year" (Way pr. pm.), the author of gloss. Harl. 978 writing.

Hieracium pilosella of Europe and the adjoining portion of Asia. Called in Britain *mouse-car* (Pr. or), in which we recognize the "auricola muris" of gloss. Harl. 3388 and *PILOSELLA* of gloss. Harl. 978, — the "muricula" or "mowseer herbe" of Galfridus pr. pm., and the "pilosella" commended by Montagnana (Spreng.): *H. pilosella* is termed "dens leonis qui pilosella officinarum" by Tournefort inst. 469, "pilosella alpina" by Hoppe; and is known to grow from France throughout Northern Europe as far as Lapland and Iceland (Pers., Hook., and Wats.). Fastward, was observed by Sibthorp from the Peloponnesus to Constantinople and on the Bithynian Olympus; is known to grow also in the Tauro-Caspian countries.

"1266, Feb. (= 664 A. H." of Ferisht., Elph.), Nasir-u-din Mahmud succeeded by Gheias-u-din Bulbun, now ninth sultan of Delhi. — His court was the resort of exiles, including the poet Amir Khusru and other literary men, and at different times no less than "fifteen" sovereigns driven from their dominions in the West by the Mogul Tartars.

"May 10th" (Nicol.), a synod at Cologne. Against the injustice and violence "committed with impunity for fifteen years during the vacancy of the imperial throne." — A synod in the following year at Vienna, on the same subject.

Cologne being at this time the entrepot or general mart between the North and South, Albertus Magnus was enabled to procure there much information respecting Northern regions: companies for

carrying on the whale-fishery SOCIETAS WALMANNORUM already in existence, and he describes the *Physeter* and its *ambergris* and *spermaceti*; also the UNICORNU MARINUM, the sea-unicorn or narwhal; the walrus (*Trichecus rosmarus*), and its skin cut into strips for cables; the white bear (*Ursula maritimus*), hunted in the water like the LUTER otter and CASTOR beaver; and the sable, *Mustela zibellina* (Pouchet).

Albertus Magnus further speaks of ANIMALIUM ANNULOSORUM *annelids* or worms: he is regarded by Humboldt as the first person who constructed a *hot-house* for living plants (Pouchet).

Geum montanum of the mountains of middle Europe. The GARIOFLATA of Albertus Magnus, called also SANAMUNDA and PES LEPORIS — (Caesalp. xiv. 12), seems to correspond: *G. montana* was observed by Dodoens i. 5. pl. 19 on the mountains of Bohemia, its root equally having a "caryophyllo"-like odour; is described also by Barrelier rar. pl. 399; and is known to grow on the mountains of Switzerland (Pers.).

Narcissus pseudo-narcissus of middle and Northern Europe. Called in Britain *lent-lily* or *daffodil* or *daffadownilly*, by all the older writers "affodilly," in medieval Latin "asphodelus" (Prior); in which we recognize the AFFODILLUS of Albertus Magnus, — and the "felde lylle" having leaves like "sapharoun" of ms. Sloane 1571: *N. pseudo-narcissus* is described by Brunfels i. p. 129 (Spreng.), and Dodoens; is termed "n. sylvestris" by Lamarck fl. fr.; was observed by Scopoli in Carniola; and is known to grow wild in middle and Northern Europe (Engl. bot. pl. 17, and Lindl.). By European colonists, was carried to Northeast America, where it continues under cultivation as a garden-flower. Its properties according to Lindley are "similar to those of *N. poeticus*," and "the flowers are said to be emetic."

"The same year" (Crawford vii. 11), in Java, building of the earliest of the temples of Brambanan. — The latest in "1296."

"Not more perhaps than five or six centuries ago" (Hale ethnogr. Expl. Exp. 187 to 193), the Tarawan coral-islands colonized by fugitives drifting in two canoes from Banabe. They "had just commenced their settlement, when two other canoes arrived from a land to the southeast called Amoi" (Samoa); and "for some time the two parties lived together in harmony." — Within a comparatively recent period, a great change has taken place in the condition of the people: "the grandfather of the present king of Apamama, more than a hundred years ago, visited every island of the group, for the purpose of seeing what he considered the world. At present, from the hostility which prevails between the different clusters, such an undertaking would be impossible."

Cassia Occidentalis of Tropical and Subtropical America. Called in Brazil "gajamarioba" (Lindl.), and possibly known to the Polynesians as early as this date: — observed by myself seemingly wild on the lava covered portion of Hawaii, but usually occurring in waste places around dwellings as on Tahiti and the Samoan Islands, and regularly cultivated on Tongatabu. Eastward, was observed by E. James on the Upper Arkansas along the Rocky mountains, and therefore probably indigenous; by Nuttall, lower down on the Arkansas; and is known to occur in waste places and cultivated ground from Virginia to Florida (Ell., Chapm., and A. Gray); was observed by Sloane ii. pl. 176, Swartz, and Macfadyen, in the West Indies; by Martius in Brazil, everywhere near dwellings, and spreading rapidly (Lindl.). By European colonists was carried Westward across the Pacific to the Philippines, called in Tagalo "balatongaso" or "tighiman," its seeds while tender eaten by boys (Blanco); to Australia (R. Brown cong. 58 to 61); to Burmah, "occasionally noticed in native cultivation for medicinal uses" and called "ka-lau" (Mason); to Hindustan, having no Sanscrit name (Pidd.), but called in Tamil "payaverei," in Malabar "payavera," in Telinga "cashanda" (Drur.), observed by Roxburgh, and Wight, and now according to Drury "common everywhere," by Graham as far as Bombay abundant in the rains "among rubbish in the neighbourhood of villages," by myself around villages in the dry season; to Eastern Equatorial Africa, observed by Grant from "Gondokoro 5° N." along the Nile, by Delile in gardens at Cairo: also by European colonists was carried across the Atlantic to Western Equatorial Africa, where it is cultivated by Negro tribes (Benth. fl. nigr., and A. Dec.), probably for baths and fomentations and the leaves smeared with grease for an adhesive plaster, as among their descendants in the West Indies (Macfad.). Transported to Europe, is described by Commelyn hort. i. pl. 96; and is termed "c. americana foetida" by Tournefort inst.

One hundred and sixty-seventh generation. Sept. 1st, 1267, onward mostly beyond youth: the Chinese astronomer Ko-cheou-king: the Hindustanee writer Khusrav of Delhi d. 1315: the Jewish writers, Gerson ben Solomon, Nachmanides, Abraham Abulafia ben Samuel: the Arab writers, Ebn Khallikan the biographer d. 1282, Saad ben Manssur Ibn Kemunat, Kaswiny d. 1283: the Armenian writer Vahram: the Greek writers Acropolites d. 1282, Gregorius Cyprius d. after 1280, Nicephorus Chumnus d. 1300, and Ephraemius d. after 1300: Gulielmus de Baldensal, Jacobus de Voragine, William of Piacenza, and Lanfranc: the jurist Durandus; Henry of Ghent; Albertet: John de Joinville; Rutebeuf: the Russian theologian Cyril of Kiev: the scholastic theologians, Udalricus Argentinensis, Rupertus de Russia, Aegidius Romanus, Richardus de media Villa, Henricus a Gan-

davo, Joannes Parisiensis, Thomas Aquinas, and Bonaventura: the last of the troubadours, Esteve de Bezier: the zoologists, Conrad d'Halberstadt, Guillaume de Normandie, Richard de Furnival (Pouch.): the botanists, Alfredus d. 1268, and Henri Arviel (Pouchet): the painters, Andrea Taffi d. 1294, Tommaso de Stefani d. 1310, Giovanni Cimabue d. 1300.

"The same year" (J. Glen in Orient. transl. lond.) end of the history of Armenia by Vartan.

"The same year" (Marco Polo, and Pauth. 353), a new city near Canbalu completed by Khoubilai-Khan for his seat of government: in other words, founding of the city of Pekin.

In this year (= 543 B. C. — "1809 years" in Mahavams. lxxxvii.), in Ceylon under king Parakramabahoo II. parts of the Buddhist Scriptures translated by high priests.

"In or about this year" (Blair), "the police of the city of Paris established" by the first regulator Stephen Boileau.

The spherical form of the earth, "li monde est reont," maintained by Brunetto Latini tresor (Pouchet).

"1268, Apr. 16th" (Nicol.), a synod in London. A decree was "published, To remedy the disorders occasioned by the civil war."

"1269 A. D." (F. Mason ii. 24), in Burmah, death of Narapadisæthu, king of Pagan; after founding in the latter part of his reign the city of Martaban, and leaving there thirty families "to take care of the pagoda" He was succeeded by his son Nandaraza.

"1270 A. D." (rudim. chron. Lond.), the "Establishments," a body of laws by Louis IX. suppressing *private wars* and trials by wager of battle.

"1271 A. D." (Chinese chron. table), by the Western Tartars or the Youan, names first given to their empire.

Leaves of *Tamarix Germanica* called "balgou," *Glycyrrhiza hirsuta* called "nakhalsa," and *Sanguisorba* sp. called "chudou," employed by the Mongols and Bouriates as substitutes for tea — (Klaproth, and Ainsl. mat. ind. i. 1. 228).

The continuation of the Altaian mountains separating the waters of the Amour from those of the Lena and Lake Baical, called by the Bouriates from remote antiquity * "Iableni-Daba" — (Pall. trav. iv. 266).

Allium sphaerocephalon of Siberia. From early times eaten around Lake Baical, — observed on its shores by Pallas iv. 418. Westward, is described by Micheli u. gen. pl. 24; and is known to occur in Italy and Germany (Pers.).

Polypodium fragrans of East Siberia. A fern called by the Bouriates "serlik," and from early times used as a substitute for tea, — observed by Pallas iv. 418 on rock around Lake Baical

"In this year" (Danish chron., and Relat. du Groenl. 207), by a strong Northwest wind ice driven in great quantities to Iceland, laden with so many bears and so much wood that the existence of land in that direction beyond Greenland was inferred: and an expedition was sent out, but without result.

"Sept. 1st" (Alst., and Nicol.), Clemens IV. after an interval of "two years and nine months" succeeded by archdeacon Thibaud Visdomini, now Gregorius X., twenty-eighth pope. The same year in France (Alst.), Louis IX. succeeded by Philip III.

"1272 A. D." (Way ed. pr. pm. pref.); Robertus Kylwarbi nominated archbishop of Canterbury by pope Gregorius X. His writings are voluminous, some of them grammatical, — and are quoted by Galfridus pr. pm.

"1273 A. D." (Alst., and Blair), Rodolph of Hapsburg made emperor of Germany and Italy, and head of a new dynasty. — Continued in the Austrian emperors to the present day.

"In the Thirteenth century" (according to Mirbel, in Pouchet), *herbaria* or collections of dried plants first formed.

As early perhaps as this century (native tradition, and Ciez. lii), at Santa Elena point of the Gulf of Guayaquil, arrival of reputed "giants" in "boats made of reeds, as big as large ships" (Japanese junks?), men of large stature having large eyes, "hair reaching to the shoulders," and no beards; they "were dressed in the skins of animals, others only in the dress which nature gave them, and they had no women with them." Landing, they "made a sort of village," and in the absence of fresh water dug "very deep wells" in the living rock until they procured a supply, and then lined them with enduring "masonry from top to bottom." The wells — are regarded by Cieza de Leon as certainly "executed by very strong men."

Convolvulus (Batatas) edulis of Tropical America. The *sweet-potato* from Easter Island and Tahiti to Northern New Zealand is called "gumalla" or "gumarra" or "umara" (Forst. esc. 56), on Tahiti "umara" (Bert.), on the Hawaiian Islands "ouala" (Gaud.) or "uala" (Hale), in Bra-

* *Cornus alba* of East Siberia. A shrub that gave its name to the "Oulan-Bourgassen" river of the Bouriates, a tributary of Lake Baical — (Pall. iv. 359).
